FRONTISPIECE.

BRITANNIA SEATED ON AN EMINENCE, WITH A LION AT HER FEET.

Neptune introduces Captain Cook, whom she instantly crowns with Laurel. Behind Britannia History waits to record the New Discoveries.

A NEW

HISTORICAL AND COMMERCIAL

SYSTEM OF GEOGRAPHY:

CONTAINING

A COMPREHENSIVE HISTORY AND DESCRIPTION

OF THE PRESENT STATE OF

ALL THE KINGDOMS OF THE WORLD:

INCLUDING

THE MOST RECENT DISCOVERIES

OF THE

LATEST VOYAGERS AND TRAVELLERS.

THE WHOLE FORMING

A COMPLETE GUIDE TO GEOGRAPHY,

ASTRONOMY, THE USE OF THE GLOBES, MAPS, &c.

TO WHICH ARE ADDED,

A NEW AND COPIOUS GEOGRAPHICAL INDEX,

WITH THE NAMES AND PLACES ALPHABETICALLY ARRANGED;

AND

A GENEALOGICAL TABLE OF ALL THE SOVEREIGNS

OF THE WORLD.

THE WHOLE COMPILED FROM THE BEST AUTHORITIES,

AND EMBELLISHED WITH MAPS, AND SUPERB ENGRAVINGS.

AN

USEFUL GUIDE

TO

GEOGRAPHY AND ASTRONOMY.

PART I.

THE ſcience of GEOGRAPHY conſiſts in an accurate deſcription of the earth, its ſurface, magnitude, and the poſitions of ſeveral parts of the ſurface of the terraqueous globe. This uſeful branch of knowlege, like all others of a practical nature, has advanced towards perfection by ſlow, and, in ſome periods, by almoſt imperceptible degrees; it cannot, however, be completely acquired without conſidering the earth as a planet, or as a body moving round another at a conſiderable diſtance from it. The other noble ſcience, which treats of the planets and the reſt of the heavenly bodies, is properly called ASTRONOMY, with an account of which, and of thoſe celeſtial bodies, we have thought it neceſſary to begin this part of our work. The moſt conſpicuous of theſe bodies is that glorious luminary the ſun, the ſource of light and heat to the ſeveral planets which move round it; and which, together with the ſun, as the centre, compoſe what is called by aſtronomers the ſolar ſyſtem. The way, or path, in which the planets move round the ſun, is called their orbit. There are ſix primary planets, each of which moves round the ſun in its own orbit; theſe are, Mercury, Venus, the Earth, Mars, Jupiter, and Saturn. The two firſt, as they move within the orbit of the earth (being nearer the ſun) are called inferior planets, or, perhaps with greater propriety, interior or inner planets: the three laſt, moving without the orbit of the earth, are called ſuperior, or, perhaps more properly, exterior or outer planets. The earth moves round the ſun in the ſame manner as theſe primary planets do. We ſhall now conſider the figure and motion of the earth.

In the infancy of the world, the figure of the earth was unknown: it was generally ſuppoſed to be a plane, circular ſurface, terminated by the heavens; that this plane was of no remarkable thickneſs; and that the regions below it were the habitations of ſpirits. The heavens, above our earth, in which the ſun, moon, and ſtars appeared to move daily from eaſt to weſt, were conceived to be at no great diſtance from it; and to be only deſigned for its uſe and ornament; but ſeveral reaſons, which it is needleſs to mention, concurred to render this opinion improbable. The figure of the earth is ſufficiently aſcertained, from the voyages of many navigators who have actually ſailed round it; particularly, Ferdinand Magellan, who by his circumnavigation begun in 1519, and completed in 1124 days, demonſtrated at once the ſphericity of the globe, and the exiſtence of the antipodes, which had been ſo ſtrenuouſly denied by the ignorant tongue of ſuperſtitious bigotry.

After thoroughly eſtabliſhing the roundneſs of the earth, a way was naturally opened for the diſcovery of its motion: for while mankind conſidered it as a plane, they had but an obſcure idea of its being ſupported, like a ſcaffolding on pillars, though they could not tell by what theſe latter were ſupported. This will evidently appear on conſidering that, if the earth did not move round the ſun, not only that luminary, but all the ſtars and planets, muſt move round the earth. Philoſophers have, by calculations founded on the moſt accurate obſervations, been able pretty nearly to diſcover the diſtances of the heavenly bodies from the earth, and from each other, in like manner as every perſon that knows the firſt elements of mathematics can meaſure the height of a ſteeple, or any object placed on it; hence it appears, that if we conceive the heavenly bodies to move round the earth, their velocity and motion muſt be inconceivably great, whereas all the appearances in nature may be as well explained by imagining the earth to move round the ſun in the ſpace of a year, which cauſes the viciſſitudes of the ſeaſons, and to turn on its own axis once in the 24 hours, which occaſions the different appearances of day and night.

In order to have a right conception of theſe two motions of the earth, we may imagine a ball moving on a billiard-table or bowling-green: the ball proceeds forwards upon the green or table, not by ſliding along like a plane upon wood, or a ſlate upon ice, but by turning round its own axis, which is an imaginary line drawn through the centre or middle of the ball, and ending on its ſurface on two points called the poles. Now the motion of the earth round its axis is from weſt to eaſt, and conſequently the heavenly bodies appear to move from eaſt to weſt; and as the former is performed in 24 hours, ſo the latter appears to be completed in the ſame time; and all the celeſtial objects ſeem to deſcribe circles in the heavens, which are greater or leſs, according as they are nearer to or further from the centre of thoſe motions, that is, from the two poles of the world: and as they all appear to finiſh their revolutions in the ſame time, their motions will be ſlower in proportion to the ſmallneſs of the circle they deſcribe.

It may be neceſſary to obſerve, before we exhibit a table of the planets, that, beſides the ſix above-named, there are others which are called ſecondary, becauſe they move round the primary planets. The ſecondary planets are ten in number, and go under the general name of moons, from their agreeing with our moons: of theſe, one moves round the earth, four round Jupiter, and five round Saturn. Theſe ſecondary planets ſuffer four kinds of eclipſes; 1. When they are within the ſhadows of their principal. 2. When the primary planet is between them and us. 3. When they are between their primary one and us; for then it is difficult to diſtinguiſh of two luminous points one from the other. 4. When they interpoſe between one another and our eye, ſo as to hide themſelves from our ſight.

In

In the ſolar ſyſtem are obſerved two principal laws, which regulate the motions of all the planets. Theſe laws are the following:

1. "The planets deſcribe equal areas in equal times." That is, the vector radius, in equal portions of time, deſcribes equal areas or portions of the ſpace contained within the planet's orbit.

2. "The ſquares of the periodical times of the planets are as their mean diſtances from the ſun." That is, as the ſquare of the time which any planet takes to deſcribe its orbit, is to the ſquare of the time taken by any other planet to run through its orbit; ſo is the cube of the mean diſtance of the former from the ſun, to the cube of the mean diſtance of the latter from the ſun.

Theſe are the two famous laws of Kepler, a great aſtronomer, who flouriſhed about the beginning of the ſeventeenth century, and who deduced them from a multitude of obſervations; but the firſt who demonſtrated theſe laws, was the incomparable Sir Iſaac Newton.

By the ſecond law, the relative diſtances of the planets from the ſun are known; and was the real diſtance of any one of them determined, the abſolute diſtances of all the others would be obtained. By the tranſit of Venus over the ſun in 1761, we now know the real diſtances of the planets from the ſun much better than before: theſe, together with other neceſſary particulars for forming a competent idea of the ſolar ſyſtem, are exhibited in the following table:

A TABLE of the Diameters, Diſtances, Periods, &c. of the Planets in the Solar Syſtem.

Names of the Planets.	Diameters in Engliſh Miles.	Mean Diſtances from the Sun, determined by the Tranſit of Venus, 1761.	Annual Periods round the Sun.	Diurnal Rotation on its Axis.	Hourly Motion in its Orbit.	Hourly Motion of its Equator.	Inclination of Axis to Orbit.
			y. d. h.	d. h. m.			deg. min.
Sun - - - -	890,000			25 6 0		3,818	8 0

The fixed ſtars, though they do not conſtitute a part of the ſolar ſyſtem, muſt be mentioned here, as they are of infinite uſe in the practice of geography. They are readily known from the planets, by their continually exhibiting that appearance we call the twinkling of the ſtars. They are obſerved never to change their ſituations with reſpect to each other, and hence they obtained the name of fixed ſtars; they ſhine by their own light; and there is the greateſt reaſon to think they are ſuns fixed in the centres of other ſyſtems, having planets and comets revolving round them like our ſun. They appear of various ſizes, owing to their different diſtances. Theſe ſizes are generally diſtinguiſhed into ſix or ſeven claſſes, called magnitudes, the largeſt and brighteſt are ſaid to be of the firſt magnitude; thoſe of the next claſs, or degree of brightneſs, are called ſtars of the ſecond magnitude, and ſo on to the laſt, or thoſe juſt viſible to the naked eye. But, beſides theſe, there are ſcattered in every part of the heavens, a prodigious number of others, called teleſcopic ſtars, from their being inviſible without the aſſiſtance of that inſtrument. Great part of the modern aſtronomy, indeed, owes both its riſe and perfection to that admirable machine. The diſtance between the earth and the neareſt fixed ſtar is aſtoniſhing; the orbit of the earth is at leaſt 162 millions of miles in diameter, yet this prodigious difference has no effect on the diſtance of the ſtar, which appears as far from the earth when in the neareſt as in the furtheſt point of its orbit. It has been computed, by ſome of the moſt able aſtronomers, that if a cannon ball continued to move with the ſame velocity as when firſt diſcharged from the piece, it would not reach the neareſt fixed ſtar in leſs than 700,000 years; the diſtance therefore is too great for the power of the human underſtanding to conceive: it is bewildered and loſt in the computation. Mr. Huygens takes Syrius, or the Dog-ſtar, to be about 27,000 times as far from us as the ſun is; and as the diſtance of the ſtars muſt be greater in proportion as they ſeem leſs, mathematicians have computed the diſtance of Syrius from us to be two billions and 200,000 millions of miles. The motion of light therefore, which, though ſo quick as to be commonly thought inſtantaneous, takes up more time in travelling from the ſtars to us, than we do in making a Weſt-India voyage. A ſound will not ariſe to us from thence in 50,000 years; which, next to light, is conſidered as the quickeſt body we are acquainted with; and the cannon-ball above-mentioned, flying at the rate of 480 miles in an hour, would not reach us in 700,000 years. Such indeed is the immenſe ſize of theſe heavenly bodies, and ſuch their diſtance from us, that could we advance, towards them 99 parts in 100 of the whole diſtance, and that there were but one hundredth part of the preſent diſtance remaining, they would appear very little larger to us than they do now; and if all the ſtars were to be extinct or annihilated this next night, we ſhould not miſs them till about ſix months after! for that ſtream of light flowing from them to our eyes, ſhould the fountain be ſtopped, would be half a year before it would be run quite out, though it run after the rate of about ten millions of miles in a minute; a motion almoſt as quick as thought itſelf.

The ſtars ſhine with their own native and unborrowed luſtre, as the ſun does; and ſince each particular ſtar, as well as the ſun, is confined to a particular portion of ſpace, the ſtars muſt conſequently be of the ſame nature with the ſun; and it is not in the leaſt probable that the Almighty, who always acts with infinite wiſdom, and does nothing in vain, ſhould create ſo many glorious ſuns, adapted to ſo many important purpoſes, and places them at ſuch diſtances from one another, without proper objects near enough to benefited by their influences: whoever imagines that they were created only to give a faint glimmering light to the inhabitants of this globe, muſt have a very ſuperficial knowledge of aſtronomy, and a degrading opinion of the Divine Wiſdom, whoſe works are, on the other hand, calculated to give us the moſt exalted ideas of the power and goodneſs of God! The milky way is crowded with infinite numbers of ſmall ſtars, from whence, as is uſually thought, its whiteneſs appears; which is a diſcovery entirely owing to the teleſcope; but whether the whiteneſs proceeds from the ſmallneſs of theſe numberleſs ſtars, their nearneſs to one another, or their immenſe diſtances, we cannot yet certainly determine,

determine, but muſt leave to time and future obſervations.

A ſenſible and diſcerning perſon, from what he already knows of our own ſyſtem, will naturally be led to conclude, that all the reſt are with equal wiſdom contrived, diſpoſed, and provided with accommodations for rational inhabitants: for although there is an almoſt infinite variety in the parts of the creation which we have opportunities of examining, yet there is a general analogy running through, and connecting all the parts into one ſcheme, one deſign, one whole! What an auguſt, what an elevated idea does the above ſpecimen give us of the works of the Creator! Thouſands of thouſands of ſuns, multiplied without end, and ranged all around us, at immenſe diſtances from each other, attended by ten thouſand times ten thouſand worlds, all in rapid motion, yet calm, regular, and harmonious, invariably keeping the paths preſcribed them; and theſe worlds peopled with millions of intelligent beings formed for endleſs progreſſion in perfection and felicity!—If ſo much power, wiſdom, goodneſs, and magnificence is diſplayed in the material creation, which is the leaſt conſiderable part of the univerſe, how tranſcendently wiſe, great, and good muſt HE be, who made, upholds, and governs the whole! and how far are we yet from knowing the bounds of the ſtarry world, or the thouſandth part of his works!

The ſhepherds who attended their flocks in the delightful plains of Egypt and Babylon, were the firſt people who paid a particular attention to the fixed ſtars; they were induced to obſerve the ſituation of theſe celeſtial bodies, partly for the ſake of amuſement, and partly with a view to direct them in their travelling during the night. Being poſſeſſed of a fertile imagination, they divided the ſtars into different companies or conſtellations, and ſuppoſed each of them to repreſent the image of ſome animal, or other terreſtrial object. The ſame thing is done by the peaſants in our own country, who diſtinguiſh that great northern conſtellation, which the philoſophers call Urſa Major, by the name of Charles's Wain, and fancy four of the ſtars contained in it to be the four wheels of the waggon, and the other three they ſuppoſe to repreſent the three horſes that draw it; ſome of the country people alſo gave this conſtellation the name of the Plough, the figure of which it in ſome meaſure reſembles. The conſtellations, however, have in general retained the names given them by the ancients, and are reckoned 21 northern, and 12 ſouthern; but the number of the northern have by the moderns been increaſed to 34, and of the ſouthern to 31. There are, beſides theſe, 12 ſigns or conſtellations in the Zodiac, of which we ſhall ſpeak hereafter.

The moſt famous ſyſtems, or hypotheſis, are the Ptolemaic, the Tychonic or Brahean, and the Pythagorean or Copernican ſyſtem.

The Ptolemaic ſyſtem was ſo called from its inventor Claudius Ptolemæus, a celebrated aſtronomer of Peluſium, in Egypt, and ſuppoſes the earth immovably fixed in the centre of the univerſe; and that the moon, the planets, and the ſtars, all move round it from eaſt to weſt, once in twenty-four hours, in the following order: the Moon, Mercury, Venus, the Sun, Mars, Jupiter, Saturn, and the fixed ſtars. Theſe were all ſuppoſed to be fixed in ſeparate cryſtalline ſpheres, and to be included in another, called the primum mobile, which gives motion to all the reſt.

This ſyſtem owed its origin to the ſenſible appearances of the celeſtial motions. It was taken for granted, that the motions which thoſe bodies appeared to poſſeſs, were real; and not dreaming of any motion in the earth, nor being acquainted with the diſtinctions between abſolute, relative, or apparent motion, the philoſophers were incapable of forming adequate ideas of theſe particulars, and thence reduced to the neceſſity of being miſ-led by their own ſenſes, for want of that aſſiſtance which after-ages produced. It is eaſy to obſerve, they had no notion of any other ſyſtem but our own, nor of any other world but the earth on which we live. They were perſuaded that all things were made for the uſe of man; that all the ſtars were contained in one concave ſphere, and, conſequently, at an equal diſtance from the earth; and that the primum mobile was circumſcribed by the empyrean heaven, of a cubic form, which they ſuppoſed to be the bliſsful abode of departed ſpirits. But modern obſervations and diſcoveries have ſufficiently ſhewn the abſurdity of this ſyſtem, ſo that it is now abandoned by all the learned, and hardly ever mentioned but to be exploded. Even in the infancy of aſtronomy, it was found inſufficient to account for all the motions of the heavenly bodies, without having recourſe to ſuch abſurd ſuppoſitions, that a novice in literature would be aſhamed to propoſe.

Tycho Brahe, a nobleman of Denmark, and one of the moſt eminent aſtronomers of his time, propoſed another ſyſtem to account for the motion of the heavenly bodies. This was called the Brahean ſyſtem. Unwilling to admit of the motion of the earth, and convinced that the Ptolemaic hypotheſis could not be true, he contrived another, different from any thing before offered to the world. In this hypotheſis, the earth is ſuppoſed to be at reſt in the centre of the univerſe, and that the ſun, together with the planets and fixed ſtars, revolved about the earth in twenty-four hours; and at the ſame time all the planets, except the moon, revolve about the ſun. But this was even more abſurd than that of Ptolemy, and accordingly was ſoon exploded.

The Pythagorean, Copernican, or true ſolar ſyſtem, which is now univerſally adopted by all the learned in Europe, ſuppoſes the ſun to be at reſt in the centre of the ſyſtem, and that all the planets move round him in the following order: Mercury, Venus, the Earth, attended by her ſecondary, the Moon; Mars, Jupiter, Saturn. Theſe, together with the comets, form the conſtituent parts of the ſolar ſyſtem.

About the year 1610, Galileo, a Florentine, introduced the uſe of teleſcopes, which diſcovered new arguments in ſupport of the motion of the earth, and confirmed the old ones. Learned men in different countries began to cultivate aſtronomy, and adopted this hypotheſis, and it would probably ſoon have been univerſally received, had it not met with a formidable oppoſition from an ignorant and bigotted clergy. Nurſed in the lap of indolence, and inveterate enemies to every ſpecies of free and impartial inquiry, they condemned the Copernican ſyſtem under pretence of its being repugnant to the ſacred writings, and Galileo was forced to renounce the Copernican ſyſtem as a damnable hereſy. The thunder of the Vatican was employed to ſilence the voice of reaſon, and the dread of eccleſiaſtical cenſures almoſt deterred mankind from thinking. At laſt the happy reformation in religion gave a fatal blow to ſuperſtitious tyranny; the rays of learning broke through the night of ignorance, and genuine philoſophy triumphed over the chicanery of the ſchools: mankind were now convinced, that the ſcriptures were never intended to explain the ſyſtems of philoſophy, but to make us humane, virtuous, and happy; that it is agreeable to the Great Author of our being to contemplate his works, and diſplay the wonders of his creating hand. From this fortunate æra the ſciences made rapid ſtrides towards perfection, and every day produced a diſcovery of ſome new truth, or the detection of ſome ancient error. Proofs were multiplied in confirmation of the Copernican ſyſtem, which is now eſtabliſhed on a foundation not to be ſhaken. The aſtoniſhing harmony which prevails among the ſeveral parts prove it to have been the work of a

divine hand; and that nothing leſs than Infinite Wiſdom could have planned ſo beautiful a fabric.

After the blind prejudices of weak mortals were once removed, noble diſcourſes were made in all the branches of aſtronomy. The motions of the heavenly bodies were not only clearly explained, but the general law of nature, according to which they moved, was diſcovered and illuſtrated by the immortal Newton. This law is called Gravity or Attraction, and is the ſame by which any body falls to the ground, when diſengaged from what ſupported it. This ſame law, which keeps the ſea in its channel, and the various bodies which cover the ſurface of this earth from flying off into the air, operates throughout the univerſe, keeps the planets in their orbits, and preſerves the whole fabric of nature from diſorder and confuſion. To be ſomewhat more explicit concerning this point: by the law of Gravity, or Gravitation, all heavy bodies have a tendency towards the centre of our earth, in ſuch an over-proportion, that the centripetal force, by which bodies tend thither, is almoſt 300 times greater than that by which they are forced off by the earth's motion round its axis, or the centrifugal force, as they call it; and this all-wiſe proviſion keeps all things together on the ſurface of the earth; and which, when exactly adjuſted, keeps alſo every planet in its proper circle, and at its due diſtance from the ſun, or from its primary one; and this is ſo univerſal a law, that it prevails univerſally.

There have been perceived, in the expanſe of the univerſe, many other bodies, belonging to the ſyſtem of the ſun, that ſeem to have much more irregular motions than the planets and ſtars above mentioned. Theſe are the comets, that, deſcending from the far diſtant parts of the ſyſtem with great rapidity, ſurpriſe us with the ſingular appearance of a train, or tail, which accompanies them; become viſible to us in the lower parts of their orbits, and after a ſhort ſtay, go off to vaſt diſtances, and diſappear. The ancients generally believed comets to be only meteors generated in the air, like thoſe we ſee in it every night; and in a few moments vaniſhing; while ſome modern writers have placed them among the fixed ſtars. But ſubſequent obſervations, with good inſtruments, and the application of the laws of Motion and Geometry to aſtronomical inquiries, have now ſatisfied us almoſt to a demonſtration, that they are a kind of planets, of ſolid and compact bodies, revolving in determinate periods round the ſun: but the orbits of many of them are ſo very oblong, eccentrical, or oval, as well as large and extended, that they can appear to us but very ſeldom.

That great comet, which appeared in 1680, went ſo near the ſun, as to acquire a degree of heat above 2000 times as great as that of red-hot iron; and if its body was about the ſize of our earth, as it was judged to be, it will not be cooled again this million of years. This comet was ſeen before in our hemiſphere, A. D. 1106; once before, about the year 532; and alſo 44 years before our Saviour's birth; and therefore they conclude the time of its periodical revolution round the ſun to be 575 years. The time of the revolution of that comet, which appeared again in 1758, is 75 years; and another, which was calculated to be ſeen here again in 1789, makes its ellipſis round the ſun in 129 years.

The middle diſtance of the great comet that appeared in 1680, was more than 5000 millions of miles from the ſun; as its greateſt diſtance was above twice as much; and yet its leaſt diſtance was not above a 20,000th part of its greateſt; ſo that in its whole revolution it would be ſubject to ſuch extremities, as that its greateſt degree of light and heat to its leaſt, were above 400 millions to one: and yet notwithſtanding this immenſe extenſion of its ecliptic orbit, the great and all-wiſe Architect of the univerſe hath probably ſo adjuſted the centrifugal and centripetal forces, that it doth not quite leave the ſun, though it go ſo far from him, but returns again towards him, and revolves round him in a determinate period of years. None of the orbits of any of theſe comets yet known, are in or near the plane of the earth's ecliptic; and therefore, in their aſcent from the ſun, though heated never ſo much by him, yet it is thought they will not approach near enough to our earth to burn us, or affect us with any ſenſible heat. It ought, however, to be obſerved, that our earth was out of the way when this comet laſt paſt near her orbit; but it requires a more perfect knowledge of the motion of the comet, to be able to judge if it will always paſs by us with ſo little effect; for it may be here obſerved, that the comet, in one part of its orbit, comes very near to the orbit of our earth; ſo that, in ſome revolutions, it may, approach near enough to have very conſiderable, if not fatal effects upon it.

There are, it is believed, at leaſt 21 comets belonging to our ſyſtem, moving in all manner of directions; and all thoſe which have been obſerved, have moved through the ethereal regions, and the orbits of the planets, without ſuffering the leaſt ſenſible reſiſtance in their motions, which ſufficiently proves that the planets do not move in ſolid orbs.

Of the Doctrine of the Sphere and the Globe.

The ancients were perſuaded that the earth was ſpherical, but were not able to aſcertain its dimenſions; the ſolution of that problem was reſerved for the moderns, who at length, after various reſearches, obtained ſatisfactory proofs that the earth was of a ſpherical figure: they obſerved, that the firſt part that appeared of a ſhip at ſea, was the top of the maſt; and, as ſhe approached gradually, ſhe ſeemed to riſe by degrees out of the water, till the whole ſhip was viſible; the ſame appearances, but in an inverted order, attended a ſhip ſailing from the ſpectator, ſhe ſeemed to ſink gradually beneath the ſurface of the ſea, till at laſt ſhe totally diſappeared. It being evident that this could reſult from nothing but the ſpherical form of the earth, and as theſe phænomena required no apparatus, they ſufficiently eſtabliſhed its globular figure.

The body of the earth is named a ſphere, with regard to aſtronomical ſpeculations; through the centre of this a ſtraight line is ſuppoſed to be drawn, from one oppoſite point of the ſurface to the other, which line is called a diameter. There are two points in the heavens, which always preſerve the ſame ſituation; theſe points are termed celeſtial poles, becauſe the heavens ſeem to turn round them. The motions of the heavens are imitated by the Artificial Sphere, through the centre of which a wire or iron rod is drawn, called an axis, whoſe extremities are fixed to the immoveable points called poles. But in order to render the following definitions more eaſy to be conceived, it may be proper to remark, that both the celeſtial and terreſtrial ſphere is ſuppoſed to be concentric to the centre of the earth, and to have correſpondent circles deſcribed on both ſpheres, and theſe circles are either greater or leſſer.

Great circles are thoſe which divide either the celeſtial or terreſtrial ſphere into two parts. Leſſer circles divide the ſphere into two unequal parts.

The poles of any circle are thoſe points on the ſurface of the ſphere equally diſtant from that circle. Every circle, whether great or ſmall, has two poles, or centres, and from which all others drawn to the circumference are equal.

The axis of any circle is a right line ſuppoſed to connect the poles.

The celeſtial axis is that right line about which the heavens ſeem to revolve; and the two points where this axis cuts the celeſtial ſphere, are called the north and ſouth poles of the world.

The Equinoctial, Equator, or Equaller, is that great circle of the ſphere, which is every where equally diſtant from the poles of the world; and, conſequently, divides the heavens into two equal parts. It is ſo called, becauſe when the ſun appears to deſcribe this circle, the days and nights are of an equal length to all the inhabitants of the earth. It is divided into 360 degrees.

The meridian, hour circles, circles of right aſcenſion, or circles of terreſtrial longitude, are thoſe great circles which interſect each other in the poles of the world, and cut the Equinoctial at right angles.

The ecliptic is a great circle of the ſphere interſecting the equinoctial in two oppoſite parts, and forming an angle with it equal to 23 degrees 29 minutes, the ſun's greateſt declination. It is generally divided into twelve equal parts called ſigns, beginning from one of its interſections with the equinoctial. It paſſes through certain conſtellations, diſtinguiſhed by the names of animals, in a zone called the Zodiac, of which more hereafter.

The *Doctrine of the Globe* is deſigned to repreſent the different regions, countries, nations, iſlands, and cities, on the face of the earth, upon an artificial globe or ball, called the Terreſtrial Globe, on which they are deſcribed in that order and figure that they really appear in on the face of the earth itſelf. With reſpect to the figure of the earth, though we have conſidered it as a ſpherical or globular body, yet it has been diſcovered that this is not its true figure, which Sir Iſaac Newton undertook to determine, and, according to his calculations, the diameter at the poles, or axis of the earth, and the diameter of the equator, are to each other as 229 to 230; by which it appears that the figure of the earth is nearly that of a ſphere or ball, though not perfectly ſo.

But as all concluſions reſulting from queſtions of the moſt abſtruſe kind, will ever leave ſome doubt on the mind, whether every neceſſary circumſtance has been taken into the account, and as this matter had occaſioned much diſpute between the philoſophers of the laſt age, particularly between Sir Iſaac Newton and Caſſini, a French aſtronomer, who were the heads of two different parties; it was determined to refer the deciſion to actual menſuration; it being ſufficiently known, that if the earth was a true ſphere, all the degrees of the meridian muſt be equal; but every one of them of different lengths, if the figure was that of a ſpheroid. It was alſo known, that if the length of the degrees increaſed from the equator towards the poles, the figure was that of an oblate ſpheroid; but if they increaſed from the pole towards the equator, the figure was a prolate ſpheroid, or ſomething in the form of a lemon. Conſequently if the length of a degree at the equator, and the length of another near the arctic circle could be accurately meaſured, both the form and dimenſions of the earth might be determined to a degree of accuracy ſufficient to anſwer all the purpoſes of navigation and geography. In 1736, the matter was put to trial by the king of France, who, deſirous of having this intereſting problem ſolved, ſent one company of mathematicians into Lapland, and another into Peru, in order to meaſure the length of a degree of the meridian in theſe diſtant places. The former finiſhed their taſk the ſame year, and found that the length of a degree of the meridian where it cuts the arctic circle, contained $57437\frac{6}{10}$, or 57438 toiſes nearly. The latter, who went to Peru, alſo finiſhed their operations in 1736, and found that the length of a degree at the equator, was $56767\ \frac{4}{5}$, or almoſt 56768 toiſes. Theſe menſurations not only confirmed the theory of Sir Iſaac Newton, but alſo demonſtrated, that he had determined the figure of the earth to a great degree of exactneſs; the two diameters being to each other nearly as 265 to $266\frac{1}{2}$; and ſince that time the earth has always been conſidered as more flat towards the poles than towards the equator.

The *circumference of the earth* is computed at 25,038 Engliſh miles. This ſpace, for the conveniency of meaſuring, is ſubdivided into 360 parts or degrees, each containing 60 geographical miles, or $69\frac{1}{2}$ Engliſh miles.

The *horizon* is repreſented by the upper ſurface of the wooden circular frame encompaſſing the globe about its middle. On this wooden frame is a kind of perpetual calendar, contained in ſeveral concentric circles: the inner one is divided into four quarters of 90 degrees each; the next circle is divided into the twelve months, with the days in each according to the new ſtyle; the next contains the twelve equal ſigns of the Zodiac, each being divided into 30 degrees; the next is the twelve months and days according to the old ſtyle; and there is another circle containing the 32 winds, with their halves and quarters. Although theſe circles are all on the horizon, yet they are not always placed in the ſame diſpoſition. Geographers diſtinguiſh the horizon into the *rational* and *ſenſible*. The ſenſible horizon may be conceived to be made by any great plain on the ſurface of the ſea, which ſeems to divide the concave orb of the ſtars, or the ſky into two parts or hemiſpheres, the one above, the other below the level of the earth. The rational or real horizon, encompaſſes the globe, exactly in the middle; its poles are called the Zenith and Nadir; the firſt exactly above our heads, and the other directly under our feet.

The *meridian* is a great circle, conſiſting of 360 degrees, which divides the globe into the eaſt and weſt hemiſpheres; it lies directly north and ſouth, paſſing through the poles of the equator, which it cuts at right angles: it is a changeable circle, being properly that part of the heavens, where the ſun is at noon; ſo that every place on the earth has a different meridian, if we move eaſt and weſt; but it remains the ſame, when we paſs north or ſouth.

The *Zodiac*, which is a broad circle cutting the equator obliquely, is deſigned to ſhew us what we called the ſun's place for every day in the year; and therefore, is divided into 12 parts, which are diſtinguiſhed by 12 eminent ſigns or conſtellations; and which, becauſe they are intended to ſign or mark out a particular place in the heavens where the ſun is, or appears to be, every month, have been called the Twelve Signs of the Zodiac: each of theſe ſigns is divided into 30 equal parts or degrees, which makes up the whole 360: they are as follow:

Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius, Piſces.

The *Colures* are two great circles which are ſuppoſed to interſect each other at right angles in the poles of the world, and to paſs through the ſolſtitial and equinoctial points of the ecliptic. That which paſſes through the two equinoctial points, is called the equinoctial colure, and determines the equinoxes; and the other which paſſes through the poles of the ecliptic, is called the ſolſtitial colure, becauſe it determines the ſolſtices.

The *Tropics* are two circles, ſuppoſed to be drawn on each ſide of the equinoctial, and parallel thereto. —That on the north ſide of the line is called the Tropic of Cancer, and the ſouthern tropic has the name of Capricorn, as paſſing through the beginning of thoſe ſigns. They are diſtant from the equinoctial 23° 29′, and are called tropics, becauſe the ſun appears, when in them, to turn backwards from his former courſe.

The *Polar Circles* are parallel to the equator, and at the ſame diſtance from the poles that the tropics are from the equator. The northern is called the Arctic, and the ſouthern the Antarctic, becauſe oppoſite to the former, from which it is diſtant only 23° 30′.

The ſurface of the earth is ſuppoſed to be divided into five unequal parts called *Zones*, each of which

is

is terminated by two parallels of latitude. Of theſe five zones, one is called the torrid or burning zone; two are ſtyled frigid or frozen; and two temperate: names adapted to the quality of the heat and cold to which their ſituations are liable.

The *Torrid Zone* is that portion of the earth over every part of which the ſun is perpendicular at ſome time of the year. The breadth of this zone is forty-ſeven degrees; extending from twenty-three degrees and a half north latitude, to twenty-three degrees and a half ſouth. The equator paſſes through the middle of this zone, which is terminated on the north by the parallel of latitude called the tropic of Cancer, and on the ſouth by the parallel called the tropic of Capricorn. The ancients conſidered this zone as uninhabitable, on account of the heat, which they thought too great to be ſupported by any human being, or even by the vegetable creation; but experience has long ſince refuted this notion. Many parts of the torrid zone are remarkably populous; and it has been found that the long nights, great dews, regular rains and breezes, which prevail in almoſt every part of the torrid zone, render the earth not only inhabitable, but alſo ſo fruitful, that two harveſts a year are very common.

The *Frigid Zones* are theſe regions round the pole where the ſun does not riſe for ſome days in the winter, nor ſet for ſome days in the ſummer. The two poles are the centres of theſe zones, which extend from theſe points to twenty-three degrees and a half nearly; that is, they are bounded by the northern and ſouthern parallels of latitude of ſixty-ſix degrees and a half. The part that lies in the northern hemiſphere is called the north frigid zone, and is bounded by a parallel called the arctic, or polar circle; and that in the ſouthern hemiſphere, the ſouth frigid zone, and the parallel of latitude which bounds it, is called the antarctic, or polar circle.

The two *Temperate Zones* are the ſpaces contained between the tropics and polar circles. The greater part of Europe is ſituated in the northern temperate zone; the Cape of Good Hope in Africa, and Cape Horn in America, lie in the ſouthern.

The Europeans have not yet thoroughly diſcovered all theſe zones: they are beſt acquainted with the northern temperate, and torrid zones: their knowledge of the ſouthern temperate and northern frigid zone is very ſcanty; and that of the ſouthern frigid zone, ſtill more ſo.

The term *Climate* is vulgarly beſtowed on any country or region differing from one another, either in reſpect of the ſeaſons, the quality of the ſoil, or even the manners of the inhabitants, without any regard to the length of the longeſt day. But, in a geographical ſenſe, the word *climate* more properly implies a certain ſpace upon the ſurface of the terreſtrial globe, cantained between two parallels, and ſo far diſtant from each other, that the longeſt day in one differs half an hour from the longeſt day in the other parallel. The difference of climates ariſes from the different inclination or obliquity of the ſphere: the ancients took the parallel wherein the length of the longeſt day is twelve hours and three quarters for the beginning of the firſt climate: as to thoſe parts that are nearer to the equator than that parallel, they were not accounted to be in any climate, either becauſe they may, in a looſe and general ſenſe, be conſidered as being in a right ſphere, though, ſtrictly ſpeaking, only the parts under the equator are ſo; or becauſe they were thought to be uninhabited by reaſon of the heat, and were beſides unknown. The ancients, conſidering the diverſity there is in the riſing and ſetting of the heavenly bodies, eſpecially the ſun, and, in conſequence thereof, the difference in the length of the days and nights in different places, divided as much of the earth as was known to them into climates; and, inſtead of the method now in uſe, of ſetting down the latitude of places in degrees, they contented themſelves with ſaying in what climate the place under conſideration was ſituated. According to them, therefore, what they judged the habitable part of the northern hemiſphere was divided into ſeven climates, to which the like number of ſouthern ones correſponded.

Some of the moderns reckon the different climates by the increaſe of half an hour in the length of the longeſt day, beginning at the equator, and going on till they come to the polar circle towards the pole; they then count the climates by the increaſe of a whole natural day, in the length of the longeſt day, till they come to a parallel, under which the day is of the length of fifteen natural days, or half a month; from this parallel they proceed to reckon the climates by the increaſe of half or whole months, in the artificial day, till they come to the pole itſelf, under which the length of the day is ſix months. Thoſe between the equator and the polar circles, are called hour-climates; and thoſe between the polar circles and the poles, month climates.

A parallel is ſaid to paſs through the middle of a climate, when the longeſt day in that parallel differs a quarter of an hour from the longeſt day in either of the extreme parallels that bound the climate: this parallel does not divide the climate into two equal parts, but the part neareſt to the equator is larger than the other, becauſe the further we go from the equator, the leſs increaſe of latitude will be ſufficient to increaſe the length of the longeſt day a quarter of an hour.

A TABLE of CLIMATES, according to RICCIOLUS, wherein the Effects of the Fraction are allowed for.

†

THE

THE RISE AND PROGRESS OF

NAVIGATION.

THE origin of this uſeful invention is referred, in ſcripture, to God himſelf, who gave the firſt ſpecimen thereof in the ark built by Noah: for the raillery the good man underwent on account of his enterpriſe, ſhews evidently enough, that the world was then ignorant of any thing like navigation; and that they even thought it impoſſible. However, the Phœnicians, eſpecially thoſe of Tyre, are repreſented in hiſtory as the firſt navigators. Tyre, whoſe immenſe riches and power are repreſented in ſuch lofty terms, both in ſacred and profane hiſtory, being deſtroyed by Alexander the Great, its navigation was transferred to Alexandria by the conqueror; and thus aroſe the navigation of the Egyptians, which was afterwards ſo cultivated by the Ptolemies, that Tyre and Carthage, which laſt was ſubdued by the Romans, were quite forgotten. At length Alexandria itſelf underwent the fate of Tyre and Carthage, being ſurpriſed by the Saracens, who, in ſpite of Heraclius, over-ran the northern coaſts of Africa, &c. ſo that Alexandria has ever ſince been in a declining ſtate.

Upon the fall of the Roman empire, the more brave among the Franks in Gaul, the Greeks in Spain, and Lombards in Italy, were no ſooner ſettled than they began to learn the advantage and utility of navigation and commerce, and the methods of managing them, from the people they had ſubdued; and in a little time ſome of them became able to give new inſtructions for the practice of it.

The people of Italy, and particularly thoſe of Venice and Genoa, were the firſt reſtorers of navigation and commerce in the marſhy iſlands in the bottom of the Adriatic; the Veneti, who dwelt along the coaſts of that gulf, retired, when Alaric king of the Goths, and afterwards Attila king of the Hunns, ravaged Italy.

Each of the 72 iſlands of the Adriatic continued a long time under their reſpective maſters, as diſtinct common wealths; the commerce becoming conſiderable, they began to think of uniting into a body; and it was this union, firſt begun in the ſixth century, but not completed till the eighth, that laid the foundation of the future grandeur of the Venetians.

From the time of this union the fleets of merchantmen were ſent to all the ports of the Mediterranean, and at laſt to Grand Cairo, a city built by the Saracens on the eaſtern bank of the Nile.

Thus they flouriſhed till the famous league of Cambray in 1508, when a number of jealous princes conſpired to effect their ruin; which was the more eaſily accompliſhed by the Portugueſe getting one part of the Eaſt-India commerce, and the Spaniards another.

Gonoa, which had applied to navigation at the ſame time with Venice, diſputed with it the empire of the ſea. Jealouſy ſoon began to break out, and, the two republics coming to blows, it was three centuries almoſt continued war, before the ſuperiority was aſcertained; when, towards the end of the 14th century, the fatal battle of Chioza ended the noble ſtrife. The Genoeſe, who till then had always had the advantage, had now loſt all; and the Venetians ſecured to themſelves the empire of the ſea, and ſuperiority in commerce.

About the ſame time that navigation was retrieved in the ſouthern parts of Europe, a new ſociety of merchants was formed in the north, who framed a new ſcheme of laws for the regulation of commerce, called ſtill the uſages and cuſtoms of the ſea.

In examining the reaſons of commerce paſſing ſucceſſively from the Venetians, Genoeſe, and Hanſetowns, to the Portugueſe and Spaniards; and from thoſe again to the Engliſh and Dutch; it may be eſtabliſhed as a maxim, that the relation betwixt commerce and navigation, or rather their union is ſo intimate, that the fall of the one neceſſarily draws after it that of the other.

Hence ſo many laws, &c. for its regulation; and particularly that celebrated act of navigation in England, which is the ſtanding rule, not only of the Engliſh among themſelves, but alſo of other nations with whom they traffic.

Till this act, all nations were at liberty to import into England all kinds of merchandizes, and that on their own bottoms. But Cromwell particularly paſſed an act prohibiting the Dutch from importing any merchandizes, except thoſe of their own growth, which were very few. The firſt parliament of Charles II. after the reſtoration, paſſed an act, bearing date from the firſt of December, 1660, for the encouraging and increaſing of ſhipping and navigation, which ſtill ſubſiſts in its full latitude and vigour.

Latitude, in geography, is the diſtance of any place from the equator, meaſured in degrees, minutes, and ſeconds, upon the meridian of that place, and is either north or ſouth, according as the place is ſituated either on the north or ſouth ſide of the equator. The latitude of a place is always equal to the elevation of the pole above the horizon. The complement of latitude is always equal to the elevation of the equator above the horizon, or the angle intercepted between the plane of the equator and the plane of the horizon. The latitude of a place, or of a ſhip at ſea, is found by taking the meridian altitude of the ſun, or of a ſtar whoſe declination is known.

Parallels of latitude are leſſer circles of the ſphere parallel to the ecliptic, imagined to paſs through every degree and minute of the colures. They are repreſented on the globe by the diviſions on the quadrant of altitude, in its motion round the globe, when ſcrewed over the pole of the ecliptic.

The *longitude* of a place is an arch of the equator intercepted between the firſt meridian, and the meridian paſſing through the propoſed place; which is always equal to the angle at the pole, formed by the firſt meridian, and the meridian of the place. The firſt meridian may be placed at pleaſure, paſſing through any place, as London, Paris, Teneriffe, &c. but among us is generally fixed at London: and the longitude counted from it will be either eaſt or weſt, according as they lie on the eaſt or weſt ſide of that meridian. The difference of longitude, between two places upon the earth is an arch of the equator comprehended between the two meridians of theſe places; and the greateſt poſſible is 180 degrees, when the two places lie on oppoſite meridians. Since the parallels of latitude always decreaſe, the nearer they approach the pole; it is plain, a degree upon any of them muſt be leſs than a degree upon the equator, in the ratio of the co-ſine of the latitude to the radius. Hence, as the radius is to the co-ſine of any latitude; ſo are the minutes of difference of longitude between two meridians, or their difference in miles upon the equator, to the diſtance of theſe two meridians on the parallel of that latitude, in miles; and by this theorem, is the following table:

A TABLE ſhewing how many Miles anſwer to a Degree of Longitude, at every Degree of Latitude.

D. L.	Miles.		D. L.	Miles.		D. L.	Miles.		D. L.	Miles.		D. L.	Miles.		D. L.	Miles.	
1	59	99	16	57	67	31	51	43	46	41	68	61	29	9	76	14	51
2	59	97	17	57	37	32	50	88	47	40	92	62	28	17	77	13	50
3	59	92	18	57	6	33	50	32	48	40	15	63	27	24	78	12	48

6	59	67	21	56	1	36	48	54	51	37	76	66	24	41	81	9	38
7	59	56	22	55	63	37	47	92	52	36	94	67	23	44	82	8	35
8	59	42	23	55	23	38	47	28	53	36	11	68	22	48	83	7	32
9	59	26	24	54	81	39	46	62	54	35	27	69	21	50	84	6	28
10	59	8	25	54	83	40	45	95	55	34	41	70	20	52	85	5	23
11	58	89	26	53	93	41	45	28	56	33	55	71	19	54	86	4	18
12	58	68	27	53	46	42	44	59	57	32	68	72	18	55	87	3	14
13	58	46	28	52	97	43	43	88	58	31	79	73	17	54	88	2	9
14	58	22	29	52	47	44	43	16	59	30	90	74	16	53	89	1	5
15	57	95	30	50	88	45	42	43	60	30	00	75	15	52	90	0	00

In order to find the latitude and longitude of any place on the terreſtrial globe, we muſt bring the given place under that ſide of the graduated braſen meridian where the degrees begin at the equator, by turning the globe about: then the degree of the meridian over it ſhews the latitude; and the degree of the equator, under the meridian, ſhews the longitude. Thus Briſtol will be found to lie in 51 degrees 28 minutes north latitude, and two degrees 30 minutes weſt longitude, and Dublin in 51 degrees 12 minutes north latitude, and ſix degrees 55 minutes weſt longitude.

The *diſtance* of places which lie neither ſouth, eaſt, north, nor weſt of each other, but in an oblique direction, may be readily meaſured by extending the compaſſes from one to the other, and then applying them to the equator. Example: Extend the compaſſes from Guinea in Africa to Braſil in America, and then apply them to the equator, and the diſtance will be 25 degrees, or 1500 miles, allowing 60 miles to a degree.

Quadrant of altitude is an appendage of the artificial globe, conſiſting of a lamina, or ſlip of braſs, the length of a quadrant of one of the great circles of the globe, and graduated. At the end, where the diviſion terminates, is a nut riveted on, and furniſhed with a ſcrew, by means whereof the inſtrument is fixed on to the meridian, and moveable round upon the rivet, to all points of the horizon. Its uſe is, to ſerve as a ſcale in meaſuring of altitudes, amplitudes, azimuths, &c.

The hour-circle of a globe is a ſmall braſen circle, fixed upon the braſen meridian, divided into 24 hours, having an index moveable round the axis of the globe, which, upon turning the globe 15 degrees, will ſhew what places have the ſun an hour before or after us.

GEOGRAPHICAL PROBLEMS.

PROB. I. *To rectify the globe for the latitude, zenith, and noon.*] Set the globe upon an horizontal plane, with its parts, anſwering to thoſe of the world; move the meridian in its notches, by raiſing or depreſſing the pole, until the degrees of latitude cut the horizon, then is the globe rectified for the latitude. Reckon the latitude from the equator towards the elevated pole, then ſcrew the bevil edge of the nut belonging to the quadrant of altitude, and the rectification is made for the zenith: bring the ſun's place found in the third problem, to the meridian: ſet the index to the twelve at noon, or upper twelve, and the globe is rectified for the ſun's ſouthing, or noon.

PROB. II. *To find the diſtance and bearing of any two given places on the globe.*] Lay the graduated edge of the quadrant of altitude over both places, the beginning or 0 degree being on one of them, and the degrees between them ſhew their diſtance; theſe degrees multiplied by 60, give geographical miles, and, by 69½, give the diſtance in Engliſh miles nearly. Obſerve, while the quadrant lies in this poſition, what rhumb of the neareſt fly runs moſtly parallel to the edge of the quadrant, and that rhumb ſhews nearly the bearing required.

PROB. III. *To find the ſun's place and declination on any day*] Seek the given day in the circle of months on the horizon; and right againſt it, in the circle of ſigns, is the ſun's place; by which means it will be found, that the ſun enters Aries, March 20; Tarus, April 20; Gemini, May 21; Cancer, June 21; Leo, July 23, Virgo, Auguſt 23; Libra, September 22; Scorpio, October 23; Sagittarius, November 22; Capricorn, December 21; Acquarius, January 20; Piſces, February 18. Then ſeek the ſun's place in the ecliptic on the globe, bring that place to the meridian, and the diviſion it ſtands under is the ſun's declination on the given day.—The ecliptic is readily diſtinguiſhed from the equator on the globe, not only by the different colours wherewith they are ſtained, but alſo by the ecliptic's approaching toward's the poles, after its interſection with the equator. The marks of the ſigns are alſo placed along the ecliptic, one at the beginning of every ſucceſſive 30 degrees.

PROB. IV. *To find where the ſun is vertical at any given time.*] Bring the ſun's place, found for the given day, in the manner directed by the laſt problem, to the meridian; note the degree over it, and ſet the index to the given hour; then turn the globe till the index comes to twelve at noon, when the place under the ſaid noted degree has the ſun in the zenith at that time; and all the places that paſs under that degree, by turning the globe round, will have the ſun vertical to them on that day.

PROB. V. *To find, at any given time, all thoſe places of the earth where the ſun is then riſing or ſetting; where mid. day, or mid. night.*] Find the place where the ſun is vertical at the given time, according to the laſt problem, rectify the globe for the latitude of that place, and bring it to the meridian. Then all thoſe places that are in the weſt half of the horizon, have the ſun riſing; and thoſe in the eaſtern half have it ſetting. Thoſe under the meridian above the horizon have the ſun culminating, or noon; and thoſe under the meridian, below the horizon, have midnight. Thoſe above the horizon have day; thoſe below it, have night.

PROB. VI. *To find any place on the globe whoſe latitude and longitude are given.*] Bring the given longitude, found on the equator, to the brazen meridian,

dian, and under the given latitude found on the meridian, is the place ſought.

PROB. VII. *The latitude of any place, not within the polar circle, being given; to find the time of ſun-riſing and ſetting, and the length of the day and night.*] Rectify the globe for the latitude and the noon; bring the ſun's place to the eaſtern ſide of the horizon, and the index ſhews the time of riſing. The ſun's place brought to the weſtern ſide of the horizon, the index gives the ſetting; or the time of riſing, taken from twelve hours, gives the time of ſetting. The time of ſetting being doubled, gives the length of the night. For inſtance, at London, on the 15th of April, the day is 13 hours and an half; the night ten and a half.

PROB. VIII. *To find the length of the longeſt and ſhorteſt days in any given place.*] Rectify the globe for the latitude, bring the ſolſtitial point of that hemiſphere to the eaſtern part of the horizon, ſet the index to twelve at noon: turn the globe till the ſolſtitial point comes to the weſtern ſide of the horizon; the hours paſt over by the index give the length of the longeſt day, or night; and its complement to twenty-four hours gives the length of the ſhorteſt night or day.

PROB. IX. *A place being given in the Frigid or Frozen Zone, to find the time when the ſun begins to appear at, or depart from, that place, alſo how many ſucceſſive days he is preſent to, or abſent from, that place.*] Rectify the globe for the latitude, turn the globe, and obſerve what degrees in the firſt and ſecond quadrants of the ecliptic are cut by the north point of the horizon, the latitude being ſuppoſed north. Then find thoſe degrees in the circle of ſigns on the horizon, and their correſponding days of the month, and all the time between thoſe days the ſun will not ſet in that place. Again, obſerve what degree in the third and fourth quadrants of the ecliptic will be cut by the ſouth point of the horizon, and the days anſwering. Then the ſun will be quite abſent from the given place during the intermediate days; that day in the third quadrant ſhews when the ſun begins to diſappear, and that in the fourth quadrant ſhews when he begins to ſhine in the place propoſed. Thus at the North Cape, in lat. 71. deg. N. the ſun never ſets from the 15 of May to the 28th of July, which is 74 days; and never riſes from the 16th of November to the 24th of January, which is 69 days.

PROB. X. *To find what days the ſun will be vertical at any given place in the torrid zone.*] Note the latitude of the given place on the meridian; turn the globe, and note what points of the ecliptic paſs under the latitude noted on the meridian. Seek thoſe points of the ecliptic in the circle of ſigns on the horizon, and right againſt them in the circle of months ſtand the days required. In this manner it will be found, that the ſun will be vertical to the iſland of St. Helena on the 6th of November, and on the 4th of February; and at Barbadoes on the 24th of April, and the 18th of Auguſt.

PROB. XI. *The latitude, day of the month, and ſun's altitude being given; to find the azimuth and hour of the day.*] Rectify the globe for the latitude, zenith, and noon. Turn the globe and quadrant until the ſun's place coincides with the graduated edge of the quadrant. Then will that edge of the quadrant cut in the horizon the degrees of azimuth, reckoned from the north; and the index will ſhew the hour of the day.

PROB. XII. *The day and hour being given, to find thoſe places on the globe, to which the ſun is then riſing, thoſe to which he is then ſetting, thoſe where it is noon-day, thoſe which are actually enlightened, and thoſe that are not.*] Find that place of the globe to which the ſun is vertical at the given time, bring the ſame to the braſen meridian, and elevate the pole according to the latitude of the ſaid place. The globe being fixed in this poſition, obſerve what places are in the weſtern ſemi-circle of the horizon, for there the ſun is then riſing; and thoſe places in the eaſtern ſemi-circle of the horizon have the ſun then ſetting. Thoſe places exactly under the braſen meridian have noon-day; and laſtly, all thoſe above the horizon are enlightened; but thoſe below it are deprived of the ſun at that time.

PROB. XIII. *The day of the month being given, to find the ſun's place in the ecliptic.*] Look for the day of the month in the calendar upon the wooden horizon, and over-againſt it you will find the ſign and degree of the ecliptic which the ſun is in at that time.

PROB. XIV. *The day and hour being given, to find thoſe places in the globe, to which the ſun is in the meridian at that time.*] The pole being elevated according to the latitude of the given place, bring that place to the braſen meridian, and ſet the index of the horary circle to the hour of the day; then turn the globe till the index point to the uppermoſt XII, and having fixed the globe in that ſituation, all thoſe places under the upper half of the braſen meridian have the ſun in their meridian at that particular time; ſo that with them it is noon-day.

PROB. XV. *To find the diſtances between any two given places upon the globe; and to find all thoſe places that are at the ſame diſtance from any given place.*] Lay the quadrant of altitude over the two given places, and the number of degrees intercepted between them being reduced into miles will be the diſtance required. Or you may take the diſtance between the two places with a pair of compaſſes, and, applying them to the equator, you will have the degrees of diſtance as before.—If you rectify the globe for the latitude and zenith of any place, and bring the ſaid place to the meridian; then turning the quadrant of altitude about, all thoſe places that are not by the ſame point of it are at the ſame diſtance from the given place.

PROB. XVI. *To find the Antœci, Periœci, and Antipodes of any place..*] Bring the given place to the braſen meridian, and having found its latitude, reckon the ſame number of degrees on the meridian from the equator towards the contrary pole, and where the reckoning ends is the place of the Antœci. Keeping the globe in the ſame poſition, ſet the hour index to twelve at noon; then turn the globe about till the index points to the lower twelve, and the place which lies under the meridian, having the ſame latitude with the given place, is that of the Periœci required.—As to the Antipodes, their place is found by counting 180 degrees upon the meridian from the given place, either north or ſouth.

PROB. XVII. *To repreſent the appearance of the heavens at any time in a given place.*] Rectify the celeſtial globe for the latitude, zenith, and noon; and turn the globe till the index points at the given hour; then while thoſe ſtars in the eaſtern half of the horizon are riſing, thoſe in the weſtern are ſetting, and thoſe in the meridian are culminating. The quadrant being ſet to any given ſtar, will ſhew its altitude, and at the ſame time its azimuth, reckoned in the horizon. Then by turning the globe round, it will readily appear what ſtars never ſet in that place, and thoſe which never riſe; thoſe of perpetual apparition never go below the horizon, and thoſe of perpetual abſence never come above it.

PROB. XVIII. *To find the latitude and longitude of any ſtar.*] Put the centre of altitude on the pole of the ecliptic, and its graduated edge on the given ſtar; then the latitude is ſhewn by the degrees between the ecliptic and ſtar; and the longitude by the degrees cut on the ecliptic by the quadrant.

PROB XIX. *To find the declination and right aſcenſion of a ſtar.*] Bring the ſtar to the meridian, the degree over it is the declination, and the degree of the equator under the meridian is the right aſcenſion.

PROB. XX. *The day and hour of a lunar eclipſe being known, to find all thoſe places upon the globe in which*

which it will be viſible.] Find where the ſun is vertical at the hour of the eclipſe, and bring that place to the zenith; then the eclipſe will be viſible in all thoſe places that are under the horizon. But if the Antipodes to the place where the ſun is vertical be brought into the zenith, the eclipſe will be ſeen in the places above the horizon.—But obſerve, that an eclipſe of the moon being ſometimes of a long continuance, it may be ſeen in more than one hemiſphere of the earth, as ſhe will riſe in ſeveral places after the eclipſe begins.

Note. When an eclipſe of the ſun is central, if you bring the place where the ſun is vertical at that time into the zenith, ſome part of the eclipſe will be viſible in moſt places within the upper hemiſphere: but by reaſon of the ſhort duration of ſolar eclipſes, and the latitude which the moon commonly has at ſuch times, there is no certainty in determining by the globe where thoſe eclipſes will be viſible, and therefore recourſe muſt be had to calculations.

Natural Divisions of the Earth.

The two grand diviſions of the terraqueous globe, are land and water. The land is divided into continents, iſlands, peninſulas, iſthmus's, promontories or capes, and mountains. The water is divided into oceans, ſeas, gulfs, ſtraits, lakes, and rivers.

A *continent*, terra firma, or main land, is a very large tract of country, comprehending ſeveral contiguous empires, kingdoms, countries, and ſtates: there are generally reckoned four continents, Europe, Aſia, Africa, and America; but the latter is commonly divided into two parts, called North and South America. An *iſland* is a ſmaller tract of land, entirely ſurrounded with water, as Great-Britain. A *peninſula* is a diſtrict of country encompaſſed with water, except a ſmall neck which joins it to ſome other land, as the *Morea* in Greece. An *iſthmus* is a narrow neck of land connecting ſome peninſula to another tract of country, and forming the paſſage between them; as the iſthmus of Suez, which joins Africa to Aſia, and the iſthmus of Darien, which joins North and South America. A *promontory*, or *cape*, is a head-land, generally of conſiderable height, ſtretching itſelf ſome diſtance into the ſea; as the Cape of Good Hope. Coaſts, ſhores, mountains, vallies, woods, deſerts, plains, &c. are too well known to require deſcription.

An *ocean* is a vaſt collection of waters bounded by the coaſts of different countries. Geographers generally reckon three extenſive oceans, viz. the Atlantic, the Pacific, and the Indian ocean. The Atlantic ocean lies between the continents of Europe and Africa on the eaſt, and America on the weſt; it is uſually divided into two parts, one called the North Atlantic ocean, and the other the South Atlantic, or Ethiopic ocean; that part of the North Atlantic ocean lying between Europe and America, is often called the weſtern ocean: it is 3000 miles wide. The Pacific Ocean, or, as it is often called, the South-Sea, is bounded on the Eaſt by the weſtern ſhores of America, and on the Weſt by the eaſtern ſhores of Aſia; it is computed to be 10,000 miles over. The Indian ocean waſhes the ſhores of the eaſtern coaſt of Africa, and the ſouthern coaſts of Aſia; the Indian iſlands and New Guinea, bound it on the Eaſt; it is 3000 miles wide. A *ſea*, properly ſpeaking, is a leſſer collection of waters than an ocean; as the Mediterranean ſea, the Baltic ſea, &c. A *gulf* or *bay* is a part of an ocean or ſea contained between two ſhores, and is every where environed with land, except at its entrance; as the bay of Biſcay: if a gulf be very ſmall, it is called a creek, haven, ſtation, or road for ſhips, as Milford-Haven. A *ſtrait* is a narrow paſſage forming a communication between a gulf and its neighbouring ſea, or joining one part of the ſea or ocean with another; as the ſtrait of Gibraltar, or that of Magellan. A *lake* is a collection of waters contained in ſome inland place, of a large extent; and every where ſurrounded by the land, having no viſible communication with the ocean: as the lake of Geneva, and the lakes in Canada. As rivers, canals, brooks, &c. are to be met with in moſt countries, every perſon therefore has a clear idea of what is meant by theſe leſſer diviſions of water.

Of the Winds and Tides.

Air is a fine inviſible fluid ſurrounding the earth on which we move, and extending to ſeveral miles above its ſurface; and that collection of it, together with the bodies it contains, circumſcribing the earth, is called the atmoſphere. A ſmall volume of air is capable of expanding itſelf, ſo as to fill a very large ſpace; and alſo of being compreſſed into a much ſmaller compaſs. Cold has the property of compreſſing the air, and heat of expanding it. Hence if any alteration be made in any part of the atmoſphere, either by heat or cold, the neighbouring parts will be put in motion, and either expanded or compreſſed. Wind is a ſtream or current of air put in motion, and capable of very different degrees of velocity, and thence called a breeze, gale, or ſtorm. Winds are either conſtant or variable, general or particular. Conſtant winds are ſuch as always blow the ſame way, at leaſt for a conſiderable length of time. Variable winds are ſuch as frequently ſhift, or change from one point of the compaſs to another. A general wind, is that which blows the ſame way over a large tract of the earth, the greater part of the year. A particular wind is that which blows in any particular place, ſometimes one way and ſometimes another.—The trade wind is a current of air, blowing continually from the eaſt, on the Atlantic and Pacific Ocean, between 30 degrees north, and 30 degrees ſouth latitude.—The cauſe of this conſtant wind is the action of the ſun in his apparent motion from eaſt to weſt.

In ſome parts of the Indian ocean another ſpecies of trade winds, called monſoons, prevail. Theſe blow ſix months one way, and ſix months the contrary way. Theſe phænomena flow from the ſame cauſe. For the air that is cool and denſe, muſt force the warm and rarified air in a continual ſtream upwards, where it muſt ſpread itſelf to preſerve an equilibrium; conſequently the upper courſe or current of the air will be contrary to the under current; for the under current muſt move from thoſe parts where the greateſt heat is; and ſo, by a kind of circulation, the north-eaſt trade wind below will be attended with a ſouth-weſt wind above; and a ſouth-eaſt below, with a north-weſt above. Experience has ſufficiently confirmed the truth of this propoſition; the ſeamen always finding that as ſoon as they leave the trade winds, they immediately find a wind blowing in an oppoſite direction.—Between the fourth and tenth degrees of north latitude, and between the longitudes of Cape-Verd, and the eaſternmoſt of the Cape de Verd iſlands, is a tract of ſea, which ſeems to be condemned to perpetual calms, attended with dreadful thunder and lightnings, and ſuch frequent rains, that it has acquired the name of the Rains. This phænomenon ſeems to be cauſed by the great rarefaction of the air on the neighbouring coaſt, which cauſing a perpetual current of air to ſet in from the weſtward, and this current meeting here with the general trade wind, the two currents balance each other, and cauſe a general calm; while the vapours carried thither by each wind, meeting and condenſing, occaſions thoſe frequent deluges of rain.

By the word *tide* is underſtood that motion of the water in the ſeas and rivers, by which they regularly riſe and fall. The doctrine of the tides continued unknown till the latter end of the laſt century, when it was diſcovered by the illuſtrious and immortal Sir

Map OF THE WORLD From the best Authorities.

Chas. S. Holbrook

Iſaac Newton, who explained it by his great principle of gravity or attraction. He demonſtrated that this principle is univerſally diffuſed through the ſolar ſyſtem: that the earth and moon gravitate towards, or attract each other; and both of them gravitate towards, or are attracted by the ſun: alſo, that the gravitation of bodies towards the centre of the earth, will be leſs on thoſe parts of its ſurface that are oppoſite to the ſun and moon, than in the others; and this defect of gravitation or attraction in particular parts, is the true cauſe of the ebbing and flowing of the tide. If no ſuch forces were exerted by the ſun and moon, the oceans, being equally attracted towards the earth's centre on all ſides by the force of gravity would continue in a ſtate of perfect ſtagnation: but as theſe forces are really exerted, the waters in the oceans muſt riſe higher in thoſe places where the ſun and moon diminiſh their gravity, or where the attraction of the ſun and moon is greateſt. Hence it follows that as the force of gravity muſt be diminiſhed moſt in thoſe places of the earth to which the moon is neareſt, viz. in the zenith; therefore the waters in ſuch places will riſe higher, and conſequently it will be full ſea or flood in ſuch places. From the ſame principles it follows, that the parts of the earth directly under the moon in the zenith, and thoſe in the nadir, or thoſe diametrically oppoſite, will have the flood or high water at the ſame time.

The tides are higher than ordinary twice every month, viz. about the time of the new and full moon: and thoſe are called ſpring tides. When thoſe two luminaries are in conjunction, or on the ſame ſide of the earth, they both conſpire to raiſe the water in the zenith, and conſequently in the nadir; and when the ſun and moon are in oppoſition, that is, when the earth is between them, while one makes high water in the zenith and nadir, the other does the ſame in the nadir and zenith. Twice in every month, the tides are leſs than ordinary; that is, about the times of the firſt and laſt quarters of the moon; and theſe are called neap tides: for in the quarters of the moon, the ſun raiſes the water where the moon depreſſes it; and depreſſes where the moon raiſes the water; the tides are made therefore by the difference of their actions. The ſpring tides happen not preciſely at the new and full moon, but a day or two after, when the attractions of the ſun and moon have acted in the ſame direction for a conſiderable time. The reaſon that the greateſt ſpring tides do not happen on the 21ſt of March, and the 23d of September, but in February and October, is, becauſe the ſun being neareſt the earth in December, his influence is then ſtrongeſt, and ſo muſt quicken the time of the greateſt vernal tides; and being weakeſt in June, the time of the autumnal tides will neceſſariiy be retarded. The neap tides happen a day or two after the quarters, when the force of the moon's attraction has been leſſened by that of the ſun's for ſeveral days together. The above-mentioned phœnomena of the tides would happen uniformly, if the whole ſurface of the earth was entirely covered with water: but as this is not the caſe, there being, beſides the continents, a multitude of iſlands lying in the way of the tide, which interrupts its courſe, therefore in many places near the ſhores a great variety of other appearances ariſe, beſides thoſe already enumerated; theſe cannot be explained, without conſidering the ſituations of the ſhores, ſtraits, ſhoals, rocks, and other objects, by which they are in ſome meaſure produced. In ſome bays, and about the mouths ofrivers, the tides riſe from 12 to 50 feet; but about ſmall iſlands and head-lands in the middle of the ocean they riſe very little. There are alſo certain currents, or ſettings of the ſtream by which ſhips are compelled to alter their courſe or velocity, or both, and ſubmit to the motion impreſſed upon them by the current. That between Florido and the Bahama iſlands, always runs from north to ſouth: a current runs conſtantly from the Atlantic through the ſtraits of Gibraltar, into the Mediterranean: and a current ſets out of the Baltic ſea, through the Sound or Strait between Sweden and Denmark, into the Britiſh channel, ſo that there are no tides in the Baltic. The knowledge of theſe currents is a neceſſary article of navigation; for if the current thwarts the courſe of a ſhip, then it not only leſſens or augments her velocity, but gives her a new direction compounded of the courſe ſhe ſteers, and the ſetting of the current.

A Map is a plain or flat figure, repreſenting the whole ſurface of the globe, or a part thereof, according to the rules of perſpective. They are intended to ſhew us the forms and dimenſions of countries, the courſes of rivers, the ſituation of cities, towns, mountains, &c. They are diſtinguiſhed into Univerſal and Particular. The firſt ſorts are thoſe which exhibit the whole ſurface of the earth, or the two hemiſpheres, and are commonly called Maps of the World: the laſt ſort are thoſe which repreſent ſome particular country or part thereof.—Thoſe which repreſent only the ſeas, and ſea-coaſts, are properly called charts. The principal things required in a map are, 1. That all places have their juſt ſituation with regard to the chief circles of the globe, as the equator, meridian, parallels, &c. becauſe on theſe depend many properties of regions, as well as celeſtial phænomena. 2. That the magnitudes of the ſeveral countries have the ſame proportion as on the ſurface of the earth. 3. That the ſeveral places have the ſame diſtances and ſituation with regard to each other, as on the earth itſelf. There is uſually a ſcale of miles in ſome vacant part of a map, by which the diſtance of one place from another is eaſily found. As to maps of the world, the degrees of longitude are numbred on the equator, and thoſe of latitude round each hemiſphere from the equator to the poles. Rivers are deſcribed in maps by black lines, and are wider towards the mouth than towards the head or ſpring. Mountains are ſketched on maps as on a picture. Foreſts and woods are repreſented by a kind of ſhrub; bogs and moraſſes, by ſhades; ſands and ſhallows are deſcribed by dotted beds; the depth of the water, near harbours, is expreſſed by figure repreſenting fathoms; and roads are uſually denoted by double lines.

With reſpect to the cardinal points; the north is conſidered as the upper part of the map; the ſouth is at the bottom, oppoſite to the north; the right hand is eaſt, the face being turned to the north; and the left hand, oppoſite, is the weſt; unleſs the compaſs, or flower-de-luce, which is generally placed in ſome part of a map, ſhews the country; for that always points to the north.

Parallels, or circles of latitude, are leſſer circles of the ſphere, conceived to be drawn from weſt to eaſt, through all the points of the meridian, commencing from the equator, to which they are parallel, and terminating with the poles. They are called *parallels of latitude*, becauſe all places lying under the ſame parallel have the ſame latitude. The outermoſt of the meridians and parallels are marked with degrees of latitude or longitude, by means of which, and the ſcale of miles, the ſituation, diſtance, &c. of places may be found, as on the artificial globe. If the places be directly north or ſouth, eaſt or weſt, from one another, we have only to obſerve the degrees on the meridians and parallels, and, by turning thoſe into miles, we obtain the diſtance without meaſuring.

We ſhall here give a table of the miles in uſe among the principal nations of Europe, in geometrical paces, 60,000 of which make a degree of the equator.

	Geometrical Paces.
Mile of Ruſſia - - - - - -	750
—— of Italy - - - - - -	1000
—— of England - - - - -	1250
—— of Scotland and Ireland -	1500
—— of Poland - - - - - -	3000
—— of Spain - - - - - -	3428
—— of Germany - - - - -	4000
—— of Sweden - - - - - -	5000
—— of Denmark - - - - -	5000
—— of Hungary - - - - -	6000
Old league of France - - -	1500
The ſmall league, ibid - - -	2000
The mean league, ibid - - -	2500
The great league, ibid - - -	3000

Note. The Engliſh ſtatute mile is fourſcore chains, or 1760 yards, that is, 5280 feet, or eight furlongs. The Engliſh marine league is three Engliſh miles.

The number of inhabitants computed at preſent to be in the known world, at a medium, taken from the moſt accurate calculations, are 953 millions, of which Aſia contains 500, Europe 153, Africa 150, and America 150 millions.

PART. II.

POLITICAL GEOGRAPHY.

Of the Origin, Laws, Government, and Commerce of Nations.

IN order to prepare our readers for entering upon the particular hiſtory of each country we deſcribe, it was thought neceſſary to preſent them with a general view of the hiſtory of mankind, from the firſt ages of the world, to the reformation of religion during the 16th century; wherein we ſhall give an account of the moſt intereſting and important events which have happened among men, with their cauſes and effects. This undoubtedly conſtitutes the moſt uſeful branch of Political Geography; and it may not only be deemed a matter of high importance in itſelf, but indiſpenſably requiſite to the underſtanding the preſent ſtate of commerce, government, arts, and manners in any particular country.

The beſt chronologers have placed the great event of the creation of the world in the year before Chriſt 4004; before which time, neither matter nor form of any thing appeared or exiſted. That the world was not eternal, has been fully determined by the ſacred records, which have alſo aſcertained the time of its creation with great preciſion; the Hebrew chronology being generally acknowledged to be of ſuperior authority to the Julian, Samaritan, or Septuagint. The hiſtory of the patriarchs before the flood is very ſhort, and principally confined to the creation of the world, and the fall of the firſt parents of mankind. The ſacred hiſtorian has given us very few anecdotes of the inhabitants of thoſe early times; and what is found in profane writers, is little more than a confuſed heap of the moſt palpable abſurdities. It may however be gathered from the writings of Moſes, that the world before the flood was extremely populous, that mankind had made conſiderable improvements in the arts, and were become immeaſurably vicious, both in their ſentiments and manners, inſomuch that nothing could ſtop the torrent of impiety which prevailed. They were not only addicted to every vice, and in love with every ſpecies of iniquity, but laughed at the preaching of Noah, and ſet the threatened vengeance of heaven at defiance. Regardleſs of the predictions of the prophet, they even ridiculed his building an ark for the preſervation of himſelf and deſcendents. But they were ſoon fatally convinced of their error: a deluge of water, which continued a whole year, ſwept away all the human race, except Noah and his family. This dreadful cataſtrophe not only deſtroyed the inhabitants of the earth, which is ſuppoſed to have been more populous then at preſent, but in a great meaſure affected the ſoil and atmoſphere of the globe, gave them a form leſs friendly to the frame and texture of the human body: hence followed the abridgment of the life of man, and that formidable train of diſeaſes which hath ever ſince made ſuch havock in the world. Before Chriſt 2348.

After the waters had ſubſided, and the ſurface of the earth was ſufficiently dry, Noah, with his three ſons, Shem, Ham, and Japhet, left the ark, and a new generation for peopling the earth was raiſed from the ruins of the former. The ſacred writings have preſerved an account of the poſterity of Shem, but very little with regard to Ham and Japhet. The memory of all of them was, however, preſerved among their reſpective deſcendents. The name of Japhet, changed into Japetus, continued long famous among the weſtern nations; and Ham was revered as a deity among the Egyptians, under the name of Jupiter-Ammon. The whole deſcendants of Noah remained ſome time in the plains of Shinar, afterwards called Babylonia, where they built a city, and a tower of enormous height as a land-mark, to prevent their being ſcattered abroad, or loſt in the deſerts of that wide and open country, then deſtitute of roads, and every natural accommodation: but their deſign was fruſtrated by the interpoſition of heaven. It was neceſſary, for peopling and cultivating the other parts of the world, that the ſons of Noah ſhould be diſperſed, and ſeparated from one another; this was effectually brought about by the confuſion of their language: they no longer underſtood each other, and abandoned their deſign before the ſtructure was finiſhed. They then diſperſed themſelves into different parts of the world; and the various countries of the earth were gradually peopled by diſtinct families.

The new world abounded with wild beaſts; and the great heroiſm of thoſe times conſiſted in deſtroying them. Hence Nimrod acquired immortal fame; he became a mighty hunter, and choſe Babel, or Babylon, for the place of his reſidence; there he fixed the ſeat of his kingdom, and founded there the firſt monarchy in the world. About the ſame time Aſſur, the ſecond ſon of Shem, left Shinar, and built a city which he called Nineveue, or Nineveh, which ſignifies, the habitation of his ſon. But though theſe kingdoms were founded ſo near the time of the deluge, we have no further account concerning them till ſeveral centuries after their foundation. The countries were indeed at that time very thin of people; the deſcendants of Noah were diſperſed according to their ſeveral languages and families; and therefore few remarkable tranſactions happened in the world. However, in Egypt, the four governments of Thebis, Theri, Memphis, and Tanis, began to aſſume ſome appearance of form and regularity. B. C. 2235.

As mankind began to multiply on the earth, and to ſeparate into different communities, the tradition concerning the true God was obliterated or obſcured. Ninus, the firſt Aſſyrian prince of whoſe actions we have any account, was a great and warlike prince. Warmed with ambition, and envying the ſucceſs of his neighbours, he taught his ſubjects the uſe and exerciſe of arms, and inured them to martial diſcipline and dangers. War and deſtruction now laid waſte the fertile provinces of Aſia, and a final period was put to the peace which had hitherto prevailed among the nations. He added Babylon to his dominions, and laid the foundation of a power- B. C. 2016.

a powerful empire, which for many ages extended the yoke of ſlavery over the greater part of Aſia. After the diſperſion of Babel, Ham led a colony into Egypt; and it is plain, from the writings of Moſes, that Abraham, who lived in the reign of Ninus, and was obliged by a dreadful famine to retire out of Canaan into Egypt, found that kingdom in the zenith of power. The monarch was ſurrounded by a train of courtiers; the people were governed by laws; had abandoned a wandering life, and were ſettled in cities. It became very populous; the rudiments of the arts were known; ſtructures for elegance as well as uſe were erected in various parts of the empire; and a commerce far from inconſiderable was carried on by the deſcendents of Ham.

In proceſs of time, Javan, the ſon of Japhet, and grandſon of Noah, led his colony into Aſia Minor, and eſtabliſhed himſelf in the iſlands on the weſtern coaſt of the continent. As their numbers increaſed, they extended their ſettlements; many of them paſſed over into Europe; and part of Greece became peo-
B. C. 2022. pled in very early times. But as there was ſtill room ſufficient for others, and the country very fertile, a colony from Egypt, known in hiſtory by the name of Titans, penetrated into Greece, and eſtabliſhed the policy and arts of their country. Internal jars and commotions, however, ſtopped the progreſs of improvement: war ſucceeded, and ſoon demoliſhed the Titan kingdom. The deſcendants of Javan, before the arrival of the Titans, were rude and barbarous; they inhabited dens and caverns like wild beaſts; the reaſoning faculty was debaſed, and hardly any thing but the form remained to diſtinguiſh them from the brute creation. The little progreſs
B. C. 1829. they had made in refinement under the Titan government was ſoon forgotten; and when the colonies headed by Ogyges and Inarchus arrived in that country, the inhabitants had relapſed into their former ſtate of barbarity. Inarchus exerted all his power to collect the wandering Greeks, and form them into a regular ſociety. He ſucceeded in ſome meaſure; but the hiſtories of thoſe times are ſo dark and confuſed, that it is impoſſible to withdraw the veil of obſcurity, or advance any thing with certainty.

The hiſtory written by Moſes, is the only one on which we can rely with regard to the tranſactions of
B. C. 1808. thoſe early ages. The ſacred writer, in giving an account of the calling of Abraham, and the ſettlement of the family of Jacob in Egypt, has given us a ſeries of very remarkable events, which need not be mentioned here, as they are univerſally known at this period, when very little of the hiſtory of other nations is come to hand: the improvements of mankind in the neceſſary arts of life were advanced to a great degree of perfection; but it ſhould alſo be obſerved, that all the nations of the earth were far from being equal in their mental qualifications. Some of them were ſunk into the abyſs of ignorance and wretchedneſs; while others lived under civilized governments, and enjoyed all the benefits of a well-regulated ſociety: Noah, who was acquainted with all the learning of the antediluvian patriarchs, diſſeminated theſe ſeeds of ſcience among his offspring. But thoſe who wandered far from their native reſidence, and were wholly employed in providing a ſubſiſtence for themſelves and families, had neither time nor inclination to cultivate the tender ſhoots of knowledge: theſe were neglected and forgotten. While others, who continued near the Plains of Shinar, and long enjoyed the counſels and directions of their great anceſtor, formed themſelves early into regular ſocieties, and wiſely cultivated the arts of peace.

The antediluvian patriarchs were no ſtrangers to agriculture; they were obliged to till the ground for their ſubſiſtence; and Noah himſelf was no ſooner ſettled after the flood, than he planted a vineyard, which afforded a ſufficient proof that the art of huſbandry had been carried to ſome degree of perfection. Corn was cultivated in moſt parts of the eaſt; the land of Canaan, where Jacob reſided, produced large quantities: it was the principal food of the inhabitants; for when an unfruitful ſeaſon had diminiſhed the harveſt, we find that Jacob was obliged to ſend to Egypt to purchaſe corn for the ſupport of his family. Nor was the art confined to the cultivation of corn; the fig, the almond, and the olive-trees were well known in Paleſtine; and the preſent which Jacob ſent to his ſon Joſeph, conſiſted of balm, honey, myrrh, ſpices, nuts, and almonds. The cultivation of the ground gave riſe to commerce; an exchange of commerce being the natural conſequence of improvements. The ſhepherd will give a part of his flock for corn; and the huſbandman is willing to exchange the produce of his fields for cattle. In this manner commerce muſt have been carried on in its infancy: it muſt have attained ſome degree of perfection before metals were introduced as the medium of trade; and yet this was the caſe ſo early as the days of Abraham, though the money then in uſe had not any ſtamp to aſcertain either its value or fineneſs, but was delivered by weight. As commerce increaſed, this method was laid aſide, and the pieces of ſilver were marked to aſcertain their true value. It appears, that in the time of Jacob a regular commerce was carried on between Egypt and Arabia. The Iſhmaelites and Midianites, to whom Joſeph was ſold by his brethren, were merchants going into Egypt with their camels loaded with ſpices, balm, perfumes, and other coſtly merchandize. This commerce was however only carried on by land, and muſt be diſtinguiſhed from that carried on by ſea. The former was known much ſooner than the latter, though in all probability navigation was not unknown even to the antediluvians.

The inhabitants of Tyre were the firſt people who rendered navigation ſubſervient to commerce. Situated in a barren ſoil, where agriculture could be of little advantage, they wiſely endeavoured to render their ſituation more agreeable, by cultivating the arts of peace. Commerce opened the faireſt proſpect, and was purſued with great attention and ſucceſs. The Tyrians were famous for their commerce even in the days of Abraham; and Jacob mentioned it in his laſt bleſſing to his children. The arts will flouriſh wherever commerce is cultivated; nor can it be properly carried on without ſome knowledge of navigation and aſtronomy. In theſe early times the mariner's compaſs was unknown, ſo that the ſeamen had no other guide than the heavenly bodies, whoſe ſituations, poſitions, and revolutions were obſerved in very early times; aſtronomy being cultivated in the reign of Belus, and the Egyptian prieſts were aſſiduous obſervers of the ſtars. Greece was indebted to Egypt for the elements of the ſciences: the celebrated philoſophers of that country were inſtructed by the Egyptian prieſts, from whom alſo Pythagoras learnt the true ſyſtem of the world. The Romans were indebted to the Greeks for many of the arts relative both to peace and war; and the inhabitants of Europe owe to the Romans their politeneſs and refinements. The origin of the ſciences, therefore, has with great propriety been aſcribed to Egypt.

Seſoſtris was one of the moſt celebrated kings of Egypt: during his reign, that kingdom arrived to an amazing height of power: it was adorn-
B. C. 1839. ed with the moſt ſplendid cities, and was extremely populous. This prince is ſaid to have been poſſeſſed of 400 ſail of large ſhips, with which he ſailed down the Red Sea, ſubjugating all the iſlands and ſea-coaſts, as far as India: he had alſo an army of 600,000 foot, 24,000 horſe, and 27,000 armed chariots. He conquered Ethiopia, Phœnicia, Syria, and all the Leſſer Aſia; paſſed over into Europe, where he ſubdued the Scythians and Thracians as far as the river

river Tanais. The ſucceſſors of this great prince applied themſelves to cultivate the arts of peace. They ſucceeded; and Egypt became the moſt flouriſhing kingdom then in the world. The number of inhabitants are ſaid to have been no leſs than 27 millions; it had 18,000 cities; and the buildings were amazing; ſome of them are ſtill conſidered with aſtoniſhment, particularly the pyramids.

During this period Europe was involved in the thickeſt cloud of ignorance. Fierce in their nature, and barbarous in their manners, the inhabitants lived in foreſts and caverns of the mountains: they ſometimes fell a prey to wild beaſts, and ſometimes to the ſavage brutality of one another. Such were the anceſtors of the Greeks, who afterwards became the patterns of politeneſs, and the great maſters of every elegant art. But they owed their refinement and taſte to the Egyptians, who now cultivated almoſt every ſpecies of literature with ſucceſs. Cecrops landed in Greece at the head of an Egyptian colony, and laboured with the utmoſt aſſiduity to poliſh the manners, and reform the ſavage cuſtoms of the inhabitants. B. C. 1555.

They were, before his arrival, ſtrangers to laws: even thoſe relating to marriage were unknown. They propagated their ſpecies like the beaſts of the foreſt, without forming the tender connexions that ſubſiſt in families, and which even the moſt ſavage nations cultivate and eſteem. Cecrops built Athens, ſo called from Athene or Minerva, one of the Egyptian deities worſhipped at Sais, the city from whence he came into Attica. The wiſe meaſures of Cecrops, for reforming the manners of the Greeks, were purſued by Cranaus, who ſucceeded him in the kingdom of Attica. The council of Areopagus, ſo long famous in hiſtory, was founded in the firſt year of his reign. B. C. 1528.

By the exertions of theſe wiſe princes to reform different parts of Greece, that country ſoon became celebrated for learning and the polite arts: the rough manners of the inhabitants were poliſhed and refined by ſucceſſive colonies from Egypt and Phœnicia; the rudeſt people became civilized and accompliſhed; and the arts, which had their birth in Aſia, were cheriſhed with the moſt tender care in Greece. But the number of petty ſtates, into which the country was divided, rendered the inhabitants incapable of withſtanding a powerful enemy. Amphictyon, one of thoſe ſuperior geniuſes, who appear in the world for the benefit of the age in which they live, and the admiration of poſterity, formed a plan for uniting all the ſtates of Greece in one grand confederacy. His eloquence and addreſs engaged twelve cities to unite together for their mutual preſervation. Two deputies from each of theſe cities aſſembled twice a year at Thermopylæ, and formed what was called the Amphictyonic council, after the name of its founder. Experience ſufficiently proved how well thoſe meaſures were concerted; and Amphictyon, in order to give a greater luſtre to the councils, committed to their care the temple at Delphos, with all its riches. This council was the great ſpring of action in Greece, while that country maintained her independence; and it was owing to this union that all the attempts of the Perſian emperors were rendered abortive. B. C. 1522.

This ſhoot gradually improved into a vigorous plant, and it cannot but be pleaſant to obſerve its progreſs. The Athenians had no written laws; a proper ſubordination had not yet been eſtabliſhed. This was reſerved for the great Solon, a man formed by nature for a lawgiver. He began with dividing the citizens into four claſſes, proportioned to their wealth; the loweſt were incapable of holding any public employment. They had, however, a voice in the general council of the republic, and in the aſſembly all affairs of importance to the ſtate were finally determined. But leſt the people ſhould become too powerful, the ſenate and areopagus were provided to prevent an anarchy from taking place. The ſenate conſiſted of 400 members, each tribe of the Athenians chooſing 100. In this aſſembly every important concern intended to be laid before the people was prepared. The areopagus was nothing more than a court of juſtice; but its decrees were ſo equitable, and its members ſo remarkable for their virtue and integrity, that its power in the republic was very extenſive. Such was the plan on which the great Solon founded the republic of Athens; and upon the ſame principles, with ſome variations, all the other ſtates among the ancients were conſtituted.

Some remarkable particulars occurred in the republic of Sparta or Lacedæmon. The great Lycurgus was the legiſlator of the Spartans, and his laws extended equally to peace and war. In order to inure the youth of Lacedæmon to hardſhip, all kinds of luxury, all the arts of elegance or entertainment, in ſhort, every thing that had the leaſt tendency to ſoften the mind, and relax the nerves, was abſolutely proſcribed at Spartan. The uſe of money was forbidden; they lived at public tables on the coarſeſt fare; the younger were taught to pay the utmoſt reverence to the more advanced in years; and all ranks, capable of bearing arms, were daily accuſtomed to the moſt painful exerciſes. Hence it happened, that war, which to all other nations became very fatiguing, was to the Spartans rather a relaxation than a hardſhip, and the behaviour of their troops was aſtoniſhing, and accompanied with a firmneſs and courage that was almoſt beyond conception or belief. B. C. 884.

Let us now caſt our eyes on Aſia, and obſerve the events which happened in thoſe empires of which we have long loſt ſight. Cyrus, the Perſian, founded a new empire on the ruins of thoſe of Babylon and Aſſyria. He was one of the greateſt princes that ever ſwayed an eaſtern ſceptre, and extended his empire over the greater part of Aſia. The æra of this prince is extremely remarkable, ſince, beſides delivering the Jews from their captivity, the hiſtory of the great nations of antiquity, which has hitherto engaged our attention, may be ſuppoſed to finiſh. During the reign of Cyrus, the Perſians were a brave and warlike people, but luxury ſoon found its way into that country, effeminacy ſucceeded, and the Perſians, who, under Cyrus, were almoſt invincible, were afterwards unable to face a handful of men, from the petty ſtates of Greece. Mad with ambition, and the luſt of univerſal empire, Darius led a numerous army into Greece. But the Perſians had forgot to conquer. His army conſiſted of no leſs than 100,000 foot, and 10,000 horſe. This prodigious army was met in the plains of Marathon, by Miltiades, at the head of 10,000 Athenians; and with this ſmall army the Perſians were put to flight. So great is the difference between an army enervated by luxury and depreſſed by tyranny, and forces animated by freedom and ſtrengthened by virtue. Exaſperated at the defeat of his father, Xerxes at the head of 2,100,000 men, entered Greece; but he ſhared the ſame fate with Darius. He was every where defeated both by ſea and land; reduced to the utmoſt extremity, and at laſt eſcaped to Aſia in a fiſhing-boat. Such was the ſpirit of the Greeks; and ſo well did they know, that wanting virtue, life is pain and woe; that wanting liberty, even virtue mourns, and looks round for happineſs in vain. B. C. 536. B. C. 520. B. C. 484.

The limits we are confined to will not ſuffer us to purſue the Perſian hiſtory through its different periods; it will therefore be ſufficient to obſerve, that though the Perſian monarchs were maſters of Aſia and Egypt, yet as often as they carried their arms either againſt the Scythians or the Greeks, they were not only defeated, but found the utmoſt difficulty to defend themſelves in Aſia againſt the attempts of the

latter, flushed with victory. The succeeding kings therefore, grown wise by the misfortunes of Darius and Xerxes, avoided an open war with the Greeks, contenting themselves with artfully fomenting dissentions among the Grecian states, and breaking their strength by assisting the weak against the powerful. Darius Codomanus, either ignorant of this political stratagem, or disdaining to put it in practice, drew the whole power of Greece upon him; and an end was soon after put to the Persian empire by Alexander the Great, at the head of his Macedonian army. B. C. 331.

The Persians were never remarkable for learning and the arts. Like the other inhabitants of the East, they were fond of the sublime. Their architecture was grand and noble. Their statues were gigantic, but proportion was often wanting, and the delicacy which the Greek sculptors afterwards gave to their works was unknown. The literati were divided into two sects, the Sabæans and the Magi. The former worshipped idols; maintained that the stars were gods, among whom the sun was chief, because he governed both the heaven and the earth. The Magi, on the contrary, rejected the worship of images, and adored the sun under the form of fire, as the supreme deity. Zoroaster, who flourished in the reign of Darius Hystapses, reformed the religion of the Magi, rendering it more sublime and pure. He was so successful, that most of the nobles, and even the kings of Persia, embraced his tenets; and the Sabæan religion was but little regarded. The principal science cultivated in the Persian empire was astronomy; but they never carried it to any great degree of perfection. They were more assiduous in studying the ridiculous reveries of astrology, than in labouring to explain the phænomena of the universe. They were well acquainted with the face of the heavens, but never applied themselves to investigate the laws by which the motions of the heavenly bodies were regulated. Their philosophy was an absurd jargon of loose irregular thoughts, without the least foundation in nature. They were strangers to experiments, and never attempted to deduce causes from their effects.

While the Greeks continued to cultivate the virtuous principles they received from their great legislators, they were invincible; but their victories over the Persians rendered them proud and haughty; they quarrelled with one another, and weakened themselves by intestine division. Philip of Macedon (a country till this time little known, and less regarded) observed these commotions between the states of Greece, and, becoming important and powerful, resoved to turn them to his own advantage. He artfully fomented their divisions; and when he had sufficiently exasperated them against each other, he became absolute master of Greece by the battle of Cheronæa. The Grecian states, having lost that virtue which formed the basis of their confederacy, would have fallen without a battle. The eloquence of Demosthenes was exerted in vain; his immortal Philippics had no power to inspire a people, already immersed in corruption and licentiousness, to a sense of their danger; they preferred luxury to virtue, and, dreading the chains of slavery less than a noble and timely exertion of their powers in the cause of liberty, they became an easy prey to the seductive arts of their insidious and aspiring foe. B. C. 338.

The ambition of Philip, however, was not satisfied with the conquest of his country; he proposed to extend the boundaries of his empire far beyond the narrow limits of Greece. Accordingly, he made prodigious preparations for carrying on his designs against Persia; but died before they were completed. His son Alexander, who succeeded him on the throne, having no enemy to fear in Europe, passed into Asia at the head of 3000 foot and 5000 horse. With this handful of men, he conquered the whole force of Darius in three pitched battles, and overthrew the Persian empire: he afterwards penetrated into India, and reduced nations whose very name were then unknown in Europe. Soon after this rapid career of victory and success, Alexander died at Babylon in the flower of his age. His captains, preferring power to virtue, and riches to gratitude, sacrificed all the family of their master, and divided his conquests among themselves. But this was not effected without violent struggles and dissensions; and while discord reigned among the Grecian leaders, the Parthians made themselves masters of the countries to the east of the Euphrates, and laid the foundations of a kingdom which at length became very powerful. B. C. 330. B. C. 323.

Alexander's empire was divided into four kingdoms: the Macedonian, the Asiatic, the Syrian, and the Egyptian. The Macedonian kingdom, which fell to the lot of Antipater, continued about 152 years, during which interval, ten successive princes swayed the sceptre. Perseus, the last Macedonian king was totally defeated by Emilius, carried to Rome in triumph, and died in prison; and the kingdom was reduced to a Roman province. The Asiatic kingdom, which fell to Antigonus, comprehended that country now called Natolia, together with some districts beyond Mount Taurus. This kingdom was afterwards divided into three parts, namely, the kingdom of Pergamus, the kingdom of Pontus, and the kingdom of Armenia. Attilus, the last king of Pergamus, appointed the Roman people his heir; and accordingly at his death, that country became part of the Roman dominions. The kingdom of Pontus continued in a very flourishing state till the reign of Mithridates, who carried on an obstinate war with the Romans twenty-six years. He was defeated by Sylla and Lucullus; but still supported his independence, till he was totally vanquished by Pompey, who annexed his kingdom to the Roman state. The kingdom of Armenia fell with that of Pontus. Tigranes, the last monarch, who joined Mithridates against the Romans, was, with that prince, defeated by Pompey, and left his kingdom to the conqueror. B. C. 168.

Seleucus Nicanor obtained the Syrian kingdom: his successors were called Seleucidæ, who long held the sceptre with honour. After the extinction of that family, the throne was filled by Antiochus Deus, Antiochus the Great, Antiochus Epiphanes, and Tigranes. The last governed both Syria aud Armenia; but being conquered by the Romans under Pompey, both kingdoms were reduced to the form of a Roman province.

The throne of Egypt was usurped by Ptolemy Lagus, one of Alexander's generals; and from him all his successors were called Ptolemies. That kingdom flourished under twelve princes for near 240 years. Among these, Ptolemy Philadelphus was the most famous. To him we owe the Septuagint translation of the scriptures. He founded the celebrated Alexandrine library, which consisted of near 700,000 volumes. He was remarkable for encouraging the arts. The literati flocked to the city of Alexandria as to the seat of the muses. The celebrated Cleopatra was the last who swayed the sceptre of Egypt. She was vanquished by Augustus, and Egypt underwent the same fate of the other kingdoms; it was added to the dominions of the Romans.

Greece, particularly Athens, produced, during this period, every thing great in the arts. The very names of illustrious men who flourished there in that age of literature, would be sufficient to fill a moderate volume. All the improvements made by other nations formed only the dawn of that glorious day which now shone in its meridian splendor. The Egyptians, and many of the Oriental nations, had

raiſed ſtructures, celebrated at once for their magnificence and magnitude; but it was the Greeks who firſt added proportion to greatneſs, and elegance to grandeur: the orders of architecture had their birth in Greece. The pieces of ſculpture executed by Phidias, Polycletus, Myron, Lyſippus, Praxiteles, and Scopas, have rendered their names immortal. Apollodorus, Zeuxis, Patrhaſius, Pamphilus, Timanthes, Apelles, Ariſtides, and Protegenes, diſplayed the power of the pencil, and made the world acqainted with the magic of painting. The art of compoſition was carried to the higheſt point of perfection. Homer, Eſchylus, Sophocles, and Euripides, reached the true ſublime in poetry. Proſaic writings acquired elegance and ſimplicity from the pen of Herodotus: Xenophon and Iſocrates gave it cadence and harmony; but it was reſerved for Thucydides and Demoſthenes to diſplay the full force of the Greek language.

B. C. 448.

Nor were the ſtudies of the Greeks confined to the polite arts, the more ſevere exerciſes of mathematics and philoſophy were cultivated with ſucceſs. The names of Pythagoras, Euclid, and Archimedes, are ſufficiently known. The three ſcholars of the great Socrates, Plato, Ariſtotle, and Xenophon, may, for ſtrength of reaſoning, juſtneſs of thought, and propriety of expreſſion, be compared with the writers of any age or nation. It muſt however be confeſſed, that the Greeks were much better writers than philoſophers. For though the operations of reaſon are prior to the firſt efforts of the imagination; yet the imagination when once at work proceeds much faſter. It has the advantage of acting upon objects of its own creation; whereas reaſoning being confined to the objects before it, is obliged to ſtop at every ſtep, and often exhauſts all its powers in fruitleſs reſearches. The univerſe and reflection are the moſt uſeful books of philoſophers, and thoſe were ſtudied by the Greeks; but not taking experiments for their guide, they wandered into the regions of deception, and exhauſted in ſubtle diſputes that lively and penetrating genius which, if properly employed, would have enabled them to withdraw the veil from nature, diſcover the laws which regulate the univerſe, and form a ſyſtem of morals for the general benefit of mankind. The ſtateſmen and warriors of Greece were equally famous with thoſe who applied their talents to the cultivation of the arts. The love of their country was deeply engraven on their minds, and rendered them ſuperior to labour and fatigue. Their military virtue was eminently diſplayed in their wars againſt the Perſians; of which the cauſe were the wiſe laws which Amphictyon, Solon, and Lycurgus had eſtabliſhed among them.

Leaving this nation, whoſe hiſtory, both civil and philoſophical, is as important as their territory was inconſiderable, we ſhall next turn our attention to the Roman affairs, which are ſtill more intereſting, as well on their own account, as from the relation in which they ſtand to thoſe of modern Europe. Romulus, the founder of the Roman ſtate, was of a very martial diſpoſition; and the political ſtate of Italy, divided into a number of ſmall but independent diſtricts, afforded a noble field for the diſplay of his military talents. He was continually embroiled with one or other of his neighbours; and war was the only employment by which he and his companions expected not only to enrich themſelves, but even to ſubſiſt; yet they never blended cruelty with their conqueſts; the people they ſubdued were not extirpated. Romulus eſtabliſhed a maxim which afterwards rendered his ſucceſſors maſters of the world; he united the nations he conquered to the Roman ſtate. By this prudent conduct he became ſtronger by every victory; and the number of his ſubjects was increaſed by every addition to his territories: he took care at the ſame time not to oppreſs the people he had conquered. He changed indeed the form of their government, but he never impoſed on them the yoke of ſlavery: they became members of a free ſtate, and enjoyed all the privileges of his own people. The military diſcipline of his people always engaged the attention of Romulus; and he endeavoured to improve it by the experience of all the nations with whom he was at war. Whatever weapon, whatever motion, whatever ſtratagem he ſaw in uſe, or practiſed by the enemy, which was preferable to his own, he immediately adopted, and thought it no diſgrace to learn wiſdom and improvement from thoſe he had conquered.

B. C. 753.

Romulus, though principally attached to war, did not altogether neglect the civil policy of his infant kingdom. Being himſelf no ſtranger to the art of government, he was ſenſible that no ſtate could ſubſiſt without laws, and a proper ſubordination: that liberty without reſtraint would degenerate into anarchy; and that power without being nicely balanced, would terminate in tyranny. He was therefore deſirous of ſecuring liberty without licentiouſneſs, and of placing the legiſlative power where it might not be abuſed to the prejudice of his ſubjects. Accordingly he inſtituted what was called the ſenate, a court originally compoſed of 100 perſons, diſtinguiſhed for their wiſdom and virtue. He enacted laws for the adminiſtration of juſtice, and for bridling the ferocious manners and paſſions of his followers. Under theſe inſtitutions his infant ſtate flouriſhed in a moſt ſurpriſing manner: but gratitude was not one of the virtues of the firſt court of legiſlature; for Romulus, after a long reign ſpent in promoting the civil or military intereſts of his country, fell a victim to the treachery of the ſenate he had ſo lately founded, being, as it is thought, privately aſſaſſinated by ſome of its members.

B. C. 717.

Numa Pompilius, his ſucceſſor, chiefly applied himſelf to cultivate the arts of peace; he inſtituted the religious ceremonies of the Romans, inſpired the people with the higheſt veneration for an oath, which may be conſidered as the ſoul of military diſcipline; and added two months to the year, in order to render it more conformable to the courſe of the ſun. Tullius Hoſtilius, Ancus Martius, Tarquinius Priſcus, and Servius Tullius, the ſucceſſors of Numa, laboured aſſiduouſly to promote the proſperity, and extend the power of Rome. But Tarquin the Proud, who murdered Servius Tullius, his father-in-law, and ſeized upon the throne, followed not the ſteps of his predeceſſors; he became a very cruel and infamous tyrant. He trampled on the laws of juſtice, and ſeemed pleaſed with the oppreſſions he heaped upon the people. He was at once the terror and deteſtation of Rome. The inſolence of his ſon Saxtus Tarquinius haſtened his fate. He violated the chaſtity of Lucretia, a Roman lady, and by that flagitious act affronted the whole nation. Tarquin was hurled from the throne, and his whole family expelled from Rome. This violent convulſion put a period to the regal government.

B. C. 510.

There was a neceſſity for a power equal to that poſſeſſed by their kings to reſide ſomewhere: this they placed in two conſuls; who were nothing more than annual magiſtrates, though they enjoyed a ſovereign authority. This form of government was wiſely calculated to promote the grandeur of the Roman ſtate. The ſhort time allotted for the exerciſe of the conſular power, animated them with a deſire of ſignalizing their reign with ſome remarkable action: each laboured to eclipſe the achievements of his predeceſſor; and the troops were continually led againſt ſome new enemy. It however required a conſiderable length of time before the Romans could make themſelves maſters of Italy, and they

they were more than once reduced to the brink of ruin, notwithſtanding they were animated to deeds of valour by every motive that had a tendency to rouſe the ſlothful, or inſpire the brave. The citizens of Rome were all ſoldiers, who fought for their eſtates, their children, and their liberties. They all ſtudied the art of war, and were all deeply intereſted in the fate of every battle. Thoſe who turned their backs upon an enemy were branded with ignominy; while any who ſaved the life of a citizen, received a civic crown. B. C. 264.

But the petty princes of Italy were far from being the only enemies the Romans had to contend with. They were oppoſed in their ambitious ſchemes of empire by foreign ſtates, who more than once reduced them to the brink of ruin. Among theſe the republic of Carthage was the moſt powerful. This republic was in the zenith of its glory when Rome had hardly any territories. Carthage was celebrated for her commerce and riches; ſhe had extended her trade and the terror of her arms over the greater parts of Europe and Africa that were then known. The iſlands of Sardinia and Corſica were both in her poſſeſſion, and ſhe had planted powerful colonies in Spain. She reigned the undiſputed miſtreſs of the ſea, and threatened all the neighbouring nations with the yoke of ſlavery.

The growing power of Carthage was beheld with a jealous eye by the Romans, who feared for their conqueſt. A war ſoon enſued between the two ſtates, and for ſome time the advantage was greatly on the ſide of Carthage; and had not luxury before found its way into that republic, Rome would have been no more. Fond of eaſe, and tenacious of power, the Carthaginians employed mercenaries to carry on their wars; while the armies of Rome were compoſed of citizens: the one ſerved for pay only; the other fought for all that was dear to them. The Romans were convinced by the firſt war, which laſted twenty years, that Carthage could not be conquered while ſhe remained miſtreſs of the ſea: her commerce muſt ſupply her with every neceſſary, and her fleet could at any time tranſport an army into Italy, and land them on any part of the coaſt. A Carthaginian veſſel, which was wrecked on the territories of the Romans, ſerved that aſſiduous people as a model. A fleet was ſoon fitted out; and the conſul Duilius, who fought their firſt naval battle, was victorious. The Carthaginians were now rouſed from their ſlumber of ſecurity; they feared for their commerce, the true ſource of their peace, and the ſinews of war. They began to tremble in their turn; and ſuch was the ſpirit which then animated the Romans againſt their enemies, that Regulus, their general, being taken priſoner in Africa, was ſent back on his parole to negociate a change of priſoners. He maintained in the ſenate the propriety of that law, which cut off from thoſe who ſuffered themſelves to be taken, all hopes of being ſaved, and returned to a certain death, which, with the fortitude and magnanimity of a true patriot, he accordingly ſubmitted to. B. C. 262. B. C. 259.

Though corruption had at this time widely diffuſed itſelf in Carthage, yet ſhe was not altogether deficient in great men; among whom Hannibal was the moſt celebrated. An eternal antipathy to Rome had been inſtilled into his breaſt while an infant. His father Hamilcar, one of the great generals that had raiſed Carthage to her preſent ſtate of power, took his ſon when a child, to the temple of Jupiter, where having ordered a ſolemn ſacrifice to be offered up to that deity, he led his ſon to the altar, and aſked him whether he was willing to attend him in his expedition againſt the Romans? The courageous boy not only conſented to go, but conjured his father, by the gods preſent, to form him to victory, and inſtruct him in the art of conquering. To this Hamilcar joyfully conſented, and caufed him to ſwear upon the altar to be an irreconcileable enemy to the Romans. B. C. 255.

Hannibal being, at 25 years of age, appointed general of the Carthaginian forces, determined to attack his enemies in the very heart of their country. He croſſed the Ebro, the Rhone, and the Alps, and in a moment deſcended like a torrent upon Italy. The Romans now trembled for their capital. Scipio advanced to meet the Carthaginian general, and was defeated. Hannibal purſued his victory, croſſed the Po, and encamped at Placentia. The Roman conſul appeared at the head of his army. Hannibal offered him battle, which he thought proper to decline. Terrified at the expedition of Hannibal's purſuit, and the ardour of the Carthaginian troops, he abandoned his fortified camp, croſſed the Trebia, and poſted himſelf on an eminence near that river. Hannibal followed him, and encamped in the ſight of the Romans on an oppoſite bank. A battle enſued, and the Romans were again defeated. Hannibal now croſſed the Appenines, paſſed into Etruria, and laid waſte great part of that fertile country. Provoked at the rapid progreſs of the Carthaginian general, Flaminius, one of the Roman conſuls, imprudently advanced to give him battle. The two armies met in a large field near the lake of Thraſymene, and the Romans were a third time defeated. Theſe repeated misfortunes filled the city of Rome with terror and aſtoniſhment. The inhabitants expected Hanibal would ſhortly viſit their city: even the aged flew to arms, and appeared on the battlements with the weapons taken from their enemies in former wars, and which had long been hung up as trophies in their temples. B. C. 220.

Hannibal, inſtead of marching directly to Rome, imprudently moved towards the territory of Adria. The allies of Rome were alarmed. Sicily ſides with the conqueror. Hieronymus, king of Syracuſe, declares againſt the Romans, and almoſt all Italy abandons them. In this extremity Rome owes its preſervation to the courage and conduct of three great men; among whom, Fabius Maximus was the firſt who contributed in a great meaſure to ſave Rome from deſtruction. He was choſen dictator in this alarming criſis, and led his troops againſt the Carthagenian general. Hannibal did every thing in his power to bring the dictator to a deciſive engagement; but Fabius conſtantly declined the offer. Stratagems were uſed in vain; the Roman ſaw the ſnare, and carefully avoided it. He cut off the foraging parties of the Carthaginians, and perpetually haraſſed them in their march: the army of Hanibal was in danger of being deſtroyed without a battle. The recall of Fabius ſaved them from inevitable ruin. The new conſuls Varro and Paulus wanted the abilities of Fabius: they determined to bring on a deciſive engagement with the enemy. The two armies met in a large plain near the village of Cannæ. A dreadful battle enſued, in which the Romans were totally defeated. This was the greateſt blow that people ever received: above forty-five thouſand Romans, were left dead on the field of battle; and among them ſuch a number of knights that Hannibal is ſaid to have ſent three buſhels of their rings to carthage. B. C. 212.

Notwithſtanding theſe misfortunes, Rome had ſtill reſources. The young Scipio revived the drooping courage of his country. Though then only twenty-four years of age, he led a powerful army into Spain, where both his father and uncle had loſt their lives. But Scipio was not to be intimidated. He inveſted New Carthage, and took the city at the firſt aſſault. From Spain he paſſed into Africa, where the moſt powerful kings ſubmitted to his arms. Carthage trembled in her turn, and ſaw with terror her armies defeated. Hannibal was recalled to defend his courtry; his conqueſts in Italy were abandoned, and the defence B. C. 210. B. C. 202.

defence of Carthage was now the great object of that republic. But victory had now forſaken the ſtandards of Hannibal. His forces were defeated: Carthage became tributary to Rome; and after the deſtruction of that powerful ſtate the Romans obtained victories with much leſs difficulty: there was no power able to contend for any length of time with their victorious armies.

The ſtates of Greece, who had once more recovered their liberty, fell an eaſy prey to the Romans. Antiochus the Great ſent an army to their aſſiſtance; but they were eaſily defeated; and Antiochus himſelf was obliged to ſubmit to an infamous treaty. But ſtill the Romans purſued the maxims of Romulus, their great anceſtor. They permitted the ancient inhabitants to poſſeſs their country, and reſpective eſtates: they did not even change the form of their government, and the conquered nations became the allies of the Roman people. They were however the moſt abject ſlaves, under the ſpacious title of allies. Mithridates, king of Pontus, was not indeed ſo eaſily reduced. He had great reſources. His people were ſtrong and vigorous, inured to hardſhips and fatigue. Fond of liberty, and true lovers of their country, they for many years ſupported themſelves againſt the veteran armes of Rome. But continual wars depopulated their country: defeat ſucceeded defeat, till at laſt Mithridates in a deciſive battle with Pompey, loſt at once his kingdom and his life.

B. C. 182.

B. C. 165.

In Africa the wars were bloody and of long continuance. Marius, one of the greateſt generals of Rome, at laſt, by conquering Jugurtha, put an end to the quarrels that had long waſted that country: Numidia was reduced under the Roman yoke. The ſouthern parts being thus conquered, Marius led his victorious legions towards the north. He croſſed the Alps, and was fortunate in every attempt. The barbarous nations fled before him, and ſought refuge in their foreſts and bogs. The Roman ſtandards were diſplayed in the kingdoms of the Gauls, the Cimbri, the Teutones, and other barbarous nations beyond the Alps.

B. C. 106.

But while Rome conquered the world, there ſubſiſted an internal war within her walls. After the expulſion of her king, Rome enjoyed but a partial liberty. The deſcendents of the ſenators, who were diſtinguiſhed by the name of Patricians, were inveſted with ſo many diſguſtful privileges, that the people felt for their dependence, and were determined to ſhake off the yoke. They plainly perceived there was no other method of healing the wounds of the republic, but by committing the ſupreme power to the care of a ſingle perſon. Dictators were therefore created, and intruſted with the royal power: but as ſoon as the time of office expired, the alarming convulſions of the ſtate returned. Before the Romans were acquainted with the luxuries of foreign nations; before the tide of conqueſt had rendered them haughty, and the wealth of Aſia, inſolent; theſe ſtruggles were never carried to extremeties: but when the delicacies of foreign nations had baniſhed frugality, and a deluge of corruption had ſwept virtue from the ſtate, Rome became a prey to her own children. The love of their country was now to the Romans little more than a ſpecious name; the better ſort were too wealthy and effeminate to ſubmit to the rigours of military diſcipline; the army was now no longer a band of citizens, the legions were compoſed of the refuſe of the people. The ſoldiers recognized no other power than that of their general: under his banners they conquered, and for him they were always ready to ſacrifice their lives; he might, whenever he pleaſed, lead them againſt the ſenate, nobles, or people. But the ſeveral armies, required to be kept on foot for ſecuring the numerous conqueſts, retarded the ſubverſion of the republic. Jealouſy, together with a deſire to preſerve their own independence, prompted them to watch the conduct of each other with the moſt aſſiduous attention. Marius would have been maſter of Rome, had not the ſoldiers of Sylla defeated his ambitious deſigns; but at length a general appeared, whoſe actions eclipſed the glory of all his cotemporaries.

B. C. 102.

Julius Cæſar, who planted the Roman eagles in Gaul, had nothing left to conquer but his country. Fired with the ambition of becoming maſter of the world, Cæſar paſſed the Rubicorn, and ſat down in the capitol of Rome. Pompey, the only general capable of oppoſing the conqueror of Gaul, was defeated at Pharſalia; and with him fell the liberty of the Roman ſtate. The ſenate was no more; its ſhadow only ſubſiſted; the power remained with Julius Cæſar. Rome received him as her maſter, and all the conquered nations laid their ſceptres at his feet.

B. C. 58.

But the love of liberty ſtill ſubſiſted in the breaſts of ſome of the citizens of Rome. Brutus and Caſſius undertook to free their country from the power of a tyrant. Cæſar was ſtabbed in the ſenate-houſe, and the patriots took up arms in defence of their liberties. But they gained not over to their intereſt the legions who had learned to conquer under the banners of Cæſar. Their army was defeated at Philippi, and three tyrants triumphed at Rome. Theſe wanted both the clemency and abilities of Cæſar; they rivalled him only in ambition. A triumvirate of dictators could not long ſubſiſt. Mark Antony, who alone had any pretenſions to the military talents of Cæſar, was ſoon enervated by the pleaſures of the Egyptian court; he preferred the charms of Cleopatra to the glories of conqueſt; and ſuffered Octavius, at the battle of Actium, to wreſt from his hand the ſceptre of the world.

B. C. 45.

B. C. 31.

At this period, Rome had no patriots left to ſupport her falling liberties: ſome fell at the battle of Philippi, and the reſt by the bloody proſcription of the tyrannical triumvirate. Octavius, under the name of Auguſtus, took the title of emperor, and ſat down unmoleſted on the throne of Cæſar. Theſe diſtractions of the empire had no effect on the military diſcipline of the Roman legions; they were the undiſputed maſters of the world, when Rome was without a chief. And no ſooner was Auguſtus eſtabliſhed on the throne, than ambaſſadors from all parts of the known world crowded to pay him homage, or court his friendſhip. Deputies from the burning ſands of Africa, the ſoft luxuriant plains of Aſia, and the frozen regions of the North of Europe, met at Rome to proclaim Auguſtus emperor of the world. The tumults of war ceaſed in every kingdom: the ſword of deſolation was ſheathed, and harmony ſucceeded to the diſcord of nations. Auguſtus ſhut the temple of Janus, and the Saviour of the world, the Prince of peace, was born.

Let us now, before we proceed to the hiſtory of the emperors that ſucceeded Auguſtus, conſider the ſtate of learning and the arts in this period of Roman greatneſs. In the infancy of the republic, and even long after the conſular government was eſtabliſhed, learning and the arts made very little progreſs at Rome. Agriculture and the cultivation of arms principally engaged their attention. An adequate idea may be formed of the little valve they placed upon works of art by the edict of Mummius, who, having deſtroyed the city of Corinth, ordered the pictures painted by the moſt eminent artiſts of Greece to be carried to Rome, with this remarkable caution, that if any were loſt in the paſſage, they ſhould be obliged to make up the number. Nor were the ſciences in more requeſt at Rome. In the time of Cato the elder, ſome of the ableſt philoſophers of Greece coming to Rome, he ordered them to depart the city, leſt the minds of the youth ſhould be enervated

vated by philoſophy, and rendered too ſoft for military achievements. For a loug ſeries of years there were no written laws at Rome; thoſe of Solon, brought from Greece, were the firſt that were known in that city. They were generally called the laws of the twelve tables, becauſe they were written in twelve departments: they were afterwards corrected by various decrees of the ſenate, orders of the people, and edicts of the prætors: and in them was contained the civil law of the Romans.

After the downfal of Carthage, the Romans, having no enemy to fear from abroad, began to taſte the ſweets of ſecurity, and to cultivate the arts of peace. The curious remains of the Grecian magnificence, which were ſent to Rome, inſpired them with a deſire of imitating the perfect models of the Greek artiſts. Whatever was elegant, curious, and beautiful, might be conſulted without trouble or expence. But the Romans, though undoubtedly great artiſts, never equally finiſhed the works of their maſters. Eloquence had been long ſtudied in Rome; but it did not reach its greateſt height till Cicero appeared; but his orations are inferior to thoſe of Demoſthenes. Cicero gave to eloquence all the graces of which it is ſuſceptible, without learning its ſolidity and gravity. He gave cadence and harmony to the Roman language, and enriched it with beauties before unknown: he was to Rome what Demoſthenes had been to Greece, the glory of his country; they both carried eloquence to the higheſt perfection it ever attained.

The poetry of Virgil is equal to any thing produced by the Greeks, except the Iliad of Homer. Like the proſe of Demoſthenes, the verſes of Virgil are inimitable. Horace, in his ſatires and epiſtles, had no model among the Greeks, and ſtands to this day unrivalled in that ſpecies of writing. Rome abounded in hiſtorians; among whom, Livy poſſeſſes all the natural eaſe of Herodotus, and is more deſcriptive, more eloquent, and ſentimental. Salluſt is generally ranked with Thucydides, and ſome have not ſcrupled to conſider him as the moſt excellent hiſtorian of antiquity. Tacitus did not flouriſh in the Auguſtan age; but he has acquired the greateſt honour by his works, while they reflect ignominy on his country and human nature, whoſe corruption and vices he paints in the moſt ſtriking colours. To write the life of Tiberius required the genius of Tacitus, who could unravel all the intrigues of the cabinet, aſſign the real cauſes of events, and withdraw the veil of deception, which concealed from the eyes of the public the real motives and ſprings of action.

The Romans never applied themſelves greatly to philoſophy. Lucretius, who delivered, in ſpirited verſification, the opinions of Epicurus, is the only philoſopher, except Cicero, whoſe writings have reached our times: a cloſe and aſſiduous ſearch into the operations of nature, was not perhaps agreeable to the genius of the Romans. In tragedy as comedy, the Romans never produced any thing that can bear the leaſt compariſon with the writers of Greece. The tragic poets hardly deſerve to be mentioned. Plautus and Terence are juſtly placed at the head of the comic poets of Rome; but neither were poſſeſſed of the vis comica, or lively vein of humour, which is eſſential to comedy, and which diſtinguiſhes the writings of the comic poets of Greece.

We are now arrived at an æra which preſents us with a ſet of monſters, under the name of emperors, who filled the throne of the Cæſars, and whoſe hiſtories, a few excepted, diſgrace human nature. The government of Rome ſoon degenerated into the moſt deſpotic tyranny: a people long celebrated for their liberty, were now reduced to the moſt abject ſtate of ſlavery. The army was in reality the ſovereign of Rome: and while the emperors inflicted the moſt inhuman cruelties on their ſubjects, they themſelves trembled at the power of the legions: the emperors were at once the tyrants of the people and the ſlaves of the army. To keep the turbulent legions (who too well knew their own power) employed, they were led againſt the barbarous nations beyond the Alps. The Germans, the Britons, and other nations of the North, were ſubdued; and the Roman arts and learning were introduced among the nations of diſtant countries. But this required abilities and perſeverance. Fond of their liberties, and ſtrangers to every thing but the neceſſaries of life, the ferocious inhabitants of the North long defended themſelves againſt the power of Rome. In their ſtruggles for liberty, their countries were laid waſte, and famine aſſiſted the Romans to plant their eagles in the countries inhabited by a barbarous people. Many kingdoms were depopulated; and the Romans marched to conqueſt through the blood of an innocent people, whoſe only crime was a love for their country: but conqueſt, which raiſed the Romans power to the ſummit of glory, proved at laſt its deſtruction. Its boundaries were extended to ſo enormous a diſtance, that the ſprings which gave motion to the political machine of government, loſt their force.

The northern tribes of barbarians who had been increaſed by the inhabitants of more ſouthern climes, driven from their country by the Roman legions, multiplied in ſo rapid a manner, that the barren mountains of the North could not afford them ſubſiſtence. They returned in colonies towards the ſouth, in ſearch of a more fruitful ſoil. The ſoft, delicious climate of Italy excited their deſires; they poured like a torrent from the Alps into the plains, ſweeping all before them. They purſued a very different maxim from the Romans: they ſought for a ſettlement, and therefore extirpated the inhabitants. The moſt dreadful ſcene of blood and ſlaughter marked the route of the barbarians. Before them the country exhibited the moſt lovely proſpect, ſmiling in all the beauties of nature, populous, and full of cities and villages; behind them, ſmoking deſerts, without inhabitants, and without a farm. The ſword of deſtruction was drawn, and the barbarians ſeverely retaliated on the Romans the miſeries their conquering legions had carried into other climes. Perhaps a more diſmal ſcene was never exhibited ſince the earth was peopled: cotemporary authors, who beheld that ſcene of deſolation, are at a loſs for expreſſions by which to deſcribe the horror of it: the Scourge of God, the Deſtroyer of Nations, are the dreadful epithets by which they diſtinguiſh the moſt noted of the barbarous leaders, who ſpared neither age, ſex, nor rank; all were ſwept away by thoſe cruel invaders, and fell together in one undiſtinguiſhed carnage; even Rome itſelf fell a victim to barbarity and fury. Theſe calamities befel the Roman empire between A. D. 395 and 571, when the eſtabliſhment of the Lombards in Italy commenced.

Conſtantine, the emperor, who had embraced Chriſtianity, transferred the ſeat of the empire from Rome to Conſtantinople. A. D. 328. By this impolitic meaſure, the weſtern and eaſtern provinces were ſeparated from each other, and governed by different ſovereigns. The former was ſtyled the weſtern, and the latter the eaſtern empire. The withdrawing the Roman legions from the Rhine and the Danube to the eaſt, threw down the barriers of the weſtern empire, and laid it open to the northern invaders, who laid all the glories of the empire, vainly deemed immortal, in the duſt. The ancient military diſcipline of the Romans was ſo efficacious, that it muſt have proved an overmatch for all their enemies, had it not been for the vices of their emperors, and the univerſal corruption of manners among the people. Satiated with the luxuries of the known world, the emperors were at a loſs to find new provocatives. The moſt diſtant regions were explored, the ingenuity of mankind was exerciſed, and the tribute of provinces expended upon

one favourite diſh. The tyranny and deplorable licentiouſneſs of manners that prevailed under the emperors, or Cæſars, as they are called, could only be equalled by the barbarity of thoſe nations who overcame them. With reſpect to the eaſtern empire, that ſtood firm, and for a conſiderable time defied all the attacks of the northern invaders; but at length the followers of Mahomet effected what the Goths and Vandals had attempted in vain: they reduced the whole empire, and the family of the Othmans filled the throne of Conſtantine.

A dreadful revolution in the republic of letters ſucceeded this change of inhabitants. And learning being driven from her favourite ſeat, took refuge in the plains of Arabia. The Mahometan princes grew polite in proportion as they grew powerful. The caliphs of Babylon, after a ſeries of ſucceſsful wars, ſpent their time in ſecurity, and revived the arts. The muſes for a time fixed their ſeat on the banks of the Euphrates. Aaron Rachild was more reſpected than any of his predeceſſors, and was obeyed from Spain to the Indies. This prince revived the ſciences, and cultivated the polite arts. The learned from all parts reſorted to his court, where they were at once careſſed and rewarded. Barbariſm was baniſhed from his extenſive dominions, and her place ſupplied by politeneſs. Under his government the Arabians, who had before adopted the Indian method of computation by the nine figures and a cypher, brought the improvement into Europe. From them the Europeans learned the courſe of the ſtars, and the nature of eclipſes. Benhonain, the aſtronomer, tranſlated the Almageſt of Ptolemy from the Greek into Arabic; and made ſeveral aſtronomical obſervations, then of great importance. The caliph Almamon cauſed a degree of the meridian to be meaſured, in order to determine the magnitude of the earth, above ſeven centuries before any thing of that kind was attempted in Europe. Avicnna and Averroes, two celebrated phyſicians, tranſlated the works of Ariſtotle into Arabic, when they were utterly unknown on this ſide of the Mediterranean. They cultivated phyſic and chemiſtry with great alacrity and ſucceſs: the latter may be ſaid to have been invented by the Arabians. The Chriſtians were then inſtructed by the Mahometans.

A new ſpecies of government, now known by the name of the Feudal Syſtem, was introduced by the northern barbarians, who deſtroyed the Roman empire. The confederacies entered into by the inhabitants of the North, were rather military than civil, under different leaders, to whom they were ſtrongly attached. When they eſtabliſhed themſelves in the empire, their chiefs diſtributed to the principal officers, under the burden of military ſervice, a proportion of the conquered territories; and theſe made a new partition among their ſoldiers under the ſame tenure. Theſe fiefs were ſubſtituted for pay, and were not conſidered as the property of their poſſeſſors. They were originally revokable at the pleaſure of the granter; but an attachment, which is naturally contracted for land, introducing the idea of property, the nature of theſe grants was inſenſibly altered; men were averſe to relinquiſhing lands they had for ſome time cultivated, and for which they had acquired an affection. Theſe fiefs were accordingly firſt changed into poſſeſſions for life, and afterwards became hereditary. The imprudence or weakneſs of ſovereigns allowed themſelves to be deprived of their territories. Their vaſſals roſe in independence; and their ſubjects who received protection from theſe, became more attached to them than to their ſovereigns. A multitude of inferior vaſſals conſtituted a formidable body under the great tenants of the crown; and the advantages of this aſſociation were ſo great, that fiefs were conſidered as preferable to free poſſeſſions. Thoſe, therefore, who were poſſeſſed of free lands, reſigned them, either to the prince, or ſome powerful noble, in order to receive them back in the form of fiefs. The earls who adminiſtered juſtice (for the civil was not yet ſeparated from the military power) finding their advantage in the fines and pecuniary emoluments reſulting to them as judges, found means to render the judicial power hereditary in their families. Thus the official power of the magiſtrates was in a manner converted into fiefs, and the crown was weakened by new encroachments on its prerogatives. The ſovereign, however, was ſtill conſidered as the head of this vaſt fabric of political ſubordination. Obliged to protect his vaſſals, he had a title to demand their aſſiſtance, both for his own defence, and for that of the ſtate. He ſummoned them to his court; and although their advice and concurrence was abſolutely neceſſary in all matters of moment, yet their attendance, in conſequence of his call, which, in one point of view, was a principal privilege, was, in another, conſidered as a burden, and a mark of their dependence. The inferior vaſſals were bound to perform the ſame duties ta the great barons, which theſe performed to the king; and thus a kingdom was conſidered as a great barony, and a barony as a ſmall kingdom. It was the natural ambition of every baron to render his authority as independent of the crown as poſſible, and to acquire new force and authority over his particular vaſſals. The natural conſequences of theſe Gothic inſtitutions were jealouſies, wars, and oppreſſions without number. The great baron took the advantage of granting his vaſſals the perpetual aſſiſtance they wanted, to acquire a deſpotic power over them. The manufacturer, and lower claſſes of men, languiſhed under the moſt inſupportable ſervitude; for valour and military qualities were then alone regarded.

An ariſtocracy, the moſt cruel mode of government, now prevailed, and ſtifled every principle of equity and of nature. The people perceived that they ought to exchange the dominion of ſeveral maſters, for the limited adminiſtration of a ſingle perſon. The European monarchs perceived the encroachment of the nobles, and the dreadful ſervitude of the ſubject. They ſaw the people were nothing better than ſlaves; and determined to ſupport them againſt the tyranny of the barons. They declared, that as all men were born free, they ſhould enjoy that liberty in reality as well as in name. But to effect this noble deſign, it was neceſſary to erect ſome intermediate power to counterbalance that of the barons, who enſlaved the people, and aſpired to give laws to the crown. A plan was therefore adopted, which fully anſwered the deſign. New priuileges were conferred on towns, in conſequence of which they became at once populous and rich. All marks of ſervitude were aboliſhed; they were formed into bodies corporate, and governed by magiſtrates and a council, choſen by themſelves. The very dawn of liberty rouſed all the powers of the human mind into action. A ſpirit of induſtry revived; commerce became an object of attention, and was cultivated with ſucceſs by many of the powers of Europe. The invention of the mariner's compaſs greatly facilitated the communication between one nation and another, and conſequently opened new ſources of commerce.

The cities of Alexandria and Conſtantinople had long carried on a very conſiderable trade with Indoſtan; the precious commodities of India were not unknown in Europe. The Cruſades, which robbed Europe of her inhabitants, were the cauſe of opening a trade between the ſtates of Italy and the Eaſt. Venice became very powerful by her commerce: ſhe for ſome time engroſſed the commodities of India, and diſperſed them all over Europe. The Genoeſe, by ſending proviſions to the cruſaders along he coaſt of Aſia Minor, became rich and powerful; at the ſame time they gained ſome knowledge of the Indian trade,

trade, which had been the great ſource of wealth to the Venetians. They opened a communication with the Eaſt, and became ſharers in the advantageous commerce of Indoſtan. By the riches they drew from this ſource, theſe two rival ſtates became formidable to all the powers of Europe. At laſt the Portugueſe diſcovered a paſſage to India by the Cape of Good Hope, and wholly engroſſed the trade of the eaſtern parts of Aſia. Deſirous of continuing to his country ſome part of the eaſtern commerce, Chriſtopher Columbus, a native of Genoa, propoſed ſailing to India by a weſtern courſe. This offer, however, was rejected at Genoa, and Spain reaped the benefit of his diſcoveries. He failed in queſt of the Indies, but he found a new world. Spain became miſtreſs of a larger empire than that of Rome in the height of her glory.

The inhabitants of Europe now began to emerge out of that darkneſs in which they had been involved ſince the ſubverſion of the Roman empire, a ſpace of near twelve centuries. The invention of printing, the revival of learning, arts and ſciencies, hiſtory and philoſophy, and, laſtly the happy reformation of religion, all diſtinguiſh the 15th and 16th centuries as the firſt æra of modern hiſtory. The political principles and maxims then eſtabliſhed, ſtill continue to operate; and the ideas concerning the balance of power then introduced; or rendered general, ſtill influence, in ſome degree, the councils of European nations, and happily concur in ſecuring the different empires from the encroachments of their ambitious neighbours, who, in contending for univerſal monarchy, cannot fail to weaken their own force, and may at length render themſelves incapable of defending their juſt poſſeſſions.

The partial conqueſts aſpiring monarchs may make, will rather tend to oppoſe, than to promote their deſigns. A prince may form a deliberate plan of deſtroying, by ſlow degrees, the rights of his ſubjects, and his ſucceſſor may follow his example; but external conqueſts are always leſs ſolid than brilliant, and commonly occaſion more fear than hurt. The aſpiring prince, who, has unfortunately been a conqueror, is commonly reduced in the end to the laſt extremeties by the alarms his conqueſts excite, and the confederacies they give occaſion to. How contrary ſoever this doctrine may be to the prejudices and views of a victorious and powerful nation, it is nevertheleſs well eſtabliſhed in the ſcience of politics, and has been confirmed by experience and examples both ancient and modern.

The truth of the above aſſertion will appear in a great variety of lights, if we take a retroſpective view of the conduct of the Grecian ſtates when delivered from the terror of the Perſian invaſions. The moſt inconſiderable of theſe little ſocieties imbibed the frenzy of conqueſt, and by this frenzy was reduced, in its turn, to the utmoſt miſery and diſtreſs; a full illuſtration of this ſubject, the reader will find in Iſocrates's Oration on the Peace. If there be occaſion to mention modern examples, France affords a very ſtriking one. The humiliating circumſtances that ambitious monarch Lous XIV. was reduced to, are well known, the cauſe of which himſelf lamented on his death-bed; and the nerves of that kingdom have been ſince ſtrained ſo far beyond their ſtrength, by an unbounded thirſt of acquiſition, that it ſeemed hardly poſſible they ſhould recover their natural tone in the courſe of this century. In the war of 1756, the debility of their efforts ſhewed the grounds of the evil, and the inefficacy of a ſudden and precipitate remedy; but has not the Britiſh cabinet greatly contributed to reſtore and augment the navy of France, by agitating a civil war with the North Americans? Who does not know that the houſe of Auſtria excited the terror of all Europe, before it excited the pity of Great-Britain! That family, which had once been the object of fear, became at length the object of compaſſion. Charles V. of the houſe of Auſtria, was poſſeſſed of territories which exceeded in riches and extent the moſt powerful empires of antiquity, but theſe were not ſufficient to gratify the ambition of that monarch; and his whole reign exhibited a ſcene of hoſtility againſt his neighbours. One of his ſucceſſors, the late empreſs-queen, and the repreſentative of that family, was, however, upon the death of her father, not only ſtripped of her dominions, but reduced ſo low as to be in want of neceſſaries; and contributions were actually raiſed for her in Great-Britain, whoſe king, George II. engaged in her cauſe, and reinſtated her upon the imperial throne, at the expence of this nation.—Great-Britain enjoyed, for a ſeries of years, the greateſt degree of proſperity and glory; which ſhould have induced her to be more attentive to preſerve ſo brilliant an exiſtence; but as a great empire cannot be continued in a flouriſhing ſituation unleſs governed by moderation and wiſdom; ſo the unhappy conteſt of Great-Britain with her colonies in America, through the folly, arrogance, or arbitrary deſigns of her then miniſters of ſtate, has plunged her into the greateſt difficulties; her national debt has been augmented to an enormous ſum, her taxes increaſed ſo as to become an almoſt inſupportable burden, and her trade ſenſibly diminiſhed. That this once flouriſhing kingdom may be again reſtored to her former ſplendor and tranquility, in conſequence of the late peace with America, and the other belligerent powers, is an æra more devoutly to be wiſhed for, than expected.

PART. III.

OF RELIGION.

THE attention and capacity of mankind have in all ages been as it were on the ſtretch in order form adequate conceptions of the Supreme Being; but experience has evinced all their inquiries concerning the Deity to be fruitleſs, for "who by ſearching can find out God?" Men, in general, being unable to elevate their ideas to all the ſublimity of his perfections, have too often brought them down to the degrading level of their own ideas. This obſervation may be more directly applied to thoſe nations whoſe religion was founded partly on their own natural feelings, the faint glimmerings of unenlightened reaſon, but more frequently the irregular paſſions of the human heart, and who had moreover received no light from heaven, reſpecting this important, this awful object.

In giving the hiſtory of religion, a proper diſtinction ſhould always be attended to; we muſt ſeparate what is human from what is divine; what had its origin by particular revelations, from what is the effect of general laws, and of the unaſſiſted operations of the human mind. Hence we find, that the religion of the eaſtern nations was, in the moſt early ages, pure and luminous: it originated from a divine ſource, and was neither obſcured nor diſfigured by the caprice or inventions of men. But we find that in proceſs of time theſe began to take effect, inſomuch that the ray of tradition was not only obſcured; but totally obliterated from the minds of thoſe tribes who ſeparated at the greateſt diſtance, and in the ſmalleſt numbers, from the more improved ſocieties of men.

Depraved and ignorant as the generality of mankind were reſpecting the nature and perfections of God, their dependence upon, and obligations to him; yet the moſt barbarous nations have always paid their homages to ſome deity, although they have been under great miſtakes in their notions and concluſions about him. In this ſituation, God ſelected to himſelf

ſelf a peculiar people to be the depoſitaries of his laws and worſhip; but left the reſt of mankind to form confuſed and erroneous hypotheſes upon theſe ſubjects.

Polytheiſm, or the doctrine of a plurality of gods, was the moſt common religion of antiquity; and this prevailed the longeſt, and ſpread the wideſt. The ancient polytheiſm does not appear to be the fruit of philoſophical ſpeculations, nor of disfigured traditions, concerning the nature of the Divine Being; but to have ariſen during the rudeſt ages of ſociety, while the rational powers were feeble, and while mankind were ſubject to the tyrannical influence of paſſion and the wild dreams of imagination. Their religion, therefore, was founded ſolely upon ſentiment; each tribe of men had not only their favourite heroes, but their gods likewiſe: thoſe heroes who led them forth to battle, who had the chief rank in their councils, whoſe image was inſcribed on their fancy, and whoſe exploits were impreſſed on their memory, enjoyed, even after death, an exiſtence in the imagination of their followers and adherents. They had alſo two orders of gods, the propitious, and the hoſtile, the gods who were to be loved, and thoſe who were to be feared.

The heathens had alſo a celebrated diviſion of their gods into *dii majorum gentium*, and *dii minorum gentium;* that is, into the ſuperior and inferior gods. Another diviſion was taken from their place of reſidence; thus there were celeſtial, terreſtrial, infernal, marine, and ſylvan gods. They were alſo divided into animal and natural gods; the animal gods were mortals who had been raiſed to divinity by ignorance and ſuperſtition, ſuch as the heroes above-mentioned; and the natural gods, the parts of nature, ſuch as the ſtars, the elements, mountains, rivers, &c. There were alſo deities who were ſuppoſed to preſide over particular perſons; ſome had the care of women in childbirth; others, the care of young children and young perſons; and others were the deities of marriage. Each action, virtue, and profeſſion had alſo its particular god: the ſhepherds had their Pan; the gardeners, their Flora; the learned, their Mercury and Minerva; and the poets, their Apollo and the Muſes. The ancients, in general, made their gods ſubject to all the paſſions of men; they partook even of their partial affections, and in many inſtances diſcovered their preference of one race or nation to all others. They did not indeed eat and drink the ſame ſubſtances with men, but they lived on nectar and ambroſia; they had a particular pleaſure in ſmelling the ſteam of the ſacrifices, and they made love with a ferocity unknown in northern climates.

It is, however, thought by moſt learned men, that the Pagans acknowledged but one God; and that the many different divinities worſhipped by them, were but attributes and actions of one and the ſame God. This may probably be true of the wiſer heathens; and indeed there are many ſtrong and beautiful paſſages in pagan authors, to prove that they acknowledged but one God. Anaxagoras, who flouriſhed 430 years before the Chriſtian æra, was the firſt, even in Greece, that publicly announced the exiſtence of one Creator and Governor of the Univerſe. Pythagoras likewiſe taught the unity of God, and defined him to be a mind penetrating and diffuſing itſelf through all the parts of the univerſe, from which all animals receive life; and Plato called God the being which is; and whenever he mentioned the Deity, it was always in the ſingular number.

But, of all others, the Chriſtian religion is demonſtratively of divine original, from the ſublimity of its faith, excellency of its morals, and the purity of its precepts. It conſiſts not in idle philoſophical ſpeculations, or perpetual grimace and affectation, but in a ſteady practice of the duties it requires, without the leaſt view of recompence from men; it neither ſeeks their admiration, nor attempts to dazzle their eyes and deceive them: there is no religion which ſo much excites a man to the love and practice of virtue, and hatred of vice, or that preſcribes greater rewards for one, or puniſhments for the other. This religion, in regard to the practice of it, conſiſts in the moſt exact imitation, that can poſſibly be conceived, of the infinite perfections of the Supreme Being: from hence we may derive that ſolid virtue, that power (reſulting from a divine principle implanted in the mind) which it gives to ſubdue our paſſions, and that ſatisfaction which we receive from the obſervance of thoſe laws which God has preſcribed to mankind. The characters of Chriſtianity are perfectly conformable to the attributes of the Divine Majeſty. The moral part never indulges the paſſions, it has no other view than the preſervation and happineſs of mankind: nor have the moſt inveterate enemies of the Chriſtian faith ever invented any thing but what was much inferior to it, both in practice and ſpeculation.

In time, however, Chriſtianity became corrupted by the introduction of worldly maxims, very inconſiſtent with the precepts of its divine author, and by the ambition of the clergy; which at length occaſioned the elevation and exorbitant claims of the biſhop of Rome. The power of the pope, as univerſal biſhop, and head of the church, or, in other words, the papal ſupremacy, owed its origin to the worſt of men; was procured by the baſeſt means, by flattering a tyrant (Phocas) in his wickedneſs and tyranny; and, according to the judgment of Gregory the Great, was in itſelf antichriſtian, heretical, blaſphemous, and diabolical. The biſhops of Rome, by availing themſelves of every circumſtance which fortune threw in their way, ſlowly erected the fabric of their antichriſtian power, at firſt an object of veneration, and afterwards of terror, to all temporal princes. The cauſes of its happy diſſolution are more palpable, and operated with greater activity. The ſcandalous lives of the Popiſh clergy, their ignorance, and tyranny, together with the deſire natural to ſovereigns, of delivering themſelves from a foreign yoke; the opportunity of applying to national uſes the immenſe ſums which had been diverted to the ſervice of the church in every kingdom of Europe, conſpired with the ardour of the firſt reformers, and haſtened the progreſs of the Reformation, which began by Luther in Germany in the year 1517, and took place in England in 1534; for when once the eyes of the public were opened, they could plainly perceive the unreaſonableneſs of the claims of the church of Rome; that many of her doctrines were unſcriptural, corrupt, and irrational, and after a very fair and impartial examination, moſt of her abſurd mummeries and ſuperſtitions were juſtly condemned and exploded both by argument and ridicule. The ſervices of the reformers in this reſpect, demand our admiration and gratitude; but, involved as they had been in the darkneſs of ſuperſtition, it was not to be expected but that they ſhould ſtill retain ſome errors, an attachment to ſome abſurd doctrines, and too much of the intolerant ſpirit of the corrupt and arbitrary church from which they had ſeparated themſelves; but ſince, with all their defects, theſe pious and learned men were honoured in being the inſtruments, through Divine Providence, of bringing about an event highly favourable to the civil and religious rights of mankind, they have certainly a juſt claim to our veneration and eſteem.

EUROPE.

INTRODUCTION.

EUROPE, though by far the ſmalleſt diviſion of the globe, is in many reſpects ſuperior to the other three, and that which particularly deſerves our attention. It is ſituated between the 36th and 72d degree of north latitude, and between the 10th degree weſt, and 65th degree eaſt longitude, computed from the meridian of London; being 3000 miles in length from Cape St. Vincent in the weſt, to the mouth of the river Oby in the north-eaſt; and 2500 in breadth from north to ſouth, from the north Cape in Norway to Cape Cayha or Metapar in the Morea, the moſt ſouthern promontory in Europe. It is bounded on the north, by the Frozen Ocean; on the eaſt, by Aſia; on the ſouth, by the Mediterranean Sea, which divides it from Africa; and on the weſt, by the Atlantic Ocean, which ſeparates it from America.

This quarter of the globe, though the leaſt extenſive, is beyond compariſon the moſt happy and valuable part of it, both with regard to religion, arts, learning, riches, and commerce. It juſtly claims a pre-eminence over the other parts, becauſe the human mind hath here made the greateſt progreſs in whatſoever is uſeful and ornamental to mankind in general. The mildneſs of the climates of moſt parts of Europe, the fertility of its ſoil, which produces every thing neceſſary for the ſupport, and even luxury of human life; the flouriſhing ſtate of the arts and ſciences; and the nature of the ſeveral governments, which are far leſs deſpotic, and far more equitable than thoſe of either Aſia or Africa; render this the moſt deſirable quarter of the terraqueous globe for the reſidence of a rational being. To theſe advantages we may add, that no part of it is ſituated within the torrid, and but a ſmall portion within the frigid zone; and the difference of its face, or variety of its ſurface, by ſeas, rivers, mountains, &c. which are at once innumerable and beneficial, contribute greatly to its ſuperiority.

The preſent inhabitants of the principal ſtates of Europe are deſcended from thoſe multitudes of northern people who deſtroyed the Roman empire. Conſtantine the Great had ſome time before removed the ſeat of empire from Rome to Conſtantinople, and this occaſioned its fall. The Viſigoths forced a paſſage into Italy, ſacked Rome in the year 409, and ſettled in Italy, Languedoc, and Spain. The provinces of Gaul fell to the ſhare of the Franks and Burgundians, and ſtill retain the name of their conquerors. About the ſame time the Hunns ſubdued Pannonia, and called it Hungary after their own name. The Britons, being expelled from their habitations by their foreign allies, croſſed the Severn, and took refuge in the lofty mountains of Wales, the inhabitants of which principality are ſaid to be immediately deſcended from the original natives of Britain, and to retain their language in its purity.

The languages of Europe are derived from ſix radical ones, namely, 1. Latin, of which the Italian, French, and Spaniſh, are dialects. 2. Teutonic, from whence proceed the German, Dutch, Swediſh, Daniſh, and Engliſh tongues. 3. Sclavonian, which reigns in different dialects in Poland, Muſcovy, Bohemia, and a great part of Turkey in Europe. 4. The Celtic, of which there are remaining dialects in Wales, Ireland, the Highlands of Scotland, Brittany in France, and Lapland. 5. Greek, of which ſeveral dialects are ſpoken in the Morea, and the iſlands of the Levant. 6. Gothic, ſome remains of which are preſerved in the iſlands of the Baltic, and the ſouthern parts of Sweden. To theſe we may add the languages ſpoken in Turkey and Little Tartary as European languages.

Moſt of the European governments are monarchical; but many, if not all of them, are checked by a variety of little ſprings which break their force, and ſoften their rigour. But beſides monarchical there are ariſtocratical and republican governments in Europe. Venice is an ariſtocratical ſtate, where the government is in the hands of the nobles; and Holland is a democracy, or government of the people. Great Britain is a government of a very ſingular kind, conſiſting of the three ſpecies above-mentioned, and partakes of all the benefits, while it rejects the inconveniencies annexed to them. The other mixed governments of Europe, as Poland, Sweden, &c. are compoſed of two only of the ſimple forms; as will be explained in their proper places.

The Chriſtian religion is eſtabliſhed in every part of Europe, except the diſtricts poſſeſſed by the Turks, where the Mahometan tenets are profeſſed. The Chriſtians are divided into a number of different ſects, which may be comprehended under three general denominations; namely, 1. The Greek church; 2. Popery; and 3. Proteſtantiſm: which laſt is again divided into Lutheraniſm and Calviniſm, ſo called from Luther and Calvin, the two eminent reformers of the 16th century: but all their principles are founded upon the ſame baſis, ſince they all acknowledge Chriſt to be the Redeemer of mankind, and that the ſcriptures were written by divine inſpiration.

The following Table contains the principal Kingdoms and States of Europe, their Length, Breadth, Chief Cities, Distances and Bearings from London, Difference of Time from London, and their Religions.

Nations.		Length.	Breadth.	Chief Cities.	Distance from London.	Bearing from London.	Religions.

CHAP. I.

WEST GREENLAND.

Description of the Country, Climate, Soil, Vegetable and Animal Productions, &c.

WEST GREENLAND, otherwiſe called Old Greenland, or Groenland, begins in 59 deg. 50 min. north lat. The eaſtern coaſt is ſuppoſed to extend as far northward as Spitzbergen, or Eaſt Greenland; and the weſtern part is only ſeparated by a channel of 40 miles in breadth. The weſtern ſhore has been diſcovered higher than the 70th deg. of north lat. The country is exceeding mountainous; and the mountains are ſo very high that they may be diſcerned at ſea at the diſtance of 30 leagues. The inland mountains and hills are perpetually covered with ſnow; but the low lands on the ſea ſide are, in ſummer, clothed with verdure. The coaſt is difficult of acceſs, on account of the great number of rocks with which the ſurrounding ſeas, and the mouths of the Greenland rivers, abound, independent of the vaſt mountains of floating ice which ſeem to threaten with deſtruction the adventurous navigator.

The climate, from the moſt ſoutherly part of Greenland to the 68th deg. of north lat. is not ſo ſevere as might at firſt be imagined. The ſummer includes the latter end of May, the whole of June, July, and Auguſt, and half the month of September; during which the weather is generally warm: while the wind blows eaſterly the ſky is always ſerene, but when it veers to the other points, ſtorms are ſure to enſue. The ſea coaſt is generally infeſted with unhealthy and diſagreeable fogs, which are, however, ſo fattening to the land, that the ſhores are covered with verdure; but the inland mountains are capped with ſnow perpetually.

The weather, to the northward of the 68th deg. is much more ſevere, and the cold ſo very intenſe, that even in the midſt of ſummer the very ſtrongeſt ſpirituous liquors will freeze cloſe to the fire-ſide. The winter in this part continues from September to May, and ſometimes June, during which time the ſea is covered with vaſt mountains of ice.—"Nothing (ſays an eminent writer) can exhibit a more dreadful, and, at the ſame time, a more dazzling appearance than thoſe prodigious maſſes of ice that ſurround the whole coaſt in different forms of rocks, caſtles, towers, and ſpires, reflecting a variety of colours according to the nature of the concrete, and floating from place to place, as if the whole ſcene was illuſion, or enchantment; ſuch are the proſpects they yield in calm weather, but when the winds begin to blow, and the ſea to ſwell in vaſt ſucceſſive billows, the conflict of thoſe congregated bodies of ice encountering, daſhing, cracking, burſting, and ſhivering into ten thouſand fragments, fills the eye and ear with terror and aſtoniſhment.

Thunder and lightning ſeldom diſturb the air of Greenland, which, however, is ſubject to many other natural phænomena, ſuch as ſhooting ſtars, and in particular the aurora borealis, or northern lights. In the ſpring of the year, and about the new moon, this phænomenon appears ſo univerſally bright over the face of the whole northern ſky, darting its rays, and glaring with ſuch radiancy, as to afford ſufficient light whereby to read.

There is no night at the ſummer ſolſtice, and people who reſide here have the pleaſure to ſee the ſun turn about the horizon all the twenty-four hours: but in the depth of winter they have but little comfort in that planet, the nights being proportionably long; yet they can ſee to travel up and down the country, though ſometimes it is neither moon-ſhine or ſtar-light. The temperature of the air is not unwholeſome; for, except the ſcurvy, and the diſtemper of the lungs, the inhabitants know nothing of many other diſeaſes with which other countries are plagued; and theſe pectoral infirmities are not ſo much the effects of the exceſſive cold, as of the foggy weather, to which this country is very much ſubject. From the beginning of April to the end of July is the foggy ſeaſon; and from that time the fog daily decreaſes. But as in the ſummer-time they are troubled with fogs, ſo in the winter ſeaſon they are plagued with the vapour called froſt-ſmoke, which, when the cold is exceſſive, riſes out of the ſea, as the ſmoke out of a chimney, and is as thick as the groſſeſt miſt, eſpecially in bays, where any opening in the ice is found.

A wonderful harmony and correſpondence is obſerved in Greenland between fountains and the main ſea: at ſpring tides in new and full moon, when the ſtrongeſt ebbing is at ſea, the hidden fountains or ſprings of freſh water break out on the ſhore, and diſcover themſelves often in places where they might be little expected, eſpecially in winter, when the ground is covered with ice and ſnow; yet there are no water ſprings in thoſe places at other times.

In Greenland the hills are barren, and indeed frozen all the year; the low lands are tolerably fertile, particularly towards the ſea. A few oak trees are found in the ſouthern parts near the States Promontory. In theſe particular parts the meadows are rich in graſs: turnips and coleworts are eaſily raiſed, and excellently flavoured: underwood, which grows to a vaſt height, is plentiful: birch, elm, and willows are not ſcarce, and juniper-berries grow in abundance. The herb angelica grows wild, and is found in great profuſion: it is endued with a turpentine flavour, and yields an aromatic oil, which is extracted by diſtillation.

A pleaſant and ſalutary kind of ſcurvy-graſs grows in great plenty on the ſhores, and the mountains near the bays and creeks are covered with wild thyme. A ſpecies of graſs bearing yellow flowers, the herb tormentil, and many other plants, herbs, and vegetables, abound in this country. The fruits of Greenland are bramble-berries, bilberries, blue-berries, and juniper-berries. Here it is to be obſerved, when any thing is ſaid relative to the fertility of Greenland, that the ſouthern parts are only meant, for in the northern parts no herbs and plants will grow.

Various metals are produced in Greenland: to the ſouthward of the Dutch colony copper ore is found. Mr. Egede once received a lump of ore from a Greenlander, and himſelf found calamine of a yellow colour. He likewiſe ſent a conſiderable quantity of yellow ſand mixed with vermillion ſtreaks to the Bergen company, who, by letter, requeſted him to procure as much as poſſible of that commodity: he could not, however, execute his commiſſion, as he was never after able to find the place where he got the firſt ſpecimen: it was, it ſeems, one of the ſmalleſt among a great cluſter of iſlands, and the mark he had ſet up was blown down by a ſtorm, ſo that he could not trace out the ſpot a ſecond time.

Red and white rock cryſtals are the produce of this country; and a baſtard marble, of various colours, is very plentiful about the Daniſh colony, which is known by the name of Good Hope; of the latter the natives make bowls, lamps, pots, and crucibles. The ſeas and bays, beſides a variety of beautiful ſhells, yield great quantities of excellent coral. But one of the greateſt natural curioſities of this country is the aſbeſtos, or amianthus, which has the vulgar appellation of earth-flax, and is a fibrous, flexible, and mineral ſubſtance, compoſed

of ſhort and abrupt filaments. It is a ſtony concrete, of the talcky kind, though differing from talc in its external appearance. It is neither ſo bright, ſo ſmooth, or ſo unctuous, and is not compoſed of leaves or plates, but of long filaments, like flax. It has been ſpun into cloth, and formed into paper, both of an incombuſtible nature, and not to be conſumed by fire. Some kinds have filaments that are rigid and brittle, and others more flexible. The firſt cannot be ſpun, or formed into cloth; the latter may, but not without difficulty. This manufacture appears to have been known to the ancients, who, according to Pliny, wrapped the bodies of the dead in cloth made of earth-flax, to preſerve their aſhes ſeparate from thoſe of the funeral pile, an uſe to which ſome of the Tartarian chiefs ſtill apply this kind of cloth.

This country is not infeſted with any ravenous animal, the great white bear excepted, which, however, very ſeldom appears near the Daniſh colony. The quadrupedes of Greenland are dogs, foxes, hares, and rein-deer. The dogs are large and rough, white or ſpeckled; and their ears ſtand upright, which is a peculiarity belonging to curs in general in all cold climates. Theſe dogs are timorous and ſtupid, do not bark, but make a moſt diſmal howling at times. In the northern parts they are rendered of infinite ſervice, as the natives there yoke them to ſledges, which, when heavy laden, they are able to draw upon the ice at the rate of ſeventy miles a day. Theſe poor uſeful animals, are however, very ill rewarded for their ſervices, being left to provide for themſelves, except when their owners happen to be ſucceſsful in taking a great number of ſeals, at which times their maſters gratify them with a meal, compoſed of the entrails and blood. The foxes appear of different colours, white, grey, and blueiſh. They are neither ſo hairy, or ſo large, as thoſe of Denmark and Norway. Hares are found in Greenland in great abundance: they are of a white colour, very fat in ſummer, and of an exquiſite flavour. Rein-deer feed in great herds, and are hunted all the ſummer by the natives, who are uſually accompanied by their wives and children in theſe excurſions, and in purſuit of their game will penetrate very far into the country.

Lizards, ſerpents, toads, newts, &c. are unknown in Greenland; but gnats ſwarm, and are exceedingly troubleſome in the ſummer time.

Here are vaſt numbers of partridges, which are white in winter, and grey in ſummer; as well as ſparrows, linnets, ſnow-birds, and ice-birds. A great many ravens hover about the huts of the Greenlanders, as, near the habitations of theſe people, the ground is uſually ſtrewed with offals of ſeals, and other fiſh. Greenland likewiſe abounds with eagles and falcons of a prodigious ſize, and large ſpeckled owls.

Bees, waſps, ſpiders, and flies, are the inſects of this country. The people, however, are not plagued with beetles, ants, mice, or rats.

The inhabitants are fond of the ſeal, which contributes at once to their ſuſtenance and conveniency. There is ſome difference in ſeals, but the moſt remarkable ſpecies is that called the Cap-miſs, which appellation it receives from the cap, or cawl, with which it covers its head occaſionally. The head itſelf reſembles that of a dog with cropped ears, his ſnout is bearded like a cat, his eyes are large, and his teeth ſharp. His ſkin is covered with a ſhort thick fur, which is white, black, brown, or tawny: he is web-footed, which is a great convenience to him in ſwimming; and he ſeems to drag himſelf along, rather than walk. Seals are from five to eight feet in length. The fat of this creature furniſhes the Greenlanders with oil, the

† fleſh with food, the ſkin with clothing, and with coverings for their huts and boats.

The Greenland ſeas abound alſo with turbot, cod, haddock, ſcate, ſalmon, halibut, cat-fiſh, roe-fiſh, ſtents, whitings, bream, muſcles, crabs, ſhrimps, and other fiſh. Under the article of Eaſt or New Greenland, that aſtoniſhing creature the whale will be amply deſcribed from ſome late minute obſervations.

The principal ſea-fowl in Greenland, is the edder-fowl, ſwarms of which, at times, ſeem to cover the whole ſurface of the ocean. In the warm ſeaſon infinite numbers of them hover about the Daniſh colony every evening, and take their flight to the ſea regularly the enſuing morning. In ſpring they retire to the iſlands to lay their eggs, and hatch their young, and return to the continent about June or July. The Greenlanders are very fond of their eggs and their young, but make no manner of uſe of their fine down feathers, which are excellent in their kind, and to be found in and about their neſts in large quantities.

Three ſpecies of ducks are found in, or frequent Greenland. The firſt, which is of the tame duck kind, has fine ſpeckled feathers, and lays and hatches its eggs in the iſlands, returning afterwards with its young to the continent. The ſecond ſort is ſmaller, has a long pointed bill, frequents only freſh waters, and builds its neſt in the flags, or reeds of rivers. The third kind, which is the largeſt of all, has the appellation of the wood-duck, and is diſtinguiſhed by a black breaſt and grey belly. The alkes is another kind of ſea fowl, which the Greenlanders are fond of feeding on; it is leſs than a duck, and of a rancid taſte. But the moſt beautiful ſea bird of theſe parts is the tungoviarſek. This bird is not bigger than a lark, but its feathers are uncommonly elegant. Swarms of wild geeſe come to the northern parts of Greenland, from more ſouthern climates, in the ſpring; and breed, and quit the place at the commencement of winter. Many ſea-mews build in the rocks and cliffs; and ſea-terns lay their eggs on the iſlands about Greenland. Lundes, or Greenland ſea-parrots, are common here, as are ſea-earnes, and ſea-ſnipes.

Various authors concur in opinion, that the native or original Greenlanders are deſcended from the Schrellings, who formerly exterminated the Iceland ſettlers. Theſe people bear a near reſemblance to the Laplanders and Samoides, in their perſons, complexions, and way of life. There will always be found a ſtrong affinity between the cuſtoms of different nations living in the ſame kind of climate, expoſed to the ſame wants and neceſſities, and involved in the ſame ignorance and brutality.

The Greenlanders are ſhort of ſtature, thick made, and inclined to be fat: their faces are bread, their lips thick, and their noſes flat. They have black hair and eyes, and yellow complexions, poſſeſs health and vigour, but have very ſhort lives. Their clothes are, for the moſt part, made of rein-deer or ſeal-ſkins; as alſo of birds ſkins, nicely dreſſed and prepared.

The men's habits are, a coat or jacket, with a cape or hood ſewed to it, to cover the head and ſhoulders. This coat reaches nearly to the knees. Their breeches are very ſmall, not coming above their loins, that they may not hinder them in getting into their boats; and the hair of the ſkins the coat is made of is turned inward to keep them warm. Over this coat they put on a large frock, made of ſeal-ſkins dreſſed and tanned, without hair, in order to keep out the water; and thus they are dreſſed when they go to ſea. Between the leathern frock and the under coat they wear a linen ſhirt, or, for want of linen, one made of ſeals guts, which

alſo

alſo helps to keep out the water from the under coat. Of late they appear ſometimes in more gaudy dreſſes; as ſhirts made of ſtriped linen, and coats and breeches of red and blue ſtuffs or cloth, which they buy of the Daniſh or Dutch merchants, but faſhioned after their own way. In theſe they parade and feaſt, when they keep holy days on ſhore. The hoſe they wore formerly were made of rein-deer or ſeal-ſkins; but now they prefer our ſort of worſted, of different colours, white, blue, and red, which they buy of the Danes. Their ſhoes and boots are made of ſeal-ſkins, red or yellow, well dreſſed and tanned. They are nicely wrought, with folds behind and before, without heels, and ſit well upon the feet. The only difference between the dreſs of the men and women is, that the women's coats are higher on the ſhoulders, and wider than the men's, with higher and larger hoods. The married women, that have children, wear much larger coats than the reſt, like gowns, becauſe they muſt carry their children in them upon their backs. They wear drawers which reach to the middle of the thigh, and over them breeches. The drawers they always keep on, and ſleep in them. Their breeches come down to the knees: theſe they do not wear in ſummer or in winter, but when they go abroad; and, as ſoon as they come home, they pull them off again. Next to their bodies they wear a waiſtcoat made of young fawn-ſkins, with the hairy ſide inward. The coat, or upper garment, is alſo made of fine coloured ſwan-ſkins, or (in defect of that) ſeal-ſkins, trimmed and edged with white, and neatly wrought in the ſeams, and about the brim. Their hair, which is very long and thick, is braided, and tied up in a knot. They commonly go bare-headed, as well without as within doors: nor are they covered with hoods, but in caſe of rain or ſnow.

Their chief ornaments are glaſs beads, of divers colours, or coral, about their necks and arms, and pendants in their ears. They alſo wear bracelets made of black ſkin ſet with pearls, with which they trim their clothes and ſhoes. Some have, beſides this, another ſort of embelliſhment; they make long black ſtrokes between the eyes on the forehead, upon the chin, arms, and hands, and even upon the thighs and legs. They keep their clothes pretty clean, though in other things, eſpecially in their victuals, they are not ſo nice. The women, in general, who have children, are very dirty and ſlovenly, well knowing that they cannot be repudiated. But thoſe unfortunate women that are barren, or whoſe children are dead, and do not know the moment they may be ſent away, are obliged to take more care to be cleanly, that they may pleaſe their huſbands thereby.

As to diſpoſition, the Greenlanders are good-natured and orderly, but indolent, dull, and phlegmatic. They live peaceably without laws, and act regularly without diſcipline. In caſes of murder (which, however, ſeldom happens) no cognizance is taken of the murderer, unleſs the neareſt relation to the deceaſed thinks proper, perſonally, to revenge his death. Old women, who, from an untoward diſpoſition, are ſuppoſed to be witches, they kill, by the unanimous conſent of the community.

Conceiving all the productions of nature deſigned for mankind in general, they deem every thing common property. This naturally obviates the idea of robbery, as none can ſteal where he has a right to take whatever he happens to lay his hands on. But this idea they extend to ſtrangers, and take as freely from them as from their own neighbours, which occaſions them to have a worſe name than they deſerve; as the notions they are brought up in excuſe, in ſome meaſure, their ſuppoſed delinquency.

Adultery and fornication are unknown to the Greenlanders, except upon particular occaſions, when certain ceremonials, at which both ſexes attend, admit of promiſcuous intercourſe; and theſe permiſſions do not proceed ſo much from vice as arbitrary cuſtom; for, in general, the Greenlanders are modeſt, civil, generous, and hoſpitable. Only married people are admitted to the above-mentioned feſtivals; for the unmarried, of both ſexes, are remarkable for their modeſty and continence. To confirm this aſſertion, Mr. Egede, the Daniſh miſſionary, ſays, he never ſaw any of them hold any looſe converſation, or ſhew the leaſt inclination to it, either in word or deed. During fifteen years that he lived in Greenland, he did not hear of more than two or three unmarried young women who were pregnant, becauſe it is reckoned the greateſt diſgrace in ſuch.

The worſt quality in the Greenlanders is, their being ſo exceeding dirty, for they are ſlovens to a degree of beſtiality. The men are ſo fond of dirt, that they never waſh themſelves with clean water, but, in the manner of cats, lick their fingers, and clean their faces, as well as they can with the ſpittle. They even eat their victuals in the ſame bowls and platters that have been licked by their half ſtarved dogs, without the leaſt idea of making them clean. The women think they are never ſo ſweet as when they waſh themſelves in urine, that being deemed their grand perfume; and a female, when ſo cleaned, imagines her ſmell to be peculiarly grateful. Even the men adopt this opinion ſo far as to compliment a woman, after having been thus ſcoured, with the title of *niviarſiar ſuarneaks*, or, maidenly ſweet.

Company never hinders either ſex from complying with the calls of nature; and the utenſils for thoſe purpoſes being always in the ſame room as the family, a diſagreeable effluvium ariſes, which is extremely offenſive to any but thoſe who are, by long uſe, familiarized to ſuch ſtenches. Many of theſe people ſoak raw hides in thoſe very utenſils, which contributes conſiderably to the nauſeous ſmell of the place, and renders a Greenlander's habitation inſufferably diſagreeable.

Theſe people feed upon the fleſh of ſea-partridges, hares, ſeals, rein-deer, and whales. Their fleſh-meat they eat either boiled, dried in the ſun or wind, or raw. Their fiſh they either boil or dry thoroughly. Indeed, it is by perfectly drying that they preſerve their ſalmon, halibut, or ſtents, which are caught in the ſummer, and laid up for winter ſtore: for theſe people, with all their ignorance, are as careful as the ant in providing for future exigencies.

Seals are only to be caught in the ſummer, unleſs they happen, in the winter, now and then to meet with a few floating upon the ice. The mode of preſerving theſe animals is by burying them under the ſnow, from whence they are dug out as occaſion requires, and eaten without further preparation. They are as naſty in eating as in other things; for they never clean either platters, pots, or kettles; and the dirty ground ſerves them for a table. But they act wiſer than many more poliſhed nations, in not eating ſet meals at particular hours, but gratifying the calls of hunger, when the craving appetite requires. The women uſually eat by themſelves; but when the Greenlanders return from ſea, they make merry, and regale ſumptuouſly together.

The Greenlanders are not delicate in their appetites, neither are they very particular, in times of ſcarcity, with reſpect to their food, as they will feed upon pieces of rotten ſkins, ſea-weeds, flags, any kind of roots, whales fat, train oil, &c. In ſummer they uſe wood as fuel to dreſs ſuch victuals as they do not chooſe to eat raw; but in winter,

they uſually boil their food upon their train-oil lamps. Their kettles are made either of braſs, copper, or marble, and, in general, manufactured by themſelves. Their method of kindling a fire is by the friction of a piece of hard wood upon a block of dried fir-tree. The Danes found great difficulty in bringing the Greenlanders to taſte their proviſions. Some, however, at length came to be fond of bread and butter; but very few have, as yet, overcome their ſtrong averſion to ſpirituous liquors; and none can be perſuaded to ſmoke tobacco, or chew it.

In this country, the men are commonly contented with one wife. There are ſome, indeed, but thoſe are very few, that keep two, three, or four wives; but theſe paſs for heroes, or more than ordinary men; becauſe, by their induſtry, they are able to maintain ſo many wives and children. Before the arrival of the Danes, jealouſy never prevailed among thoſe wives; but they agreed well together; though the firſt wife was reckoned the miſtreſs. But ſince the Danes have informed them of the word and will of God, importing, that, in the beginning, the all-wiſe Creator made one man and one woman to live in matrimony as huſband and wife, there have been ſome reſentment in the wives, when their huſbands have been diſpoſed to take any others beſide them; and they have applied to Mr. Egede, deſiring him to put a ſtop to ſuch a proceeding. Alſo, when he has inſtructed them in their catechiſm, they have always reminded him fully to inſtruct their huſbands in the duty of the ſeventh commandment. They refrain from marrying their next relations, even in the third degree, deeming ſuch matches unwarrantable and unnatural It is likewiſe cenſurable, if a young man and woman who have ſerved and been educated in one family, ſhould deſire to be married together; for they look upon them as brother and ſiſter, on that account.

With reſpect to their marriage ceremonies: when a young man fancies a maiden, he commonly propoſes it to the parents and relations on both ſides. After he has obtained their conſent, he procures two or more old women to fetch the bride. Theſe go to the place where the young woman is, and carry her away by force; for, though ſhe approves of the match, yet, out of modeſty, ſhe muſt affect coyneſs, in order to avoid the cenſure of forwardneſs. After ſhe is brought to the bridegroom's houſe, ſhe keeps, for ſome time, at a diſtance, and ſits retired, in ſome corner, upon a bench, with her hair diſhevelled, and her face veiled. In the mean while the bridegroom uſes all the rhetoric he is maſter of, and ſpares no careſſes to bring her to compliance; which being effected, the maiden yields to his embraces, and the wedding is over. Huſbands often divorce their wives, either if they do not ſuit their humours, or if they are barren (which they hold to be very ignominious) and for many other reaſons: but they keep them for life, if they have children by them.

That the women are of robuſt conſtitutions, is particularly evinced in child-bearing; for as ſoon as it is over they will go to work, and do their ordinary buſineſs: but ſometimes it coſts them their lives. They have a tender love for their children. The mother always carries her infant upon her back, wrapped up in her coat, wherever ſhe goes, or whatever buſineſs ſhe has in hand; for they have no cradles. They ſuckle their children till they are three or four years old, or more; becauſe, in their tender infancy, they cannot digeſt the ſtrong victuals that the reſt muſt live upon. But they are negligent in the education of their children, for they never chaſtiſe or correct them when they do amiſs, but leave them to their own diſcretion: notwithſtanding which, when they are grown up to years of maturity, they ſeldom appear inclined to vice. Although they ſhew no great reſpect to their parents in any outward forms, they are always very willing to do what they order them. They are under the care of their parents, boys as well as girls, till they are married; afterwards they ſhift for themſelves; yet they continue to dwell in the ſame houſe, or under the ſame roof, with their fathers, together with other kindred and relations; and they all enjoy in common what they get.

When a Greenlander dies, all his property is thrown away as impure and unfortunate. All who reſide in the ſame houſe are obliged to carry whatever belongs to them into the open air to purify; but in the evening they fetch their effects back again. They dreſs the corpſe in its beſt apparel, bend the legs under the back, wrap the whole up in rein-deer and ſeal-ſkins, and bury it under a heap of ſtones. Thoſe who are concerned in the funeral are for ſome time deemed unclean; and the mourners, to teſtify their grief, make moſt hideous howlings. A corpſe is always conveyed out of the back part of a hut, but never through the door; and, at the funeral, a woman lights a ſtick, and, waving it round her head, pronounces the words, "Pikleruk pok," which is, he is to be obtained no more. They fix a dog's head upon the burial place of a young child, for this curious reaſon, that as a child is deficient in point of underſtanding, it would not be capable of finding its way to the land of ſpirits without a faithful dog to run before, and guide it to the place.

The chief amuſements and diverſions of the Greenlanders are ſinging in a very harſh diſcordant manner, dancing after a very ruſtic mode, running, wreſtling, foot-ball, &c. They very ſeldom quarrel with each other, not having, indeed, in their language any ſcurrilous words, or ſuch as are calculated to expreſs anger or reſentment. They are never known to fight: but when a Greenlander conceives himſelf aggrieved or affronted, he challenges the aggreſſor to a trial of ſatirical ſkill, or to bandy ſarcaſm with him. The two parties meet accordingly, when the challenger begins firſt, and, in a humorous poetical manner, charges his antagoniſt with having affronted him, and likewiſe recapitulates whatever faults or follies he has been guilty of. The perſon challenged replies in a ſimilar ſtrain, exculpates himſelf as well as he can, and retorts by recounting the errors of the challenger. In this war of words, if the challenger has the advantage, his antagoniſt is obliged to apologize for having affronted him; but, on the contrary, if he is out-ſatiriſed, he muſt confeſs himſelf wrong, and beg pardon for having made the accuſation. Let the ſatirical conteſt conclude how it will, a reconciliation is ſure to take place, and the day to conclude with the utmoſt mirth and feſtivity. In this manner terminate the quarrels of the Greenlanders, and ſuch is their ſevereſt reſentment. It is to be wiſhed that other nations, which pretend to great politeneſs and benevolence, would terminate their differences in a like ſenſible and friendly manner, without having recourſe to that Gothic, unchriſtian, and inhuman practice of duelling, or appealing to the ſavage brutality of blows, and cruel wars. The ſongs, which are ſung at their aſſemblies, are ſatires againſt their neighbours' follies, or rather good-natured poetical documents and repreſentations of each other's faults. The perſon who ſings always beats a little drum with his finger, as an accompaniment to his verſes, and likewiſe makes ſtrange geſticulations for the greater entertainment of the company.

Theſe people employ the greateſt part of the year either in hunting or fiſhing. The principal game they hunt is the rein-deer. To purſue this animal they penetrate into the interior parts, accompanied

companied by their whole families. Having found a herd of rein-deer, a number of Greenlanders ſurround them at a conſiderable diſtance, and then, with ſhouts and hideous yellings, drive them into a narrow compaſs, by contracting the circle they have formed round them. The animals being thus cooped up, become an eaſy prey, and may be killed with great eaſe.

The weapons uſed by the Greenlanders in hunting are fir-tree bows, wound about with the twiſted ſinews of animals, and ſtrung with the ſame, or with ſlips of ſeal-ſkins. The arrows are near ſix feet in length, and bearded with iron or ſharp-pointed bone: but thoſe they ſhoot birds with are blunt pointed, that they may not tear the fleſh, the blow being ſufficient to kill the bird, without mangling it. In killing ſea fowls they uſe lances, which they throw with aſtoniſhing dexterity, and very ſeldom miſs the object.

Whale-fiſhing among them is practiſed by a different method from what is practiſed by other Europeans. When they ſet out upon thoſe expeditions, they go in a large long-boat, called kone-boat, becauſe it is rowed by women; for the word *kone* implies a woman. About fifty perſons go in one of theſe boats, and when they find a whale, the men ſtrike him with their harpoons, to which are faſtened, with very long lines, blown ſeal-ſkins, which are filled with wind like bladders. Theſe artificial bladders are of infinite uſe to the Greenlanders in their whale-fiſhing; for, by floating on the ſurface of the ſea, they not only diſcover the track of the whale after he is wounded, but hinder him from diving under the water for any length of time. When the whale loſes his ſtrength, and is exhauſted by fatigue, the Greenlanders again attack him with ſpears and lances till he expires. On this occaſion they are clad in ſkin coats, conſiſting of only one piece, with boots, gloves, and caps, ſewed and laced ſo tight together, that no water can penetrate them. In this garb they jump into the ſea, and begin to ſlice the fat all round the whale's body, even under water: for in theſe coats they cannot ſink, as they are always full of air; ſo that they can ſtand upright in the ſea.—Nay, they are ſometimes ſo daring, that they will get upon the whale's back, to make an end of him, and cut away his fat, while there is yet life in him.

They take ſeals by various methods, ſuch as ſtriking them with harpoons, ſimilar, in form, to thoſe uſed in whale-fiſhing; but much ſmaller; watching them when they come to breathe at the air-holes in the ice, and ſtriking them with lances, approaching them diſguiſed like their own ſpecies, that is, covered with a ſeal-ſkin, creeping upon the ice, and wagging their head in the very ſame manner as a ſeal; by which means the Greenlander approaches the animal without ſuſpicion, and kills him with his lance. Previous to the falling of the ſnow, theſe people can ſee the ſeals through the tranſparent ice, and trace them to the openings, where they are eaſily killed. They are likewiſe ſurpriſed while they baſk themſelves in the ſun, either upon rocks or floating pieces of ice.

The Greenlanders angle with lines made of whale-bone, cut very ſmall, and generally catch a great many fiſh. The halibut is caught with lines of hemp, or ſeal-ſkin. Salmon and roe-fiſh are taken by means of weirs, or ſtone encloſures, into which the tide carries them at flood, and leaves them on dry land at low water. Stent fiſh are caught by means of netting extended upon poles. They are dried upon the rocks in the open air, and ſerve for part of the winter proviſion of the natives, being dreſſed in train oil, or melted fat.

Two ſorts of boats are uſed by them: the one, which the men alone make uſe of, is a ſmall veſſel, and ſharp pointed at both ends, three fathoms in length, and but three quarters of a yard wide at moſt, with a round hole in the middle, juſt large enough for a man's body to enter, and ſit down in it. The inſide of the boat is made of thin rafts, tacked together with the ſinews of animals; and the outſide is covered with ſeal-ſkins, dreſſed, and without hair. No more than one can ſit in it, who faſtens it ſo tight about his waiſt that no water can penetrate it. In theſe ſmall boats they go to ſea, managing them with one oar, a fathom long, broad at both ends, with which they paddle about in the moſt ſtormy weather, to catch ſeals and ſea fowls; and if they happen to overſet, eaſily raiſe themſelves, and recover their boats by the means of their paddles. The kone-boat is made in the ſame manner, but more durable, and longer, being ſixty feet in length, and likewiſe has a maſt, with a triangular ſail, which is made of the membranes and entrails of ſeals, and managed with the help of braces and bowlings. The women build, repair, and row theſe boats, and likewiſe build all the Greenlanders huts; the whole mechanic employment of the men being to make fiſhing-tackle and hunting implements.

Weſt Greenland is but thinly peopled. The huts which the inhabitants reſide in during winter are low, and built of ſtone and turf. The windows are on one ſide, made of the bowels of ſeals, dreſſed, and ſewed together, or of the maws of halibuts, and are white and tranſparent. On the other ſide are placed their beds, which conſiſt of ſhelves or benches, made of deal boards, raiſed half a yard from the ground. Their bedding is made of ſeal or rein-deer ſkins. Several families live together in one of theſe houſes or huts, each family occupying a room by itſelf, ſeparated from the reſt by wooden poſts, by which alſo the roof is ſupported. Before the poſts there is a hearth or fire-place, in which is placed a great lamp, in the form of a half-moon, ſeated on a trivet. Over this are hung their kettles of braſs, copper, or marble, in which they boil their victuals. Under the roof, juſt above the lamp, they have a ſort of rack or ſhelf, to put their wet clothes upon. They burn train-oil in their lamps, and moſs ſerves them as a ſubſtitute for wick. The door of the hut is low, that as little cold as poſſible may be admitted. The houſe is lined with old ſkins within, and ſurrounded with benches. The men and women ſit to work with their backs to each other. In the ſummer the Greenlanders dwell in tents made of long poles, fixed in a conical form, covered with deer-ſkins within, and outwardly with dreſſed ſeal-ſkins, ſo that they are impenetrable by rain.

Theſe people traffic with the Danes, by exchanging whale-bone, blubber, train-oil, horns of ſea-unicorns, rein-deer ſkins, ſeal ditto, and fox ditto, for coats, ſhirts, ſtockings, knives, hand-ſaws, needles, angling-hooks, cheſts, boards, looking-glaſſes, toys, and ſuch like.

The Greenlanders' language is guttural, and full of conſonants. The alphabet is without the letters C, D, Q, X; and, like the people of North America, they have a great number of polyſyllables.

They treat the Daniſh miſſionaries with great reſpect, and attend to what they preach with the utmoſt patience; but at the ſame time hear them with the moſt mortifying indifference; ſo that thoſe gentlemen make but few proſelytes, or, at leaſt, if any are converted, they ſeldom long remember what has been ſaid to them. Thoſe who remain in their original ſuperſtition believe in the immortality of the ſoul, but have very confuſed and inadequate ideas of the Deity, whom they call *Torngarſeck*, and ſuppoſe that he reſides either in the bowels of the earth, or in the ſea. They likewiſe believe

believe in another ſpirit, whom they call *Innirirrirſok*, or the reſtrainer, becauſe they fancy he prevents them from eating or drinking what is pernicious, and from doing wrong in other things. A third ſpirit, called *Erloerſortok*, or the gutter, they repreſent as a monſter, and imagine he lives upon the entrails of the dead.

The Greenlanders ſuppoſe all the elements to be filled with ſpirits; and believe that their prieſts, whom they call Angekuts, have each one of theſe ſpirits as an attendant or familiar; and this ideal familiar ſpirit they call *Tornagh*, and fancy that he always comes with great readineſs to the Angekut when ſummoned. When an Angekut pretends to invoke the great ſpirit Torngarſeck, he retires to ſome unfrequented place, where none of the people dare follow him, and, on his return, makes them believe that he has invoked Torngarſeck, who anſwered his invocation by appearing in ſuch a horrid form that he was overcome by terror, ſickened, ſunk into a trance, and remained without ſigns of life for the ſpace of three days, and that when he recovered, he found himſelf endued with the ſpirit of conjuration. Theſe Angekuts are very great impoſtors, and, by a variety of artifices, maintain an entire aſcendancy over the poor deluded people of this country.

The chief diſeaſes of the Greenlanders are of a ſcorbutic nature, and they are greatly accuſtomed to weak eyes, which latter diſorder is occaſioned by the ſharp piercing winds incident to the country, and the white glare reflected from the ice and ſnow, with which the whole country is covered ſo great a part of the year. The ſmall-pox being brought among theſe people in the year 1734, from Copenhagen, made great havock. With reſpect to ſurgery or phyſic, they are extremely ignorant. Their great ſpecific plaſter for all kinds of wounds, is a compoſition of the bark of a tree, burned moſs, and train-oil; and all their inſtruments of ſurgery conſiſt in a common knife, a fiſh-hook, and a needle. They are alſo utterly ignorant of natural philoſophy, and, indeed, of ſcience in general, a ſmall ſmattering of aſtronomy excepted; for they have made ſufficient obſervations on the ſtars to be able to ſteer by them at ſea.

They meaſure time by months, commencing the year after the ſun's firſt riſing above the horizon in the winter; and by every month they are preciſely acquainted with the proper times for killing or taking the ſeveral ſpecies of fiſhes, fowls, animals, &c. So that their little aſtronomy ſerves to direct all their avocations, ſuch as remaining at home to do their little domeſtic and mechanic works, going abroad to fiſh, hunt, &c.

EAST GREENLAND, OR SPITZBERGEN,

AND THE COUNTRY ADJACENT.

THIS country, which lies between 76 and 80 deg. of north lat. and between 18 and 24 deg. of eaſt long. was called Greenland by Sir Hugh Willoughby, who diſcovered it in 1553. It afterwards derived from the Dutch the appellation of Spitzbergen, which ſignifies *ſharp mountains*. The whole of its boundaries are not known. However, on the weſt it has the northern ocean; on the ſouth the ſame ocean between it and the Ruſſian Lapland, and the northernmoſt part of Norway, over againſt which it lies; on the eaſt it has an undiſcovered country, to which it is joined by an iſthmus. On the weſt ſide of Spitzbergen lies Charles-iſland, which is divided from the main land by a narrow ſtreight, called Foreland-Ford; between which, and Muſcle-Haven, are the higheſt mountains, moſt of which are of a red colour, and reflect the ſun's beams ſo as to ſeem all on fire: but ſeven of the mountains, all of remarkable ſharpneſs, are of a fine ſky-blue. South-Haven is the moſt commodious place on the iſland, affording all the conveniencies neceſſary for repairing leaky or damaged ſhips; and is ſo large, that thirty or forty ſail may ride at anchor there very conveniently: here alſo may be had freſh water, from the melting of the ſnow; for as to the rivers they are brackiſh, as far as they have been hitherto diſcovered; and no ſprings or wells have yet been found. The mountains about South-Haven are very high, eſpecially on the left; and in the midſt of the harbour is an iſland called Dead-man's-Iſland, becauſe they uſually buried there ſuch as died in the voyage.

That called Maurice-Bay by the Dutch, is the next capacious haven, where ſome of them have wintered; near this place are a few cottages, built by the Dutch, for the convenience of making their oil; and this place they call Smearburg, or Smearingburg, or the Haerlem Cookery. In the north bay there is an iſland called Vogel-Sang by the Dutch, (i. e. Bird-Song) from the great noiſe which the fowls make when they take their flight. Deer-Sound is ſo called from the abundance of deer which feed about it, though the ſoil ſeems to be all ſlates ſet edge-ways. Muſcle-Haven lies at the mouth of the Waygate, to the north of which, Martens ſays, he ſailed to 81 deg. and ſaw ſeven iſlands, but could not approach them becauſe of the ice; the loweſt part of that country lies about this harbour.

The Waygate mentioned here muſt not be miſtaken for the famous ſtreight of that name, which lies between Nova Zembla and the main land of Samoieda. Waygate here meant is a harbour, of which the Dutch voyagers ſay they do not know whether it goes through the country. They call it by this name becauſe of the winds which frequently blow there; and about this place, they ſay, the country is low, and adorned with ſmall hills. Roe-field-Harbour is ſo called, becauſe it abounds with deer. Alderman Freeman's Inlet, (called by the Dutch Walter Thymen's Fort) is the large mouth of a river, which is not yet diſcovered. The voyagers mention alſo the Engliſh, Daniſh, Hamburg, and Magdalen Havens; with one called the Bay of Love, but not ſo diſtinctly as to enable us to judge whether they are different from thoſe already mentioned, with Dutch or Engliſh names.

Bell-Harbour, on the weſtern coaſt of this country, is the place where, in the year 1630, eight Engliſh ſailors wintered, and ſuffered very great hardſhips, during nine months and twelve days, the ſingular circumſtances of which will be hereafter related. Theſe particulars are confirmed by the concurrent teſtimonies of moſt voyagers, previous to the expedition under Commodore Phipps. The account given by the writer of that voyage corroborates what they have ſaid, and adds ſome new particulars which we ſhall tranſcribe. "This country (ſays the journaliſt) is ſtony, and, as far as can be ſeen, full of mountains, precipices, and rocks. Between theſe are hills of ice, generated, as it appears, by torrents that flow from the melting of the ſnow on the ſides of thoſe towering elevations, which, being once congealed, are continually increaſed by the ſnow in winter, and the rain in ſummer, which often freezes as ſoon as it falls. By looking on theſe hills a ſtranger may fancy a thouſand different ſhapes of trees, caſtles, churches, ruins, ſhips, whales, monſters, and all the various forms that fill the univerſe. Of the ice hills, there are ſeven that more particularly attract the notice of ſtrangers. Theſe are known by the name of the Seven Icebergs, and are thought to be the higheſt of the kind in that country. When the air is clear, and the ſun ſhines full upon theſe mountains,

tains, the proſpect is inconceivably brilliant. They ſometimes put on the bright glow of the evening rays of the ſetting ſun, when reflected upon glaſs at its going down: ſometimes they appear of a bright blue, like ſapphire, and ſometimes like the variable colours of a priſm, exceeding in luſtre the richeſt gems in the world, diſpoſed in ſhapes wonderful to behold, all glittering with a luſtre that dazzles the eye, and fills the air with aſtoniſhing brightneſs."

The rocks are ſtriking objects: before a ſtorm, they exhibit a fiery appearance, and the ſun looks pale upon them, the ſnow giving the air a bright reflection. Their ſummits are almoſt always involved in clouds, ſo that it is but juſt poſſible to ſee the tops of them. Some of theſe rocks are but one ſtone from top to bottom, appearing like an old decayed ruin. Others conſiſt of huge maſſes, veined differently like marble, with red, white, and yellow, and, probably, were they to be ſawed and poliſhed, would equal, if not excel, the fineſt Egyptian marble we now ſo much admire. Perhaps the diſtance and danger of carrying large blocks of ſtone may be the reaſon that no trials have been made to manufacture them. On the ſoutherly and weſterly ſides of thoſe rocks grow all the plants, herbs, and moſſes peculiar to this country. On the northerly and eaſterly ſides, the wind ſtrikes ſo cold when it blows from theſe quarters, that it periſhes every kind of vegetable. Theſe plants grow to perfection in a very ſhort time. Till the middle of May the whole country is locked up in ice; in the beginning of July, the plants are in flower, and about the latter end of the ſame month, or the beginning of Auguſt, they have perfected their ſeed. The earth owes its fertility, in a great meaſure, to the dung of birds, who build and breed their young here in the ſummer, and retire to more favourable climates in the winter-ſeaſon.

In this country, the rocks and precipices are full of fiſſures and clefts, which afford convenient harbour for birds to lay their eggs, and breed their young in ſafety. Moſt of theſe birds are water-fowls, and ſeek their food in the ſea: ſome, indeed, are birds of prey, and purſue and kill others for their own ſuſtenance, but theſe are rare: the water-fowls eat ſtrong and fiſhy, and their fat is not to be endured. They are ſo numerous about the rocks as ſometimes to darken the air when they riſe in flocks; and they ſhriek ſo horribly that the rocks echo with the noiſe they make.

About Spitzbergen the air is at no time free from icicles: if you look through the ſun-beams tranſverſely as you ſit in the ſhade, or where you ſee the rays confined in a body, inſtead of dark motes as are ſeen here, you behold myriads of ſhining particles that ſpangle like diamonds; and when the ſun ſhines hot, as it ſometimes does ſo as to melt the tar in the ſeams of ſhips, when they lie ſheltered from the wind, theſe ſhining atoms appear to melt away, and deſcend like dew. The air ſeldom continues clear for many days together in this climate, but when that happens the whalers are generally ſucceſsful.

There is no difference between night and day in the appearance of the atmoſphere about Spitzbergen, one being as light as the other; only when the ſun is to the northward you may look at it with the naked eye, as at the moon, without dazzling. The fogs here come on ſo ſuddenly, that from bright ſun-ſhine you are preſently enveloped in ſuch obſcurity, that you can hardly ſee from one end of the ſhip to the other. The cold here is generally very intenſe, but in the extremity of winter it is intolerable, particularly when the wind blows from the north or the eaſt. The air is tolerably calm during the months of June, July, and Auguſt; not but the wind ſometimes blows incredibly cold even at this ſeaſon, and the froſt continues without intermiſſion. The ſea-water here is leſs ſalt than in ſoutherly climates, and changes its colour with the ſky, that is, in a clear air it appears blue, when the atmoſphere is overcaſt with clouds it ſeems green, during fogs it is yellow, and in ſtormy weather quite black.

In this part of Greenland, the ſun uſually appears about the beginning of February, and diſappears about the firſt of October. From May to Auguſt he continues above the horizon without ſetting, and then the night and day are diſtinguiſhable only by his appearing either in the eaſtern or weſtern parts of the heavens. The face of this country exhibits ſcarce any thing but rugged rocks and barren mountains that riſe into the clouds, or vallies choked up with ſtones and ice that fall from thoſe mountains. About Deer-Sained and Muſcle-Haven are ſome detached pieces of low lands, which are uſually covered with ſnow; but in a fine ſummer, when that diſſolves, a coat of heath and moſs is ſeen interſperſed with a few plants. No ſprings have been found here, and the rivers are all brackiſh; but theſe inconveniences are recompenſed by the great plenty of ſnow-water, which is both pleaſant and wholeſome.

In Spitzbergen, the vegetables are excellent ſcurvy-graſs, ſorrel, wild lettuce, ſnake-root, ground-ivy, heart's-eaſe, limewort, ſea-bugloſs, wild ſtrawberries, wall-pepper, and houſeleek. "Theſe (ſays a learned author) are conſidered as effectual remedies ſupplied by the hand of Providence for the cure of the ſcurvy, and other diſeaſes incident to thoſe who yearly viſit this inhoſpitable country. The ſcurvy-graſs here, as in many other northern climates, has no pungency to the taſte, but is mild, grateful to the palate, and ſuch an excellent anti-ſcorbutic, that the ſeamen term it the "Gift of God." Although the ſhips employed in the whale-fiſhery are, of all others, the beſt ſupplied with good proviſions, and plenty of freſh water, yet the mariners are in theſe northern latitudes much more ſubject to the ſea-ſcurvy than in any ſouthern voyage.

The attack of the malady is here more ſudden, and the progreſs of it more rapid. The patient feels its ſymptoms increaſe as he advances nearer the pole; nor does he enjoy the leaſt alleviation until the weather ſoftens in the month of July, which is very moderate, and, indeed, the only interruption of winter. Then the ſcurvy-graſs appears in plenty as an infallible cure, and performs wonders, reſtoring, in a few days, to health and vigour, thoſe who were ſeemingly in the laſt ſtage of the diſtemper. The other vegetable productions of this country are, poppies, hellebore, dandelion, mountain-heath, ſaxifrage, dwarf-willow, &c. but all are ſmall and ſtunted in their growth, the natural conſequence of an inclement ſky, and unproductive ſoil.

An aquatic vegetable peculiar to this country is that called the rock plant; the leaves are ſhaped like a man's tongue, about ſix feet long, of a dull yellow colour, the ſtalk is round and ſmooth, and of the ſame colour with the leaf, it riſes tapering, and ſmells like muſcles. It grows in the water, and riſes in height in proportion to the depth of water in which it is diſcovered.

A Greenland captain, in 1737, brought to England ſeveral pieces of gold, which he found accidentally in a hunting excurſion among the rocks of Spitzbergen. This diſcovery, however, was not proſecuted. Alabaſter, Selenites, and Lapis Spicularis are found here; and naturaliſts conjecture that iron ore abounds in the country.

Not many land-birds are ſeen in this country, except partridges, a few birds of the ſnipe kind, ſome ſmall birds that, even in this dreary climate, ſome-

times warble ſweetly, the ſnow-bird and the ice-bird; the latter is a ſmall but very beautiful bird; in ſize and ſhape it reſembles the turtle-dove, but the plumage, when the ſun ſhines upon it is of a bright yellow, like the golden ring in the peacock's tail, and almoſt dazzles the eye to look upon its feathers.

Here the fox differs but little in ſhape from thoſe we are acquainted with; but in colour there is no ſimilitude, for the body is white and the head is black. Foxes are ſeen here in great plenty; they are exceeding ſwift, and very ſubtile; ſo that it is a difficult matter to catch them. The author of commodore Phipps's voyage ſays, "The Dutch ſeamen report, that when they (the foxes) are hungry, they will feign themſelves dead, and when the ravenous birds come to feed on their fleſh, they riſe and make prey of them."

In this country, the deer are large, grey, and ſhaggy, with branching horns, ſhort tails, and long ears. Their fleſh is of an admirable flavour; and, in the ſummer ſeaſon, they are exceeding fat, which is owing to their feeding on the yellow moſs: this natural ſtore of fat enables them to ſubſiſt during the winter; many of them are, however, ſtarved to death; and all in general appear very thin and meagre in the ſpring. On this occaſion a learned gentleman ſays, "In all probability theſe animals ſleep in caverns during the winter, like the bears in Norway. Perhaps the abundance of poppies in this country may diſpoſe them to a lethargy, which ſeems neceſſary for their preſervation, as little or no nouriſhment is required for animals that have no exerciſe, and a languid circulation." Theſe deer fly at the ſight of a human creature, but immediately ſtop when their purſuers ſtop, and thus are eaſily ſhot.

Bears here have long ſnouts, and bark in a huſky manner, like dogs that are hoarſe. They are large, white, lean, ſwift, and fierce. Some have been found that were ſix feet high, and four long, which yielded an hundred weight of fat. The largeſt kind are termed water bears, becauſe they are fond of ſubſiſting chiefly on the productions of the ſea, and have been ſeen near twenty miles from the ſhore.

When a bear is atacked, he makes a dreadful roaring; and his companions, who are within hearing, immediately run to his aſſiſtance. A ſhe-bear will ſuffer herſelf to be killed rather than abandon her cubs: notwithſtanding which attachment, when a bear is found dead, his fellows will eat him without the leaſt ſcruple. Theſe creatures are ſo ſtimulated by hunger, that they will frequently venture to attack whole armed crews; and have been known to take the water, and attempt to board large veſſels. They are ſo tenacious of life, that they ſometimes eſcape with many ſhots in their bodies. They are attacked with muſkets and lances; and, when at bay, riſe on their hind legs, and frequently break the lances of the aſſailants; ſo that they are not aſſaulted without imminent danger. They take to the water naturally, and ſometimes, when attacked in that element, dive like an otter. Here are innumerable ſwarms of water-fowl, ſuch as are common to all the northern countries of Europe; and ſeals, whales, ſea-horſes, &c.

Deſcription of the Whale, and Whale-Fiſhery.

THAT enormous monſter, called the large Greenland, or whalebone whale, differs from the reſt of the fiſh ſo called, by his having no teeth; inſtead of which, on each ſide of the upper jaw grows the whalebone, in four or five hundred different blades, at equal diſtances, ſome exceeding twelve feet in length, and a foot broad at bottom, growing narrow upwards, like the ſticks of a fan inverted, the largeſt of them weighing about twenty pounds. He contracts and dilates the diſtances of thoſe blades at the ſhutting and opening his mouth, making them ſerve as ſtrainers, to ſeparate the water from the ſhrimps, prawns, and ſuch ſmall fiſh as his food conſiſts of; and, for the ſame purpoſe, on the inſide of the bone, next to the tongue, grows a quantity of hair, to make a ſtill finer percolation, or ſtraining; which is the more neceſſary, becauſe, notwithſtanding the bulk of a whale's body, the throat in general is not much above a foot wide.

The head of the whale makes near a third part of the whole body, with very ſmall eyes in the midſt of it, conſidering the ſize of the creature; and the eye-lids are fringed with hair, like thoſe of a man. Inſtead of the ears, appear, on the outſide, only two holes, ſo ſmall, that they can hardly be found out, and will ſcarce admit of a ſingle ſtraw: but within the head they have large orifices, which are formed like ears, and afford them a ſharp hearing. On the top of the head he has two pipes, for the drawing in and out of the air, and diſcharging the water which he ſwallows in his mouth, and which is forced out through theſe holes in a vaſt quantity, and to a great height. The tongue is very large; in ſome whales of the ſize of an ordinary woolpack, and will yield aſtoniſhing quantities of oil. His bones are hard, like thoſe of four-footed beaſts; but, inſtead of having one large cavity in the middle, are porous, and full of marrow. His belly and back are quite red. The fleſh of this creature is coarſe and hard, like that of a bull, mixed with many ſinews, and is very dry and lean, becauſe the fat lies between the fleſh and the ſkin. The fat is mixed with ſinews, which holds the oil as a ſpunge does water. The other ſtrong ſinews are about the tail, with which he turns and winds himſelf as a ſhip is guided by a rudder. He ſwims with great celerity, and makes a track in the ſea like a large ſhip under ſail. Beſides the uppermoſt thin ſkin, there is another almoſt an inch thick; but neither of them are very ſtrong, which is believed to be the reaſon why the whale does not exert that great force which might be expected from a fiſh of its ſize. They are mightily tormented with lice, which makes them ſometimes ſpring out of the ſea in an agony. It is alſo believed that they feel great pain in their bodies before a ſtorm, which makes them twiſt and tumble violently, while the wind blows from the eaſt. They, are, however, harmleſs, unleſs provoked, and rather of a very timorous nature; though ſome of them will now and then approach very cloſe to a ſhip. The middling ſized ones are from fifty to ſixty feet long, and yield from ſeven to an hundred barrels of blubber; though ſometimes they are much larger. A voyager mentions one that yielded an hundred and thirty hogſheads. This blubber lies immediately under the ſkin, and is a very valuable and uſeful acquiſition.

The ſkeleton of a ſpermaceti whale, now in the repoſitory of an eminent virtuoſo in London, is affirmed to meaſure ſeventy-two feet in length, and between ſeven and eight feet in breadth. The ſkull alone meaſures fifteen feet in length, and is ſuppoſed to weigh three tons. This great weight of bones is probably buoyed up in the ſea by a vaſt quantity of fat or oil, contained in the cellular membrane, between the ſkin of the head and the upper ſurface of the ſkull. From this oil, and alſo from that which ſurrounds the body, the ſubſtance called ſpermaceti is extracted. That ſpecies of whale called the ſpermaceti whale, differs from the whalebone whale, which, as before obſerved, has

no teeth; whereas the former has one row of ſharp-pointed teeth along each ſide of the lower jaw, but none in the upper. With theſe, it is probable, he can devour fiſh of a conſiderable ſize. The ſpermaceti whale has alſo a blowing-hole, but uſes it more particularly for the purpoſe of breathing.

The following method is purſued in catching whales: As ſoon as a ſhip arrives at a large field of ice, as it is termed, three or four boats are put out to watch for the whale's coming from beneath the ice, which is judged of by the noiſe they make in approaching and riſing. When the whale gains the ſurface of the water, the harpooner ſeizes the opportunity to dart the harpoon either into his body, or near his ſnout; for there is no ſtriking into the bone of his head. When the whale is ſtruck, the other boats, which are near at hand, approach to give aſſiſtance, and an oar is put up at the head of the harpooner's boat who wounded the animal, and they cry out, *Fall! fall!* upon which token other boats from the ſhip join thoſe already concerned, to render every needful help as exigencies may require. As ſoon as the whale is ſtruck, they take care to give him rope enough, for otherwiſe, when he goes down, as he frequently does, he would inevitably ſink the boat; and this rope he draws ſo quick, that, if it were not well watered, it would ſet the boat on fire. The line faſtened to the harpoon is ſix or ſeven fathoms long, and is called the forerunner. It is made of the fineſt and ſofteſt hemp, that it may ſlip the eaſier. To this they join a heap of lines, of ninety or an hundred fathoms each; and when there are not enough in one boat, they borrow from another.

The man at the helm obſerves which way the rope goes, and ſteers the boat accordingly, that it may run exactly out before; for the whale runs away with the line as faſt as the wind, and would overſet the boat if it were not kept ſtraight: during which the other boats row before, and obſerve which way the line ſtands, and ſometimes pull it. If they feel it ſtiff, it is a ſign the whale ſtill pulls in ſtrength; but if it hangs looſe, and the boat lies equally high, before and behind, upon the water, they pull it in gently, but take care to lay it ſo, that the whale may have it eaſily again, if he recovers ſtrength. They are cautious, however, not to give him too much line, becauſe he ſometimes entangles it about a rock, and ſo gets looſe. When this happens, however, if he is afterwards taken by the crew of another ſhip, he is returned to thoſe who firſt wounded him, as that is known by the harpoon, which is always diſtinguiſhed by a peculiar mark. They begin to ſtink as ſoon as they expire; and their fleſh ferments, creating ſuch a ſteam as inflames weak eyes. When they ſee him ſpout out blood, they know that he draws towards his end, and then prepare for cutting him up.

In order to do this, they haul him cloſe to the ſhip's ſide, and ſlice his ſides with great knives, raiſing the blubber by a hook and a pully, which they lift up as they cut. In this work they muſt be extremely expeditious, otherwiſe the ſharks, which abound here, will have a greater ſhare of the fleſh than the whalers themſelves. Of the great flakes of fleſh they uſed formerly to make their oil upon the ſpot, but at preſent the blubber is barrelled up, and brought to England, Holland, &c. to be boiled at leiſure, the huts at Spitzbergen being rather neglected. Some ſhips even return from the whale fiſhery without ſeeing that country, proceeding no further than a certain latitude, and there fiſhing without being moleſted by a lee-ſhore, ice, or currents. The ſhips that uſe this trade generally carry from 30 to 50 men, ſix or ſeven boats, and from 400 to 800 hogſheads of blubber. Their arms conſiſt of 60 lances, ſix ſea-horſe lances, 40 harpoons, 10 long harpoons for ſtriking whales under water, ſix ſmall ſea-horſe harpoons, and 30 lines, of nine hundred or a thouſand fathoms.

The catching of ſeals alſo makes a valuable branch of the fiſhing practiſed in theſe ſeas. Three hundred ſeals yield near as much blubber as a middling ſized whale. The ſeals are not harpooned, but are generally knocked on the head with clubs; and many bears are likewiſe ſhot, killed with lances, &c. upon the ice. The ſhips ſet ſail in February for the ſeal fiſhery, and in April for the whale fiſhery; government allowing a bounty to theſe ſhips of 40s. per ton, as far as 300 tons; ſo that a ſhip of ſuch a burthen receives 600l. bounty-money. If a ſhip is clear of the ice after the 1ſt of June, and goes back again, or if it is known that ſhe carries out with her leſs than ſix months proviſions, ſhe forfeits her bounty-money.

In the body of the whale there is ſeldom found any thing but ten or twelve handfuls of a kind of ſmall black ſpiders, and ſome ſmall quantities of green herbs, torn up from the bottom of the ſea, which are ſuppoſed to be the food upon which the whales chiefly live. The ſea hereabouts is ſo covered with theſe inſects, that it appears quite black; which is a ſign, to thoſe who go about catching of whales, that they are like to make a good booty. The whales generally delight in that part of the ſea in which theſe inſects are produced.

Belonging to the whale kind, there are alſo the dragon-fiſh, long, thin, grey, and glittering, with two fins on his back, and two holes, through which he ſpouts the water. The butſhorf, or laced-head, is ſixteen feet long, with a ſpout-hole in his neck, a brown back, and a white belly. The white-fiſh is as long as the butſhorf, but much fatter. The ſea-unicorn whale is from ſixteen to twenty feet in length, with a ſpout-hole in his neck, and projecting from his ſnout, having a fine wreathed horn, for which he is principally valued. The throne of his Daniſh majeſty is entirely compoſed of theſe horns.

The whale called fin-fiſh is as long as the blubber, or whalebone whale, but not above one third part ſo bulky. It is known by the fin on the back near the tail, and by the ſpouting up of the water more violently, and higher, than the other whale. The back is more ſtraight than that of a whale, and the lips are of a browniſh colour, appearing like a twiſted rope. The whalebone hangs from the upper lip, as it does in the whale, but not out of the mouth at the ſides, as in that animal. The inſide of the mouth, between the whalebones, is all over hairy, and is of a blue colour, that is, when the bone begins to grow; for the other is brown, with yellow ſtreaks, which are thought to be the oldeſt. The colour of this fiſh is like that of a tench, and the ſhape of the body is long and ſlender. The tail is flat, like that of the whale; and he ſeldom appears till the whales are gone. All theſe creatures ſwim before the wind, and are obſerved to tumble immediately before ſtorms; a circumſtance from which ſome naturaliſts have concluded, that they are violently ſeized with the cramp in their bellies, owing to a change in the atmoſphere.

A variety of enemies haraſs the whale, beſides the vermin which adheres to his body like lice. He is purſued by the ſaw-fiſh, or ſword-fiſh, ſome of which are twenty feet long. This fiſh is ſhaped like a man's arm, and his eyes are remarkably prominent. His ſword projects from his ſnout, is of different lengths, according to the different ſizes of the fiſh, ſometimes ſmooth and ſharp, like a real ſword, and ſometimes indented like a ſaw; hence the creature is called either ſword-fiſh, or ſaw-fiſh. A very few of theſe animals will attack and maſter a great whale; yet, when they have ſlain him, they eat no part of him but the tongue. In calm weather

weather the fiſhermen lie upon their oars, as ſpectators of this combat, until they perceive the whale at the laſt gaſp, when they row towards him, and his enemies retiring at their approach, the fiſhermen enjoy the fruits of the victory. Another more deſperate enemy of the whale, is known by the name of the hay, which is of the ſhark kind: they are of different ſizes, being from one to three fathoms long. The hay is ſo voracious, that it tears large pieces of fleſh from the whale, as if they had been dug with ſhovels. The liver of this fiſh abounds with oil, and is exceſſively large. The fleſh on their backs, when dried ſome days in the air, is accounted tolerable proviſion, either boiled or roaſted; and the ſmaller the fiſh the better. They are caught by a large hook, baited with fleſh, and faſtened to a long iron chain: and if men fall overboard by accident, the hays devour them, in their turn.

On account of the extreme rigour of the climate of this country, it was long deemed uninhabitable throughout the year, till the contrary was proved by the fate of ſome Britiſh mariners, who ſailed thither in the year 1630.

A Greenland ſhip, named the Salutation, which ſailed from the Thames on the 1ſt of May, and arrived here the 11th of the next month, being in want of proviſion the latter end of the year, ſent eight men on ſhore in a boat, to a place frequented by rein-deer, to kill veniſon, leaving them there, with orders to follow the ſhip to Green-Harbour, which lies to the ſouthward of the place where they went aſhore. Theſe men, having killed 14 or 15 deer, lay that night aſhore, and propoſed next day to have gone on board, but a great quantity of ice driving towards the ſhore, obliged the ſhip to ſtand out ſo far to ſea, that when they came to Green-Harbour ſhe was out of ſight. The ſhips being to rendezvous in Belſound, further to the ſouthward, and being to leave the country within three days, our huntſmen began to be very anxious, leſt the ſhipping ſhould be gone from thence too before they arrived. They thought it proper, therefore, to throw their veniſon into the ſea, in order to lighten the boat, and made the beſt of their way to Belſound, diſtant from thence about ſixteen leagues: but none of them knowing the coaſt, they overſhot their port about ten leagues, when, ſenſible of their error, they returned to the northward. One of their company, however, being poſitive that Belſound lay further to the ſouth, they were induced to ſail to the ſouthward again, till they were a ſecond time convinced of their miſtake, and turned their boat to the north again, and at length arrived at Belſound; but had ſpent ſo much time in rowing backwards and forwards, that the ſhips had actually left the coaſt, and were gone to England, to their great aſtoniſhment, being provided neither with clothes, food, firing, or houſe to ſhelter themſelves from the piercing cold they were to expect in ſo rigorous a climate. They ſtood ſome time looking on one another, amazed at the diſtreſs to which they were ſo ſuddenly reduced; but their conſternation being a little abated, they began to think of the moſt proper means to ſubſiſt themſelves during the approaching winter.

The weather being favourable, they agreed, in the firſt place, to go to Green-Harbour, and hunt for veniſon, having two dogs with them very fit for their purpoſe. Accordingly, on the 25th of Auguſt they went in their boat to Green-Harbour, where they arrived in twelve hours, being 16 leagues to the northward of Belſound. Here they ſet up a tent made with the boat's ſail, the oars ſerving for poles; and, having ſlept a few hours, went early next morning to their ſport, killing ſeven or eight deer, and four bears. The day following they killed twelve deer more, with which they loaded their boat; and finding another boat, which had been left there by the company, they loaded that with the greaves of whales (being the pieces which remain in the coppers after the oil is drawn from them) and returned with their booty to Belſound. Here happened to be ſet up a large ſubſtantial booth, which the coopers worked in at the fiſhing ſeaſon: it was 80 feet long, and 50 broad, covered with Dutch tiles, and the ſides were well boarded. Within this booth theſe ſailors determined to build another of leſs dimenſions, being furniſhed with boards and timber, by pulling down a booth which ſtood near the former; and from the chimnies of three furnaces, uſed for the boiling of oil, they got 1000 bricks. They found alſo four hogſheads of very fine lime, which, mingled with the ſand on the ſea ſhore, made excellent mortar. But the weather was now grown ſo cold, that they were obliged to have two fires to keep their mortar from freezing. They perſiſted, however, in their work, and raiſed a wall, of a brick thickneſs, againſt one of the ſides of their innermoſt booths; but wanting bricks to finiſh the reſt in like manner, they nailed thick boards on each ſide the timbers, and filled up the ſpace between with ſand; by which means it became ſo tight and cloſe, that the leaſt breath of air could not enter it; and their chimney's vent was in the greater booth.

The length of the leſſer booth, or rather houſe, was 20 feet, the breadth 16, and the height 10; their ceiling being made of deal boards five or ſix times double, and ſo overlaid, that no air could poſſibly come in from thence. Their door they not only made as ſtrong and cloſe as poſſible, but lined it with a bed which they found there. They made no windows, except a little hole in the tiles of the greater booth, by which they received ſome little light down the chimney of the leſſer. The next work was to make them four cabins, chooſing to lie two in each cabin. Their bedding was the ſkins of the rein-deer, the ſame that the Laplanders uſe; and they found them exceeding warm. For firing they took to pieces ſome caſks, and ſeven or eight of the boats which were left behind; for it ſeems they uſed a great many boats in whale-fiſhing, which they left in the country every winter, rather than be at the trouble of carrying them backwards and forwards. Our ſailors ſtowed their firing between the beams and the roof of the greater booth, in order to make it the warmer, and keep out the ſnow, which, but for this contrivance, would have covered every thing in the greater booth.

September 12, obſerving a piece of ice come driving towards the ſhore, with two morſes (or ſea-horſes) aſleep upon it, they went out in their boat, with a harping-iron, and killed them both. On the 19th they killed another, which was ſome addition to their food. But taking a ſurvey of all their proviſions, they found that there was not half enough to ſerve them the whole winter, and therefore ſtinted themſelves to one meal a day, and agreed to keep Wedneſdays and Fridays as faſting days, allowing themſelves then only the fritters or greaves of the whales, which, as obſerved already, are only the ſcraps of the fat of the whale, which are thrown away after the oil is got out of them, and is food of a very loathſome nature.

The nights being grown very long by the 10th of October, and the weather becoming ſo cold that the ſea was frozen over; and having no buſineſs now to divert their thoughts, they began to reflect on their miſerable circumſtances; ſometimes complaining of the cruelty of the maſter of the ſhip for leaving them behind; at other times excuſing him, and bewailing his misfortunes, as believing him to have periſhed in the ice. At length, putting their confidence in the Almighty, who alone could re-

lieve

lieve them in their great diſtreſs, they offered up their prayers for ſtrength and patience to go through the diſmal trial. Having ſurveyed their proviſions again, they found that the fritters of the whale were almoſt all mouldy, having taken ſome wet; and that, of their bear and veniſon, there was ſcarce enough left to afford them five meals a week; whereupon it was agreed to live four days in the week upon the mouldy fritters, and the other three to feaſt upon bear and veniſon. Leſt they ſhould want firing hereafter to dreſs their meat, they thought proper to roaſt half a deer every day, and ſtow it up in hogſheads. With this kind of food they filled three hogſheads and a half, leaving as much raw as would ſerve to roaſt a quarter every Sunday, and alſo for Chriſtmas-day a quarter.

The ſun leaving them on the 14th of October, they ſaw it no more till the 3d of February; but they had the moon all the time, both day and night, though very much obſcured by the clouds and foul weather. There was alſo a glimmering kind of day-light, for eight hours, from the latter end of October, which ſhortened every day till the 1ſt of December; from which time, to the 20th of the ſame month, they could perceive no day-light at all. It was now one continued night, there appearing only, in clear weather, a little whiteneſs, like the dawn of day, towards the ſouth; and on the 1ſt of January they found the day to increaſe a little.

They counted their days, it ſeems, in the dark ſeaſon, by the moon, and were ſo exact, that, at the return of the ſhipping, they were able to tell the very day of the month on which the fleet arrived. For light within doors they made three lamps of ſome ſheet lead they had found upon one of the coolers; and there happened to be oil enough to ſupply them left in the cooper's tent. For wicks they made uſe of rope-yarn. Theſe lamps were one of the greateſt comforts to them in that long continued night. Their hardſhips, however, were ſo great, that ſometimes they were driven to deſpair. At other times they hoped they were reſerved as a wonderful inſtance of God's mercy in their deliverance, and continued to fall down on their knees, and implore divine protection in their diſtreſs.

The cold increaſed with the new year to that degree, that it ſometimes raiſed bliſters in their fleſh, as if they had been burnt; and the iron they touched ſtuck to their fingers. When they went abroad for water, the cold often ſeized them in ſuch a manner that it made them ſore, as if they had been beaten. Their water, the firſt part of the winter, iſſued from a bay of ice, and ran down into a kind of baſon, or receptacle, by the ſea ſide, where it remained with a thick ice over it, which they dug open at one certain place with pick-axes every day. This continued to the 10th of January, when they drank ſnow water, melted with a hot iron, until the enſuing 20th of May.

Having taken another review of their proviſions, they found that they would not laſt them above ſix weeks longer. To alleviate their miſery, however, on the 3d of February they were cheered again with the bright rays of the ſun, which ſhone upon the tops of the ſnowy mountains with inconceivable luſtre. To them, at leaſt, this afforded the moſt delightful ſcene that ever was beheld; for, after a night of many weeks and months, what could be imagined more glorious or pleaſing to a mortal eye? As an addition to their joy, the bears began to appear again, on the fleſh of which animal they made many hearty meals. But the bears were as ready to devour our countrymen as they were the bears; and being pinched with hunger in this barren country, came up to their very door. One of theſe creatures, with her cub, they met at the entrance of their apartment, and gave her ſuch a reception with their pikes and lances, that they laid her dead upon the ſpot, and the young one was glad to make its eſcape. The weather was ſo very cold that they could not ſtay to flay her, but dragged the beaſt into their houſe. There they cut her into pieces of a ſtone weight, one of which ſerved them for a dinner. Upon this they fed twenty days, eſteemed her fleſh beyond veniſon. Her liver only did not agree with them; for, upon eating it, their ſkins peeled off: though one of the company, who was ſick, attributed his cure, in part, to the eating it.

If it be demanded how they kept their veniſon and bear's fleſh without ſalt? it is to be obſerved, the cold is ſo intenſe that no carcaſe ever putrifies. Fleſh needs no ſalt to keep it here: that was their happineſs. Had they been ſtocked with ſalt proviſions, they had infallibly died of the ſcurvy, as others did who were left on the ſhore, much better provided with liquors, and other neceſſaries, than theſe poor men were. By the time they had eaten up this bear, others came about their booth frequently, to the number of 40 or more, of which they killed ſeven (one of them ſix feet high at leaſt) roaſting their fleſh upon wooden ſpits, having no other kitchen furniture, except a frying-pan they found in one of the booths. Having now plenty of proviſions, they ate very heartily, and found their ſtrength increaſe conſiderably.

On the 16th of March, the days being then of a reaſonable length, fowls, which, in the winter time, were fled to the ſouthward, began to reſort to Greenland again in great abundance, where they live and breed in the ſummer, feeding upon ſmall fiſh. The foxes, alſo, which had kept cloſe in their holes under the rocks all the winter, now came abroad, and preyed upon the fowls; of which our countrymen having taken ſome, baited traps with their ſkins, and caught five foxes in them, which they roaſted, and found them to be very good meat, at leaſt in the opinion of men who had hitherto fed much on bear's fleſh. Thus they continued taking fowls and foxes till the 1ſt of May, meeting with no further misfortunes, except the loſs of one of their maſtiff dogs, which went from their houſe one morning in the middle of March, and was never ſeen afterwards, being probably overpowered by the bears, and devoured by them.

In May the weather beginning to grow warm, they rambled about in ſearch of willocks eggs, a fowl about the ſize of a duck, of which they found ſome, being a change of diet they eſteemed very agreeable food.

As the ſeaſon was now coming on for the arrival of the ſhipping, ſome of them went every day almoſt to the top of a mountain to ſee if they could diſcern the water in the ſea, which they had no ſight of till the 24th, when, it blowing a ſtorm, and the wind ſetting from the main ocean, broke the ice in the bay, and ſoon after turning about eaſterly, carried great part of the ice out to ſea; but ſtill the water did not come within three miles of their dwelling. The next morning, the 25th of May, none of their men happened to go abroad; but one of them being in the outer booth, heard ſomebody hail the houſe in the ſame manner as ſailors do a ſhip, to which the men in the inner booth anſwered, in ſeamen's terms, that they were juſt then going to prayers, and ſtayed but for the man in the outer booth to join with them. The man who hailed them was one of the boat's crew that belonged to an Engliſh ſhip juſt arrived, which our ſailors no ſooner underſtood, than they ran out to meet their countrymen, looking upon them as ſo many angels ſent from heaven to their relief; and certainly the tranſport of joy

they felt upon this occaſion, if it may be conceived, can never be expreſſed.

A mortification ſtill remained which no man could well have expected. One of the ſhips which arrived, was commanded by the ſame maſter who left theſe poor wretches on ſhore, and he, like a barbarous brute, in order to excuſe his own inhumanity, began to revile them in the moſt opprobrious terms. This man, it ſeems, had left ſeven or eight other men in Greenland two years before, which were never heard of afterwards; for which, no doubt, he richly deſerved the ſevereſt puniſhment. Notwithſtanding the barbarity of their own captain, the commander and officers of the other ſhip took care they ſhould be kindly uſed, and brought to England when the ſeaſon for whale fiſhing was over, where they received a gratuity from the Ruſſia Company, and were otherwiſe well provided for by them.

CHAP. II.

ICELAND.

Situation, Extent, Diviſion, Climate, Air, Soil, Produce, Animal, Inhabitants, Religion, Curioſities, &c.

ICELAND receives its name from the great fields of ice that are ſeen near it, and is ſituated in the Atlantic Ocean, between Norway and Scotland. It lies between 63 and 68 deg. of north lat. and between 14 and 29 deg. of weſt long. from the meridian of London: it is about 400 miles in length, and 160 in breadth. This iſland is divided into four quarters, viz. eaſt, weſt, north, and ſouth, which are again ſubdivided into eighteen ſhires, or, as the inhabitants call them, ſyſſels.

The following extraordinary circumſtance relative to this iſland is affirmed to be authentic; viz. that in April 1783, the inhabitants of Iceland obſerved ſomething riſen and flaming in the ſea, to the ſouth of Grinbourg, at eight miles diſtant from the rocks Des Oiſeaux, which was afterwards found to be a new iſland, but its dimenſions and ſituation are not well aſcertained. The information brought by the laſt ſhip from thence, was, that the iſland was ſtill increaſing, and that great quantities of fire iſſued from two of its eminences.

The ſummers in Iceland are generally warm, the ſun being but three hours below the horizon; notwithſtanding which, it ſometimes hails and ſnows, but not violently. In winter the ſun is never more than one hour above the horizon, and the longeſt day at that ſeaſon is only three hours. The ſky is uſually ſerene, and, as in other northern climates, the aurora borealis is very frequently ſeen. The ſoil is tolerably fruitful in graſs, but differs according to different ſituations, being in ſome places ſandy, and in others a ſtiff clay. Corn cannot be cultivated here to any advantage; though cabbages, parſley, turnips, and peas, may be met with in five or ſix gardens, which are ſaid to be all in the whole iſland. It is, however, thought that the ſoil, if properly cultivated, would produce ſeveral kinds of grain, beſides vegetables.

The animals in Iceland are black cattle, ſheep, horſes, a few hogs, bears, foxes, goats, and dogs: but the white bear is not a native of the place, but conveyed hither from Greenland on the ſhoals of ice which float from thence. A number of them arrive yearly in this iſland, and commit great ravages, particularly among the ſheep. The Icelanders attempt to deſtroy theſe intruders as ſoon as they get ſight of them; and ſometimes they aſſemble together and drive them back to the ice, with which they often float off again. On theſe occaſions, the bear-hunters are obliged to make uſe of ſpears, for want of fire-arms. The government encourages the natives to deſtroy theſe animals, by paying a premium of ten dollars for every bear that is killed. Their ſkins are not allowed to be ſold to the common people, but are always purchaſed for the king.

This iſland abounds in moſt kinds of wild fowl, wild geeſe, ſea-birds, and birds of prey. But the moſt extraordinary bird, and which brings the greateſt emolument to the inhabitants, is a ſpecies of duck, called the down-bird, or eider-duck. The female is about the ſize of the common duck, and the ſame colour, except on the breaſt, which is of a lighter hue; but the male is as large as a gooſe, and has a great number of white feathers. In forming their neſts, the duck plucks the down from her own breaſt, in order to make a ſoft warm lining for the inſide. On this ſhe lays four green eggs, which are delicious eating; and theſe the natives take away, together with the down, and deſtroy the neſt. The duck immediately ſets about repairing this damage, and having once more built her neſt, lays four more eggs, of which ſhe is again robbed. Not diſcouraged, ſhe goes to work the third time; but if ſhe is then deprived of her eggs, ſhe quits that part of the country, and ſeeks a new habitation, for which reaſon the Icelanders always ſuffer her to hatch her laſt eggs, and are certain that ſhe and her young will return the next ſeaſon, and that they ſhall have three neſts inſtead of one. When the young quit their neſts, the people once more gather the down, ſo that every pair of birds yield eight eggs, and three parcels of down, in one ſeaſon. Swans are likewiſe ſeen here in great numbers, which the inhabitants kill for their down and feathers, and they eſteem their eggs a great delicacy.

The ſea of Iceland yields great plenty of cod, haddocks, whitings, and divers other kinds of fiſh. Whales are very numerous here: as alſo the ſea-calf, or white ſhark, called haakal. To theſe we may add the ſword or ſaw-fiſh, the land ſeal, the Iſland ſeal, and the Greenland ſeal. The freſh-water fiſh are eels, ſalmon, and excellent trout.

Some of the lakes here are thirty miles in circumference; and, beſides rivulets and ſtreams, the country is watered with large rivers, which flow from the mountains; and in ſome places there are chalybeat and hot ſprings.

Though there are no remarkable foreſts in Iceland, yet this want is in ſome meaſure ſupplied by drifts of excellent timber, which float aſhore on different parts of the coaſt.

No mines are worked here, yet large lumps of ſilver, copper, and iron ore, have been found on the ſurface. The principal mineral is ſulphur, generally found near hot ſprings.

Through the interior parts of Iceland run two chains of large mountains, called Jokells, one in length, and the other acroſs the country, ſome of which are continually covered with ice and ſnow, yet commonly paſſable to men and horſes: and on the tops of them are plains, extending twenty-five miles. In the year 1728, a dreadful eruption happened from the mountain Krafle, which diſcharged from it a ſtream of lava for the ſpace of eighteen miles, that fell with a horrible crackling noiſe into a great lake, called My-vatne, after having continued its courſe till the year 1730. Other eruptions of the like nature, preceded by earthquakes, have likewiſe been obſerved in this iſland, particularly in 1734, 1752, and 1755, when fiery eruptions from the earth produced very fatal conſequences. Mount Hecla, long famous in hiſtory, has not burnt for many years: the laſt eruption

eruption happened in 1766, and continued five months. Flames proceeded alſo from it in December 1771, and in September 1772; but no eruptions of lava. It is divided into three points at the top, has ſeveral chaſms on its ſides and ſummit, filled with boiling water.

With reſpect to the population of Iceland; it has been affirmed by ſome writers, that a Norwegian colony, among which there were many Swedes, ſettled there in the ninth century; among theſe, were found ſome Iriſh books, bells, and croſiers; and hence it is conjectured, that the people who were there at that time, originally came from England and Ireland. The inhabitants long retained their freedom; but were at length obliged to ſubmit to the kings of Norway, and afterwards became ſubject to the king of Denmark, by whom a governor is appointed, ſtiled Stiftſamtmann, who conſtantly reſides in the iſland.

The Icelanders are in general middle-ſized, and well formed, though not very ſtrong. They are a ſober, honeſt, induſtrious people, and very faithful and obliging; are much inclined to hoſpitality, which they exerciſe according to their ability. Their chief employment is fiſhing, and the care of their cattle. On the coaſt, the men employ their time in fiſhing, both winter and ſummer; and the women prepare the fiſh, and ſew and ſpin. The men alſo prepare leather, work at ſeveral machanic trades, and ſome few work in gold and ſilver. They likewiſe manufacture a coarſe kind of cloth, called wadmal. The women clean and comb wool, ſpin, and knit gloves and ſtockings.

Their diſpoſitions are ſerious, and they are much inclined to religion. They never paſs a river, or any other dangerous place, without previouſly taking off their hats, and imploring the divine protection; and they are always thankful for their preſervation, when they have paſſed the danger. The women are exceedingly fond of their children, whom they bring up with the moſt watchful tenderneſs.

The dreſs of the Icelanders is not elegant or ornamental, but it is neat, cleanly, and ſuited to the climate. On their fingers the women wear ſeveral gold, ſilver, or braſs rings. The poor women dreſs in the coarſe cloth called wadmal, and always wear black: thoſe who are in better circumſtances wear broad-cloth, with ſilver ornaments, gilt.

The houſes of the Icelanders are generally bad; in ſome places they are built of drift-wood, and in others they are raiſed of lava, with moſs ſtuffed between the lava. Their roofs are covered with ſods laid over rafters, or ſometimes over ribs of whales, which are both more durable and more expenſive than wood. They have not even a chimney in their kitchens, but only lay their fuel on the hearth, between three ſtones, and the ſmoke iſſues from a ſquare hole in the roof.

Their food conſiſts for the moſt part of dried fiſh, ſour butter, which they conſider as a great dainty, and a little meat, chiefly mutton. Bread is ſo ſcarce among them, that there is hardly any peaſant who eats it above three or four months in the year. Their common drink is ſour whey, or, as they term it, ſyre, milk mixed with water and whey; and the moſt wealthy of them import malt and hops, with which they brew their own beer.

When they meet together, their chief paſtime conſiſts in reading their hiſtory. The maſter of the houſe begins, and the reſt continue in their turns when he is tired. They are famous for playing at cheſs; and one of their paſtimes conſiſts in reciting verſes. Sometimes a man and a woman take one another by the hand, and by turns ſing ſtanzas, which is a kind of dialogue, and in which the company occaſionally join in chorus.

The inhabitants of this iſland live chiefly along the ſea-coaſt; their number is computed at 60,000, which is by no means adequate to the extent of the country. It has been much more populous in former times, but great numbers have been deſtroyed by contagious diſeaſes. From the years 1402 to 1404, the plague carried off many thouſands: famine has alſo made dreadful havock among them: for though the Icelanders cannot in general be ſaid to be in want of neceſſary food, yet the country has ſeveral times been viſited by great famines, chiefly occaſioned by the Greenland floating ice; which, when it comes in great quantities, prevents the graſs from growing, and puts an entire ſtop to their fiſhing. The ſmall-pox has likewiſe been very fatal here; for that diſeaſe deſtroyed 16,000 perſons in the years 1707 and 1708.

Theſe people do not meaſure time by the clock or hour, but take their obſervations from the ſun, ſtars, or tide, which laſt is always regular; and parcel out the day into different diviſions, each of which has its particular appellation; viz. night, midnight, twilight, broad day, forenoon, noon, afternoon, evening mid-evening.

The Lutheran is the only religion tolerated in Iceland. The churches on the eaſt, ſouth, and weſt quarters of the iſland are ſubject to the biſhop of Skalholt, the capital of the iſland, and thoſe of the north quarter are under the juriſdiction of the biſhop of Hoolum. The iſland is divided into 189 pariſhes, of which 127 belong to the ſee of Skalholt, and ſixty-two to that of Hoolum. All the miniſters are natives of Iceland, and receive a yearly ſtipend of 4 or 500 rix-dollars from the king, excluſive of what they obtain from their congregations. The clergy are generally perſons of good morals, and tolerable education. The biſhop is obliged to maintain the rector and corrector, the miniſter of the cathedral church, and a certain number of ſcholars. In each dioceſe is a Latin ſchool, under the inſpection of a rector and proper aſſiſtants; where the languages, theology, and other branches of literature are taught, in order to qualify youth for the univerſity.

With reſpect to their learning and learned men, we are told that poetry formerly flouriſhed among them; and that Egil Skallagrimſon, Kormuk Ogmundſon, Glum Geirſon, and Thorlief Jarlaa, were celebrated as great poets. But writing was litttle practiſed till after the year 1000; though the Runic characters were introduced there before that time, and probably from Norway. Soon after the Chriſtian religion was eſtabliſhed, the Latin characters were adopted, as the Runic alphabet, which conſiſts of only ſixteen letters, was found inſufficient.

The firſt Icelandic biſhop, Iſleif, founded a ſchool at Skalholt; and four other ſchools were ſoon after founded, wherein the youth were taught the Latin tongue, divinity, and ſome parts of theoretic philoſophy. And from the introduction of the Chriſtian religion here, till the year 1264, when Iceland became ſubject to Norway, it was one of the free countries in Europe, and the only one in the north, where the ſciences were either cultivated, or held in eſteem; and this period of time ſeems to have produced more learned men in Iceland, than any period ſince.

From their ancient chronicles it appears, that they had made a conſiderable progreſs in the ſtudy of morality, philoſophy, natural hiſtory, and aſtronomy. They wrote moſt of their works from the 11th to the 14th centuries, ſome of which have been printed. Sir Joſeph Banks preſented 162 Icelandic manuſcripts to the Britiſh Muſeum.

§

In

In 1772, that gentleman viſited Iceland, accompanied by Dr. Solander, Dr. Van Troil, and Dr. Lind. An account of this voyage was publiſhed by Dr. Van Troil, who obſerves, that he found more knowledge among the poorer ſort of people in this iſland, than is to be met with in moſt other places; as a proof of which, he added, that many of them could repeat the works of ſome of their poets by heart; and that a peaſant was ſeldom to be found, who was not only inſtructed in the principles of religion, but alſo acquainted with the hiſtory of his own country; this knowledge in a great meaſure proceeds from the great delight they take in frequently reading, by way of amuſement, their traditional hiſtories, thus happily blending profit with pleaſure. What inconceivable advantage would accrue to the lower claſs among us, what multitudes would be made uſeful members of ſociety, and reſcued from untimely deſtruction, could they be brought thus to employ and improve their time and talents!

About the year 1530, John Areſon, biſhop of Hoolum, employed John Matthieſſon, a native of Sweden, to ſet up a printing-preſs in Iceland; he began with printing the Breviarium Nidaroſienſe; he afterwards printed an eccleſiaſtical manual, Luther's catechiſm, and other books of that nature. In 1578, the Icelandic code of laws appeared; and in 1584, the Icelandic Bible. Several valuable books have likewiſe been printed at a printing-office lately eſtabliſhed and privileged at Hrappſey, in this iſland.

Amongſt all the curioſities in Iceland, the hot-ſpouting-water ſprings are moſt worthy of notice. None of the hot ſprings or water-works in Germany, France, or Italy, can by any means be compared with thoſe. Some of them ſpout columns of water, of ſeveral feet in thickneſs, to the height of many fathoms; and, as many affirm, of ſeveral hundred feet. Theſe ſprings are of unequal degrees of heat. From ſome, the water flows gently as from other ſprings, and it is then called a bath: from others, it ſpouts boiling water with a great noiſe, and then it is called a kettle. The degree of heat is unequal, though ſeldom obſerved to be under 188 of Fahrenheit's thermometer. It was found at Guyſer, Rœynum, and Laugarvatn, to be at 112; and in the laſt place in the ground, at a little hot current of water, 213 degrees. Some of the ſpouting-ſprings have been known to ceaſe, and others riſe up in their ſtead. Earthquakes and ſubterraneous noiſes, which are often heard at the time, cauſe great terror to the neighbouring people. The inhabitants who live near theſe hot ſprings, boil their victuals in them, only by hanging a pot, into which the fleſh is put in cold water, in the hot water of the ſpring. They alſo bathe in the rivulets that run from them which, by degrees, become lukewarm, or are cooled by being mixed with rivulets of cold water. Theſe ſprings are eſteemed very wholeſome when drunk by the people, and the cows that drink of them are ſaid to yield an extraordinary quantity of milk.

About two days journey from Heckla, and not far from Skalholt, is the largeſt of all theſe ſpouting-ſprings, which is called Guyſer. In approaching towards it, a loud roaring noiſe is heard, like the ruſhing of a torrent, precipitating itſelf from ſtupendous rocks. The water here ſpouts ſeveral times a day, but always by ſtarts, and after certain intervals. The water is thrown up much higher at ſome times than at others: When Dr. Van Troil was there, the utmoſt height to which it mounted, was computed to be 92 feet. Some travellers have affirmed, that it ſpouts to the height of 60 fathoms.

Baſaltine pillars, reſembling black marble, are likewiſe very common in Iceland. The lower ſort of people imagine them to have been piled upon one another by giants, who made uſe of ſupernatural force to effect it. They have generally from three to ſeven ſides, and are from four to ſix feet in thickneſs, and from twelve to ſixteen yards in length, without any horizontal diviſions. In ſome places, they are only ſeen here and there among the lava in the mountains: but in other places, they extend two or three miles in length, without interruption. They are ſuppoſed to have been produced by ſubterraneous fires.

The whole trade of Iceland is engroſſed by a company of Daniſh merchants, who have been indulged by their monarch with an excluſive charter; and though there is not any conſiderable town in the whole iſland, the Icelanders have ſeveral frequented ports. Their exports conſiſt of dried fiſh, ſalted mutton and lamb, beef, butter, tallow, train-oil, coarſe woollen cloth, ſtockings, gloves, raw wool, ſheep-ſkins, lamb-ſkins, fox furs of various colours, eider-down, and feathers. Their imports conſiſt of brandy, wine, ſalt, bread, tobacco, timber, fiſhing-lines and hooks, horſe-ſhoes, linen, and a little ſilk; beſides ſome neceſſaries and ſuperfluities for the more wealthy. They have properly no manufactures: they make a coarſe baize, termed wadmal, in a very awkward manner. Some of their woollen yarn they dye in verdigris; and afterwards make into pretty ſtuffs. The women knit great numbers of ſtockings and gloves.

The governor of this iſland, called Staffts-amptmand, is appointed by the king of Denmark, and is generally a perſon of diſtinction. He has the power of chooſing a deputy, called Amptmand, who always reſides in Iceland, and in ſpiritual caſes ſits as judge, with the clergy as his aſſeſſors. A third officer of the crown in Iceland, is a receiver, whoſe buſineſs it is to collect all the taxes and revenues, and tranſmit them to the royal treaſury. Beſides him, there are people termed ſyſſelmen, who farm the king's taxes in certain diſtricts, and act as juſtices of the peace; each within his own province.

For the regular adminiſtration of juſtice in this iſland there are two judges, called Langmænd, one of whom preſides over the northren, and the other over the ſouthern diviſion. Actions are firſt begun in the court of the ſyſſelman, from whence they may be removed to the langret, or general court, held under one of the judges. If ſatisfaction is not obtained there, an appeal may be lodged at the high court, in which the Amptmand preſides, together with the other judge, and eleven ſyſſelmen; and if the cauſe is not determined there, it is carried to the ſupreme court at Copenhagen. The only legal method of putting men to death in Iceland, is by beheading, or hanging them; but when a woman is condemned to die, ſhe is ſewed up in a ſack, and flung into the ſea.

The inhabitants of Iceland depend entirely upon his Daniſh majeſty's protection; and the revenues which the king draws from this country, amounts to about 30,000 crowns per annum. They ariſe chiefly from taxes and dues, a yearly ſum paid by the company of merchants, ſecularized abbey-lands, and other royal demeſnes farmed out to the natives.

The FARO or FERRO ISLANDS are 24 in number, lying in a cluſter in the northern ocean, between 61 and 63 deg. of north lat. and 6 and 8 deg. of weſt long. having Shetland and the Orkneys on the ſouth-eaſt, and Greenland and Iceland upon the north and north-weſt. The ſpace of this cluſter extends about 60 miles in length, and 40 in breadth, 300 miles to the eaſtward of Norway. They are ſeparated from each other by deep and rapid channels; are all indented by the ſea, and furniſhed with

with many inlets, creeks, and harbours, which afford protection to fiſhermen, and trading veſſels, in bad weather. The largeſt of theſe iſlands, called Stromoe, is about 17 miles in length, and eight in breadth; the reſt are much ſmaller, and not inhabited. The revenues of Denmark acquire little addition from the trade and income of the inhabitants, who may be about 3000 or 4000.

CHAP. III.

NORWAY.

Situation, Boundaries, Extent, Diviſions, Animal and Vegetable Productions, Towns, &c.

THIS country is ſituated towards the north-pole, Norvegia, Nordway, and Norway, ſignifying the Northern Way. It lies between the 57th and 72d degrees of north latitude, and between the 5th and 31ſt deg. of eaſt long. It is bounded on the ſouth by the entrance into the Baltic, called the Scaggerac, or Categate; on the weſt and north, by the Northern Ocean; and on the eaſt it is ſeparated from Sweden by a long ridge of mountains, which have the various appellations of Rundfield, Dofrefield, Dourfield, and Fillefield. Its length is computed at 1020 miles, its breath at 290, and its ærea is ſuppoſed to contain 82,824 ſquare miles.

Norway is divided into four governments; viz. 1. The province of Aggerhus, which extends in length about 300 miles, and comprehends the ſouth-eaſt part of Norway. 2. Bergen, ſituated in the moſt ſoutherly and weſterly part of the country. 3. Drontheim, or Trontheim, which ſtretches about 500 miles on the coaſt. And, 4. The province of Wardhus, which extends to the north cape, and includes the iſlands of Finmark and Norwegian Lapland. Beſides theſe, there is the province of Bahus, being a narrow tract of land, about 90 miles in length, ſituated on the coaſt of Scaggerac, which, though now yielded to Sweden, is reckoned part of Norway.

The climate of this country is exceedingly different, according to the difference of its ſituation towards the ſea. In the eaſtern parts, the ground is generally covered with ſnow; and the cold, which ſets in about the middle of October, is very intenſe till the middle of April, during which time the waters are frozen to a conſiderable thickneſs. In 1719, 7000 Swedes, who were on their march to attack Drontheim, periſhed in the ſnow on the mountains which ſeparate Sweden from Norway, and their bodies were found in different paſtures. At Bergen, the winter is ſo moderate, that the ſeas are navigable both to mariners and fiſhermen, except in creeks and bays, which extend far enough up the country to be affected by the keen north-eaſt winds from the land. In Finmark, a part of Norway, ſituated in the frigid zone, the cold is ſo great, that very little of the country has ever been explored.

In proportion to the extreme cold of this climate in winter, is its heat in ſummer, occaſioned by the reflection of the ſun's rays from the ſides of the mountains, and the ſhortneſs of its duration below the horizon. The warmth in the vallies is in general ſo exceedingly great, that barley is ſown and fit to be houſed in the ſhort ſpace of ſix weeks.

At Bergen the longeſt day conſiſts of nineteen hours, and the ſhorteſt does not exceed ſix; ſo that in ſummer it is very eaſy to ſee to read at midnight, by the twilight; and in the diſtrict of Tromſen, at the extremity of Norway, the ſun never ſets at Midſummer; but in the depth of winter it is inviſible for weeks, and all the light, even at noon-day, is a faint glimmering occaſioned by the reflection of the ſun's rays upon the higheſt mountains. Happily for the inhabitants, however, the ſky at this ſeaſon of the year is exceedingly ſerene and clear, ſo that the moon ſhines without obſtruction, and her light, being reflected from the mountains, illuminates the vallies. The aurora borealis, or northern lights, which are very ſtrong in this country, are alſo of infinite uſe to the people, who by theſe helps employ themſelves in their daily occupations in the open air. This country is ſubject to frequent rains, and ſometimes the ſudden thaws prove terrible to the Norwegians; for vaſt maſſes of ſnow being thereby looſened, fall from prodigious high precipices, and overwhelm men, cattle, boats, houſes, nay ſometimes entire villages.

The air in Norway is generally pure and ſalubrious, and ſo dry in the midland parts of the country, that meal may be kept for many years without being worm-eaten, or otherwiſe damaged; but on the ſea-coaſt the vapours and exhalations render it moiſt, and not ſo healthy, except to people in conſumptions, with whom it is ſuppoſed to agree beſt.

No country in the world contains more mountains than Norway, a long chain of which runs from north to ſouth. The roads over theſe mountains are equally terrible and dangerous, there being often no other path than what is formed by an ill-ſecured wooden bridge, thrown over a breach in a frightful precipice or a roaring cataract. Theſe roads wind in ſuch a manner, as to render the paſſage over the mountain Hardangerfield, about ſeventy Engliſh miles, extremely dangerous. The ſame may be obſerved of that over Filefield, wich is about fifty miles, and the poſt road. To prevent travellers from being loſt or bewildered, the way is pointed out by poſts fixed at the diſtance of two hundred paces from each other; and on Filefield are two houſes furniſhed with fire, light, and kitchen utenſils, at the public expence, for the convenience of thoſe who are obliged to paſs along this dreadful road.

Beſides this chain, there are various other mountains ſcattered over the country, of extraordinary height. On the left hand, in ſailing up Joering Creek, is a cluſter of theſe mountains, which has the appearance of a city, decorated with old Gothic towers and edifices. The ſummit of the mountain Skopſhorn, in the pariſh of Oerſkong, repreſents the figure of a fortification, with regular walls and baſtions. A very high range of mountains, in the diſtrict of Hilgeland, are diſtinguiſhed by the appellation of the Seven Siſters, from having ſeven high pinnacles on their tops, diſcernable at ſea for a conſiderable diſtance. The mountain Torghatten, in the ſame diſtrict, derives its name from the reſemblance the ſummit bears to a man with his hat on; an aperture in the mountain one hundred and fifty ells high, and three thouſand ells in length, forming a ſingle eye to the ſuppoſed face.

Innumerable are the difficulties and dangers to which theſe rocks and mountains ſubject the Norwegians. Their journies from place to place are always performed at the hazard of their lives: their habitations are rendered inſecure by the vaſt torrents, and falls of ſnow, which frequently overwhelm them, together with their cattle, and their land. This misfortune is much greater, as a very trifling part of the whole country is arable. Sometimes huge pieces of rock fall into the plains below, and cruſh every thing they meet with into ruins. Entire rifts of rocks, many fathoms in

length and breadth, have been known to tumble all at once, and cauſe ſuch a concuſſion of the air, as ſeemed a prelude to the diſſolution of the globe. At Steerbroc in Laerdale, a ſtupendous body appears to have been ſevered and tumbled from the mountain, in large, ſharp, and ragged fragments, through which the river roars with a continual and dreadful noiſe. Frequently both men and beaſts, by one falſe ſtep, are hurled down theſe dreadful precipices and daſhed to pieces. When a kid, ſheep, or goat, is unlucky enough to fall from ſome height on the projection of a rock, from whence it can neither aſcend nor deſcend, the owner generally endeavours to preſerve the life of his animal, though with the utmoſt hazard of his own. He ſeats himſelf on a croſs ſtick tied to the end of a long rope, whereby he is lowered down, by ſome of his companions, till he arrives at the place where the creature ſtands, which he faſtens to the ſame rope with himſelf, and both are drawn up together.

The caverns in Norway are equally wonderful with the ſtupendous mountains. In the lower part of Torghatten is one of theſe caves, into which a plumbet, faſtened to a line four hundred fathoms in length, being let down, did not reach the bottom. In the year 1750, two clergymen reſolved to make diſcoveries concerning a cavern at Herroe in Sundmoer, called Dolſteen. Accordingly, they entered this ſubterranean cavity, and proceeded till they heard the ſea daſh over their heads. The paſſage was as wide and high as an ordinary church, the ſides perpendicular, and the roof vaulted. They deſcended one flight of ſtairs, and arrived at a ſecond, which they did not venture to go down, but returned again, having conſumed two candles from the time they entered to the time they came back. In the diſtrict of Rake, in the neighbourhood of Frederickſhall, are three cavities in a rock; one of which is ſo deep, that a ſmall ſtone dropped down, is two minutes in arriving at the bottom, when it produces a ſound like that of a bell: and a cavern of a very curious nature penetrates through the ſides of the mountain Limur, and ſerves as a conduit to a ſtream of water.

The large and extenſive foreſts of Norway form the principal ſource of the wealth of that kingdom. In theſe, which are very numerous, are found in amazing quantities, fir, pine, elm, aſh, yew, benreed, birch, beech, oak, eel, or alder, juniper, aſpin-trees, comel, or ſloe-tree, haſel, elder, lyme, willow, and ſome ebony. The Norwegians ſupply foreigners with maſts, beams, planks, and boards. A vaſt quantity of wood is likewiſe expended in home conſumption, for building houſes, ſhips, bridges, piles, moles, fences, and in making charcoal for the founderies. In the timber trade, their lakes and rivers prove of the utmoſt conſequence; for the maſts and large beams are not only floated down them for exportation, but they erect mills on their banks for ſawing balks into planks, and deals, which, by this contrivance, is done with inconceivable expedition. A tenth of ſawed timber is claimed by the king of Denmark, and forms a conſiderable part of his revenue. The beſt timber grows in the provinces of Guldbranſdale, Tellemark, Valders, Romſdale, Saltan, Sognifiord, Oeſterdale, Helleland, Soloe, Hallingdale, and the lordſhip of Nedere. The principal exports of this article are made from Frederickſhall, Frederickſtadt, Chriſtiana, Chriſtianſand, Chriſtian's-Bay, Drontheim, Skeen, Drammen, and Anendal. Great quantities are exported annually from the weſtern coaſt of Norway to Spain and Scotland.

The principal rivers in Norway are the Neid; the Sule Ely; the Gulen; the Otteroen; the Syre; the Nid; the Sheen; the Tyrefiord, or Dramme; the Loven; the Glaaman, or Great River; and the Worme. In the year 1344, the Gulen buried itſelf under ground; from whence it burſt forth again with ſuch violence, that the earth and ſtones, thrown up by the eruption, filled the valley and formed a dam, which, however, was ſoon demoliſhed by the force of the water. Several churches, farm-houſes, and 250 perſons were deſtroyed on this occaſion. The Syre diſcharges itſelf into the ſea, through a narrow ſtreight formed by two rocks, which contraction augmenting its natural impetuoſity, it ſhoots with great ſwiftneſs into the ocean, where it produces vaſt agitation. The water-falls of the Nid and Sheen have been diverted with infinite labour and expence, by canals and paſſages cut through rocks, and they are now of the utmoſt convenience to the inhabitants for floating down their timber. Many of the lakes contain floating iſlands, formed by the coheſion of the roots of trees and ſhrubs in the ſoil, which, though thus ſeparated from the main land, bear herbage and trees. Near Frederickſtadt is a lake 300 ells in length, and about half as broad, formed by the ſudden ſinking of the noble family ſeat of Borge, into an abyſs 100 fathoms in depth. This accident, whereby 14 perſons and 200 head of cattle were killed, was occaſioned by the river Glaaman precipitating itſelf down a water-fall, near Sarp, and undermining the foundation of the houſe.

The freſh water of this country is very agreeable to the taſte, and remarkably ſalubrious, but it is generally turbid, depoſits a thick ſediment, and is often impregnated with oker and particles of iron.

Norway abounds in quarries of excellent marble, of all colours: ſome detached pieces of alabaſter; ſeveral kinds of ſpar, chalk-ſtone, cement-ſtone, ſand-ſtone, mill-ſtone, baking-ſtone, ſlate, talc, ſwine-ſtone, the magnet, or load-ſtone, and the amianthus, or aſbeſtos, whoſe delicate fibres are woven into cloth, which, when dirty or ſoiled, is cleanſed by being thrown into the fire, which has not the power of conſuming it. In this country are likewiſe found amethyſts, agate, granates, beautiful cryſtals, thunder-ſtones, eagle-ſtones, and pyrites or quartz; but there are no flints.

At preſent there are no gold mines worked in Norway, though formerly a ſmall quantity, found in the dioceſe of Chriſtianſand, was coined into ducats. Mines of ſilver have been diſcovered in ſeveral parts of the country, and there is now one working at Koningſburg, at the ſole expence and account of his Daniſh majeſty, out of which a piece of 560 lb. weight being taken, is preſerved as a curioſity in the Royal Muſeum at Copenhagen. The copper mines are worked with the greateſt ſucceſs: the principal of theſe is at Roraas, an hundred Engliſh miles from Drontheim, which yields annually about 1100 ſhip-loads of pure copper. Iron is ſtill in greater plenty, and the profit ariſing from this metal is eſtimated at 300,000 rix-dollars yearly. A few mines of lead have lately been opened in the diſtrict of Poloer, but no very conſiderable advantage has as yet been derived from them.

The minerals found in Norway are vitriol, ſulphur, alum, and ſalt.

The animals found in Norway are all natives of Denmark, with an addition of many more. The wild beaſts peculiar to this country are the elk, the rein-deer, the hare, the rabbit, the bear, the wolf, the lynx, the fox, the glutton, the leming, the ermine, the martin, and the beaver. The elk is a tall, aſh-coloured animal, its ſhape partaking at once of the horſe and the ſtag; it is harmleſs, and, in the winter, ſocial; and the fleſh of it taſtes like veniſon. The rein-deer (which we ſhall deſcribe more

more particularly afterwards) is a ſpecies of ſtag. The hares are ſmall, and are ſaid to live upon mice in the winter time, and to change their colour from brown to white. The Norwegian bears are ſtrong and ſagacious: they are remarkable for not hurting children: they are hunted by little dogs; and ſome prefer bear-hams to thoſe of Weſtphalia. The Norwegian wolves are very fierce, but at the ſame time ſhy, even of a cow or goat, unleſs impelled by hunger: the natives are dexterous in digging traps for them, in which they are taken or killed. The lynx, by ſome called the goupes, is ſmaller than a wolf, but equally dangerous: they are a ſpecies of cat, with claws like thoſe of a tyger. They often undermine ſheep-folds, where they make dreadful havock. The fur of the lynx is very beautiful and valuable. The foxes of Norway are of different colours, white, red, and black; but the ſkin of the latter is the moſt eſteemed: the white and red foxes partake of the nature of that wily animal in other countries; they draw crabs aſhore, by dipping their tails in the water, which the crabs lay hold of. The glutton, in ſhape and ſize of a turn-ſpit dog, with a long body, thick legs, ſharp claws and teeth: his fur, which is variegated, is ſo precious, that he is ſhot with blunt arrows, to preſerve the ſkin unhurt. This animal, which is ſometimes called the erven, or vielfras, is remarkably fierce and voracious, and of ſuch an inſatiable appetite, that he will devour a carcaſe larger than himſelf, and diſburthens his ſtomach by ſqueezing himſelf between two cloſe-ſtanding trees: and when he has overgorged himſelf with eating, he becomes an eaſy prey to the hunters: when taken, he has been even known to eat ſtone and mortar. The ermine is a little creature, very ſhy, and ſo remarkably cleanly, that, it is ſaid, he will rather ſuffer himſelf to be taken, than run through the leaſt dirt to avoid his purſuers. The marten, or haaren, is of a beautiful gloſſy brown, and the fur very valuable: it reſembles a great foreſt cat, is very fierce, and its bite dangerous.

There are moſt of the birds in this country common to Europe, and its ſea coaſts are covered with innumerable flights of water-fowl, among which are wild geeſe and ducks. But the birds peculiar to Norway are the alk, the berg-ugle, the baſier, the ſtrand-ſneppe, the gagl, the hav-aare, the hav-heſt, the hav-ſule, the imber, or great northern diver, the jo-fugl, the krage, the kryk-kie, the lax-tite, the lom, the gull or maage, the ſavoren, the ſkare or loon, the treſt, the north-wind's-pipe, the ſouden-wind's-fugl, the he-dom-paps or coco-thrans, and the tiur uræ-gallus major, or the cock of the wood. Some of the moſt remarkable of theſe birds will here meet with a particular deſcription. The alk is an aquatic fowl, about the ſize of a large duck: they frequent the rocks in ſuch numbers, as frequently darken the air, and the noiſe of their wings is equal to the roaring of a ſtorm. The north-wind's-pipe is ſomething leſs than a ſtarling, and of a grey colour: this bird makes a particular noiſe before the north wind begins to blow; and the ſouden-wind's-fugl never appears but againſt a ſoutherly wind. The he-dom-paps is a very beautiful bird, the male particularly, whoſe plumage is variegated with red, black, and white: ſome of them are green, with red tufts of feathers on their heads, and theſe are moſt valuable: the hens are generally of a blue-grey. The cock of the wood is a noble bird, and may juſtly be placed at the head of the Norwegian game-fowl. He is very large, and in the bill and feet bears ſome reſemblance to the wild Turkey-cock: his colour is a dark grey, approaching to black, and his eyes not unlike that of a pheaſant.

The eagles of Norway, of which there are two kinds, viz. the land and the ſea, are of a prodigious ſize and ſtrength; the firſt of theſe having been known to carry off lambs, kids, and even children of two years old, in their talons. The ſea-eagle ſurpaſſes the former in ſize: his chief food is fiſh, upon which he darts down with amazing velocity: but this often proves his deſtruction, for when he ſtrikes a large fiſh, too ſtrong for him, the form of his talons, which are long and crooked, prevents him from diſengaging himſelf before his antagoniſt dives, whereby he is always drowned. The tiuren is alſo an inhabitant of this country: he bears ſome reſemblance to an eagle, but is not ſo fierce.

There are thirty different kinds of truſhes in Norway, and a great variety of hawks. The ſwallows are alſo very numerous. About the latter end of ſummer they take wing in large flights, and plunge themſelves into freſh water lakes, chooſing a place filled with reeds and buſhes, where they remain all the winter in a ſtate of inſenſibility, and revive again in the ſpring.

The Norwegians, who reſide upon the ſea-ſhore, are amazingly expert in climbing the ſteepeſt rocks in order to take the birds, with their eggs, feathers, and down; all which prove of the utmoſt advantage to them. When theſe bird-men intend to climb the rocks, two of them tie themſelves together with a rope of a moderate length, each having a pole in their hands with a net fixed to the end; this net is applied to the mouth of the holes from whence the birds take their flight, which are by theſe means ſecured; but ſome of them will ſuffer themſelves to be taken with the hand out of their neſts. The man who firſt begins to climb is puſhed on by the pole of his comrade, till he arrives at a proper ſtanding place, where he fixes himſelf; and the ſecond man clambers up by the aſſiſtance of the rope which is tied round the waiſt of his fellow. In this manner they proceed alternately, till they arrive at the place moſt frequented by the birds. If one of theſe men makes a falſe ſtep, which, notwithſtanding their great care and dexterity, too often happens, he drags his companion down with him, and both periſh in the fall. Sometimes theſe men are lowered down, by upwards of a hundred fathom of rope, over dreadful precipices; which method is likewiſe attended with the utmoſt danger, for ſometimes the looſe fragments of the rock, being put in motion by his deſcent, fall upon, and cruſh him to death; and at others, the rope being cut aſunder by the ſharp pointed ſtones, he is precipitated and daſhed in pieces among the rocks. The farmers in the northern diſtricts train their dogs to aſſiſt them in bird catching, and theſe animals will take birds from holes almoſt inacceſſible.

There is ſcarcely a fiſh to be named which is not found in the lakes, rivers, or ſeas of Norway, and the latter is the habitation of ſeveral extraordinary monſters, a deſcription of which we ſhall add for the ſatisfaction of the reader; but ſhall firſt take notice of the prodigious ſhoals of herrings which annually come from under the ice at the north pole, where they breed, to the weſtern coaſts of Norway. Theſe fiſh are the prey of the whale, porpoiſe, ſhark, &c. which purſue them along ſhore into inlets and creeks, where they may be taken up by pails. One of theſe ſhoals extends a conſiderable way in length and breadth, and will reach from the bottom to the ſurface of the water, even in the depth of two hundred fathoms. Theſe fiſh are in the greateſt perfection from Chriſtmas to Candlemas; at which ſeaſon the country people aſſemble in multitudes on the ſea-ſhore with their boats, caſks, fiſhing-tackle, and ſalt. Three hundred boats, within the compaſs of a mile, may meet with employment for a whole month; and frequently, at one ſingle caſt, a fiſherman will take more fiſh than he can diſpoſe of. About the lati-

tude

tude of Iceland the herrings divide themſelves into three bodies; one of which ſupplies the weſtern iſles and coaſt of Scotland; a ſecond directs its courſe round the eaſtern parts of Great Britain down the channel; and the third enters the Baltic through the Sound. The cod fiſhery is another great ſource of wealth to the Norwegians; and this, together with the herring-fiſhery, is computed to employ and maintain above 150,000 people.

The coaſts of Norway abound in ſhell-fiſh; among which are exceeding fine rock oyſters; and on the weſt ſide of this country is found the pearl muſcle.

There are ſeven different ſpecies of whales found in the Norwegian ſeas, whither they follow the herrings and other fiſh. The largeſt of theſe reſembles the cod, having ſmall eyes, a dark marble ſkin, and white belly. They meaſure 70 feet in general from head to tail, ſometimes more, and the water, which they take in by inſpiration, they ſpout again through two apertures or holes in the back part of the head. Their throats are exceedingly narrow in proportion to their ſize; their tails are placed horizontally, and under the ſkin the fleſh is covered with fat two or three feet thick, which is called the blubber. The whales copulate like land animals, and the female brings forth one, and ſometimes two at a birth, about nine or ten feet long. Beſides ſmall inſects, which float in myriads upon the water, they feed upon cod, herring, and divers other fiſh, which they drive together in ſhoals, and ſwallow in ſuch amazing numbers, that their bellies are diſtended almoſt to burſting, in which caſe they roar moſt hideouſly from pain. Numberleſs are the enemies which encounter the whale. The threſher faſtens on his back, and beats him without intermiſſion; while another, called the ſaw-fiſh, furniſhed with a ſharp horn, aſſaults him from below, and frequently rips open his belly. The ſpekhuggeren, a ſpecies of porpoiſe, having very long and ſharp teeth, bites and tears the fleſh from his body; and, when he comes up to the ſurface, he is aſſaulted by divers birds of prey. In the midſt of theſe tortures he roars moſt dreadfully, and leaps ſo as to raiſe himſelf perpendicular above the ſea, and then plunges down again with ſuch violence, that, if he happens to be in ſhallow water, where there are rocks, he uſually fractures his ſkull, and comes floating up quite dead.

A ſpecies of ſhark are found in theſe ſeas, called haac-mæren, ten fathoms in length, and its liver yields three caſks of train-oil. The tuella-flynder is ſhaped like a turbot, but exceedingly broad. It is reported that a fiſherman in ſtriking at one of theſe fiſh happened to fall overboard, and ſink to the bottom, upon which the tuella-flynder immediately dived and ſpread his enormous body over the man to prevent his riſing again; and he muſt have been inevitably drowned, though there was only between two and three fathom water, if his companions in the boat, who ſaw all that paſſed, had not drove the fiſh away with their boat-hooks. The rana-piſcatrix, or ſea-devil, is about ſix feet in length, and is ſo called from its monſtrous appearance and voracity. The ſea-ſcorpion, found in the ſeas of Norway, is about four feet long, with a head larger than the whole body. The aſpect of this animal is frightful: he has a wide mouth, monſtrous jaws, and his bite is ſaid to be poiſonous.

It is now a generally received opinion that the kraken, or korven, and the ſea-ſnake or ſerpent of the ocean, are no longer the fictitious productions of travellers and authors, but that theſe monſters really exiſt in the ſeas of Norway. The firſt of theſe is of the polypus kind, and ſuppoſed to be about a mile and a half in circumference. In ſummer, when the Norwegian fiſhermen find no more than 20 or 30 fathoms water, where the depth is uſually 80 or 100, they are certain that the kraken is below them, and if, by their lines, they perceive that he riſes, they row away with the greateſt expedition. As ſoon as part of the kraken has attained the ſurface of the water, it has the appearance of a number of ſmall iſlands, interſperſed with ſand-banks, covered with ſea-weeds, and abounding with a great variety of ſmall fiſh. On his further emerging, a number of pellucid antennæ riſe upon his back, as large and as high as the maſts of a moderate veſſel; by means of theſe arms, or tentacula, he moves himſelf and gathers in his food, which conſiſts of ſmall fiſh. Having remained a ſhort time in this ſituation, he begins to ſink again, and, though the motion is very ſlow and gradual, it produces a dangerous ſwell and whirlpool in the water. In 1680, a young kraken periſhed among the rocks and cliffs in the pariſh of Alſtahong, where it had by ſome means entangled itſelf, and the ſtench of the putrified carcaſe was for ſome time ſo great, that it rendered the channel impaſſable.

In 1756, a ſea-ſnake was ſhot at by a maſter of a Norwegian veſſel. The head of this monſter reſembled that of a horſe; the mouth was very large and black, as were the eyes; and a long white mane hung down from its neck and floated upon the ſea. Beſides the head, which this animal held about two feet above the ſurface of the water, they ſaw ſeven or eight coils of him, about the diſtance of a fathom one from another, and each about the ſize of a hogſhead. Immediately upon its being ſhot at, this ſnake diſappeared, though it was undoubtedly wounded, as the water for ſome ſpace was tinged with blood.

Egede, an author of veracity, ſays, that on the 6th of July, 1734, a large and frightful ſea monſter raiſed itſelf ſo high out of the water, that its head reached above the main-top-maſt of the ſhip: that it had a long ſharp ſnout, broad paws, and ſpouted water like a whale: that the body ſeemed to be covered with ſcales, the ſkin was uneven and wrinkled, and the lower part was formed like a ſnake. Though it is impoſſible to aſcertain the exact dimenſions of this frightful animal, yet from the teſtimony of numbers who have ſeen it, it is natural to ſuppoſe, that he is 100 fathoms in length, and the circumference of his body as large as that of an hogſhead. His ſkin, which he is ſaid to ſhed annually, is ſmooth and variegated like tortoiſeſhell, and his excrement, which floats upon the ſurface of the water, is ſo corroſive, that if the ſeamen touch it, their hands immediately bliſter. The ſailors ſuppoſe that this creature has an exquiſite ſenſe of ſmelling, from his avoiding a veſſel which has caſtor on board; for which reaſon all maſters of ſhips provide themſelves with that drug, to prevent being overſet or ſunk, the ſerpent's olfactory nerves being remarkably exquiſite.

The mer-man and mer-maid, are likewiſe ſaid to reſide in the Norwegian ſeas, and in 1719 one of the males of this ſpecies was found dead on a point of land in Norland. This animal was of a dark grey colour, with a face reſembling, in ſome reſpects, that of a man; the mouth was large, the noſe flat, the forehead high; the eyes were exceeding ſmall, and it had neither chin nor ears. The arms, which were ſhort and without joints or elbows, were faſtened to the ſides by a thin membrane, and terminated in members ſomewhat like a human hand, having the fingers connected by a membrane. The body tapered into a fiſh's tail, like that of a porpoiſe, which is always kept under water, and the length extended to three fathoms. The mer-maid is formed in the ſame manner, except the difference of ſex, which is diſtinguiſhed like that of the human race, and they have breaſts at which they ſuckle their young. Theſe creatures

tures have been ſeen in different parts of the North, and are of various ſizes, from two feet to three fathom.

With regard to the vegetable productions, it will be ſufficient to obſerve, that the cultivated parts of Norway yield plentiful crops of barley, oats, and rye; but the whole country does not produce corn ſufficient to ſupport half its inhabitants. Peas, buck-wheat, hemp, flax, and hops, are propagated there, but not with any great degree of ſucceſs. Till within theſe few years the Norwegians imported their roots, cabbages, and every other kitchen vegetable from England and Holland; but, by taking ſome pains in the culture of their own lands, they now have gardens which produce theſe ſalutary neceſſaries of life in as much perfection as in other northern countries. There are numbers of plants which grow wild; and many of them peculiar to the country. The meadows afford plenty of excellent paſture for ſheep and cattle; and among the other kinds of graſs found there, is that called by the botaniſts viola canina, deſcribed below.

Here are many wild plants, the infuſion of one of which ſome of the inhabitants drink in the manner of tea, and deem it an admirable pectoral.

As the ſcurvy is a prevailing diſorder in Norway, nature hath bountifully ſupplied that country with a profuſion of antiſcorbutic herbs, ſuch as angelica, roſewort, gentian, creſſes, trefoils, ſorrel, ſcurvy-graſs, &c. But to counterbalance theſe conveniences, Norway abounds with many nauſeous and poiſonous herbs and plants, that are prejudicial both to men and cattle.

That admirable graſs, called viola canina, which grows here, was rendered particularly famous by having, in the year 1652, contributed, in a moſt aſtoniſhing manner, to the preſervation of two Norway youths: The ſtory of this tranſaction is as follows:

On the firſt day of Auguſt, in the ſaid year, two brothers made an excurſion of about ſeven leagues from their father's houſe, to take their pleaſure in hunting, ſhooting, fiſhing, &c. After having enjoyed the diverſion of fiſhing for the ſpace of four days, in the lake Riff, they rowed, in a little ſkiff, to a very ſmall iſland on the ſaid lake. While they ſtaid here a ſudden ſquall of wind occaſioned the ſkiff to break looſe, and drive to the ſhore, where their dog ſtood waiting for them. As neither of the youths could ſwim, they ſaw themſelves ſuddenly abandoned to famine, on a deſolate iſland, and ſequeſtered from all intercourſe with mankind.

Their firſt care was to build a kind of hut, with ſmall ſtones, that they might, in ſome degree, be ſcreened from the inclemency of the weather. Towards the cloſe of the ſecond day, their appetites being whetted to the keeneſt ſenſe of hunger, they induſtriouſly ſought ſome vegetable food, and ventured to eat the viola canina, each to the amount of an ounce twice a day; and this was all that they could find at one ſearch. Their ſtomachs were eaſed, their ſpirits refreſhed, and the acute pains which had begun to ſeize their arms and ſhoulders immediately abated. Eleven days did they ſubſiſt on this vegetable, but it failed on the twelfth, and they were reduced to the brink of deſpair; when they accidentally found a little ſpot overgrown with ſorrel, which they conſumed at one meal: nevertheleſs it was reproduced in leſs than twenty-four hours, and the devout young men, with tears of gratitude to heaven, owned it as an interpoſition of Providence in their behalf.

During the firſt days of their ſuffering they had called and beckoned to their dog, and uſed every poſſible allurement to induce that animal to ſwim over, that they might kill him for their ſubſiſtence, but he would not obey their ſignals. They were now reduced to ſuch a weak condition that they could not ſtand, and could hardly make ſhift to creep from their hut in queſt of the ſorrel. The eldeſt was ſeized with a violent palpitation of the heart; and the youngeſt carved their names, and a ſhort account of the ſad accident they had met with, upon a piece of timber, pointing out, at the ſame time, a text of the pſalms, on which he requeſted that their funeral ſermon might be preached. Then having joined in fervent prayer, they embraced each other, and became perfectly reſigned to their approaching fate.

Their dog, in the mean time, having tarried eight days with their baggage on the ſhore, returned to their father's houſe, where he refuſed food, and inceſſantly moaned in a moſt diſmal manner: hence the parents concluded that their ſons had met with ſome misfortune, and diſpatched a man in ſearch of them. The meſſenger arrived at the lake, found their baggage, and concluding they were drowned, returned with the melancholy tidings. On the thirteenth day of their being on the iſland, and after having reſigned every hope of relief, they heard the trampling of horſes feet, and exerting their utmoſt efforts, they called out loud enough to be beard. The travellers immediately came to the ſhore, and, having found the ſkiff, humanely put off to the iſland, where they found the brothers almoſt exhauſted. The eldeſt, when food was offered him, could ſcarce bear the ſmalleſt portion; and, after being conveyed to his father's houſe, remained for ſome time in great danger; but at length recovered, and ſurvived this diſaſter thirty-ſeven years. The younger recovered his ſtrength ſomewhat ſooner, and afterwards drew up this narrative as a pious acknowledgment of God's providence in their favour.

Common fruits grow tolerably well here; but the ſuperior ſort but very indifferently. Norway, however, produces a great variety of excellent berries, ſuch as juniper-berries, ſun-berries, gooſeberries, barberries, cranberries, coriander-berries, raſpberries, blackberries, bilberries, ſtrawberries, &c.

With reſpect to the ſtones of Norway, they have a brown pebble, which eaſily decays; black, white, blue, grey, and variegated marble; alabaſter, chalk-ſtone, cement-ſtone, ſand-ſtone, mill-ſtone, baking-ſtone, load-ſtone, ſlate, talc, amianthus or aſbeſtos, ſwine-ſtone or a kind of cryſtal, real cryſtals, granates, amethyſts, agates, various kinds of ſpars, thunder-ſtones, and eagle-ſtones. The eagle-ſtone is very ſingular, and ſeems to conſiſt of ſeveral ſhells, or cruſts, laid one over another: but that which diſtinguiſhes it from all others is its being hollow in the inſide, in which cavity there is another ſtone that is ſmaller. This, when it is ſhaken, may be heard to rattle. It is of various colours, as white, grey, dun, or brown. Modern authors mention only three ſorts of this ſtone; the firſt of which is rough on the out-ſide, and is of different colours, but commonly of a black dun. This makes a very diſtinct noiſe when rattled. The ſecond is of an aſh colour, and contains a ſort of marle in the inſide, which is ſometimes white, yellow, red, or blue; the outſide is rough and ſandy, and ſeems to conſiſt of the particles of flint. A third is of ſeveral colours, but has the like contents as the former. The firſt kind is no larger than a peach-ſtone, but the other two are often as large as a man's fiſt. Theſe ſort of ſtones are found in moſt parts of the country.

The curioſities of Norway are only natural, conſiſting of ſtupendous mountains, caverns, waterfalls, and whirlpools. The moſt remarkable vor-

tex, or whirlpool, is on the coaſt, lat 67, called Maleſtroom or Moſkoeſtrom, and, by navigators, the navel of the ſea. Moſkoe, the iſland from whence this whirlpool takes its name, belongs to the diſtrict of Lofoden, in the province of Norland, lying between the mountains Heſleggen in Lofoden, and the iſland Ver, which are about a league diſtant; and between the iſland and coaſt, on each ſide, the ſtream makes its way. Between Moſkoe and Lofoden it is near 400 fathoms deep; but, between Moſkoe and Ver, it is ſo ſhallow as not to afford paſſage for a ſmall ſhip. When it is flood, the ſtream runs up the country between Lofoden and Moſkoe with a boiſterous rapidity; and, at ebb, returns to the ſea with a violence and noiſe unequalled by the loudeſt cataracts, and is heard at many leagues diſtance. At the ſame time, it forms a vortex or whirlpool of great depth and extent; ſo violent, that, if a ſhip comes near it, it is immediately drawn irreſiſtibly into the whirlpool, and there diſappears, being abſorbed and carried down to the bottom in a moment, where it is daſhed into pieces againſt the rock; and juſt at the turn of ebb and flood, when the water becomes ſtill for a quarter of an hour, the wreck riſes again, but in fragments ſo ſmall as ſcarcely to be diſtinguiſhed for parts of a ſhip. When the natural fury of this vortex is heightened by a ſtorm, it is dangerous for a veſſel to venture within a league of it. Whales, and even land animals, in attempting to ſwim from the coaſt to the iſland, have ſometimes, notwithſtanding their utmoſt efforts and hideous bellowings, been abſorbed in the vortex, and deſtroyed. If brutes are thus affected by the view of their approaching danger, how muſt it affect a whole ſhip's crew with horror, when, beholding themſelves on the brink of inevitable deſtruction, they cry out for that help which they know cannot be obtained; and ſee before them the dreadful abyſs in which they are about to be plunged, and daſhed among the rocks at the bottom of the water. Bears, in their attempts to ſwim to the iſland, to prey upon the ſheep, have frequently experienced the ſame fate.

The inhabitants of Norway are a middling kind of people, between the ſimplicity of the Greenlanders and the Icelanders, and the more poliſhed manners of the Danes. In their perſons, the men are well formed, tall, and robuſt. The women are likewiſe tall, have good ſhapes and comely features, and are remarkably fair. They are an honeſt, hoſpitable, and ingenious people, but, at the ſame time, raſh, quarrelſome, and litigious.

Every man is in ſome degree a ſoldier, and the method of deciding their quarrels, even among the farmers, is by ſingle combat with their knives. There is no nation where the nobility and merchants live better than in Norway, but the lower claſs ſubſiſt in a very frugal manner. Their common bread is made of oat-meal, and, when that is ſcarce, they mix it with the bark of the fir or elm tree, ground into powder, of which compoſition they make haſty pudding and ſoup, the latter being enriched with the addition of a pickled herring, or ſalted mackerel. Fiſh, grouſe, partridges, hares, red deer, and rein deer, form their ſummer proviſions, as the fleſh of cows, ſheep, and goats, pickled, ſmoked, or dried, does their winter. Their common drink is a liquor made from ſour whey, which they call ſyre, mixed with water; but, againſt feſtivals and holydays, they have always a reſerve of ſtrong ale, with the uſe of which, at ſuch times, they indulge themſelves even to intoxication; and this exceſs, added to the natural warmth of their tempers, ſeldom fails to produce bloodſhed, if not murder. They are remarkable for longevity, nothing being more common than to ſee a peaſant of an hundred years of age following his profeſſion with alacrity and cheerfulneſs; and, in the year 1733, four men, together with their wives, danced before his Daniſh majeſty at Frederickſhall, whoſe ages, when added together, exceeded 800 years.

Some of the Norwegians, however, are ſubject to the gout, epilepſy rheumatiſm, catarrhs, leproſy, ſcurvy, &c.

Both ſexes wear jackets, girt round them with leathern belts; thoſe of the women being adorned with ornaments of ſilver, and their hair, caps, and handkerchiefs, are decorated with ſmall plates, rings, and buttons of the ſame metal, if they can afford it, and, if not, its place is ſupplied by braſs and tin. Thoſe in affluence likewiſe wear ſilver chains round their necks. The men, except upon particular occaſions, never cover their boſoms, but ſuffer the wind, rain, and ſnow, to beat into them, without receiving the leaſt injury in their health. In winter, they wear buſkins made of leather, ſnow ſhoes, and long ſkaits, with which they travel at an amazing rate; and it is ſaid, that a corps of Norwegian ſoldiers, thus accoutred, will outmarch the ſwifteſt horſes. Their uſual diverſions are riding, ſwimming, ſkaiting, blowing the horn, or playing upon a ſort of guittar, and the violin, and in making verſes.

Their houſes are in general made of the trunks of fir and pine-tree laid upon each other, and joined by mortiſes at the corners; ſome have neither chimnies nor windows, but a ſquare hole on the top, for admitting the light, and letting out the ſmoke. The church, public edifices, and houſes of the people of faction, are built of ſtone.

There is a tincture of Paganiſm in their funeral ceremonies: they play on the violin at the head of the coffin, and while the corpſe is carried to church, which is often done in a boat. In ſome places, the mourners aſk the dead perſon why he died; whether his wife and neighbours were kind to him, and other ſuch queſtions, frequently kneeling down, and aſking forgiveneſs of the deceaſed, if they had ever offended him.

The Norwegians profeſs the Lutheran religion. Their church is governed by an archbiſhop, who reſides at Drontheim, and four ſuffragans, whoſe ſees are Bergen, Staffanger, Hammer, and Chriſtiana. They ſpeak the ſame language that is uſed in Denmark; but their original tongue is that of Iceland.

Their commerce differs little from that of Denmark, which we ſhall particularize in our deſcription of that kingdom. Their exports amount annually to 100,000 rix-dollars; and conſiſt of wrought and unwrought copper, iron, lead, marble, mill-ſtones, cow-hides, goat-ſkins, fox-ſkins, ſeal-ſkins, bear-ſkins, beavers, martins, ermines, maſts, deal boards, timber, herrings, cod, ling, ſalmon, lobſters, flounders, down, feathers, butter, tallow, train oil, juniper, and other berries, ſalt, glaſs, tar, nuts, alum, vitroil, pot-aſhes, &c. The commodities imported chiefly conſiſt of luxurious articles, and moſt of the neceſſaries of life.

We are aſſured, from the beſt calculations, that Norway can furniſh out 14,000 excellent ſeamen, and above 30,000 brave ſoldiers, for the uſe of their king. The royal annual revenue from Norway amounts to near 200,000l. and, till his preſent Majeſty aſcended the throne, the army, inſtead of being expenſive, added conſiderably to his income, by the ſubſides it brought him in from foreign potentates.

The principal cities in Norway are Chriſtiana, Bergen, Chriſtianſand, Konigſberg, Frederickſhall, Frederickſtadt, and Drontheim.

Chriſtiana, conſidered as the chief city of Norway, is thirty miles diſtant from the Baltic, ſituated

on the weſt ſide of a bay, and defended by the caſtle of Aggerhus. It is a large and regular city, the buildings in general are good, and ſome of them elegant. Its trade is conſiderable; and, in the year 1636, an academy was eſtabliſhed here, but it has lately declined, and is now little better than a public ſchool.

Bergen, the capital of Norway, is 137 miles diſtant from Chriſtiana, to the north-weſt, This is a conſiderable city and port on the German ocean, and carries on a very large trade. It ſtands in the middle of a valley, forming a ſemicircle, or rather horſe-ſhoe, on the ſhore of a bay called Waag, and is the principal place of trade in this kingdom. On the land ſide it is defended from any attack by a range of lofty mountains, and, towards the ſea, the harbour is defended by ſeveral ſtrong fortifications. There were formerly no leſs than thirty churches and convents in Bergen; but, at preſent, there are only ſix. All the churches, public ſtructures, and moſt of the burghers houſes, are of ſtone. The caſtle is a conſiderable building, which, together with the ſchool built and endowed for twelve ſcholars in the year 1554, by biſhop Petri, and the Frederick ſeminary, are worth notice. The number of inhabitants are computed at 30,000. It is the ſee of a biſhop, ſuffragan to the archbiſhop of Drontheim.

Chriſtianſand, ſo called from Chriſtian IV. of Denmark, and the ſandy beach on which it is ſituated. The city is of a quadrangular form, has broad and regular ſtreets, and a good town-houſe. It is advantageouſly ſituated, and has a pretty good trade. In 1734, the church and the greater part of the city were reduced to aſhes by an accidental fire.

Konigſberg is more remarkable for the ſilver mines in its neighbourhood, than for its buildings. It has, however, ſome good houſes, and a few public edifices.

Frederickſhall is ſituated on the Categate, at the mouth of the river Glammen, and carries on a pretty good trade. It is well fortified, and is conſidered as the key of the kingdom. Charles XII. of Sweden beſieged this place in December 1718, but was killed by a ſhot from the ramparts, as he was viewing the trenches, about nine at night.

Frederickſtadt is a conſiderable place, well fortified, and ſituated on the frontiers of Sweden. It carries on an extenſive trade, and ſome of the buildings are neat and elegant.

Drontheim, ſituated on a little gulf at the mouth of the river Nider, is about 220 miles diſtant from Bergen to the north-eaſt. This was formerly the capital, where the kings of Norway reſided, and the city had once ten churches and five convents; but, at preſent, there are only two churches, and a chapel belonging to the hoſpital. The cathedral, a beautiful ſtructure, was burnt in 1530, except the choir, which ſtill remains. It is fortified on the land ſide, and its harbour is defended by Monkholm fort, erected on a rock ſurrounded by the ſea. There is a good Latin ſchool, a miſſion ſeminary, an orphan houſe, an infirmary, and an hoſpital. It carries on a conſiderable trade in timber, fiſh, coarſe cloths, and copper from the neighbouring works at Meldal and Roraas.

The ancient Norwegians were certainly a very brave and powerful people, and the hardieſt ſeamen in the world. If we may believe their hiſtories, they were no ſtrangers to America long before it was diſcovered by Columbus. Many cuſtoms of their anceſtors are yet diſcernible in Ireland and the north of Scotland, where they made frequent deſcents, and ſome ſettlements, which are generally confounded with thoſe of the Danes. When the two kingdoms of Denmark and Norway were united under one monarch, by the marriage of Aquin, King of Norway, with Margaret, Queen of Denmark, in the year 1376, the people of both nations enjoyed conſiderable privileges; but, from the time that the Daniſh government became abſolute, Norway has been governed by a viceroy, who preſides in the ſupreme court of judicature, and regulates his conduct according to the laws of Denmark. Since the union, from the moſt turbulent, they are become now the moſt loyal ſubjects in Europe; which we can eaſily account for, from the barbarity and tyranny of their kings when a ſeparate people. We muſt refer to Denmark for further particulars relating to their hiſtory, and ſhall conclude this part with the character of the peaſantry of Norway, and a view of the preſent ſtate of the country, extracted from Mr. Coxe's Travels into Poland, &c.

"The Norwegians, being the ſame race with the Danes, and ſo long connected with them in religion and government, ſpeak the ſame language, with a neceſſary mixture of provincial expreſſions. Wilſe, a native of Norway, informs us, that the gentry and inhabitants of the principal towns, allowing for a few provincial expreſſions, ſpeak purer Daniſh than is uſual even in Denmark, not excepting Copenhagen; that the inhabitants of the eaſtern confines bordering on Sweden naturally blend many Swediſh words; that, throughout the whole country, the general accent and cadence is more analogous to the Swediſh than to the Daniſh pronunciation: and that the inhabitants on the weſtern coaſts, who have a more conſtant communication with the Danes, partake leſs of this peculiarity.

"The people of this country maintain their own army, which conſiſts of 24,000 infantry, and 6,000 cavalry. The troops are much eſteemed for their bravery, and, like the Swiſs mountaineers, exceedingly attached to their country. The horſes which ſupply their cavalry are ſmall, but ſtrong, active, and hardy. Every peaſant (thoſe excepted who inhabit the coaſts, and are claſſed as ſailors) not born in a town, or upon ſome noble eſtate, is by birth a ſoldier, and enrolled for ſervice at the age of ſixteen. From that year till he has attained the age of twenty-ſix, he is claſſed in the young militia. At twenty-ſix he enters into the old militia, and continues till thirty-ſix, at which period he receives his diſcharge. The militia take the field every year in the month of June, and remain encamped about a month.

"The Norwegians are bleſſed with a particular code, called the Norway Law, compiled by Grieffelfeld, at the command of Chriſtian the Fifth, the great legiſlator of his country. By this law, the palladium of Norway, the peaſants are free, a few only excepted on certain noble eſtates near Frederickſtadt. But the virtue of this law extends itſelf even to thoſe ſerfs, for no proprietor can have more than one of theſe privileged eſtates; and unleſs he poſſeſſes a title or certain rank, and reſides on his eſtate, he loſes his privilege, and the peaſants are free. The benefits of the Norway code are ſo viſible in its general effects on the happineſs and in the appearance of the peaſants, that a traveller muſt be blind who does not inſtantly perceive the difference between the free peaſants of Norway and the enſlaved vaſſals of Denmark, though both living under the ſame government.

"Many of the peaſants pretend to be deſcended from the ancient nobles, and ſome even from the royal line: they greatly pride themſelves upon this ſuppoſed deſcent, and are careful not to give their children in marriage but to their equals in birth and blood.

"A curious cuſtom prevails in Norway, called odels right, or right of inheritance, by which the proprietor

proprietor of certain freehold eſtates may re-purchaſe his eſtate, which either he or any of his anceſtors have ſold, provided he can prove the title of his family. But, in order to enforce his claim, his anceſtors, or he, muſt have declared every tenth year, at the ſeſſions, that they lay claim to the eſtate, but that they want money to redeem it; and if he, or his heirs, are able to obtain a ſufficient ſum, then the poſſeſſor muſt, on receiving the money, give up the eſtate to the odels-man. For this reaſon, the peaſants, who are freeholders, keep a ſtrict account of their pedigree.

"This cuſtom is attended with advantages and diſadvantages. As to the advantages, it fixes the affections of the peaſant on his native place, and he improves with pleaſure thoſe poſſeſſions which are ſo ſtrongly ſecured to him: it increaſes the conſequence and excites the induſtry of his family. On the contrary, the eſtate loſes its value when ſold to another perſon, becauſe, as he poſſeſſes only a precarious eſtate, which he may be obliged to reſign, he is not inclined to improve the lands, as if they were irrecoverably his own.

"The Norwegian peaſants poſſeſs much ſpirit and fire in their manner, are frank, open, and undaunted, yet not inſolent; never fawning to their ſuperiors, yet paying proper reſpect to thoſe above them.

"Their principal mode of ſalute is by offering their hand; and, when we gave them or paid them a trifle, the peaſants, inſtead of returning thanks by words or by a bow, ſhook our hands with great frankneſs and cordiality.

"The peaſants here are well cloathed and well lodged, and appear to poſſeſs more comforts and conveniencies of life than any which I have ſeen in the courſe of my travels, excepting in ſome parts of Switzerland.

"They weave their ordinary cloth and linen; they make alſo a kind of ſtuff like a Scotch plaid. The cloth which the men uſe for their coats is principally of a ſtone colour, with red button-holes, and white metal buttons.

"The women, while employed in their houſehold affairs, frequently, as in Sweden, appear only with a petticoat and a ſhift, with a collar reaching to the throat, and a black ſaſh tied round the waiſt. Their linen is remarkably fine; and, as they are uſually well made, this mode of dreſs ſets off their ſhapes to the higheſt advantage.

"The common food of the peaſant is milk, cheeſe, dried or ſalted fiſh, and ſometimes, but rarely, fleſh or dried meat, oat-bread, called fladbrod, baked in ſmall cakes about the ſize and thickneſs of a pancake; it is uſually made twice a year. I obſerved a woman employed in preparing it: having placed over the fire a round iron plate, ſhe took a handful of dough, and rolled it out with a rolling-pin to the ſize of the iron plate; ſhe then placed it on the plate, and baked it on one ſide, then turned it on the other with a ſmall ſtick. In this manner ſhe baked an aſtoniſhing number in leſs than a quarter of an hour; and I was informed that one woman, in one day, can bake ſufficient for the family during a whole year. The peaſants alſo, in times of ſcarcity, mix the bark of trees, uſually of the fir tree, with their oatmeal; they dry this bark before the fire, grind it to powder, mix it with oatmeal, then bake it, and eat it like bread: it is bitteriſh, and affords but little nouriſhment.

"As a luxury, the peaſants eat ſharke, or thin ſlices of meat, ſprinkled with ſalt, and dried in the wind, like hung beef; alſo a ſoup made like a haſty-pudding, of oat-meal or barley-meal; and, in order to render it more palatable, they put in it a pickled herring or ſalted mackerel. The uſe of potatoes has been lately introduced, but theſe roots do not grow to any ſize in a country where the ſummer is ſo ſhort.

"Fabricius ſtrongly recommends, in times of ſcarcity, the moſſes and lichens, and particularly the *lichen iſlandicus*, which yields a very nouriſhing ſuſtenance, and is commonly uſed for food in Iceland.

"According to a ſeries of meteorological obſervations taken by Mr. Wilſe, paſtor of Sydeborg, it ſnows moſt in December and in the middle of January. It rains moſt in April, October, and Auguſt. The cleareſt weather is during the whole month of March, and from the middle of June to the middle of July. Winds are moſt violent in the middle and latter end of April, May, and October. The ſtilleſt ſeaſon is in January; from the 10th of June to the 11th of July, and in the middle of Auguſt, a circumſtance very profitable to the oat-harveſt, which of all corn is more eaſily ſubject to caſt its ripe grain in windy weather. If we compare the climate of Norway with the climate of London, March at London is like April and the beginning of May in Norway; and the March of Norway is our January. On account of the frequent ſpring froſts, ſeeds ought not to be ſown in gardens before the 20th of May; and the froſts of the latter end of Auguſt are no leſs detrimental.

"The heat and cold varies ſo much in Norway, that, in June or July, the mercury in Fahrenheit's thermometer, as obſerved by Mr. Wilſe at Sydeborg, near Frederickſhall, not unuſually riſes to 88, and, on the 1ſt of January, 1782, fell to 22, or 54 degrees below the freezing point. At Eger, cording to Profeſſor Stroem's obſervaitions, it fell on that ſame day, to $36\frac{1}{2}$; and, at Konigſberg, to 40, or 72 below the freezing point, a degree of cold by which quickſilver is congealed. This extreme riſe and fall of the quickſilver makes a difference of 110 degrees between the greateſt heat and the greateſt cold at the ſame place; a difference much more conſiderable than is obſerved at Upſal or Stockholm, which lie nearly in the ſame latitude as Sydeborg.

"In ſome places vegetation is ſo quick, that the corn is ſown and cut in ſix or ſeven weeks. Tillage cannot generally be very flouriſhing in a country which is in many parts ſo rocky as to defy the plough; where the climate is ſo ſevere, that the hoar-froſts begin in September, and where the cold in the high lands prevents the maturity of the corn. It is true, indeed, that the ſmall vallies, and the intervals between the rocks, are uſually provided with a fruitful ſoil, and that the induſtry of the peaſants covers the naked rocks, and the ſandy grounds with a new earth; yet the arable grounds are few, and no parts of Norway yield ſufficient corn for interior conſumption, the diſtricts of Hedemark, Toten, and Ringerike, excepted. This deficiency is occaſioned hy the nature of the climate and ſoil.

"In ſpring, and in the firſt ſummer months, the drought and heat are frequently ſo intolerable, and the vegetable mould ſo thin, that the roots of the corn and graſs are burned up, if a few days of ſunſhine ſucceed each other without rain. Alſo the greateſt part of the ſoil is ſo much blended with ſand, that too much rain cannot fall in ſpring and ſummer. In autumn, on the contrary, the decreaſed warmth, and the great quantity of rain, prevents the corn from ripening, and it is frequently cut green. Not unuſually, when a favourable ſeaſon has ripened the corn, the frequent and violent autumnal rains hinder the carrying of it in until it is almoſt ſpoiled. Alſo the ſmall quantity of arable land ſeldom lies fallow, but is ſowed every year, and therefore requires more manure than can be eaſily procured.

"All theſe circumſtances ſo much counteract the induſtry of the Norwegian farmers, that even in the moſt

moſt favourable ſeaſons, a conſiderable importation of corn is annually neceſſary; and in unfavourable harveſts the utmoſt dearth is experienced in all the inland parts, as the tranſport of the corn from the ſea coaſts is highly expenſive.

"In order to dry the corn expoſed to the heavy rains, the peaſants fix forked poles, about ten feet high, place rows of other poles tranſverſely, on which they file the ſheaves, the lowermoſt row hanging about two feet from the ground. They are alſo frequently obliged to bake the corn in wooden ſheds, heated by means of ſtoves.

"As Norway, therefore, does not produce ſufficient corn for its own conſumption, Denmark enjoys the excluſive privilege of ſupplying with grain that part called Sudenfields, comprehending the two governments of Aggerhuus and Chriſtianſand. This monopoly frequently occaſions a ſcarcity of corn; but though ſometimes attended with great inconveniencies and occaſional diſtreſs, yet will not be aboliſhed without great difficulty, becauſe the Daniſh nobles, who are always at the head of affairs, find their intereſt in its continuance.

"But Norway, however deficient in arable land, is exceedingly rich in paſture; and, conſequently, produces much cattle. The mode of keeping the cows is ſimilar to that practiſed in the mountains of Switzerland. About the middle of May they are driven to the meadows, towards the middle of June are ſent to paſture on the heights, or in the midſt of the foreſts, where they continue till autumn. The cows are uſually attended by a woman, who inhabits a ſmall hut, milks them twice a day, and makes butter and cheeſe on the ſpot. On their return the cattle are paſtured in the meadows, until the ſnow ſets in about the middle of October, when they are removed to the ſtables, and fed during winter with four-fifths of ſtraw, and one-fifth of hay. The horſes are uſually foddered with hay during winter, and are ſeldom paſtured before the beginning of June. In ſome places the cattle are fed alſo with ſalted fiſh.

"Agriculture has been of late years greatly improved in theſe parts, and the landed eſtates are increaſed, within theſe laſt fifty years, near one-third in their value. This improvement is conſiderably owing to the labours and encouragement of the patriotic ſociety, which gives premiums for the beſt improvements and inſtructions in every part of farming.

"The fiſheries, particularly on the weſtern coaſt, furniſh employment and wealth to the natives, and are the means of ſupplying the fineſt ſailors for manning the Daniſh fleet in times of war.

"The principal fiſh, which, dried and ſalted, furniſh ſo conſiderable an article of exportation, are the cod, the ling, and the whiting: their livers, beſides, yield train oil, and the ſmalleſt are given as winter fodder to the cattle.

"The herring fiſhery is not ſo profitable as formerly, as theſe fiſh, which uſed to frequent the coaſts of Norway, in their progreſs from the north pole, now keep at a greater diſtance from theſe ſhores, and firſt approach the rocks of Marſtrand and Stroemſtrand, which has transferred to the Swedes the principal herring-fiſhery in theſe parts, though ſtill ſufficient profit accrues to thoſe enterpriſing fiſhermen who venture further from the coaſts.

"The ſalmon are taken partly in the bays and partly in the rivers, the ſtreams of which they aſcend for the purpoſe of ſpawning in ſpring. This is the moſt coſtly fiſh in theſe parts, and is cured by ſalting and ſmoking.

"Mackerel might alſo be taken in much larger quantities, if many of the Norwegians were not prejudiced againſt eating them, from a ſtrange notion, that ſhoals of mackerel often attack and devour the human ſpecies when bathing in the ſea.

"The extenſive foreſts of Norway, which furniſh riches to the proprietors, and ſo much employment to the natives, are applied to the following purpoſes:

"1. For ſpars, beams, and planks, which are exported in ſuch large quantities. 2. For charcoal, which is required for the ſmelting of the ores, for the glaſs furnaces, and other manufactures. The wood uſed for this purpoſe is uſually of an inferior ſort, and chiefly in the inner parts, where the tranſport of the planks is too expenſive. 3. For building, the greateſt part of the houſes in Norway being conſtructed of wood; for, although there is plenty of ſtone, yet the tranſporting of the materials, and the lime, are too expenſive for common uſe. 4. For the roads, which, in the more northern parts, are almoſt entirely formed with wood. 5. For turpentine, for which the oldeſt trees are moſtly uſed. 6. For fencing and encloſing the fields, quickſet hedges being almoſt unknown. The wood uſed for encloſures is chiefly pine or fur, and muſt be renewed every three or four years. 7. For fuel. 8. For manure, by the ſame proceſs of burning the trees and manuring the ſoil with the aſhes, which is practiſed in Sweden, and is ſo deſtructive to the foreſts.

"Beſides theſe general uſes derived from the foreſts, the particular trees are beneficially employed to the following purpoſes:

"The bark of the pine or fir, and alſo of the elm, which is not common in Norway, is dried, ground, and mixed among meal, and is boiled up with other food, to feed ſwine, who thrive much upon it.

"The birch, which flouriſhes in theſe northern regions, is particularly uſeful for various purpoſes. It is more generally uſed for fuel than any other wood. The outer bark, or the white rind, on account of its firmneſs and ſap, eaſily eſcapes putrefaction even in the dampeſt places: and, for this reaſon, is employed for covering the roofs of the houſes, in order to keep out the rain.

"This mode of roofing occaſions ſuch a large conſumption of the outward bark, that the birch, which are felled, would not ſupply a ſufficient quantity; it is, therefore, not unuſual to ſtrip off the outward bark while the tree is ſtanding, and, if peeled with care, it always grows again.

"The inner bark of the birch is applied, like the bark of oaks, for tanning hides, fiſhing-nets, and ſails, which it renders more durable.

"This tree alſo ſupplies a kind of wine by the following proceſs: a hole is bored in the trunk, and the wine diſtils into a flaſk placed under it. The tree ſuffers little damage, if the hole is immediately cloſed by a wooden peg. The twigs of the birch, as well as the elder and aſpen, are given to horſes in ſcarcity of fodder. A decoction of oak-leaves in beer is uſed by the peaſants as a cure for the rheumatiſm, by applying a cloth dipped in the decoction to the part affected.

"The general exports of Norway are tallow, butter, ſalt, dried fiſh, timber and plank, horſes and horned cattle, ſilver, alum, Pruſſian blue, copper, of which the celebrated mine of Roraas yields annually to the value of 67,500l. and iron, of which the moſt productive mine is near Arendal.

"Norway is remarkable for the number and beauty of the bays fringed with wood. Many of the lakes (ſome of which we have deſcribed above) are ſo large, that they appear like inlets of the ſea; and the bays are ſo ſmall, that they appear like lakes."

CHAP. III.

DENMARK.

Situation, Extent, Boundaries, Climate, Soil, Produce, Population, Cities, Inhabitants, and Hiſtory.

THIS kingdom, commonly ſtyled Denmark Proper, is ſituated between 54 and 58 deg. of north lat. and 8 and 11 deg of eaſt long. It extends, from north to ſouth, near 240 miles; and the breadth, in ſome parts, is only about 24, and, in others, near 180. It is bounded on the north from Norway by the Scaggerac ſea, and from Sweden on the eaſt by the Sound; on the ſouth by Germany and the Baltic; and, on the weſt, by the German Ocean, which ſeparates it from Great Britain. It is divided into two parts; the peninſula of Jutland, anciently called Cimbria Cherſoneſus, and the iſlands at the entrance of the Baltic, mentioned in the table. Though all theſe together conſtitute the kingdom of Denmark, yet not any one of them is ſeparately called by that name.

The air is not ſo piercing cold in Denmark as it is in ſome parts of Germany, ſituated much further to the ſouthward, being here tempered by the vapours of the ſea, which ſurrounds it in almoſt every part. Theſe vapours alſo greatly mitigate the heats of ſummer. Spring and autumn are ſeaſons ſcarcely known in Denmark, on account of the ſudden tranſitions from cold to heat, and from heat to cold, which diſtinguiſh the climate of this kingdom. In all the northern provinces of Denmark the winters are very ſevere, ſo that the inhabitants often paſs arms of the ſea in ſledges upon the ice; and, during the winter, all their harbours are frozen up. The ſoil, as in all other countries, is various, but principally conſiſts of the ſandy and clayey; the former abounds in the iſlands, and the latter on the continent. The mountains, near their ſummits, are barren, but the vallies fertile.

Jutland is one of the largeſt and moſt fertile of all the provinces of this kingdom, produces abundance of all ſorts of grain and paſturage, and is a kind of magazine for Norway on all occaſions. A great number of ſmall cattle are bred here, and afterwards tranſported into Holſtein, to be fed for the uſe of Hamburgh, Lubeck, and Amſterdam. This province is every where interſperſed with hills, generally barren; and, on the eaſt ſide, has fine woods of oak, fir, beech, and other trees; but, the weſt ſide being leſs woody, the inhabitants are obliged to uſe turf and heath for fuel.

Zealand is, for the moſt part, a ſandy ſoil, but rather fertile in grain and paſturage, and agreeably variegated with woods and lakes of water. The climate is more temperate here, on account of the vapours from the ſurrounding ſea, than it is in many more ſoutherly parts of Europe.

In ſome parts of the country there are large foreſts, which produce excellent timber, and are full of game. Moſt of the lakes abound with fiſh of a very delicate flavour. There are few rivers in Denmark; the moſt conſiderable is the Eyder, which riſes at the foot of a mountain near Segeberg, and falls into the ſea at Tonningen.

The Danes have an excellent breed of horſes, greatly eſteemed for the ſaddle and carriage; above 5000 are ſold annually out of the country, and of their horned cattle near 30,000. Beſides numbers of black cattle, they have ſheep, hogs, and other uſeful animals; alſo plenty of poultry and wild fowl.

In 1559, a numeration was made, by authority, of the number of people in his Daniſh majeſty's dominions of Denmark, Norway, Holſtein, the iſlands in the Baltic, and the counties of Oldenburgh and Delmenhorſt, in Weſtphalia, and found it to amount to 2,444,000, excluſive of the Icelanders and Greenlanders. But the moſt accurate account of the population is that made under the direction of the famous Struenſee, by which Jutland numbered 358,136; Daniſh Iceland, 283,466; Funen, 143,988; Norway, 723,141; Iſlands of Ferro, 4754; Iceland, 46,201; duchy of Sleſwick, 243,605; duchy of Holſtein, 134,665; Oldenburgh, 62,854; Delmenhorſt, 16,217: in all, 2,017,027. Several of the ſmaller iſlands, included in the diſtrict of Fionia, are omitted in this computation, which may add a few thouſands to it.

Though the above number may ſeem diſproportioned to his Daniſh majeſty's dominions, yet, every thing conſidered, it is far greater than could have been expected from their uncultivated ſtate. The nobles of Denmark formerly lived at their country-ſeats with great magnificence and hoſpitality, and poſſeſſed a degree of courage which approached to ferocity; but by a continual ſeries of tyranny and oppreſſion, their national character is much changed, and from a brave, enterpriſing, and warlike people, they are become indolent, timid, and dull of apprehenſion. The corruption and arbitrary proceedings of the Daniſh miniſters have greatly ſhackled the trade of the country; and her merchants are ſo terrified by the deſpotiſm of her government, that, inſtead of being rich and flouriſhing, it is at preſent one of the moſt indigent and diſtreſſed ſtates in Europe. Theſe circumſtances prevent Denmark from being ſo populous as it would otherwiſe be, if the adminiſtration of government were more mild and equitable, and if proper encouragement were given to foreigners, and to thoſe who engage in uſeful arts and agriculture.

The higher ranks of people value themſelves extremely upon thoſe titles and privileges which they derive from the crown, and are exceedingly fond of pomp and ſhew. They endeavour to imitate the French in their manners, dreſs, and even in their gallantry; though they are naturally the very contraſt of that nation.

The lower claſs of people are as abſolute ſlaves as the negroes in the ſugar iſlands, and ſubſiſt on much coarſer proviſions. They have not the leaſt piece of furniture of any value in their houſes, except feather beds, which are excellent in Denmark, from the amazing quantity of feathers annually collected.

The warlike genius of the Danes ſubſiſts no longer: the common people are timorous and diſpirited, nor do they poſſeſs that talent for mechanics and natural ingenuity, ſo remarkable in other nations of the North.

The Danes, like other northern nations, are greatly given to intemperance, in eating, drinking and other convivial entertainments. There was great reaſon to hope, at the beginning of his preſent majeſty's reign, that theſe and ſeveral other vitious cuſtoms would have been reformed; but theſe pleaſing expectations are now vaniſhed, and the good of the people ſeems to be forgotten.

The Lutheran doctrine is univerſally embraced through all Denmark, Sweden, and Norway, ſo that there is not another ſect in theſe kingdoms. Denmark is divided into ſix dioceſes; one in Zealand, one in Funen, and four in Jutland: but the biſhops are, properly ſpeaking, no other than ſuperintendants of the church. They have no cathedrals, eccleſiaſtical courts, or temporalities. Their buſineſs is to inſpect the doctrine and morals of the inferior clergy. They are only diſtinguiſhed from other miniſters by their habit. The revenue of the biſhop of Copenhagen amounts to about

two

two thouſand rix-dollars, and this is the richeſt benefice in the kingdom. The clergy are wholly dependent on the government: they never intermeddle, nor are employed or conſulted in civil affairs: they nevertheleſs have acquired great influence over the minds of the common people, by whom they are greatly revered. Their churches are kept extremely neat, and have organs in them. They preach without notes, and inveigh ſeverely againſt the vices of the great, whom they ſcruple not to attack perſonally. The commonalty admire their courage, and the government connives at their preſumption, while they confine themſelves to their own province of preaching. They are, generally ſpeaking, men of good morals, exemplary lives, and ſome erudition.

Literature receives very little encouragement in Denmark, which may be the principal cauſe of its not being more cultivated there, though, it muſt be confeſſed, they begin now to make ſome promiſing attempts in hiſtory, poetry, and the drama. This kingdom has formerly produced ſeveral men of eminence, eſpecially in aſtronomy and medicine, among whom Tycho Brahe, Borrichias, and the Bartholines, have done honour to their country: but though the univerſity at Copenhagen has funds to the amount of 300,000 rix-dollars, for the gratuitous ſupport of 328 ſtudents, yet the Danes in general make no great figure in letters. The language of Denmark is a dialect of the Teutonic; but High Dutch and French are ſpoken at court, and the nobility have lately made great advances in the Engliſh, which is now publicly taught at Copenhagen, as a neceſſary part of education. As they are great lovers of muſic, and encourage the drama, a company of Engliſh comedians occaſionally viſit the capital, where they meet with a pretty favourable reception.

We ſhall now proceed to deſcribe the diviſions, cities, and towns of this country, with their reſpective ſubdiviſions and circumſtances.

Denmark is divided into the four following duchies: 1. Jutland, properly ſo called, or North Jutland. 2. The duchy of Sleſwic, or South Jutland: 3. The duchy of Holſtein; and, 4. The Daniſh iſlands.

JUTLAND PROPER, or North Jutland, is bounded on the ſouth, by the duchy of Sleſwic; on the north and weſt, by the German Ocean; and towards the eaſt by the Baltic, the Categate, and the Leſſer Belt.

This country is divided in four dioceſes, viz. Ripen to the ſouth, Arhuſen to the eaſt, Wyburg to the weſt, and Aalburg to the north.

Ripen dioceſe is bounded, on the ſouth, by the duchy of Sleſwic; on the north, by the dioceſes of Arhuſen and Wyburg; and extends eaſt and weſt from the Baltic to the German Ocean. It contains 30 prefectorſhips, or bailiwicks, 282 pariſhes, 10 royal palaces, 100 noblemen's ſeats, and ſeven cities, which are as follow:

Ripen, Rypen, or Ripa, is ſeated on the river Nipſaw, which, before it comes to this city, divides itſelf into three branches, the largeſt of which runs on the north ſide of the town; the middle branch, which is the ſmalleſt, runs on the ſouth of it; the third alſo on the ſouth, but at ſome diſtance: they join again a little lower, and fall into the German Ocean, three miles below, forming a commodious harbour. This city is 26 miles diſtant from Tonderon, towards the north, and 24 from Colding, to the north-weſt. It is a place of conſiderable trade: the neighbouring paſtures and fields produce abundance of cattle and corn. Hither are driven almoſt all the black cattle from many parts of Jutland, which are here ſhipped off for foreign countries, eſpecially for Holland; and their corn they export into the neighbouring countries. Theſe articles afford them very great profit. But the city is often expoſed to imminent dangers from the tides flowing in with prodigious violence from the ſea, ſo that the water ſometimes comes into the very churchyard of the cathedral, which ſtands on a hill; and even during the terrible inundation that afflicted Jutland in the year 1734, the water roſe an ell high in the very cathedral. This town is ſtrong by nature only, without much aſſiſtance from art. Towards the weſt there is a caſtle flanked with four bulwarks, after the old faſhion, built in the year 1150. The citizen's houſes are pretty well built, and the inhabitants were formerly in better circumſtances than they are now; but they ſuffered very much during the wars with Sweden, the city being taken by the Swedes in 1645, but ſoon after recovered by the Danes. Before the Reformation this was a biſhop's ſee, as it is now of a ſuperintendant or Lutheran biſhop. The cathedral is a noble pile, built with free-ſtone, as well as its ſteeple, which is ſquare, very high, and covered with lead. This church is adorned within with ſeveral marble columns, and with the tombs of ſome kings. There is another church dedicated to St. Catharine. Here are alſo two public ſchools for the education of youth in polite literature, and a college for divinity, in the court of the biſhop's palace, where there is alſo a public library. The city is governed by two burgomaſters, or conſuls, and by a ſenate, who formerly adminiſtered juſtice with ſo much ſeverity, that *the juſtice of Ripen* was become a proverbial ſaying, to expreſs a rigorous execution of the law.

Colding, or Kolding, an ancient city mentioned by Ptolemy, ſtands on the banks of a little river called Coldinger Aa, which parts North Jutland from the duchy of Sleſwick, and falls into a little gulf, thence named the Gulf of Colding. The city is about 11 miles diſtant from Haderleben to the north. It was burnt down during the civil wars in 1247. In 1268, king Eric VI. redeemed it out of the hands of Eric, duke of Sleſwick, and ſon to king Abel. He built a citadel there, to be a bulwark to Denmark, and fortified the town, eſpecially towards the ſouth. Chriſtian III. who liked the city very much, on account of its agreeable ſituation, and wholeſome air, built the caſtle of Arnſburg, above the city, removed thither with his court, and died there January the 1ſt, 1559. The hoſpital was built by Frederick II. whoſe ſon endowed it conſiderably.

In May 1664, the Danes gained a conſiderable victory over the Swedes near Colding. This town is but ſmall, ſince it does not contain above 100 or 120 houſes; but what makes it chiefly conſiderable is its bridge over the Aa, which is called Boherit, and gives name to the whole country about it. All the black cattle and horſes that come from Jutland, and go into Sleſwick, muſt paſs over this bridge, and pay each a crown for toll; whence ariſes a conſiderable part of the king of Denmark's revenue. Though this town lies commodious for trade on the Leſſer Belt, over-againſt Middlefort in Funen, yet they have hardly any trade but in cattle. They have good fiſh, and the river Aa produces excellent eels.

Frederick's Ode, or Frederici Oda, ſtand on the banks on the Leſſer Belt, 10 miles from Colding to the north-eaſt, and about 27 from Ripen towards the eaſt. It was built by king Frederick III. of Denmark, and is well ſeated on a point of land, with an eaſy deſcent to the ſea-ward: it has been well fortified, being a paſs over the Leſſer Belt, or Middlefort Sound. The works are very high on the land ſide; and on the other ſide of the point there are eight baſtions: it has four gates, and before each a ravelin, but ruinous. Towards the

ſea

ſea the fortifications are lower, and of a greater extent; where there are baſtions, platforms, and ſome batteries on the ſhore. Theſe fortifications encloſe a great deal of ground, but the fifth part of it is not inhabited, for there are many corn-fields and orchards within the walls. This place was formerly a refuge for bankrupts and Jews; but king Frederick IV. recalled thoſe privileges. Here are two churches, one Daniſh, and another German, but they have no ſteeples. In 1558 this town was taken by Charles Guſtavus's troops, commanded by Wranget; the garriſon, conſiſting of 2000 men, were all killed or taken. This opened a way to the king of Sweden to undertake his expedition over the ice from this place to Funen, where the paſſage over the Belt is above three Engliſh miles.

Weille, or Weel, is ſix miles diſtant from Frederick's Ode to the north-weſt, and about 12 from Colding to the north. It ſtands on a little river, which falls into a great bay that communicates with the Leſſer Belt, and makes a good harbour. The city is neat, and well-built, but not large. About 22 miles to the north-weſt ſtands Warde, on a river that falls in the German Ocean, 10 miles below the town, which is conveniently ſituated for trade.

Ringcoping, or Ringkiobing, is 45 miles from Ripen, and 24 from Warde, to the north. It lies on a bay of the German Ocean, made by a neck of land 25 miles in length from north to ſouth, ſo that ſhips ride in the port ſafe from all winds.

Lenwick ſtands on the gulf of Limford (from whence it has its name) on the north-weſt borders of this dioceſe, 10 miles from the German Ocean to the eaſt, 56 from Ripen, and 81 from Ringcoping, to the north.

Haſtlebrow, or Hodſelbrow, ſtands about 11 miles from Lenwick to the ſouth-eaſt, and 12 from Ringcoping to the north-eaſt. It is an inland town, but lies on a river which communicates with the German Ocean by a lake, into which the river falls.

Arhuſen dioceſe is the eaſtern part of Jutland, having on the north the dioceſes of Wyburg and Aalburg, on the weſt and ſouth that of Ripen, and on the eaſt the Categate and Leſſer Belt. It extends about 60 miles along the coaſt of the Baltic, but is not much above 30 miles in breadth at the wideſt part. It contains 31 prefectorſhips, or bailiwicks, 304 pariſhes, five caſtles, or forts, and eight cities, or walled towns, viz. 1. Arhuſen, the capital of the dioceſe, ſtands at the mouth of the river Gude, which runs through it, and a little lower falls into the Categate. It is 86 miles to the northward of Sleſwick, and 42 north-eaſt of Ripen. The ſituation is pleaſant, being ſurrounded with foreſts full of game, paſtures that are exceeding rich for the country, and fields which produce a conſiderable quantity of grain. The town itſelf is neat and agreeable, well furniſhed with proviſions and domeſtic neceſſaries from the neighbouring country, and with other commodities and luxuries from various countries, by the means of ſhipping. The harbour is tolerable, and the cathedral church erected after a curious ſtile of architecture, beautified and embelliſhed with various monuments of noblemen, prelates, &c. The biſhop's palace was once a magnificent ſtructure, but is now fallen to decay. The city was made an epiſcopal ſee in the year 1014, and is now the ſee of a ſuperintendant. 2. Scanderburg, ſix miles from Arhuſen to the ſouth-weſt, is a good fortreſs, near the ſpring of the river Gude. 3. Horſens, 12 miles diſtant from Arhuſen to the ſouth-weſt, is a ſmall city or town ſituated on a little gulf, which ſerves it inſtead of a harbour, and falls into the Baltic. 4. Randers is a very ancient city, ſituated on the river Gude, which, about 12 miles lower, falls into the Baltic, and thus affords this place a good conveniency for navigation. It is a place of great trade, and famous for the beſt ſalmon in Jutland. The neighbouring fields produce plenty of corn. 5. Ebelſtot is ſeated at the bottom of a bay of the Categate, about 18 miles from Arhuſen to the north-weſt. 6. Grinaa ſtands near the point or cape of a peninſula, which juts out into the Categate, and is ſeven miles diſtant from Ebelſtot to the north. It is defended by a caſtle. 7. Mariager ſtands on the ſouth-ſide of a large bay of the Categate, 16 miles diſtant from Arhuſen to the north. 8. Hobro, or Hebro, is a ſmall town on the ſame bay, ſix miles above Mariager to the weſt.

Wyburg dioceſe has that of Aalburg on the north, from which it is partly ſeparated by the gulf of Limford, Arhuſen on the eaſt, and Ripen on the ſouth and weſt. It is not above 24 miles from ſouth to north, and 26 from eaſt to weſt, being almoſt of a round figure. Though it is an inſland country, yet it wants not the conveniency of navigation; for here are large lakes, that branch out into ſeveral parts of this land, and from whence, by means of the Limford, into which they run, and which communicates with the Baltic Sea, they receive veſſels of great burthen. Among theſe lakes there is one named Othoſunde, from the emperor Otho, ſurnamed the Great, who, about the year 948, made an inroad this way, penetrated even as far as this country, and, caſting his javelin into the water, gave it the name it ſtill retains. The beſt horſes in Denmark are bred in that part of the dioceſe named Salling. In this territory are comprehended 16 prefectorſhips, or bailiwicks, 218 pariſhes, and three garriſons. The moſt conſiderable towns are, 1. Wyburg, which ſtands in the middle of North Jutland, of which it is the capital city. It is a place of great reſort, being the ſeat of a high court of judicature, which receives the appeals from inferior courts, but none can be made from it, except to the king. This Wyburg has been the ſee of a biſhop for above 600 years; but the exact time cannot be fixed; for it is a matter ſtill diſputed whether this or Aalburg be the moſt ancient. The biſhop and chapter ſtill ſubſiſt. It ſtands near a branch of the gulf of Limford, called Virkſund, and was anciently called Cimmerſburg, as being the chief city of the Cimbri; but whence it had its preſent name is not certain. 2. Scheve, or Schiffhnis, which ſtands on the ſame gulf, and is ſituated 12 miles from Wyburg to the north-weſt. The peninſula of Salling, ſurrounded on all ſides by the ſame gulf, except towards the ſouth, is the moſt noted place in Denmark for fine horſes, which are exported by foreigners. 3. Nibe, one the ſame gulf, 18 miles from Wyburg to the north-eaſt, is alſo noted for a good breed of horſes.

Aalburg dioceſe is the moſt northern part of Jutland, and ſurrounded by the ſea on all parts, except on the ſouth, where it is divided from Wyburg and Ripen by the gulf called Limford, which runs from the Baltic Sea above 50 miles acroſs the country, and is ſhut out of the German Ocean by a narrow iſthmus, or neck of land, made by the ſand-hills on the weſt ſhore of Jutland, over-againſt a great ſhoal called Juſche-Riff. This dioceſe is about 70 miles long, from the ſouth-weſt to the uttermoſt point of Schager-Riff, in the north-eaſt; but as it is of a triangular form, its breadth is not equal every-where, being but about 40 miles where broadeſt. The north part of this dioceſe, which is cut off by the gulf (for the city of Aalburg lies on the ſouth-ſide of it) is called Wenſuſal, and by Latin authors Vandalia, whence ſome apprehend it was the ſeat of the Vandals.

Vandals. The inhabitants are the hardieſt of the king of Denmark's ſubjects. The country is fruitful, and pretty well enriched by trade. It is divided into 13 bailiwicks, which contain 177 pariſhes, 100 caſtles, and the following cities and towns. 1. Aalburg, ſo called from the great quantity of eels taken in the gulf of Limford, ſtands on the ſouth ſhore of it, about ſix miles from the Categate to the weſt. It is the ſee of a biſhop, founded about the year 1060; but the biſhops reſided anciently at Burglaw, whence the dioceſe was then called the dioceſe of Burglaw; but ſince the reformation, the Lutheran biſhops have had their palace at Aalburg. 2. Wenſuſal, or Burglaw, ſtands on the river Ryaa, which, 14 miles lower, falls into the gulf of Limford, from which this city is as many miles diſtant to the north. It was formerly the ſee of a biſhop, which has been removed to Aalburg. 3. Schagen, Scagen, or Skau, as the inhabitants call it, is ſeated on the promontory, or cape, which it gives name to; and is the moſt northern land of Jutland, betwixt the Norwegian ſea and the Categate, or Schager-Rack. The town is more frequented by merchants from all parts of Europe than any other town in Jutland, becauſe they touch here in their way to the Sound. Its trade would be far greater ſtill, were it not for the dangerous coaſt it lies on. 4. Nikioping ſituated in the Iſle of Mors, made by the gulf of Limford, is a conſiderable town. 5. Tyſted, on the ſouth-weſt part of this dioceſe, ſtands near 30 miles from Aalburg to the weſt, in the middle of the iſthmus made by the German Ocean and gulf of Limford, which is the moſt fruitful place of this diſtrict. This town is noted for a kind of univerſity, which was firſt a free-ſchool only, founded by Chriſtian the Third. 6. Seeby is a ſmall ſea-port town on the eaſtern ſhore, 15 miles diſtant from Schagen, towards the ſouth-weſt.

SLESWICK, or SOUTH JUTLAND, is an ancient duchy dependent on the kingdom of Denmrk; for, in the year 1128, king Nicolas the Firſt gave it to his nephew Canute, the ſon of Eric. Denmark was afterwards deprived of it; but, in the year 1459, Chriſtian the Firſt re-united it to that kingdom. It is about 86 miles in length, and 60 in breadth, being bounded by Jutland on the north, by the Baltic on the eaſt, by the duchy of Holſtein on the ſouth, and by the German Ocean on the weſt. It is watered by ſeveral ſtreams, which render it exceeding fruitful in moſt parts, and in general abounds in meadows and paſtures. The eaſtern parts lie conſiderably higher than the weſtern, and in the latter there are large plains, which produce a great plenty of all ſorts of corn. The nobility here are rich, and the common people enjoy a great ſhare of independence. This duchy is divided into four circles, viz. Gottorp, Tonderon, Flenſburg, and Haderſleben. The principal cities and towns are the following:

1. Sleſwick, the capital of the whole duchy, which is ſituated on a ſmall arm of the ſea, called the Sley, at the diſtance of about 38 miles from Gluckſtadt to the north-eaſt, and 28 from Lemden to the eaſt. Chriſtianity was eſtabliſhed here in the ninth century, and the great church founded by Eric Barn, in conjunction with St. Anſchar, biſhop of Hamburg; and in the year 930, king Harold Blatand erected an epiſcopal ſee. Afterwards the Sclavonians invaded theſe parts in the year 1065, deſtroyed the church, and reſtored the pagan ſuperſtitions; but ſoon after theſe foreigners were expelled, Chriſtianity was reſtored, and the cathedral rebuilt. In the next century it became a place of great trade, and much frequented by merchants from Great-Britain, France, Spain, Flanders, &c. The ſoil, eſpecially towards the ſouth and eaſt, is not very fruitful; but the town is ſufficiently ſupplied with all neceſſaries of life from the neighbouring country, and the Sley affords abundance of fiſh. They brew beer here, which is not very palatable; but they import ſome from abroad, as well as wine, which is pretty cheap.

Among the public buildings is a ducal palace, which they ſhew to ſtrangers: it does not contain much that is worthy of notice, except a library, which contains a few ancient manuſcripts, and a cabinet of rarities in natural hiſtory, which has ſeveral things that are really curious. In the gardens are ſome water-works, and many walks in the old taſte, which the poor people of this country think great exertions of magnificence. The principal church is ancient, and a very large fabric; it contains many monuments of the ducal families, but none that will yield much entertainment to a traveller. In the ſuburbs there is a church dedicated to St. Michael. Sleſwick was formerly the ſee of a Roman Catholic biſhop, and is now that of a Proteſtant ſuperintendant.

A few miles diſtant from Sleſwick, to the ſouth, are yet to be ſeen, in many places, the ruins of the famous wall and trench which was built in ancient times by the Daniſh kings, againſt the incurſions of the Saxons. It is thought to have been begun by Gotherick, or Gothofred, king of Denmark, to keep out the armies of the emperor Charles the Great, about the year 808; and afterwards improved by queen Thyra, and other Daniſh monarchs, and rendered ſo ſtrong, as to be eſteemed impregnable by the counſellors of Henry, ſurnamed the Lion, duke of Saxony. This rampart was called Danewark, and, like Hadrian's wall in England, is reported to have reached from ſea to ſea, quite acroſs this neck of land.

2. Gottorp was the ancient ſeat and patrimony of the dukes of Holſtein, the chief branch of which family, after the royal one, took from thence the title or ſurname of Gottorp. It is about ſix miles diſtant from Sleſwick to the ſouth-weſt, and ſtands on the Sley, which almoſt ſurrounds it, and carries veſſels of ſmall burthen to and from the Baltic. This place is, at the ſame time, a fortreſs, and a noble palace, being accounted one of the fineſt ſeats in all theſe northern parts. The caſtle ſtands to the weſt of the Sley, in the middle of a little lake, and is built in the form of an oblong ſquare, fortified with four baſtions of earth; the bottom is paved with free-ſtone, the curtains are long, and the ſides ſtand north and ſouth. You approach the caſtle by a bridge, which joins it to the ſouth ſhore. It is commanded by a mountain that ſtands north-eaſt of it, from whence the Danes annoyed the caſtle in the year 1675, when the duke was treacherouſly ſurpriſed by the king of Denmark at Rentſburg. The duke, before his death, had deſigned to rebuild the caſtle, but the front only is finiſhed; if the whole had been completed, it would have been one of the fineſt palaces in Europe. A rampart encompaſſes the firſt court, and the gate of the caſtle is a fine blue ſtone, as hard as marble, with a lantern over it that has 27 lights.

On the north ſide of the caſtle there is a bridge of 200 paces over the lake; and, at the end of the bridge, a walk, between two rows of trees, that lead to the garden, which is adorned with many fine water-works and caſcades. On the left there is a baſon, or fiſh-pond, 200 paces ſquare, with rows of trees on all ſides, except to the north; there are, alſo, fine arbours on the ſides of the pond; and, in the middle, a Hercules, of a monſtrous ſize, repreſented with his club, going to kill the Lernæan hydra. Out of every part the water plays. In every corner of the pond, there are ſtatues which form caſcades. On the north there

is a parterre, in the form of a creſcent, divided into ſeveral compartments, with niches round, containing buſts of many kings, and modern princes. There are alſo the repreſentations of many fabulous animals, that throw water. At the end of the walk there is a ſmall room, in which is to be ſeen a globe, made by the famous Tycho Brahe, ſo contrived, that, by mechaniſm, it repreſents his ſyſtem of the world. There is another admirable globe of copper, 10 feet and an half in diameter, with a ſphere, wherein the ſun moves in the ecliptic, and all the heavenly bodies are carried round in exact order, by means of certain wheels, which are turned about by water conveyed from the adjacent mountain. Before this houſe there is a level ground 50 paces broad, and three times as long, divided into three parts: thoſe on the ſides have fine parterres, and that in the middle has a great baſon in the centre, with water-works; the next terrace is higher; and the whole is encloſed with green pales, as high as each terrace, with buſts all round.

From the higheſt terrace there is the fineſt proſpect perhaps in the world, viz. the caſtle in the front, in the middle of a lake ſurrounded with a charming country, and a fine plain before it. On the left there is a great orangery, or green-houſe, where they keep the Indian trees, myrtles, pomegranates, and other exotics, in boxes. The park is noble, about four Engliſh miles in circumference, and full of fallow deer and ſtags. There is a toll-booth, or cuſtom-houſe, where all toll is paid for great numbers of black cattle that paſs from Jutland into Germany; this produces a conſiderable ſum to the king of Denmark, ſince, in ſome years, toll is paid for above 50,000 head of cattle.

3. Eckrenford ſtands on a little gulf of the Baltic, which makes a very commodious haven, and affords it a conſiderable trade, being one of the ſafeſt ports on that ſhore. It is about 22 miles diſtant from Gottorp to the eaſt, and ſix from Kiel towards the north.

4. Chriſtianpreis, the capital of a bailiwick of that name, which borders on the duchy of Holſtein, is ſituated on a gulf of the Baltic, at the entrance of the haven of Kiel, and is commanded by a caſtle that was built in 1637, by Chriſtian IV. king of Denmark. It is about five miles diſtant from Kiel to the north, and four from Eckrenford to the eaſt. It has about 500 houſes, and two gates, defended with ſtrong works. The Eyder ſerves for a ditch, and makes it inacceſſible; and where the river grows narrower they have built a creſcent in the water, with port-holes for 16 pieces of cannon.

5. Frederickſtadt, thus called from its founder, Frederick, duke of Holſtein and Sleſwick, who built it in the year 1621, peopled it with Hollanders, and granted them great privileges. He endeavoured alſo to ſettle a ſilk trade there, and, for that purpoſe, ſent an embaſſy to Muſcovy and Perſia, which gave occaſion to Adam Olearius, ſecretary to it, to publiſh an account thereof in an excellent book of travels. This town ſtands on the banks of the river Eyder, and is 24 miles diſtant from Sleſwick towards the weſt, and 24 from Gluckſtadt to the north. It is built after the Dutch faſhion, and all religions are tolerated there. The town is ſquare, and ſurrounded with a large canal, planted with rows of trees. It is divided into two parts by another canal, alſo with trees on the ſides. The Lutheran church is built with bricks, and very neatly.

6. Tonderon is alſo ſituated on the river Eyder, 10 miles below Frederickſtadt, and about 14 miles from the German Ocean. It is not an ancient town, but it has a good trade, which increaſes daily, by means of its commodious harbour formed by the Eyder. It was formerly well fortified, but the fortifications were demoliſhed in 1714 by the Danes, who, after a long blockade, forced the town to ſurrender upon terms. This is the capital of the bailiwick of Eyderſtadt, and much frequented by the Dutch, who buy black cattle here.

7. Flenſburg, the capital of a diſtrict known by the ſame name, as well as that of Angelen, or Engeland (the country of the Angles, who invaded South Britain, and beſtowed upon it the appellation of England) is ſituated eight miles to the northward of Sleſwick, on the gulf of Flens, formed by the Baltic; and the harbour is ſo commodious, that ſhips of great burden may come up, and lie loaded from the warehouſes.

8. Huſum, which is 10 miles from Tonderon, and ſituated on the gulf of Hover, was formerly flouriſhing and opulent, but it is now greatly decayed; its ruin being deduced from the three capital cauſes, war, inundations, and conflagrations.

9. Lohm-Cloſter is an inconſiderable town ſituated on the river Lohm-Beoke, about 10 miles from the German Ocean.

10. Haderſleben is a large ſea-port town, by the lake of Haderſleben, which runs into a narrow gulf, that diſembogues itſelf into the Baltic. The inhabitants carry on a tolerable trade by means of the fiſh that are caught in great plenty, both in the lake and gulf.

11. Timder, 12 miles to the weſtward of Haderſleben, is a remarkable neat town, ſituated in a fertile ſoil, on the ſouthern bank of the river Wydaw. Here is a ſmall ſtrong fort, which the king keeps in excellent repair. The harbour, however, is choked up at preſent, and the town hath ſcarcely any trade.

12. Apenrade is ſituated at the bottom of a gulf of the Baltic, 25 miles north of Sleſwick. It is defended by a tolerable citadel; but has, nevertheleſs, been fequently plundered in time of war.

13. Luxburg, or Gluckſburg, is four miles to the eaſtward of Flenſburg, near the ſame gulf, but on the oppoſite ſide. It is but a ſmall town, yet has a caſtle, and gives title to the dukes of Holſtein-Gluckſburg.

The Duchy of HOLSTEIN, part of the king of Denmark's German dominions, lies on the north-eaſt ſide of the river Elbe, and is one of the richeſt provinces in the dominions of that monarch. A traveller, who had acceſs to the public records of the kingdom of Denmark, and received many curious particulars from the unfortunate prime miniſter Count Struenſee, thus deſcribes this duchy.

The great duchy of Holſtein, which is all united to the Daniſh dominions at preſent, is famous for its fine paſtures, and for producing excellent beef. Great quantities of horned cattle are brought up in Jutland, and other provinces of Denmark, and brought here to be fattened: and their beef, beſides what is uſed for the conſumption of Hamburg and Lubeck is ſalted, dried, and exported; the former to Holland, and the latter to all parts of Lower Germany; and, together with an excellent breed of horſes, of which great numbers are exported yearly, bring conſiderable ſums of money into the province, of the whole of which the court of Denmark has not hitherto found the means to drain them; ſo that this province may juſtly be ſaid to be the richeſt in the Daniſh dominions.

Holſtein is bounded on the weſt by the German Ocean, on the eaſt by the Baltic, on the ſouth-eaſt by Mecklenburg, on the ſouth-weſt by the river Elbe, and on the ſouth by the territory of Hamburg, and by Lauenburg. It is 80 miles in length, 60 in breadth, where broadeſt, and divided into four principal parts, or provinces, viz. Holſtein Proper, Wagria, Stormar, and Ditmarſh.

This

This duchy is remarkably fertile, and contains many rich marſh, paſture, and meadow lands. Dykes have been cut through the marſh lands at an immenſe expence, not only to drain off the waters, which naturally accumulate there, but to drain off ſuch as are occaſioned by the inundations both of the ſea and rivers, which are frequent. Theſe, however, give ſuch a richneſs to the ſoil of the marſhes, that cattle are bred in great numbers, and fattened in them; and vaſt quantities of excellent butter and cheeſe are made of the milk. In ſome parts of them they ſow wheat, barley, peas, beans, rape-ſeed, &c. which thrive exceedingly. Sheep are bred in the more ſandy, heathy, and barren diſtricts; and woods and orchards abound in other parts. The beef, veal, mutton, lamb, and pork, are all fat and palatable; and the beſt ſea and river fiſh are caught in great plenty. The Holſtein horſes are exceeding beautiful, and, on that account, are highly prized both in Denmark and Germany. The principal people uſually farm out their cattle to a kind of bailiff, who runs all hazards, receives all profits, and allows the proprietor ſo much per head for the whole: thus the gentry receive a certain income without having any trouble, and the bailiff is ſufficiently rewarded for his pains, as he uſually makes a fortune by the extra profits.

In general, the country is plain and level, and watered by the rivers Eyder, Stor, and Trave, with many rivulets, dykes, &c. An odd cuſtom prevails here, which is, to drain the lakes and ponds, at certain times, and ſell the carp, lampreys, pike, perch, &c. which are found in them; and then ſome years after to ſow them with oats, or uſe them for paſture; and after that to lay them under water, and breed fiſh in them again. The houſes and churches are very neat; for the people here, with reſpect to nicety, reſemble the Hollanders. The duchy contains about 30 cities and towns, great and ſmall, and 600 pariſhes. The clergy are annually choſen, and removeable at pleaſure. The people are rigid Lutherans; ſo that they give but very little countenance to Calviniſts, and are ſtrongly prejudiced againſt the Roman Catholics. With regard to their character, in other reſpects, they are, in general, well made, finely featured, fair, ſtrong, courageous, and ſo celebrated for their integrity, that the expreſſion Holſteinglaube, or *honeſt Holſteiner*, is proverbial throughout Germany, Denmark, &c.

The principal cities, towns, &c. in Holſtein, are,

1. Lubeck, an imperial city, and chief of the Hans Towns, is ſituated at the conflux of ſeveral rivers, the largeſt of which is the Trave. It is 12 miles from the Baltic, where it has a fine harbour, 25 miles north of Lauenburg, 40 north-eaſt of Hamburg and 117 ſouth-weſt of Copenhagen. It is a biſhopric, under the archbiſhop of Bremen, and was tranſlated hither from Oldenburg in 1163.

This is a government or republic within itſelf, with royal juriſdiction, viz. to make and execute its own laws, as well in civil as in capital cauſes. From the conſiſtory there lies an appeal to the ſenate of the city, which conſiſts of four burgomaſters, two ſyndics, who are civilians, and ſixteen common-council-men; each of whom has his particular province, and they are all for life: but the common council is only formed of lawyers and merchants, with an excluſion of mechanics. Father and ſon, or two brothers, cannot be in the regency at the ſame time.

The name of Lubeck is ſuppoſed to be derived from Lob-eck, the German word for a point of land, which agrees with its ſituation. It is an ancient place, and, as the Poles ſay, was founded by one of their kings, who conquered this part of the kingdom; but the Germans aſcribe its foundation to Codeſchalk, one of the kings of the Vandals, in 1040. It has ſuſtained wars, both offenſive and defenſive, for ſeveral years, not only againſt the dukes of Mecklenburg, but againſt the king of Sweden. It is ſaid to have been a conſiderable city when taken in the year 1134, by Crito, a prince of Reugen, who deſtroyed it; but it was rebuilt in the year 1140, by Adolph II. count of Holſtein, and then firſt endowed with the immunities of the city. In 1158 it was again reduced to a heap of ruins by fire, and was afterwards reſtored by Henry the Lion, duke of Saxony, in whoſe time the collegiate church was founded. In 1164, the famous league of the Hans Towns was begun here; and their college is ſtill kept, together with their records, and common ſtock raiſed by contributions. In 1181 the emperor Frederick I. brought it under ſubjection to the empire; but Henry the Lion retook it; upon which it fell into the hands of Holſtein, and afterwards of Denmark. The city having ſuffered greatly by fire, particularly in 1276, was rebuilt in the handſome manner now ſeen; the ſenate having made an order that none of the houſes ſhould, for the future, be built with timber, or covered with thatch. In 1350 it was almoſt depopulated by the plague, which carried off vaſt numbers of the inhabitants.

At preſent, this is a fine noble city, ſpacious, and well fortified; two miles in length, and more than one broad; the ſtreets being ſtraight, uniform, and wide. Many of the ſtreets have rows of lime-trees on the ſides, and a canal in the middle. The churches are magnificent, and about twenty of them have high ſpires. The two chief ſtreets leading from the cathedral, and the Miller's Gate, to the royal and caſtle gate, being the higheſt parts of the city, are interſected by others that deſcend gradually on each ſide to the Trave and Wagnitz rivers. The houſes are large and ſtately, being built of brick, covered with tiles, generally high, and adorned with ſculpture. The river Trave brings ſhips into the very heart of the city, which is near ten miles from the ſea. The largeſt veſſels, however, unload at Travermund, a fort on the bay of Lubeck. The principal trade is to Riga, Revel, Narva, and Peterſburg; and the magazines and warehouſes are well ſtocked with the productions and commodities of England, France, Spain, Holland, the Eaſt and Weſt Indies, &c. The fortifications are ſtrong, well finiſhed, and kept in good repair. The baſtions are lofty and extenſive, the out-works numerous, and the haven defended by ſeveral forts and ramparts. The ſeveral market-places are large, and well ſupplied; and the public buildings ſtately, particularly the ſenate-houſe, arſenals, hoſpitals, &c. All parts of this city are ſerved with water by pipes from a reſervoir.

St. Mary's church is the moſt conſiderable in the place, being a lofty edifice, ſtanding in the midſt of the city, and has a double ſteeple, 217 yards high, built in 1304. The inſide of it is profuſely ornamented with pillars, monuments, &c. but there are few of them which deſerve much notice. The great altar is very richly executed in marble, by Quillin, who executed ſo many at Antwerp; and near it is a famous clock, which is the moſt remarkable object at Lubeck, exhibiting the ecliptic, zodiac, equator, and tropics, and the planets in their ſeveral courſes; which are ſo minutely done, that the ſtation of any of them is to be found at every hour of the day. It ſhews the regular variations of the celeſtial bodies, ſun riſing and ſetting, the eclipſes, feſtivals, and other remarkable days; all which it will continue to ſhew till the year 1875. Beſides all this, there are ſeveral automatons; and, among others, a figure of our Saviour, with a door on its right hand, which opening at twelve at noon,

out come, in order of proceſſion, the emperor and the ſeven eldeſt electors, and, turning to the image, make a profound obeiſance; this the figure returns by a wave of his hand; after which the whole group retires in the ſame order, through a door on the left, and both doors ſhut directly. In the tower is another piece of machinery, the chimes, which play the hours with a pleaſing melody, and minute exactneſs. Under them is the bell, on which is ſtruck the hour. This is performed by a figure of Time; whilſt a leſſer figure, repreſenting Mortality, and ſtanding at the other ſide of the bell, turns aſide his head at every ſtroke. This work, for its preſervation, is ſurrounded with a frame of wire. By the inſcription it appears to have been erected in 1405.

Here is, among others, a very curious piece called Death's Dance, which repreſents human beings in all ſtations of life, from an emperor to the meaneſt perſon, and from an old man to an infant, led round a circle by ſo many ſkeletons, ſhewing that death ſpares neither age or condition.

Lubeck cathedral is a building of very great antiquity, being erected in the year 1170, by duke Henry the Lion, anceſtor of the preſent elector of Hanover. The occaſion of building it is mentioned in an inſcription on one of the walls, viz. that Henry the Lion, duke of Saxony, hunting in this part of the country, caught a ſtag, with a gold collar and croſs about its neck, on which was this inſcription, *Hoc me Cæſar donavit*, "Cæſar gave me this;" containing the date of the year, which which was in the reign of Charlemagne: and the duke, from ſurpiſe at this accident, erected this cathedral, for commemoration of it, on the ſame ſpot, and endowed it with a handſome revenue. In the top of the church is to be ſeen the figure of the ſtag.

The next ſtaple commodity to corn is beer, which is in high eſtimation, not only as a pleaſant liquor, but as a medicine, when externally applied to bruiſes, wounds, &c. Here are ſeveral hoſpitals, which are well ſupported. There is one for ancient people of both ſexes, which was once a caſtle, from whence the citizens drove out the Daniſh garriſon. St. Ann's is for orphans, and other children of poor burghers, who are inſtructed in ſome handicraft buſineſs; and there is an apartment for the confinement of libertines and lunatics. There are two other hoſpitals for the reception of poor travellers, where they are allowed three days refreſhment, and then ſent forward with a paſs; but ſuch as happen to be ſick, are provided with all neceſſaries till they recover or die. The richeſt foundation of this ſort is St. George's Cloyſter, which is chiefly for the maintenance of ſuch artificers as are grown old and paſt their labour. There is alſo St. Gertrude's hoſpital, which is a peſt-houſe. There are, moreover, ſeveral alms-houſes, endowed by the merchants, for the maintenance of the widows of poor members; beſides ſeveral little ſtreets of houſes for the widows of other poor citizens.

2. Travemund, dependent on Lubeck, from whence it is but nine miles to the north-eaſt, and thirty-two weſt of Wiſmer, is a little town near the mouth of the river Trave. One of the counts of Holſtein ſold it, in 1320, for 4000 marks, to the Lubeckers, who fortified it with four good baſtions, erected a light-houſe to guide the ſhips at night, and commonly keep a garriſon here of 3 or 400 men, commanded by a burgher of Lubeck, who receives his orders from the burgomaſters, and admits no perſons into the place without a paſſport. It was ſeized by the czar in 1617, in order to ſecure tranſports for his troops; but he was perſuaded to quit it. There is a peninſula over-againſt it, about a quarter of a league in circumference, which belongs to the duchy of Mecklenburg. The river Trave riſes out of a great lake, in the juriſdiction of Segeberg; and, after a ſerpentine courſe from north to ſouth, by Segeberg and Oldeſlo, turns ſhort to the eaſt, waters the city of Lubech, of which this town is the port, and then falls into the Baltic.

3. Oldeſlo, or Odelſo, on the river Trave, ſeven miles ſouth of Segeberg, eighteen weſt of Lubeck, and thirty-one north-eaſt of Hamburg, is a little old town, which was formerly a very flouriſhing place, and the capital of this part; but ſuffered ſo much by the nighbouring princes, who contended for this province, and by a duke of Brunſwick, who deſtroyed its ſalt-works, to favour thoſe of Lunenburg, that it is greatly decayed.

4. Travendal, on the ſame river, within a mile of Segeberg, is only noted for ſeveral treaties betwixt the king of Denmark and the duke of Holſtein in 1700, for adjuſting the duke's rights.

5. Eutin, or Utin, about ſixteen miles from Lubeck, has given title of duke, and ſeat, to the younger ſon of the duke of Holſtein, ever ſince the year 1596.

6. Ploen is a town almoſt ſurrounded by lakes: it is the capital of what is deemed a principality of the ſame name. It has a palace, which ſtands high, and commands a beautiful proſpect, and is adorned with pleaſant gardens and a park. The neighbouring lakes and woods furniſh great quantities of fiſh and timber, upon the ſale of which the inhabitants principally ſubſiſt.

7. Oldenburg, or Altenburg, was once a very conſiderable town, but is now fallen to decay. It is ſituated near the Baltic, twenty-ſeven miles north of Lubeck, and gives name to a ſmall diſtrict. In ancient times the Sclavonian kings kept their court here.

8. Lemden is a market-town on the confines of Sleſwick, not far from the Eyder. It is celebrated for its beer, which is ſent into many parts of the circumjacent country, and even tranſported abroad.

9. Meldorp, or Meldorf, is a large town, ſtanding on a river or ſtream, called the Meele. It has ſome trade, and three market-places round its church, diſtinguiſhed by the names of the north, ſouth, and weſt markets. Here is likewiſe a public ſchol for the ſtudy of the claſſics and rhetoric.

10. Heyde is a large but poor town, ten miles to the north of Meldrop.

11. Krempi is a ſmall open town, on a little river of the ſame name.

12. Gluckſtadt is ſituated on the north ſide of the Elbe, twenty-ſix miles ſouth-weſt of Hamburg, It is a neat well-built town, and ſo ſtrong as to be deemed impregnable. The Danes have 2000 men in garriſon here, and ſome men of war in the harbour, which is very ſafe and ſpacious. Here the Calviniſts have a church, the Roman Catholics a chapel, and the Jews a ſynagogue. The town was founded in 1620, when Chriſtian IV. king of Denmark, ordered it to be called *Gluckſtadt*, which implies *Fortunate-Town*. There being no ſprings about the town, the inhabitants uſe rain-water, or that of the river. Thoſe who are convicted of theft receive this ſentence—to draw, during life, the duſt-carts belonging to the town, to which they are chained like ſlaves.

13. Bredenberg, or Breitenburg, is a village on the Stor, defended by a caſtle; it gives name to a lordſhip that has long been the property of the ancient and celebrated family Ranzau.

14. Primeburg is a market-town on the Pinace, thirteen miles from Hamburg, and fourteen from Gluckſtadt. It is only remarkable for giving name

name to a county which fell to the crown of Denmark by the death of its laſt count, in 1640.

15. Altena, a large and populous village, is joined by a row of houſes on the Elbe to Hamburg. It had its name from the king of Denmark, as it is ſaid, purely to banter the deputies of Hamburg. The latter remonſtrated to him againſt building this town too near their city; and having frequently obſerved thereupon, in their diſcourſe to the king, Dat is al te na," which, in the language of this country, is, " It is too near;" the king, taking particular notice of the three laſt monoſyllables, ſaid to the deputies, he could not excuſe himſelf if he did not go on with the buildings; but that, to oblige them, he would call it by the name they had given it. It was formerly a refuge, not only for inſolvent debtors, but even malefactors, that came from Hamburg; becauſe, although the inhabitants, a few fiſhermen and ſailors, ſubject to the king of Denmark, depended entirely on the trade and buſineſs of that city, yet it was quite out of his juriſdiction.

This place is noted for a treaty in 1689, between the king of Denmark and the duke of Holſtein-Gottorp; but much more for its calamity in 1712, when count Steinboch, the Swediſh general, having juſt defeated the king of Denmark and his army at Gadebuſch, came and burnt this town to the ground. The reaſons pretended by the Swedes were, that magazines of bread, beer, &c. were preparing here for the Muſcovites and Saxons; and that it was partly in repriſal for the burning of Staden, and other cruelties committed by the Danes and Muſcovites in the duchies of Bremen and Pomerania: but there was this difference as to Staden, that the Danes beſieged it in form, and deſtroyed it by their bombs; whereas, Steinboch was judged to act the part of an incendiary. As ſoon as he appeared before Altena, he ſent in a meſſage to adviſe the inhabitants to retire with what they could carry off, for that he was going to deſtroy their town. The magiſtrates came out in a body, and, falling at his feet, offered him 50,000 rix-dollars to ſave the town; but Steinboch inſiſted on 200,000, which they were ready to comply with, and only deſired time to go to Hamburg for the money; but the General would admit of no delay; ſo that the poor inhabitants were obliged to turn out; the mothers with their infants at their breaſts, and ſons with their aged and infirm parents on their backs, others groaning under loads of houſehold goods, and all lamenting their fate with the moſt lamentable cries. The Swedes ſtood at the barriers with flaming torches in their hands while they paſſed, and, before they were all gone out, entered the town, and ſet fire to all parts of it, which burnt 2000 houſes, with ſeveral fine magazines, and the Popiſh church. Several old men and women, beſides infants, periſhed in the flames; but they ſpared the Lutheran and Calviniſt churches, with about 80 houſes that lay neareſt to Hamburg. Never was greater deſolation known. But what completed the ruin of this place was the raging of the plague at the ſame time in Holſtein, inſomuch that the Hamburgers were forced, for their own preſervation, to ſhut the gates againſt the diſtreſſed neighbours, many of whom periſhed with cold and want. The king of Denmark relieved them as far as the neceſſity of the times would permit, and cauſed them to be ſupplied with materials for rebuilding their town.

The buildings at Altena are now better in appearance than thoſe of Hamburg; the ſtreets are ſtraight and regularly built, wide, and well paved. There is a town-houſe erected; and ſeveral other public buildings ſhew that the place is on a flouriſhing and improving hand. The merchants' houſes are on the water ſide, ſo that ſhips unload and load at their doors. The king of Denmark made it the ſtaple of the Daniſh Eaſt India company, which has been of very great importance to the town. This meaſure was an admirable one; for Altena, by means of her ſituation, diſtributes the India goods where no other town in Denmark could: ſhe ſends large quantities into moſt parts of Germany, and herein rivals the Hamburgers, who are forced to buy theirs of the Dutch. In all theſe points the intereſt of Denmark has been very well conſidered for this laſt century, from a noble attention in their kings to promote whatever has been moſt for the intereſt of their ſubjects.

Toleration is allowed here, which is denied at Hamburg, to all Chriſtian ſects, of whom there is ſaid to be a greater variety at Altena than in any city of Europe, except Amſterdam. The Calviniſts of Holland and France have handſome churches, built altogether on two ſides of the ſame court. The Papiſts, though tolerated, are not ſo publicly countenanced as the Proteſtants.

16. Kiel is a town of great trade at the mouth of the river Swentin, on a bay of the Baltic, and the capital of all Holſtein, 17 miles eaſt of Renſburg, 24 of Gottorp, 36 north-weſt of Lubeck, and 48 north of Hamburg, and ſtands between hills on an arm of the ſea, where it forms a lake. It has a good harbour, well frequented by ſhips from Germany, Sweden, &c. and is populous and wealthy.

Both the town and harbour are defended by a caſtle on a neighbouring hill. On the right, or eaſt ſide of this caſtle, the ſea waſhes its walls; and on the other ſide of the bay there is a delightful country, though woody. On the left there is a ſmall arm of the ſea, and another delicate country adjoining to it. There is a garden facing the caſtle, which is the only place whereby Kiel has communication with the main land; only to the left of the caſtle there is a row of houſes leading to a village called Brunſwick. This garden, which ſtands along the ſea ſide, is above 200 paces broad, and conſiſts of a terrace walk, levelled with the foundation of the caſtle, from whence there is a deſcent to parterres full of all ſorts of flowers, and adorned with a fountain and wilderneſs; and this leads to other parterres, from whence there is a ſmall aſcent to another terrace. It ſuffered very conſiderably during the war between Sweden and Denmark. An univerſity was eſtabliſhed here by the duke in 1665, which has had many learned profeſſors.

It is divided into the new and old towns, of which the former is the largeſt and moſt pleaſant, the ſtreets being planted with rows of trees. The old town, which is a ſort of peninſula, is fortified by deep ditches; and there are fine walks of trees on the harbour. There is a palace facing the town on the north ſide, but it is in very bad repair. Here are ſeveral conſiderable buildings, particularly a large church and an hoſpital, which, before the Reformation, was a Franciſcan monaſtery.

In this town, the trade is not ſo conſiderable as it was in the time of duke Frederick, who ſent an embaſſy to Perſia in 1633, to ſettle a commerce with that country. But it is much enriched by its yearly fair, which is kept for three weeks after Twelfth-day, and frequented by multitudes of all ranks, eſpecially by the nobility and gentry of the duchies of Sleſwick and Holſtein, who meet every evening at a houſe, where there is a variety of gaming; and very often parties are made for ſupper, which is generally followed with a ball. Vaſt ſums of money are here negotiated; and payments made of ſums contracted beforehand, as punctually as by an Amſterdam banker upon the Exchange; inſomuch that the man who does not preſerve his credit at this fair, is looked upon as a bankrupt, and ſubjected to puniſhment, beſides

the ſcandal. During this fair Hamburg looks like a deſert, becauſe every body hurries hither to pay their rents, to renew their leaſes, or to let out money, &c. by which means the town, which at other times is but inconſiderable, is ſo full, that it is difficult to get lodgings. The old town is ſeparated from the new one by a bridge, at the end whereof is a draw-bridge and gate, guarded.

17. Renſburg is ſituated near 20 miles weſt of Kiel, and 32 ſouth-eaſt of Lunden, being near the borders of Sleſwiek. It is ſmall, but well built, and very ſtrong, having modern built fortifications, a capacious moraſs on one ſide, and a neat old caſtle, with a round tower, on the other. The town is ſurrounded by the river Eyder, which forms two ſmall lakes, that abound with fiſh. It is divided into the old and new town.

18. Wilſter is a ſmall town on a river of the ſame name, ſix miles from Gluckſtadt.

19. Itzehoe is a ſmall town on the river Stor, which is navigable from thence to the Elbe. The country from hence to Hamburg is remarkably pleaſant, and exceeding fertile. The town is divided into the old and new, the latter of which is extremely well built. Here is a Lutheran nunnery for ladies of quality, but they do not make vows, or lie under thoſe reſtrictions which are cuſtomary in Roman Catholic convents. It conſiſts of an abbeſs and 19 other ladies, and has the advowſon of ſeveral churches annexed to it.

To our deſcription of the continent of Denmark, we ſhall here add its iſlands, which comprehend the principal parts and places in the Daniſh dominions, becauſe, collectively conſidered, they are the ſeat of regal and legiſlative government, contain the metropolis of the realm, the general archives of the nation, and are the ſources whence flow the chief political, civil, and eccleſiaſtical decrees, ſtatutes, &c. They are likewiſe ſo abſolutely blended with, and nearly contiguous to, the other main parts of the nation, that it would be impoſſible to deſcribe Denmark as a kingdom, without taking them into particular conſideration. But, before we enter into a deſcription of theſe parts of the Daniſh monarchy, it will be neceſſary to premiſe a few obſervations concerning the Baltic.

This ſea, or rather inland gulf, ſituated between Denmark, Sweden, Germany, and Ruſſia, receives into its boſom ſeveral other gulfs, particularly the gulfs of Finland, Bothnia, Livonia, and Dantzick. It is remarkable that this ſea, or gulf, neither ebbs or flows; and there is always a current from it, that ſets through the Sound into the ocean. It is likewiſe generally frozen over three or four months in the winter ſeaſon.

ZEALAND, called alſo Zeeland, or Seeland, is the moſt extenſive and fertile iſland of the Baltic, and the principal part of the kingdom of Denmark. It is bounded on the eaſt by the Sound, which divides it from Schonen, and on the weſt by the Greater Belt, which ſeparates it from Funen. The iſlands of Moon, Falſter, and Laland, lie on the ſouth; and on the north are the Categate and Schagerack. It is almoſt of a round form, being 70 miles in diameter, and about 200 in circumference. The land, in general, is low, and very fertile; and its woods, foreſts, &c. abound with game. The coaſt is indented with many gulfs, bays, creeks, &c. which are of great commercial uſe, as they afford many ſecure harbours. The ſea vapours render the air thick, but not unwholeſome, as the people here, in general, live to a very old age; but they are dull, diſpirited, and inactive. Zealand is divided into 26 bailiwicks, called herrits, and theſe contain 346 pariſhes, with ſeveral conſiderable cities, towns, &c. The principal of theſe is,

†

Copenhagen, the capital of the whole kingdom. This city takes its name from the commodiouſneſs of its port; for the word itſelf ſignifies, *The Merchant's Port, or Haven.* It is ſituated on the eaſtern ſhore of Zealand, upon a fine bay of the Baltic, near the ſtreight called the Sound, in 55 deg. 40 min. north lat. and 12 deg. 56 min. eaſt long. This city was originally a mean little village of fiſhermen's huts, which, by the aſſiſtance of the biſhops of Roſchild, gradually roſe to be a conſiderable town, and at length was declared a city, and made the royal ſeat of the Daniſh ſovereigns. The houſes were formerly of wood; but, in the year 1728, almoſt the whole city was reduced to aſhes by fire; and ſince that time it has been more ſumptuouſly and ſecurely built of free-ſtone. The then reigning king exhauſted immenſe treaſures to erect a ſuperb palace; and the town is embelliſhed with elegant houſes, belonging to the nobility, and many magnificent churches, and other elegant public edifices.

An ingenious gentleman, who lately took an accurate ſurvey of this city, ſays, "So few perſons viſit this metropolis, or kingdom, from motives of curioſity, that they are quite ſurpriſed when I aſſure them I have no ſort of buſineſs here, and am only employed in the ſearch of knowledge. There is no face of induſtry or buſineſs here; and Copenhagen, though one of the fineſt ports in the world, can boaſt of little commerce. The public places are filled with officers, either in the land or ſea ſervice; and they appear to conſtitute three-fourths of the audience, both at the comedy and the opera. The number of forces are indeed much too large for this little kingdom. They can boaſt, it is true, a vaſt extent of dominion; but of what importance are the barren and almoſt uninhabited mountains of Norway and Lapland, ſtretching to the pole, or the plains of Iceland, where the inhabitants are yet, and will probably ever remain, in the moſt profound barbariſm? Their dominions in Holſtein are by far the moſt rich, and furniſh a large part of the royal revenue. There needs, indeed, no ſtronger proof of the poverty of the kingdom, than the ſcarcity of ſpecie. I have ſeen no gold, and hardly any ſilver. They pay every thing in paper; and if you loſe a ſingle dollar at the card-table, or the billiard-table, it is given in a bill." The excellency of the harbour is owing to the iſland of Amack, which breaks off the waves, and ſhelters it from the ſurge of the ſea. Here ſtands the arſenal, the exchange, the caſtle, and the mint, with about 500 houſes, known by the name of the New Town.

"The whole city of Copenhagen is about five miles in circumference. It lies very low; but there is a riſing ground within about half a league of it, and two or three little hills that cover it on the weſt-ſide, from whence the city may eaſily be bombarded. It has a very regular citadel on the north and north-weſt, built on the ſhore, with ſeveral fine baſtions, with ravelins of earth, well ſtored with cannon, and paliſadoed. The other ſides are of more difficult acceſs, by reaſon of marſhes. There are ſeveral royal baſtions, with ravelins before the curtains, which reach from the citadel to the ſouth part, and continue beyond the arm of the ſea which ſeparates Zealand from Amack. A circuit of fortifications, conſiſting of eight royal baſtions, and a ravelin, encloſes the new city, the port, and fleet, and faces the tolbooth, or cuſtom-houſe battery, which ſecures the entry into the haven. Theſe fortifications make the city of a round form. The houſes, which are not above 7000 in number, do not take up above half the ground encloſed. The entrance into the harbour is ſo narrow, that one ſhip only can paſs at a time; and this entrance is ſhut up every night

with

with a ſtrong boom. The citadel on one ſide, and a good block-houſe, well furniſhed with cannon on the other, command the mouth of it. Within this haven rides the royal navy, every ſhip having its place aſſigned to it. A wooden gallery ranges round the whole encloſure where the fleet lies, and is laid over the water in ſuch a manner, that all the ſhips may be viewed near at hand, as eaſily and commodiouſly as if they lay on dry land. This harbour is capacious enough to hold 500 ſail, where neither the wind or the enemy can do them the leaſt miſchief. The road without is very good and ſafe, being fenced from the ſea with a large ſand-bank, on the points of which are always two buoys floating, to direct all the ſhips that come in or go out. Here are no tides to fear, and there is always a ſufficient depth of water. Sometimes, indeed, according as the wind blows in or out of the Baltic, there lies a current; but it is neither frequent or dangerous.

AMACK lies eaſt from the city of Copenhagen, on the other ſide of the haven, and is called the Garden of Copenhagen. It is almoſt of an oval form, and was chiefly peopled by Hollanders, ſent thither by Margaret, ducheſs of Savoy, and governeſs of the Low Countries, at the deſire of Chriſtian II. who had married her niece, ſiſter to Charles V. emperor of Germany. He wiſhed that his queen might have pulſe, and other garden-ſtuff, planted there, which none knew ſo well how to cultivate as the Hollanders. Half the iſland was granted to them, and keeps to this day the name of Hollandeſby. They ſtill retain the Dutch faſhions, and ſupply Copenhagen with milk, butter, and cheeſe. The other half of the iſland is inhabited by Danes. Beſides pulſe, and other fruit, which this iſland produces, here is alſo plenty of wheat, barely, and oats. It alſo produces abundance of hares. The inhabitants are induſtrious, and their houſes neat and cleanly.

On this iſland is a place which approaches nearer to the nature of a circus than a ſquare. Each ſide is formed of only one ſingle palace; and in the centre is an equeſtrian ſtatue, in bronze, of king Frederick the Fifth. This place has a good effect, and is much more handſome than the Place des Victoires at Paris. There is a fine collection of paintings in one of theſe palaces, and a very curious private muſeum in another. But the greateſt curioſities, natural and artificial, both of variety and intrinſic value, are preſerved in the Royal Muſeum, in eight chambers, erected over the king's library. The chambers, or apartments, are large and well furniſhed. One of theſe rooms is wholly taken up with medals, antique and modern, each ſort being kept by themſelves, and very judiciouſly arranged; and in a ſeparate caſe are contained the Paduans, and other counterfeit medals, which, in workmanſhip, ſo nearly reſemble the true Grecian and Roman antiquities, that a good judge can ſcarcely diſtinguiſh them from originals. The ſeries of the modern medals of European nations are abſolutely complete, and thoſe of each nation kept diſtinct. Here it is proper to obſerve, by way of explanation, that a Paduan, amongſt medaliſts, is a modern medal ſtruck with all the marks and characters of antiquity. The name is taken from a famous Italian painter, called the Paduan, from Padua, the place of his birth, who ſucceeded ſo well in the cheat, that the beſt judges are at a loſs to diſtinguiſh his medals from thoſe which are really antique.

Among the natural rarities preſerved in the chambers, one of the moſt remarkable is a petrified child. It was cut out of the mother's belly at Sens, in Champagne, in the year 1582, after having lain there between 20 and 30 years; and that it is a human fœtus, and not artificial, is evident beyond all diſpute. Its head, ſhoulders, and belly, are of a whitiſh colour, and very much reſemble alabaſter; the back and loins are ſomewhat brown and harder; but, from the hips downwards, it is of a red colour, and as hard as perfect ſtone can be, exactly reſembling the hard ſort of ſtones generated in the bladder. This fœtus, after it was taken from the mother, was firſt carried to Paris, where it was ſold to a jeweller of Venice, who happened to be there, for about 20l. ſterling; of whom it was afterwards purchaſed by Frederick III. king of Denmark, for 60l. and added to this collection. In one of the chambers are to be ſeen two elephants teeth, each weighing an hundred and fifty pounds, which were dug out of a ſtone quarry in Saxony.

In this fine collection of curioſities there are ſeveral large pieces of ſilver ore, dug out of the mines of Norway in 1666, one of which weighs 460 pounds, and is valued at 5000 crowns. Another piece, ſomewhat leſs, is valued at more than 3000; both being ſo rich, that they are reckoned to contain at leaſt three parts ſilver. They are compoſed of a whitiſh ſtone, the cracks or cavities whereof ſeem to be filled with pure virgin ſilver, which, in ſome places, lie in broad flat plates, and in others like pieces of fine ſilver lace. But what is moſt admired in theſe pieces of ore, are the threads, or branches of ſilver, which ſhoot out an inch or two beyond the ſurface of the ſtone, appearing in the form of ſmall ſhrubs or buſhes. Several other rarities of this kind are to be ſeen among the ſilver ores preſerved in this muſeum. Here are alſo ſeveral large pieces of amber, ſome weighing 40 or 50 ounces; which, upon opening the ditches about Copenhagen, when they fortified the city, were found ſticking to the ſides of old trees that were buried there, like the gum on the plum-trees in our gardens.

In the ſame chamber are a great many large branches of white and red coral, and one of black; likewiſe a pair of ſtag's horns growing out of a piece of wood in a ſurpriſing manner. Here is a human thigh bone three feet three inches long; and two very large ſcollop ſhells, holding about three gallons each, and weighing 224 pounds each. Theſe were brought from the Eaſt-Indies; and, it is ſaid, the fiſh they belong to is of ſuch ſtrength, that if a man happens to get his arm or leg between the ſhells when they open, it claps them together ſo forcibly as to cut the limb clear off.

In this collection a piece of marble is preſerved, which the Lutherans reckon a very valuable curioſity, the natural veins of the ſtone running in ſuch a manner as to repreſent the exact figure of a crucifix. Some, indeed, have ſuſpected the repreſentation to have been by art; but, upon the niceſt examination, it appears to be entirely the work of nature.

Among the artificial curioſities there is a ſkeleton made of ivory, two feet ſix inches high, in imitation of a human one; and it is ſo nicely formed and put together, that it may be eaſily taken for a natural one. There are likewiſe two crucifixes of ivory, and the whole hiſtory of our Saviour's paſſion, beautifully expreſſed in a piece of carved work. A ſmall man of war in ivory, with ſilver guns, is a curioſity much admired; as is alſo a watch made of ivory, with all its wheels and movements. Beſides theſe, there are many other curioſities in ivory, ebony, box, amber, and other materials, which are kept for the ſake of their elegant workmanſhip. There is likewiſe a common cherry ſtone, on the ſurface of which are engraved 220 heads, but their ſmallneſs makes them appear imperfect and confuſed.

In this royal repoſitory are ſix golden ſepulchral urns, which were found in the iſland of Fuen, in

in 1685, by a peaſant, as he was ploughing his land, and contained each of them ſome aſhes of a greyiſh colour. The largeſt of them weighs two ounces and a half, and the others two ounces and a dram. They are extremely thin, and each has three rings of gold about its neck, and ſeveral circles carved upon the outſide of the urn, having one common centre. This diſcovery confirms the accounts given by various writers, that it was an ancient cuſtom among the northern nations to burn their dead, and then bury their collected aſhes in golden urns. There is another ſepulchral urn of cryſtal, of a conical figure, which has alſo a golden ring about it, and was found near Bergen, in Norway.

There are likewiſe in this collection ſeveral veſſels of different ſizes, ſome of glaſs, and others of earth, which are called lachrymal urns, or lachrymatories, being uſed by the ancient Romans to catch the tears of weeping friends, which were afterwards mixed with the aſhes of the deceaſed.

We ſhall cloſe our account of this celebrated muſeum with a deſcription of the Daniſh and Oldenburg horns, two curioſities which are greatly admired. The Daniſh horn is of pure gold, weighs an hundred and two ounces and a half, is two feet nine inches long, and holds about two quarts of wine meaſure. This horn was accidentally diſcovered in the year 1639, by a country girl, in the dioceſe of Ripen, in Jutland, and is undoubtedly a piece of great antiquity, by the figures carved on the outſides, which ſeem to be hieroglyphics, &c. It is likely that ſome of theſe figures were deſigned to repreſent their deities; and the horn was probably uſed in ſacrifices, as among the ancient Aſſyrians, and other nations, who upon ſuch ſolemnities, made a great noiſe with horns and trumpets, and uſed them to drink out of at their ſolemn entertainments.—The Oldenburg horn is of pure ſilver, gilt with gold, weighs about four pounds, and is curiouſly enamelled with green and purple colours. The Daniſh antiquaries relate many fabulous ſtories of this horn, which are not worth repeating; and as to what they ſay of its being given to Otho, earl of Oldenburg, in the year 982, it is plain it cannot be of that date, for the figures and characters on the outſide are modern; which, however, with the enamelling, and other ornaments, are of excellent workmanſhip, and make it a very fine and valuable curioſity.

An ingenious traveller, in his deſcription of the palace of Roſenburg, in the iſland, ſays, it was conſtructed by our famous Inigo Jones, and ſtands in the middle of a large garden. It is ſmall, and at preſent very little uſed by the king, or royal family. There is an air of antiquity in all the apartments, tapeſtry, and furniture, which is not diſpleaſing, and impreſſes with reſpect. The grand ſala, or dining-room in particular, is in this ſtile. The hangings, which are not ill executed, repreſent the various actions by ſea and land, which diverſified the ancient laws between the Swedes and Danes, who ſeem always to have had the ſame rivalſhip and animoſity which the French and Engliſh are diſtinguiſhed for, and which, it is probable, they will ever, in ſome degree, retain. At one end of this grand apartment are three ſilver lions as large as life, who ſeem, by the ferocity and rudeneſs of their appearance, deſigned to characterize the age and nation in which they were caſt. Here are ſeveral cabinets full of curious rarities, which the various ſovereigns of Denmark have ſucceſſively collected and left to their poſterity. Many of them are intrinſically valuable, others only preſerved from ſome event or accident connected with them. Among the firſt is a ſaddle, on which Chriſtian IV. made a ſort of triumphal entry into Copenhagen. It is covered with pearls, diamonds, and other precious ſtones; and the ſpurs are of ſtones enriched with jewels. The coat worn by the king, and a light helmet on the ſame occaſion, are likewiſe covered with pearls. They preſerve likewiſe, with great care, a handkerchief of this prince, dyed with his blood from a wound which he received by a ball, that deprived him of an eye. The man who accompanied us ſhewed me, with exultation in his countenance, a ſword of Charles XII. of Sweden. It is juſt ſuch a ſword as ſuch a monarch may be ſuppoſed to have uſed, and would well become the meaneſt ſoldier. It, indeed, evinces his ſtrength and vigorous frame of body, by its ſize and weight: the blade is at leaſt four feet long, and both the hilt and garde are entirely compoſed of braſs.

The gardens of this place conſtitute one of the chief diverſions of this city, as they are always open, and on feſtivals or Sundays crowded with company. They are large, but not laid out with taſte, or adorned with any productions of art, one ſtatue only excepted, of Hercules vanquiſhing the Nemæan lion, which ſtands under a portico, raiſed to defend it from the inclemency of the weather. This is of Italian workmanſhip; and the artiſt has found means to diſplay great anatomical ſkill and beauty in the attitude and muſcles of the hero, who, by an extraordinary exertion of ſtrength, forces open, and breaks the jaw of his adverſary.

The other principal buildings of Copenhagen are the king's muſe, or ſtables, the orphan-houſe, the opera-houſe, the military ſchool, the royal library, which contains above 40,000 printed books and manuſcripts, in various languages, and the univerſity. With reſpect to the latter, it muſt be obſerved, that, prior to the reign of Chriſtian I. (who was one of the beſt kings that ever ruled the Danes, and, indeed, may be deemed the Alfred of Denmark) the Daniſh nobility and gentry, for want of proper ſeminaries of learning in their own country, were under the neceſſity of ſending their children to the French and German univerſities and colleges for education. To remedy this great inconvenience Chriſtian applied to, and obtained leave of, the pope, to eſtabliſh a public ſeminary of learning in his own dominions, when the univerſity of Copenhagen was accordingly founded in the year 1475. But neither the ſucceſſors of this wiſe and patriotic monarch, or even the clergy, have ſeconded his laudable endeavours with a proper degree of ſpirit: for a very intelligent gentleman, who recently viſited this city, ſays,

"There are ſeveral hundreds of ſtudents in the univerſity of Copenhagen, who were entered upon eſtabliſhments which were made by former kings, when all the neceſſaries of life were very cheap, and when their young men could live decently upon what were allowed them; but now, as all theſe neceſſaries are become much dearer, and as few of thoſe ſtudents have any private fortune, many of them are in the greateſt miſery. I have met with ſeveral young men of lively parts, in the univerſity, which might make a conſiderable figure in the world; but ſince the new titular nobility bear the ſway here, ignorance and impudence, as coming the neareſt to their own character, are rewarded; whilſt real merit, modeſty, and decency, are treated with the greateſt contempt. Some time ſince, the king had a French comedy eſtabliſhed at Copenhagen, to the ſight of which every decent perſon was admitted gratis: but I was really aſtoniſhed to ſee three or four young men of genius refuſed admittance to this comedy, becauſe they were ſtudents in the univerſity, though they were very decently dreſſed, and even ſolicited to be admitted into the galleries; while

while thoſe places were filled with valets de chambre, and others of that claſs. No claſs of people are held in more contempt, in this country, than the ſtudents of the univerſity. What encouragement, then, have men of genius to ſtudy and cultivate the ſciences?"

Elſineur is ſituated about 20 miles north of Copenhagen, on a neck or ſtreight of the ſea, called the Sound, and ſurrounded by walls. The caſtle of Cronenburg, which defends Elſineur, and the caſtle of Helſinburg, on the oppoſite ſhore, command the commerce of the Baltic; for between theſe two forts all veſſels that trade into that ſea muſt paſs; ſo that this ſtreight is moſt frequented of any in Europe, that of Gibraltar excepted. The caſtle of Cronenburg was built by Frederick II. of free-ſtone, brought from Gothland. Every ſhip that paſſes this ſtreight muſt ſtrike ſail at Cronenburg, and come to the town to compound for the cuſtom, under the penalty of forfeiting the veſſel and cargo. Elſineur was ſurrounded with walls under the reign of Chriſtian IV. and peopled not only with Danes, but alſo with citizens from ſeveral nations. The city ſuffered very much when Charles Guſtavus, king of Sweden, beſieged Cronenburg in 1658. It was taken by him, but reſtored to the Danes by the treaty of Copenhagen in 1660. This was the native place of the celebrated John Iſaac Pontanus, though his parents were of Haerlam in Holland. He was doctor of phyſic, profeſſor in the univerſity of Hardewyck, and hiſtoriographer to the king of Denmark, and the province of Gelderland.

Cronenburg caſtle is 4 or 500 paces diſtant from Elſineur, on the ſpot where ſtood formerly the fortreſs of Orekrange. It is built upon oaken piles, faſtened with hewn ſtones; and ſo ſolid, that it ſupports the fury of the tide, which ſometimes beats againſt it moſt violently, without damaging it in the leaſt. It makes a large ſquare court, and was adorned with fine ſtatues; the apartments alſo being very ſplendid. The pipes of the ciſtern, which ſupplied the garriſon with water, and the locks of the doors, were all of fine ſilver, before it was plundered by the Swedes. It has four little towers at each corner, covered with copper: but the caſtle, with the chapel, ſteeple, and ornaments of it, are all going to decay. It has a ditch towards the ſea, ſurrounded with another ditch; and the land ſide is ſecured by five baſtions, and a half baſtion. They have five cannons upon them: but the baſtion that ſecures the paſſage of the Sound has but two cannons, 36 pounders each; and 11 more of ſmaller ſize. The rampart is vaulted with free-ſtone. Frederick II. who built this caſtle, ſpent none but his own money in the building of it; and declared, that if he knew there was one ſingle ſtone in it that coſt his people a farthing, he would have it removed. The unfortunate queen Caroline Matilda was confined in this caſtle.

There is a little hunting-ſeat, or palace, about a quarter of a mile from Elſineur, to which the king reſorts, for a few hours, in ſummer. There is nothing worthy of obſervation in the ſtructure itſelf; but from the roof the proſpect is enchanting, as it commands the town of Elſineur, the caſtle of Cronenburg, the Sound, and the coaſt of Sweden, for a conſiderable way.

Oppoſite Elſineur, lies the iſland of HUEN, or Ween, remarkable only for the caſtle of Uraniburg, built by the famous Tycho Brahe. King Frederick II. had given him that iſland for his life, that he might build an obſervatory there, with other buildings proper for his purpoſe. The king gave him alſo a penſion of 2000 golden crowns, a conſiderable fief in Norway, and a prebend in the church of Roſchild. This iſland was perfectly well ſuited to Tycho Brahe's deſign; for it is properly a hill, which riſes in the middle of the ſea, the top of which is flat and ſmooth, and commands a proſpect all over the coaſt of Schonen, and the neighbouring country, affording thus a very extenſive horizon. Add to this, that the ſky is here generally clear, there ſeldom ariſing any fogs. Tycho Brahe laid, towards the middle of the iſland, the foundation of his caſtle, which he named Uraniburg, that is to ſay, the Town of Heaven; and finiſhed it in four years time. From the diſpoſition and convenience of the apartments, together with the engines and inſtruments for obſeration it contained, it was looked upon as a building that had not its equal in the world. In the neighbourhood of it were lodgings for workmen of all kinds, maintained at the expence of the maſter; a printing-houſe, a paper-mill, forges for making of inſtruments, laboratories for chymical experiments, &c. Four years after he built, in the ſouth part of the iſland, another houſe, which he called Stelburg, that is, Starburg; there he kept ſeveral inſtruments, and lodged ſome ſtudents and ſervants, who applied themſelves to ſome particular ſtudy. But Uraniburg is now gone to decay; and the the iſland of Huen belongs now to the Swedes.

The chair in which Tycho Brahe uſed to ſit, to make his aſtronomical obſervations, is ſtill preſerved in the royal muſeum, and held, by the Danes, in the higheſt veneration. "Thus," ſays a judicious traveller, in a letter to a friend, "it ever happens! I need not remind you that the aſtronomer himſelf was driven from his native country by faction and malevolence; or that he died at Prague, in the court, and under the protection, of the emperor Rodolphus, who ſheltered this illuſtrious fugitive, and afforded him an aſylum."

Frederickſburg is a ſmall town, twenty miles diſtant from Copenhagen to the north-weſt, and eighteen from Elſineur to the ſouth-weſt. It is conſiderable only by the ſtately caſtle and royal palace which ſtands near it. That caſtle was formerly but a ſmall ſeat belonging to a private gentleman. King Frederick II. being charmed with its ſituation, bought it of him, and began to enlarge it. His ſon, Chriſtian IV. finiſhed it. This is the Verſailles of Denmark. The houſe is built on piles in a lake. The body of the caſtle conſiſts of a very fair front, with two great wings. The chapel is well adorned, and covered with gilt copper. It has twelve ſilver ſtatues of the apoſtles; and all the locks, bolts, &c. were ſilver, till it was plundered by the Swedes. The hall is adorned with paintings, and has the pictures of ſeveral of the kings of Denmark, and of the royal family, as large as the life; and a frame of paintings, which repreſent the ſea and land battles of the kings of Denmark. It is hung with rich tapeſtry of mohair, repreſenting the actions and battles of Chriſtian IV. There is a gallery which leads from the caſtle to the hall of audience, adorned with pictures, moſt of which were bought in Italy. Here is a park about nine miles long, of a proportionable breadth, and interſperſed with pools and fiſh ponds, with a mixture of green plods, hillocks, and ſmall vallies. It was ſtocked with fallow-deer from England. There is a pretty flower garden behind the caſtle, in the very lake; in which, though it is exceeding deep, they have built a kind of terrace on piles that coſt an hundred thouſand crowns.

The town of Roſchild, or Roſkild, lies at the bottom of the bay of Iſefiord, and is eighteen miles diſtant from Copenhagen to the weſt. It was formerly the capital of Denmark, when the king reſided there; but ſince they have choſen Copenhagen for their reſidence, it has dwindled greatly in point of importance, and is much de-

cayed with reſpect to wealth and commerce. Of twenty-ſeven churches, which formerly embelliſhed this town, only two are now ſtanding. It continues, however, to be the burial-place of the royal family. Among the monuments of the Daniſh ſovereigns, ſome of which are extremely magnificent, ſtands a beautiful marble pillar, erected by queen Margaret, as a ſupport to the whetſtone ſent her by Albert, king of Sweden, to ſharpen her needles, in deriſion to her ſex. But it whetted her reſentment in ſuch a manner, that he ſuffered ſeverely for his ſarcaſm; for he was taken priſoner by the queen, detained ſeven years in cuſtody, and obliged to relinquiſh all his pretenſions to the crown of Sweden.

Here is a convent of Lutheran nuns belonging to the beſt families; but they are not obliged to wear any particular habit, or to be reſtricted by the vows uſual in convents; but are permitted, if they think proper, to quit the convent, and marry. In 1658 the famous treaty of peace was here concluded between Denmark and Sweden. The univerſity is in a declining condition; and, indeed, the whole town exhibits evident marks of poverty and decay.

Sora is ſituated on the banks of a lake, about the centre of Zealand, was formerly the ſeat of a rich abbey, and has many pleaſant fields and foreſts near it. To this place the academy of Frederickſburg was removed, and the foundations of the univerſity were augmented by Chriſtian IV. Charles Guſtavus, king of Sweden, was educated here, and retained ſuch a veneration for the place, that when he invaded Zealand, he would not ſuffer his ſoldiers to enter the town. But the revenues of this ſeminary have been annexed to the crown of Denmark, and the whole is gone to decay. Abſalom, archbiſhop of Lunden, once founded here an eſtabliſhment for the maintenance of thoſe who ſhould write the hiſtory of Denmark; and to this foundation we owe the hiſtory written by the celebrated Saxo Grammaticus.

FUNEN is the next iſland to that of Zealand, in the ſcale of importance among the ſeveral parts which form the Daniſh kingdom. It is bounded by the Greater Belt on the eaſt, by the Leſſer Belt on the weſt, by the Baltic on the ſouth, and by a little channel, which ſeparates it from the iſland of Samſæ, on the north. It is about 36 miles from eaſt to weſt, and 30 from north to ſouth. The country is fertile and agreeable, being finely diverſified with verdant hills, ſhady woods, pleaſant groves, fruitful fields, rich paſtures, &c. The ſoil is good, well cultivated, and affords a great deal of grain, not only for home conſumption, but exportation. Great quanties of black cattle, horſes, hogs, &c. are bred here. This iſland is an appendage to the eldeſt ſons of the kings of Denmark, and is deemed one of the richeſt governments belonging to that ſovereignty. It contains four garriſoned towns, and 264 villages; but the moſt conſiderable places, and the only ones, indeed, worthy of deſcription, are the following:

Odenſee, the capital of the iſland, ſtands about the centre, and is a capacious, well-built, pleaſant town. Here the kings once reſided, and the aſſembly of the ſtates met before the crown became hereditary, and the ſovereign abſolute. In a church here, which is dedicated to St. Canute, the body of that prince was found near a century and a half ago. It was depoſited in a copper coffin, gilt, and adorned with precious ſtones. The moſt particular circumſtance relative to this town, at preſent, is, that the inhabitants brew the beſt beer in the whole kingdom.

On the narrower part of the Greater Belt, between Funen and Zealand, lies Nyburg. This place has ſome trade, the harbour is good, and the adjacent country is fertile. The damages done to the fortifications in the late wars with Sweden, are not yet thoroughly repaired. Embarkations for the iſland of Zealand are made at this town.

Schwenborg is an agreeable town, with a commodious harbour, ſituate on the ſouth-eaſt part of the iſland. From hence Charles Guſtavus, in the year 1658, began his march, over the ice, to the iſlands of Langeland, Zealand, and Falſter.

The ſmall town of Woburg, or Foburg, is ſituate on a little gulf on the ſouthern coaſt of Funen, over-againſt the iſland of Arroe, and is about 10 miles diſtant from Schwenborg to the weſt.

In the duchy of Sleſwick, on the ſouth-weſt coaſt of this iſland, over-againſt Haderſleben, lies Aſſens. It is about 11 miles diſtant from Odenſee to the ſouth. In the year 1535 the army of king Chriſtian III. commanded by John Rantzaw, routed that commanded by Chriſtopher, earl of Oldenburg, and killed Guſtavus Troll, archbiſhop of Upſal. Rantzaw afterwards levelled this town with the ground.

On the weſtern ſhore of the iſland, lies Middlefar, on the Leſſer Belt, hence alſo called Middlefar-Sound. It is 17 miles diſtant from Aſſens to the north-weſt, and as many from Odenſee towards the ſouth-weſt. It is a ſmall, but neat town, in a country abounding with all the neceſſaries of life. It is the common paſſage from this iſland to Colding in Jutland; the Belt not being broader here than the Thames is at Graveſend. On the 13th of January 1652, Charles Guſtavus, king of Sweden, led his army over the ice to this place, routed the Daniſh forces that oppoſed him, and made himſelf maſter of the whole iſland of Funen.

FALSTER lies to the north-eaſt of Laland, from which it is ſeparated by a narrow ſtreight. This iſland has Zealand on the north, and the iſland of Moon on the north-eaſt. It is 20 miles in length, and eight in breadth. Its ſoil is very fruitful; and much corn is ſent from hence to Mecklenburg, and other parts of Germany. It is divided into two bailiwicks; that of the ſouth, or Synder-Herrit; and that of the north, or Norre-Herrit. It has ſeveral towns; among which the chief are Nycoping, on the weſtern coaſt of the iſland, of which it is the capital. It is one of the moſt pleaſant and well-built towns in the whole kingdom, and ſtiled, by Dr. Heylin, the Naples of Denmark. It has a ſtrong caſtle, and a well frequented harbour. Stubcoping, in Latin, Stubcopia, ſeated on the north coaſt, is a place of ſome trade, being the uſual paſſage from Zealand into Germany.

ARROE is ſituated near the coaſt of Funen, being eight miles in length, and two in breadth. It is extremely fruitful in corn, and abounds in aniſeed, with which the inhabitants give a flavour to their bread, and ſeaſon their meat. In this iſland are plenty of horſes and black cattle; and ſome woods, in which are abundance of hares. The whole iſland has but three pariſhes, the moſt conſiderable of which is Kopin, or Kioping. The town belonging to it ſtands on the ſouthernmoſt part of the iſland, and bears the ſame name as the pariſh. It has a trade on account of its port, and is ſituated at the bottom of the bay.

LALAND is ſituated on the eaſtward of Langeland, and to the ſouthward of Zealand, from which it is ſeparated by a narrow ſtreight, called Grone Sound. From its lowneſs, or flatneſs, it has the appellation of Laland, or Lowland. It is near 40 miles in length, and about 20 in breadth, where wideſt. The ſoil is very fertile; ſo that Copenhagen is ſupplied from hence with great quantities

quantities of corn, beſides what the Dutch traders are furniſhed with for exportation. This iſland is divided into five diſtricts, or bailiwicks, is the ſeat of a governor, and has ſeveral ſmall iſlands ſubject to its juriſdiction. It contains various pleaſant little villages and hamlets, and a few ſeats belonging to the nobleſſe, excluſive of four towns, Naſcow, Saxcoping, Levenſcoping, and Nyſted.

Naſcow, or Naxkow, the capital, is 59 miles ſouth-weſt from Copenhagen, and has a commodious harbour for trade. The fiſhery is of ſome conſequence, and the circumjacent country is rich in meadow and paſture lands.

MOON lies to the ſouth-eaſt of Zealand, and to the north-eaſt of Falſter. It is about 20 miles long, eight broad, and full of high chalky hills. Here is ſome paſture ground, but very little corn land. It was formerly part of the Daniſh admiral's allowance, as being the firſt place for him to reſide in. There are in this iſland ſeveral villages, large pariſhes, and a conſiderable city, called Stege, or Stekoe, which lies on the north of the iſland, on a little rivulet, that a mile lower falls into the ſtreight called Grone Sound. This city made a brave defence againſt the Lubeckers in the year 1510, and forced them to retreat: and the valour of the inhabitants of the whole iſland was ſignalized in 1659, when they defended themſelves better againſt the Swedes than the larger iſlands had done.

LANGELAND is 22 miles long, and eight broad, is ſituated on the Greater Belt, to the ſouthward of Funen. This iſland abounds with wheat, rye, and barley, of which the natives export great quantites. It is divided into 16 pariſhes, and Rutcoping, on its weſtern coaſt, is the moſt conſiderable town, being defended by the fort of Traneker, which is always furniſhed with a ſtrong garriſon.

FEMEREN lies near the coaſt of Holſtein, from whence it is ſeparated by a ſtreight which is not above two miles broad, and is called Der Femmer Sundt, i. e. the Streights of Femeren. Though it is but a ſmall ſpot of ground, yet it has always been looked upon as one of the keys of Denmark, with regard to the empire. Therefore king Chriſtian IV. was more afraid of the Germans becoming maſters of this iſland, than of their overrunning Jutland, which cauſed him to fortify all the old caſtles, and put ſtrong garriſons in every place of importance here. This iſland is extremely fruitful in corn and paſtures, and yet has but two pariſhes, namely, Borg and Peterſdorp. There is a fort at the place where people land from Holſtein, called Fethſchans, that is, the Fort of the paſſage.

BORNHOLM, anciently called Boringia, is ſaid to have been diſcovered by Thicloraus, the ſon of a prince of Jutland. It is the remoteſt and moſt eaſterly of all the iſlands belonging to the king of Denmark, being about 75 miles diſtant from Zealand to the eaſt, and not above 15 from the neareſt coaſt of Schonen to the ſouth-eaſt. It is about 18 miles long, from north-weſt to ſouth-eaſt; and about 10 in breadth, from ſouth-weſt to north-eaſt. Bornholm is a place of great importance for its ſituation and fruitfulneſs, and belonging once to the archbiſhop of Lunden; but king Chriſtian II. took poſſeſſion of it in the year 1524, as being abſolutely neceſſary for the fleet he was preparing againſt Sweden; which uſurpation George Seſteburg, who was then archbiſhop, oppoſed with all his power, but in vain; for he was forced afterwards to fly into Germany, to avoid the effects of the king's diſpleaſure. The Swedes have frequently laid this iſland waſte; and in the war with Frederick II. they made themſelves maſters of it, and deſigned to keep it; but they were obliged to reſtore it by the treaty of Copenhagen, concluded May 27th, 1660. The moſt conſiderable places are Sandwyck, on the northern coaſt; Ratenby, on the ſouth-weſtern; Nex, on the eaſtern; and Sand-Hamer, to the north of Nex, on the ſame coaſt; beſides which here are ſeveral villages.

Many little iſlands ſurround the above-mentioned more conſiderable ones; but they are either uninhabited, or of ſo little importance, as not to be thought worthy of notice by travellers, or of mention by geographers. Some others are contiguous to them, and belong to the other provinces of Denmark; the moſt conſiderable of which are Samſoe and Leſſaw, on the coaſt of Jutland.

SAMSOE, or SAMSOI, is in the Baltic, eight miles from the coaſt of Jutland. It is near nine miles in length, three in breadth, fruitful, healthy, and pleaſant.

LESSAW belongs to the dioceſe of Aabur, oppoſite to which it lies, at about the diſtance of 12 miles from the ſhore. It is ſurrounded by ſand-hills, but has two places where ſhips may ride ſafely at anchor, on the north and eaſt ſides, and contains three ſmall villages.

Appertaining and contiguous to the duchy of Sleſwick, are the following iſlands, viz.

1. ROM, which is in length ſeven, and in breadth four miles, contains ſeveral ſmall hamlets, and about 1500 inhabitants. Towards the eaſtern parts the paſturage for cattle is excellent; and on the weſtern ſide of the iſland are ſeveral harbours, in which ſmall veſſels may ride in ſafety.

The greateſt part of Manoe, formerly a conſiderable iſland, has been ſwallowed up by the ſea.

2. SYLT, ſituated to the northward of Fora, and is of a triangular form, the longeſt ſide being about 14 miles in length. It is ſandy, barren, and inhoſpitable; and the people, who are a hardy, clowniſh race, are annually engaged in the whale fiſheries, on the coaſts of Iceland, Greenland, and Spitzbergen. Earthen urns, containing human bones, aſhes, &c. have been found in the hills of this iſland, which further evinces that the ancient inhabitants burned their dead.

3. NORTHSTRAND lies oppoſite to the bailiwick and town of Huſum, and was, it is ſaid, ſeparated from the continent by a violent ſtorm. When it became an iſland it was about 12 miles long, and four broad, in ſome places, and in others leſs. Its ſoil is very fruitful, and produced abundance of corn before the inundations we ſhall mention hereafter. It had alſo very fat paſtures, where they fed exceeding good cattle; and they uſed to ſend daily to Huſum, and other places, a prodigious number of ſheep, fowls, ducks, and geeſe, and great quantities of butter. It contained 21 or 22 pariſhes, and about 8000 inhabitants; but it has ſuffered prodigiouſly at ſeveral times by fatal inundations. In the year 1300 the little city of Rungholt, with ſeveral churches and villages, were carried away by the waves, which drowned alſo great numbers of people, as well as cattle.

In 1532 there aroſe ſuch a violent ſtorm here, that almoſt the whole iſland was overflowed; when 1600, or, according to others, 1900 perſons periſhed in the water. The next year another ſtorm damaged the dykes very much. From 1612 to 1618, there happened every year ſuch inundations, as occaſioned prodigious loſſes, and put the inhabitants to very great expence; and particularly in 1615, when 300 perſons periſhed in the

waves. They were afterwards free for ſome years, and had time to repair their banks and dykes; but all their care and precautions proved ineffectual againſt the ſtorm that happened October the 11th, 1634. At ten of the clock at night the whole iſland lay under water, above 6000 perſons were drowned, and, of all the inhabitants, there were hardly 1500 that ſaved their lives. The churches, which ſtood on the riſing grounds, held out the ſtorm indeed, but fell down afterwards; and 28 windmills were carried away by the waves. The loſs of cattle of all ſorts was reckoned to amount to 50,000 heads; and the dykes were broke in 44 different places. The whole iſland continued thus overflowed, except a ſmall ſpot of ground which ſtood higher than the reſt. Since that time the inhabitants have laboured, with the aſſiſtance of ſome Dutchmen, to regain part of the land they had loſt.

4. AMRON, or Amroen, is a ſmall iſland to the north-weſt of Northſtrand, from which it is about ſeven miles diſtant. It is in the form of a creſcent, and is only conſiderable for its oyſter fiſhery.

5. FORA, or Foehr, lies towards the north-eaſt of Amron, and nearer the coaſt of Sleſwick, between Northſtrand and Sylt. It belongs to the prefectorſhip of Tunder, and is of an oval figure, about ſix miles in length, and four in breadth. It abounds in cattle and corn, has about 4200 inhabitants, and ſeveral villages. The inhabitants ſtill preſerve the language, manners, and dreſs of the ancient Friſons, though ſome of them ſpeak the dialect of Lower Saxony.

Denmark is extremely well ſituated for commerce; her harbours are well calculated for the reception of ſhips of all burthens, and her mariners are very expert in the navigation of the different parts of the ocean. The dominions of his Daniſh majeſty furniſh a great variety of timber, and other materials for ſhip-building; and there are many productions for exportation in ſome of his provinces. Beſides fir, and other timber, here are black cattle, horſes, butter, ſtock-fiſh, tallow, hides, furs, train-oil, tar, pitch, and iron, which being the natural product of the country, are properly denominated exports; theſe enable Denmark to carry on a very profitable trade with France, Spain, and the Mediterranean; but the exportation of oats is prohibited. Salt, wine, brandy, and ſilk from France, Portugal, and Italy, are the imports. The Danes have lately had a great intercourſe with England, from whence they import broad-cloths, clocks, cabinet and lock-work, hardware, &c.

But the commercial ſpirit of the Danes appears in a very favourable light, when we conſider their ſettlements in the Eaſt and Weſt-Indies. A company for carrying on the former was eſtabliſhed at Copenhagen in the year 1612, under the protection of Chriſtian IV. About four years after the eſtabliſhment, four large ſhips ſailed for the Eaſt-Indies; and the Danes made a ſettlement at Tranquebar on the coaſt of Coromandel. Here they built a fort, which is reckoned the ſtrongeſt in the Indies. This colony ſoon increaſed from the encouragement given by the Danes to the Indians, who, finding themſelves protected in their privileges, and permitted to carry on their trade without oppreſſion, reſorted to Tranquebar in ſuch numbers, that the commerce ſoon became very valuable, and the company received a yearly tribute of 10,000 rix dollars. But not content with this increaſing eſtabliſhment, the Danes attempted, in the year 1620, to make a ſettlement on the iſland of Ceylon, in order to acquire the ſpice-trade, then monopolized by the Portugueſe.—This ſcheme, however, failed in the attempt, and the Danes having embroiled themſelves with the Indian princes on the continent, their ſettlement at Tranquebar muſt have been taken by the rajah of Tranjour, had not Mr. Pitt, an Engliſh Eaſt-India governor, generouſly ſent them aſſiſtance.

After the death of Charles XII. of Sweden, when the wars in Europe were ended, the Daniſh Eaſt-India company found themſelves ſo much in debt, that they publiſhed propoſals for a new ſubſcription for enlarging their ancient capital ſtock, and for fitting out ſhips to Tranquebar, Bengal, and China. The capital was conſiderably enlarged for theſe purpoſes by a ſpirited ſubſcription, which alarmed France and the maritime powers. The Dutch raiſed a proceſs againſt the projects of Van Aſperin, who, being a ſubject of the States, was condemned and executed in effigy. Every objection that could be ſtarted againſt the accompliſhing of the ſcheme, was publiſhed in the newſpapers of Paris, London, and Amſterdam, with a view to diſcourage people from engaging in the commerce. The miniſters of Great-Britain and Holland, who reſided at the court of Denmark, were ordered to make remonſtrances to his Daniſh majeſty againſt this new charter, which they apprehended would interfere with the Eaſt-India trade of their ſubjects. The king prudently anſwered, that he was not reſtricted by any treaty whatever from ſupporting and extending the traffick of his ſubjects by every means in his power, provided he did not infringe the laws of nature and nations, which he had no intention to violate. After great difficulties the company was eſtabliſhed, their commerce extended, and they now carry on an advantageous trade to China, and the coaſt of Coromandel. Their credit is extenſive; their funds are conſiderable; their ware-houſes, magazines, yards, and docks in complete order; and they ſend annually two or three ſhips richly laden to the Eaſt-Indies.

Beſides the trade to the Eaſt-Indies, the Danes have extended their commerce to the Weſt-Indies, where they poſſeſs the iſlands of St. Thomas and St. Croix, and the ſmall iſland of St. John, which are free ports, and celebrated for ſmuggling; alſo the fort of Chriſtianburg on the coaſt of Guinea, and to Greenland. Within a ſhort period of time, the Daniſh merchants have opened new channels of trade, particularly with the Mediterranean; the number of ſhips has been doubled, and the revenues of the kingdom increaſed in proportion.

Denmark is not famous for its antiquities, if we except the royal Muſeum at Copenhagen, which conſiſts of a very numerous collection of them. Beſides artificial ſkeletons, curious carving in ivory, models, clock-work, and a beautiful cabinet of ivory and ebony made by a Dutch artiſt who was blind, here are a great variety of aſtronomical, optical, and mathematical inſtruments, which are placed in the round tower at Copenhagen, ſo contrived that a coach may drive to its top: a ſet of medals ancient and modern: and two famous antique drinking veſſels, one of gold, and the other of ſilver, and both in the form of a hunting horn. That of gold ſeems to be of Pagan manufacture, and from the raiſed hieroglyphical figures on its outſide, it was probably made uſe of in religious ceremonies: it is about two feet nine inches long, weighs 102 ounces, contains two Engliſh pints and a half, and was found in the dioceſe of Rippen, in the year 1739. The other, of ſilver, weighs about four pounds, and is termed Cornu Oldenburzicum; which, they ſay, was preſented to Otho I. duke of Oldenburg, by a ghoſt. Some, however, are of opinion that this veſſel was made by order of Chriſtian I. king of Denmark, the firſt of the Oldenburg race, who reigned in 1448.

The conſtitution of Denmark was heretofore of the free Gothic original. The convention of the

ſtates, even including the repreſentatives of the boors or peaſants, elected a king for his perſonal virtues, having a due regard to the ſon of their late monarch, whom, however, they made no ſcruple of ſetting aſide, if they deemed him unworthy of the royal dignity. They enacted laws, conferred the great offices of ſtate, debated all affairs relative to commerce, peace, war, and alliances; and occaſionally gave their conſent to the impoſition of neceſſary taxes. The king was in reality no other than chief magiſtrate, generaliſſimo, and, as it were, prime miniſter to his people. His buſineſs was to ſee juſtice adminiſtered impartially; to command the army in time of war; to encourage induſtry, religion, arts and ſciences, and to watch over the intereſts of his ſubjects. He had no public revenue from the ſtate, but lived like a private nobleman from the produce of his own lands and demeſnes. Such was the conſtitution of Denmark till the year 1660, when it underwent a very extraordinary revolution.

At the concluſion of the peace with Sweden, the nation reſounded with the clamour of miſery and diſcontent. There was nothing left in the public treaſury to pay off and diſband the army, which therefore became inſolent and licentious. The common people, and even the burghers, were exhauſted by the long expenſive war: the clergy were unſatisfied with their condition and want of importance, and the nobility were become proud and tyrannical. When the eſtates aſſembled to deliberate and redreſs the grievances of the nation, the commons propoſed that an equal tax ſhould be laid upon all perſons without diſtinction, in proportion to their circumſtances. The nobles pleaded their privilege of being exempted from all impoſition. The burghers alledged, that as the nobility engroſſed all the lands and riches in the kingdom, it was reaſonable they ſhould bear their ſhare of the common burthen; in conſequence of this, violent diſputes enſued. At length a nobleman, named Otto Craeg, ſtood up, and in a tranſport of paſſion told the commons, that they neither underſtood the privileges of the nobility, who were always exempted from ſuch impoſitions, nor the condition of themſelves, who were no other than their ſlaves. This inglorious term produced an immediate ferment in the aſſembly, and the hall reſounded with murmurs and altercations. Nanſon, ſpeaker of the commons, ſtarting up in a rage of indignation, ſwore that the nobility ſhould repent their having branded the commons with ſuch an opprobrious epithet. He had previouſly concerted the deſign with the biſhop of Copenhagen, and the court was not ignorant of their intention. The clergy and burghers breaking up in diſorder, marched under the auſpices of theſe leaders to Brewer's-Hall, where, after much debate, they agreed to make a ſolemn tender of their freedom and ſervices to the king, that he might become abſolute monarch of the realm, and ſee the right of hereditary ſucceſſion eſtabliſhed in his family. Next morning they marched in couples, each burgher being paired with a clergyman, through the ſtreets, which were filled with the populace, who ſhouted as they paſſed to the council-hall, where the nobles had re-aſſembled. There Nanſon, in a ſhort harangue, ſignified the intention of the clergy and commons, demanded the concurrence of the nobles, and threatened that, in caſe of a refuſal, they would forthwith proceed without them to the palace. The nobles, confounded and abaſhed, endeavoured to gain time: they profeſſed a deſire of concurring with the other ſtates, but deſired that an affair of ſuch infinite conſequence might not be precipitated. The others, being deaf to their remonſtrances and entreaties, continued their proceſſion to the palace, where they were met by the prime miniſter, who conducted them to the hall of audience. There the biſhop of Copenhagen, in a florid ſpeech, as deputy from the two orders, made a ſolemn tender to the king of an abſolute and hereditary dominion; aſſuring his majeſty, that he might command their purſes and arms, to ſupport a meaſure ſo neceſſary to the welfare of his people. He received them graciouſly, aſſented to the propoſal, thanked them for their zeal and confidence, and aſſured them they might depend upon his royal favour and protection. The city gates were immediately ſhut, that none of the ſenators ſhould eſcape, a precaution by which the nobles were ſo greatly intimidated, that they immediately ſignified their readineſs to concur with the ſtep which the other two orders had taken. Preparations were forthwith made for this ſtrange inauguration. Scaffolds were raiſed in the open ſpace before the caſtle, and the troops and burghers received orders to appear in arms, under their reſpective officers. On the ſixteenth day of October, in the year 1660, the king, queen, and royal family, aſcended an open theatre, and placing themſelves on chairs of ſtate, under canopies of velvet, received in public the homage of all the ſenators, nobility, clergy, and commons, couched in an oath of allegiance compoſed for the purpoſe. Thus the people, with a raſh and deſperate hand, from motives of revenge, fomented by an artful miniſtry and ambitious clergy, reſigned their liberty and independence, and inveſted their ſovereign with a deſpotic power over their lives and fortunes.

Soon after this extraordinary revolution took place, the king of Denmark diveſted the nobility of many of the privileges which they had before enjoyed; though he took no method to relieve or reward thoſe poor people by whoſe means he was inveſted with the ſovereign power, but left them in the ſame ſtate of ſlavery in which they were before, and in which they have remained to the preſent age.

When the revolution in the reign of Frederick III. had been effected, the king re-united in his perſon the rights of the ſovereign power; but as he could not exerciſe all by himſelf, he was obliged to intruſt ſome part of the executive power to his ſubjects. The ſupreme court of judicature for the kingdoms of Denmark and Norway is holden in the royal palace at Copenhagen, of which the king is the nominal preſident. The German provinces have likewiſe their ſupreme tribunal; which for the duchy of Holſtein is holden at Gluckſtadt, and for the duchy of Sleſwick in the town of Sleſwick.

The king for the moſt part decides matters of importance in his council, the numbers of which are named and diſplaced at his will. In this council the laws are propoſed, diſcuſſed, and receive the royal authority; here likewiſe great changes or eſtabliſhments are propoſed, and approved or rejected by the king; and in the council, or in the cabinet, he grants privileges, and decides upon the explication of laws, their extenſion, or their reſtriction, and upon the moſt important affairs of the kingdom, according to his ſovereign will and pleaſure.

The kings of Denmark not only preſide nominally in the ſovereign court of juſtice, but they have a throne erected in it, towards which the lawyers always addreſs their diſcourſes in pleading, and the judges the ſame in giving their opinion. The king is preſent every year at the opening of this court, and often gives the judges ſuch inſtructions as he thinks proper. The deciſion of thoſe judges is final in all civil actions; but no criminal ſentence of a capital nature can be carried into execution till it is ſigned by the king. There are

three courts in Denmark, and an appeal in extraordinary caſes lies from the inferior to the ſuperior tribunal. As every man is permitted to plead his own cauſe, a trial is attended with very little expence; nor can any ſuit be ſuſpended longer than 18 months.

In Denmark, the judges are puniſhable for any miſdemeanors they may be guilty of, and there are many excellent regulations for the due adminiſtration of juſtice; but notwithſtanding this, it is ſo far from being diſtributed in an equal and impartial manner, that a poor man can ſcarcely ever obtain juſtice in this country againſt one of the nobility, or againſt one who is favoured by the court or by the chief miniſter. If the laws are ſo clearly in favour of the former, that the judges are aſhamed to decide againſt them, the latter, through his influence with the miniſter, procures an order from the king to ſtop all the law-proceedings, or a diſpenſation from obſerving particular laws; and thus every rule of equity being perverted and ſet aſide, the lower claſs of ſubjects are aggrieved and injured without any poſſibility of redreſs.

The code of laws at preſent eſtabliſhed in Denmark was publiſhed by Chriſtian V. founded upon the code of Valdemar, and all the other codes which have been ſince publiſhed, and is nearly the ſame with that publiſhed in Norway. Theſe laws are contained in a quarto volume, drawn up in the language of the country, in ſo plain and perſpicuous a manner, and founded upon ſuch unerring principles of juſtice, that the moſt ignorant may underſtand, and every impartial perſon approve of them; and, if carried into execution in an equitable manner, would be productive of many beneficial effects to the people. But as the king can change, alter, and diſpenſe with the laws as he pleaſes, and ſupport his miniſters in their diſregard and violation of them, the people of Denmark undergo a great degree of tyranny and oppreſſion, and have abundant reaſon to regret the tameneſs and ſervility with which they ſurrendered their liberties, and thereby eſtabliſhed abſolute monarchy.

The police is very ſtrict in Denmark, hence highway robberies, burglaries, coining, clipping, &c. are crimes ſcarce ever heard of; and to ſpeak againſt the government is ſo ſtrongly prohibited, that none dare wag their tongues licentiouſly in political matters. The common method of execution here is beheading and hanging: in ſome caſes, as an aggravation of the puniſhment, the hand is chopped off before the other part of the ſentence is executed. The other principal modes of puniſhment are branding in the face, whipping, condemnation to the raſp-houſe, to houſes of correction, and to public labour, and impriſonment. The public executioner, though univerſally deſpiſed, is commonly rich, as he is not only well paid to deprive malefactors of life, but is the general contracter to empty all the privies, and remove from houſes, ſtables, ſtreets, &c. all kinds of filth, and, in particular, dead cats, dogs, &c. which no other Dane will touch upon any account whatever.

The revenues of Denmark ariſe from crown lands, taxes, and duties, and theſe are extremely heavy. Wine, ſalt, tobacco, and proviſions of all kinds are taxed. Marriages (a moſt impolitic tax!) paper, corporations, land, houſes, and poll money, alſo raiſe a conſiderable ſum. The expences of fortifications are borne by the people; and when the king's daughter is married, they pay about 100,000 rix-dollars towards her portion. The tolls paid by ſtrangers ariſe chiefly from the paſſage of their ſhips through the Sound into the Baltic. The income of this toll is at preſent much leſs than formerly. About the year 1640, it produced 240,000 rix-dollars per annum; but ſince 1645 it has not yielded above 190,000; ſome years not above 80,000; in 1691, it did not extend to full 70,000, and is now much leſs. The tax has more than once thrown the northern parts of Europe into a flame; having been diſputed by the Engliſh, Dutch, and Swedes, who deemed it arbitrary and unjuſt, being originally only a voluntary contribution of the merchants towards the expence of light-houſes on the coaſt; but it was at length, by the treaty of 1720, between Sweden and Denmark, agreed to be paid by the former and other powers. The toll is paid at Elſineur.

The whole revenue of Denmark, including what is received at Elſineur, amounts at preſent to above 5,000,000 of rix-dollars, or 1,002,000l. ſterling yearl. By a liſt of the revenue taken in 1730, it then amounted only to 454,700l. Engliſh money, which is leſs than half the ſum it now produces.

The military force of Denmark conſiſts in its regular troops, militia, and navy. The greateſt part of the regular troops are foreigners, particularly Germans. The cavalry and dragoons are well mounted, and conſiſt of eleven regiments; and each regiment in four ſquadrons, including the body guards. Three of theſe regiments are quartered in Zealand, one in Funen, three in Jutland, and four in Holſtein. The infantry is compoſed of ſixteen regiments; of which two do duty as the king's guards. When the regiments are complete, each conſiſts of two battalions, and each battalion contains ſix companies of 100 each. The artillery conſiſt of three regiments, one of which is ſtationed in Denmark, another in Norway, and a third in Holſtein. The body of engineers is divided into three parts, each of which compriſes twenty officers of various ranks.

Since the late reduction of the Daniſh forces, their numbers are, 10,000 cavalry and dragoons, and 30,000 infantry and artillery, which, with the militia, will make up a body of 70,000 men. Every perſon who cultivates or poſſeſſes 360 acres of land, is obliged to find one man for the militia, and pay half the expence of a man towards a corps-de-reſerve, to be embodied and called out only upon great emergencies. They receive no pay, but are regiſtered on the army liſt, and exerciſed every Sunday.

Though the Daniſh army is extremely burdenſome to the nation, yet it coſts little to the crown: great part of the infantry lie in Norway, where they live upon the boors at free quarter; and in Denmark the peaſantry are obliged to maintain the cavalry in victuals and lodging, and even to furniſh them with money.

The preſent fleet of Denmark is compoſed of thirty-ſix ſhips of the line, and eighteen frigates; but many of the ſhips being old, and wanting great repairs, if they can ſend out twenty-five ſhips upon the greateſt emergency, this is thought the moſt they can do. This fleet is generally ſtationed at Copenhagen, where are the dock-yards, ſtore-houſes, and all the materials neceſſary for the uſe of the marine. They have 26,000 regiſtered ſeamen, who cannot quit the kingdom without leave, nor ſerve on board a merchantman without permiſſion from the Admiralty; 4000 of theſe are kept in conſtant pay, and employed in the dock-yards; their pay, however, ſcarcely amounts to nine ſhillings a month, but then they have proviſions and lodgings allowed for themſelves and families, and a ſort of blue uniform, faced with different colours.

The Daniſh men of war carry the ſame complement of men, in proportion to their guns, as the French ſhips of war do; but they are much inferior,

in point of conſtruction, both to Engliſh and French ſhips of war; and, indeed, are far from being equal to the Swediſh ſhips.

The three laſt kings of Denmark, notwithſtanding the degeneracy of their ſubjects in martial affairs, were very reſpectable princes, by the number and diſcipline of their troops. Frederic IV. eſtabliſhed a marine academy for fifty young cadets, to be trained up to a thorough knowledge of naval affairs, and to be perfectly taught navigation, gunnery, drawing, fencing, hiſtory, geography, geometry, &c. and in order to join practice to theory, they were annually to make a voyage in a frigate, and ſucceſſively to perform the ſervices of common ſeamen, pilots, and officers. But this noble inſtitution is now totally neglected, and the money appointed to ſupport it is ſunk into venal pockets; ſo that except a few officers, who have been bred in the Engliſh and French ſervices, the Danes would have a great difficulty, in caſe of a rupture with any naval power, to find proper perſons to command their ſhips of war.

To the court belong two ancient orders of knighthood, viz. that of the elephant, and that of Daneburgh. The badge of the former, which is the moſt honourable, is an elephant ſurmounted with a caſtle ſet with diamonds, and ſuſpended to a ſky-coloured ribbon, worn like the George in England. This order was inſtituted by Chriſtian I. at his ſon's wedding. It is conferred only on perſons of the higheſt quality; and the number of companions amount to 30 beſides the ſovereign. The order of Daneburgh, though leſs honourable, is much more ancient; ſo that the origin of it is loſt in fable: it is beſtowed, as an honorary reward, upon the nobleſſe of inferior rank, its inſignia being a white ribbon with red edges, worn over the left ſhoulder, from which depends a ſmall diamond croſs and an embroidered ſtar on the breaſt of the coat, ſurrounded with the motto PIETATE ET JUSTITIA, by piety and juſtice.

HISTORY OF DENMARK, NORWAY, &c.

VERY little is known of the early periods of the Daniſh hiſtory. Even the name of the firſt Chriſtian king of Denmark is uncertain; and thoſe of the people whom they commanded were ſo blended together, that it is impoſſible for the reader to conceive a preciſe idea of the whole Scandinavian hiſtory. All that we can diſcover relative to the inhabitants of theſe kingdoms is, that they appear to have been colonies of the ancient Scythians, who ſpread themſelves through all the northern and weſtern parts of Europe. In the 4th century, the Saxons, a name under which the Danes, Norwegians, and other nations of the North were comprehended, committed dreadful ravages on the coaſts of Britain and Gaul, and obliged the Romans to ſtation their forces along the coaſts, under the command of an officer called Comes Littoris Saxonici. Their ravages, like their manners, were cruel and inhuman; their tracks were marked with blood and deſolation; and neither age, innocence, nor religion, could afford protection from the ſwords of thoſe barbarians. They formed ſettlements on the coaſts of Normandy, Ireland, and Scotland; and in the year 1012 made a conqueſt of England.

Few very intereſting events in Denmark preceded the year 1387, when Margaret II. aſcended the throne. That princeſs married Aquin, king of Norway, by which the two kingdoms became united. Aquin died ſoon after; but Margaret, partly by addreſs, and partly by the right ſhe had obtained by her marriage, formed a treaty, anno 1397, by which ſhe was acknowledged ſovereign of Denmark, Norway, and Sweden. This treaty is generally known by the name of the union of Calmar. Margaret, whoſe ſoul was formed for greatneſs, ſwayed the ſceptre of theſe kingdoms with honour to herſelf, and advantage to her country. Her friendſhip was courted by moſt of the European powers, ſo that hiſtorians have juſtly ſtyled her the Semiramis of the North. But like all other ſublunary greatneſs, it was fleeting and tranſient. The ſucceſſors of Margaret were far inferior to her in abilities; and the union of Calmar was ſoon deſtroyed. The Swedes rebelled, and placed Guſtavus Vaſa on the throne of his anceſtors. Norway, however, ſtill continued united to Denmark, nor has there been any rebellion in that kingdom ſince the union.

In the year 1448, the crown of Denmark paſſed to Chriſtian, count of Oldenburgh, from whom the preſent royal family is deſcended. In 1513, Chriſtian II. one of the moſt complete tyrants that modern times have produced, mounted the throne of Denmark; and having married the ſiſter of the emperor Charles V. he gave a full proof of his innate cruelty. Being driven out of Sweden for the bloody maſſacres he committed there, the Danes rebelled againſt him likewiſe; and he fled, with his wife and children, into the Netherlands. Frederic, duke of Holſtein, was unanimouſly called to the throne, on the depoſition of his cruel nephew: he openly embraced the opinions of Luther; and about the year 1536, the proteſtant religion was eſtabliſhed by that wiſe and politic prince, Chriſtian III. He was oppoſed in the Reformation by his biſhops, and therefore ſeized on the lands and revenues of the church, annexing them to his own.

Chriſtian IV. of Denmark, though very brave in his own perſon, wanted the abilities proper for the command of an army. He was choſen head of the proteſtant league formed in 1629, againſt the houſe of Auſtria; but was foiled in every attempt, and even in danger of loſing his own dominions; when he was ſucceeded in the command of the army by the celebrated Guſtavus Adolphus, king of Sweden, under whoſe command the proteſtant forces acquired immortal honour.

Frederic III. who ſucceeded his father Chriſtian IV. in 1648, declared war againſt the Swedes, at the inſtigation of the Dutch. This precipitate conduct had nearly proved fatal to Denmark. Charles took the fortreſs of Frederickſtadt by ſtorm; and in the ſucceeding winter, 1658, marched his army over the ice to the iſland of Funen, where he ſurpriſed the Daniſh forces, made himſelf maſter of Odenſee and Nyburg, and, purſuing his victories, marched over the Great Belt, and beſieged Copenhagen itſelf. Frederic, however, defended his capital with the greateſt reſolution; and Cromwell, who then governed England under the title of Protector, interpoſing, the peace of Roſchild was concluded, by which Frederic ceded the provinces of Halland, Bleking, and Sconia, the iſland of Bornholm, and Bahus and Drontheim in Norway. Frederic was very deſirous of eluding theſe ſevere terms, and poſtponed the ſurrender of the places ſtipulated in the treaty ſo long, that Charles put his army in motion, made himſelf maſter of Cronenburg, and once more inveſted Copenhagen by ſea and land. Frederic bore theſe misfortunes with ſuch an heroic firmneſs and conſtancy of mind, as endeared him to his ſubjects. Charles made ſeveral attacks upon the city, but was always repulſed with conſiderable loſs, and there ſeemed no other way of reducing it but by famine. In the mean time a ſtrong Dutch fleet arrived in the Baltic, and ſoon defeated and diſperſed the Swediſh ſhips which blocked

blocked up Copenhagen by ſea. Animated by this aſſiſtance, the Danes exerted all their power, and Charles was obliged to raiſe the ſiege. The fortune of war was now entirely changed in favour of Frederic, who was actually making preparations for invading the territories of the enemy: but before he was ready to carry his plan into execution, an Engliſh fleet arrived, and the Dutch were obliged to retire. Charles was now enabled to renew the ſiege of the capital; but by the mediation of France and England, a peace was concluded at Copenhagen, by which Charles agreed to reſtore the iſland of Bornholm; and Frederic to cede the iſlands of Rugen, Bleking, Halland, and Schonen, to the Swedes.

The magnanimous behaviour of Frederic, during this deſtructive war, ſo endeared him to his ſubjects, that on the nobles refuſing to ſubject their eſtates to the payment of an equal tax propoſed by the commons to be levied on all perſons whatever, they made the king a tender of their liberties, and the government of Denmark became arbitrary in the manner we have already mentioned.

Chriſtian V. who aſcended the throne of Denmark in 1670, was at firſt very ſucceſsful in his war againſt the Swedes; he recovered ſeveral places in Schonen, that had been wreſted from him, and obliged the duke of Holſtein Gottorp to renounce all the advantages he had acquired by the treaty of Roſchild. While he was purſuing his victories with amazing ſucceſs, fortune forſook his ſtandard, and his army was totally defeated in the bloody battle of Lunden, by Charles XI. Chriſtian, however, determined to perſevere, notwithſtanding the dreadful misfortune he had ſuffered. He raiſed a new army, and led his forces once more againſt the enemy. But he had loſt the veteran part of his forces, and his troops, new to the field, and almoſt ſtrangers to military diſcipline, were totally defeated at the deciſive battle of Landſcroon. Chriſtian was now in no condition of facing the enemy, and his allies having abandoned a cauſe which they conſidered as deſperate, he was obliged, in 1679, to ſign a treaty of peace on the terms preſcribed by France. The love of glory, however, would not ſuffer Chriſtian to abandon his military projects; and being incapable of carrying on the operations of war unaſſiſted, he became a ſubſidiary ally to Lewis XIV. who then threatened Europe with ſlavery. This treaty with the French monarch enabled him to purſue the ſchemes he had formed againſt Holſtein, Hamburgh, and other northern powers; but before any thing of importance could be effected, Chriſtian, after a vaſt variety of treating and fighting with the Hollanders, Hamburghers, and other northern powers, ended his life in the year 1699.

Frederic IV. aſcended the throne on the death of his father, and, like his predeceſſors, maintained his pretenſions to the duchy of Holſtein. He laid ſiege to Tonningen, and would probably have taken the place, had not the Engliſh and Dutch fleets forced him to abandon the enterprize. In the mean time Charles XII. of Sweden, then only 16 years of age, landed in Zealand, within eight miles of Copenhagen, in order to make a diverſion in favour of his brother-in-law, the duke of Holſtein. Charles purſued the war with that rapidity which conſtituted his character, and would, in all probability, have taken the capital of Denmark, had not his Daniſh majeſty agreed to the peace of Travendahl, which was greatly in the duke's favour. By another treaty, concluded with the States-General, Charles obliged himſelf to furniſh a body of troops, who were to be paid by the confederates; and afterwards did great ſervice againſt the French in the war between the allies and Louis XIV.

This, however, did not prevent Frederic from being continually engaged in diſputes with the Swedes; and, taking the advantage of the misfortunes of Charles, he made a deſcent on Swediſh Pomerania, another upon Bremen, and took the city of Stadt. But his troops were totally defeated at Gadeſbuſch, by the Swedes, who laid his favourite city of Altena in aſhes. Frederic had however ſoon after an opportunity of revenging the affront he had received. He made himſelf maſter of great part of Holſtein, and obliged count Steinbock, the Swediſh general, to ſurrender himſelf priſoner, with all his troops. He purſued his victories with ſuch ſucceſs, that in the year 1716 his allies began to ſuſpect that he intended to uſurp the crown of all Sandinavia. Charles now returned from his exile, and carried on the war with great vigour and a moſt embittered ſpirit againſt Frederic; but being killed at the ſiege of Frederickſhall, his Britannic majeſty offered his mediation for a peace, which Frederic durſt not refuſe. Accordingly a treaty was concluded at Stockholm, by which Frederic obtained the duchy of Sleſwick. He died in 1730, leaving the crown to his ſon Chriſtian Frederic, or Chriſtian VI. who made no other uſe of his power, than that of cultivating peace with all his neighbours, and in promoting the happineſs of his ſubjects. He aboliſhed a grievous monopoly eſtabliſhed by his father, relating to the ſale of wine, brandy, and tobacco. He terminated an old diſpute between the crown of Denmark and the city of Hamburgh, by which he obtained ſeveral valuable conceſſions in favour of his people, beſides a million of marks of ſilver. He inſtituted a council of trade, to examine all propoſals for the extenſion and encouragement of commerce: he invited artiſts and workmen from foreign countries, and eſtabliſhed manufactures at his own expence: he maintained a reſpectable fleet and army; and that theſe might not be burthenſome to his ſubjects, he, from time to time, concluded ſubſidiary treaties with foreign powers, by which his finances were always in a flouriſhing condition. In a word, he acted on all occaſions with equal fortitude and diſcretion, as a great king, a wiſe politician, and a prince who had always at heart the intereſts of his people. He died in 1746, much regretted by his ſubjects.

Frederic V. ſon and ſucceſſor of Chriſtian VI. improved upon his father's plan, for the happineſs of his people: but took no active part in the German war, being only a mediator between the contending powers; and by his intervention the treaty of Cloſter-ſeven was concluded between his royal highneſs William, late duke of Cumberland, and the French general Richlieu. He married the princeſs Louiſa, daughter to his Britannic majeſty George II. by whom he had a ſon, his preſent Daniſh majeſty: he afterwards, on the death of his firſt queen, married a daughter of the duke of Brunſwick-Wolfenbattle. He died in 1766, and was ſucceeded by his ſon.

Chriſtian VII. the preſent king of Denmark and Norway, L. L. D. and F. R. S. who was born Jan. 29, 1749; married, in 1766, to the princeſs Caroline-Matilda, youngeſt ſiſter of his preſent Britannic majeſty; and has iſſue Frederic, prince royal of Denmark, born Jan. 28, 1768; and Louiſa-Auguſta, born July 7, 1771. The reign of this young monarch opened auſpiciouſly; but was afterwards darkened by a fatal event, that occaſioned much aſtoniſhment to all Europe, and which is partly attributed to the intrigues of the queen-dowager, mother-in-law to the preſent king, who has a ſon named Frederic, and whom ſhe is repreſented as deſirous of raiſing to the throne. She poſſeſſes a great deal of diſſimulation; and when the princeſs Caroline-Matilda came to Copenhagen, ſhe

ſhe received her with all the appearance of friendſhip and affection, acquainting her with all the king's faults, and at the ſame time telling her, that ſhe would take every opportunity, as a mother, to aſſiſt her in reclaiming him. By this conduct, ſhe became the young queen's confidante, whilſt at the ſame time, it is ſaid, ſhe placed people about the young king, to keep him conſtantly engaged in all kinds of riot or debauchery, to which ſhe knew he was naturally too much addicted: and it was at length ſo ordered that a miſtreſs was thrown in the king's way, whom he was perſuaded to keep in his palace.

When the king was upon his travels, the queen-dowager uſed frequently to viſit the young queen Matilda; and, under the maſk of friendſhip and affection, told her often of the debaucheries and exceſſes which the king had fallen into in Holland, England, and France, and often perſuaded her not to live with him. But as ſoon as the king returned, the queen reproached him with his conduct, though in a gentle manner, his mother-in-law immediately took his part, and endeavoured to perſuade the king to give no ear to her counſels, as it was preſumption in a queen of Denmark to direct the king.

Queen Matilda now began to diſcover the deſigns of the queen-dowager, and afterwards lived upon very good terms with the king, who for a time was much reclaimed. The young queen alſo now aſſumed to herſelf the part which the queen-dowager had been complimented with, in the management of public affairs. This ſtung the old queen to the quick; her thoughts were now entirely occupied with ſchemes of revenge, "and who is able to ſtand before envy?" But her views of this kind appeared the more difficult to carry into execution, becauſe the king had diſplaced ſeveral of her friends who were about the court, who had been increaſing the national debt in times of profound peace, and who were rioting on the ſpoils of the public. However, ſhe at length found means to gratify her revenge in a very ample manner. We ſhall give the particulars of this unfortunate affair in the words of an intelligent gentleman, who made very minute inquiries concerning it, of the moſt cool and diſpaſſionate Danes, and wrote this narrative in the city of Copenhagen.

"I have," ſays this gentleman, "made it my endeavour, ſince my arrival here, to gain the moſt authentic and unprejudiced intelligence reſpecting the late celebrated, and unhappy favourite count Struenſee, and the late extraordinary revolution which expelled a queen from her throne and kingdom, and brought the miniſters to the ſcaffold. Struenſee had not any noble blood in his veins, nor, conſequently, any hereditary and preſcriptive title to the immediate guidance of affairs of ſtate. Fortune, and a train of peculiar circumſtances coinciding with his own talents and addreſs, ſeem to have drawn him from his native mediocrity of condition, and placed him in an elevated rank. He originally practiſed phyſic at Altena, on the Elbe, and afterwards attended the preſent king of Denmark, on his travels into England, in quality of phyſician. On his return he advanced by rapid ſtrides, in the royal favour; and ſeems to have eminently poſſeſſed the powers of pleaſing, ſince he became equally the favourite of both king and queen. He was inveſted with the order of St. Matilda, inſtituted in honour of her majeſty, created a count, and poſſeſſed unlimited miniſterial power; his conduct, in this ſudden and uncommon eminence, marks a bold and daring mind, perhaps I might add, an expanded and patriotic heart. Unawed by the precarious tenure of courtly greatneſs, and more peculiarly of his own, he began a general reform. The ſtate felt him through all her members; the finances, chancery, army, navy, nobles, peaſants, all were ſenſible of his influence. He not only dictated, but penned his replies to every important queſtion or diſpatch; and a petition, or a ſcheme of public import and utility, rarely waited two hours for an anſwer. At preſent, I am told, you may be two months without receiving any.

"The civil judicature of this capital was then veſted in 30 magiſtrates. Struenſee ſent a meſſage to this tribunal, demanding to know the annual ſalary or penſion annexed to each member. Rather alarmed at this inquiry, they ſent an anſwer, in which they diminiſhed their emoluments near two-thirds, and eſtimated them at 1500, inſtead of 4000 rix-dollars. The count then informed them, that his majeſty had no further occaſion for their ſervices; but, in his royal munificence and liberality, was graciouſly pleaſed to continue to them the third part of their avowed incomes as a proof of his ſatisfaction with their conduct. He, at the ſame time, conſtituted another court compoſed only of ſix perſons of integrity, to whom the ſame power was delegated. He proceeded to purge the chancery and other bodies of the law. Then entering on the military department, he, at one ſtroke, broke all the horſe-guards, and afterwards the regiment of Norwegian foot-guards, the fineſt corps in the ſervice, and who were not diſbanded without a ſhort, but very dangerous ſedition. Still proceeding in this ſalutary, but moſt critical and perilous atchievement, he ultimately began to attempt a diminution of the nobles, and to ſet the farmers and peaſants at perfect liberty: no wonder that he fell a victim to ſuch meaſures; and that all parties joined in his deſtruction. Theſe were his real crimes, and not that he was too acceptable to the queen, which only formed a pretext. It was the miniſter, and not the man, who had become obnoxious. I do not pretend, in the latter capacity, either to excuſe, or condemn him; but, as a politician, I rank him with the Clarendons and Mores, whom tyranny, or public buſineſs, and want of virtue, have brought, in almoſt every age, to an untimely and ignominious exit, but to whoſe memory impartial poſterity have done ample juſtice. Yet I muſt avow, that though I cannot think Struenſee made a bad uſe, yet he certainly made a violent and imprudent one of his extenſive power. He ſeems, if one may judge by his actions, to have been intoxicated with royal favour, and ſuch accumulated honours; and not to have adverted ſufficiently to the examples which hiſtory furniſhes of Wolſeys in former days, and of Choiſeuls in modern times, who moſt ſtrikingly evince the ſlippery foundation of political grandeur. When he was even preſſed, only a ſhort time before his ſeizure, to withdraw from court and paſs the Belts, with the moſt ample ſecurity for his annual remitment of forty, fifty, or even an hundred thouſand dollars, an unhappy faſcination detained him, in defiance of every warning, and reſerved him for the priſon and the block. The queen-dowager and prince Frederic were only the feeble inſtruments to produce this cataſtrophe, as being, by their rank, immediately about the perſon of the ſovereign, though common report has talked loudly of the former's intrigue, and attributed it to her imaginary abilities. The only mark of capacity, or addreſs, they exhibited, was in preſerving a ſecrecy which deluded Struenſee, and the queen Matilda, till the time of their being arreſted. I have been aſſured, that on the laſt levee-day preceding this event, the count was habited with uncommon magnificence, and never received greater homage, or court ſervility, from the crowd, than when on the verge of ruin. On the night fixed for his ſeizure, there was a bal paré, or maſked ball, in the palace. The queen,

after dancing, as uſual, one country dance with the king, gave her hand to Struenſee during the reſt of the evening. She retired about two in the morning, and was followed by him and count Brandt. The moment was now come; the queen-dowager, and her ſon prince Frederic, haſtened to the king's private chamber, where he was already in bed. They kneeled down beſide him, and implored him with tears and expoſtulations, to ſave himſelf and Denmark from impending deſtruction, by arreſting thoſe whom they called the authors of it. It is ſaid the king was not eaſily induced to ſign the order, but did it with reluctance and heſitation. At length their entreaties prevailed, and he affixed his ſign manual to the paper. Colonel Koller Banner inſtantly repaired to Struenſee's apartment, which, as well as Brandt's, was in the palace: they were both ſeized at nearly the ſame inſtant, and, as all defence was vain, hurried away immediately to the citadel. When count Struenſee ſtepped out of the coach, he ſaid, with a ſmile, to the commandant, "I believe you are not a little ſurpriſed at ſeeing me brought here as a priſoner." "No, and pleaſe your excellence," replied the old officer bluntly, "I am not at all ſurpriſed, but, on the contrary, have long expected you." It was five o'clock in the morning when count Rantzaw came to the door of her majeſty's ante-chamber, and knocked for admittance. One of the women about the queen's perſon was ordered to wake her, and give her information that ſhe was arreſted: they then put her into one of the king's coaches, drove her down to Elſineur, and ſhut her up in the caſtle of Cronenburg.—Mean while they dreaded an inſurrection in Copenhagen; every military precaution was taken to prevent it; the moſt infamous and ſilly reports were circulated among the populace, to render the ſtate priſoners odious: that they had put poiſon into the king's coffee to deſtroy him; that they intended to declare him incapable of governing; to ſend the dowager-queen Juliana out of the kingdom, as well as her ſon prince Frederic, and to proclaim Matilda regent. To confirm theſe extraordinary and contradictory reports, the king himſelf, and his brother, appeared in a ſtate coach, and paraded through the city, to ſhew himſelf unhurt, and as if eſcaped from the moſt horrid conſpiracy. During theſe tranſactions, Struenſee and Brandt were detained in the moſt rigorous impriſonment. They loaded the former with very heavy chains about his arms and legs, and he was at the ſame time fixed to the wall by an iron bar. I have ſeen the room, and can aſſure you it is not above 10 or 12 feet ſquare, with a little bed in it, and a miſerable iron ſtove; yet here, in this abode of miſery, did he, though chained, complete, with a pencil, an account of his life and conduct, as miniſter, which is penned, as I have been aſſured, with uncommon genius."

After this, the government ſeemed to be entirely lodged in the hands of the queen-dowager and her ſon, ſupported and aſſiſted by thoſe who had the principal ſhare in the revolution; while the king appeared to be little more than a pageant, whoſe perſon and name it was neceſſary occaſionally to make uſe of. All the officers who had been inſtrumental in the revolution were immediately promoted, and an almoſt total change took place in all the departments of adminiſtration. A new council was appointed, in which prince Frederic preſided, and a commiſſion of eight members, to examine the papers of the priſoners, and to commence a proceſs againſt them. The ſon of queen Matilda, the prince royal, who was entered into the fifth year of his age, was put into the care of a lady of quality, who was appointed governeſs, under the ſuperintendency of the queen-dowager.

The two counts were beheaded on the 28th of April 1772, having their right hands previouſly cut off; and their ſculls and bones are yet expoſed on wheels, about a mile and a half from the metropolis. Many of their friends and adherents, eighteen of whom had been impriſoned, were ſet at liberty. Struenſee at firſt had abſolutely denied having any criminal intercourſe with the queen, but this he afterwards confeſſed; and though he is ſaid by ſome to have been induced to do this only by the fear of torture, the proofs of his guilt in this reſpect were eſteemed notorious, and his confeſſions full and explicit.

In the following May, his Britannic Majeſty ſent a ſmall ſquadron of ſhips to convoy the unfortunate princeſs to Germany, and appointed the city of Zell, in his electoral dominions, for the place of her future reſidence. She died there of a malignant fever, on May 10, 1775, aged 23 years and 10 months. In 1780, his Daniſh Majeſty acceded to the armed neutrality propoſed by the empreſs of Ruſſia. He appears at preſent to have ſuch a debility of underſtanding, as to diſqualify him for the proper management of public affairs.

On the 16th of April 1784, another revolution took place in Denmark. The queen-dowager's friends were removed, a new council formed under the auſpices of the prince royal, ſome of the former old members reſtored to the cabinet, and no regard is to be paid for the future to any inſtrument, unleſs ſigned by the king, and counterſigned by his royal highneſs prince Frederic, his ſon, heir apparent to the throne of Denmark.

The conduct of this prince is ſtamped with that conſiſtence of behaviour, which enables him to purſue, with unremitting zeal, the prudent and benevolent meaſures which he has planned for the benefit of his grateful country. The reſtoration of the peaſantry to their long-loſt liberty, and the abolition of many grievances under which they laboured, have already been mentioned. To theſe may be added the exertions he makes for the general diffuſion of knowledge; the patronage he affords to ſocieties of learning, arts, and ſcience; the excellent meaſures he has adopted for the ſuppreſſion of beggars, with whom the country was over-run, and the encouragement of induſtry, by the moſt extenſive inquiries into the ſtate of the poor throughout the kingdom; the wiſe regulations he has introduced into the corn trade, equally beneficial to the landed intereſt and to the poor; and the judicious laws, which under his influence have been made to encourage foreigners to ſettle in Iceland. The princeſs of Heſſe Caſſel, his conſort, is ſaid to poſſeſs the moſt amiable diſpoſitions and goodneſs of heart.

Count Schimmelmann, miniſter of ſtate, finances, and commerce, has the merit of accompliſhing the abolition of the ſlave-trade among the ſubjects of Denmark. His plan was approved by the king on the 22d of February, 1792, and is to be gradual; and in 1803, all trade in negroes is to ceaſe on the part of Daniſh ſubjects. The diſintereſtedneſs of this miniſter, who poſſeſſes large eſtates in the Daniſh Weſt India iſlands, recommends his exertions to greater praiſe. The above ordinance does not ſeem to have cauſed any diſcontent in Denmark among the Weſt India merchants; and it is not thought it will cauſe any in the iſlands.

A ſcheme for defraying the national debt has been ſuggeſted and followed. One million has already been diſcharged.

Chriſtian VII. reigning king of Denmark and Norway, LL. D. and F. R. S. was born in 1749; in 1756 he was married to the princeſs Carolina-Matilda of England; and has iſſue, 1. Frederic, prince-royal of Denmark, born January 28, 1768, and married in 1790, to the princeſs Mary-Anne-Frederica,

Frederica, of Heſſe. 2. Louiſa-Auguſta, princeſs-royal, born July 7, 1771, and married May 27, 1786, to Frederic, prince of Sleſwick-Holſtein, by whom ſhe has iſſue.

Brothers and ſiſters to the king. 1. Sophia Magdalene, born July 3, 1746; married to the late king of Sweden, Guſtavus III.—2. Wilhelmina, born July 10, 1747; married Sept. 1, 1764, William, the preſent prince of Heſſe-Caſſel.—3. Louiſa, born Jan. 30, 1750; married Aug. 30, 1766, Charles, brother to the prince of Heſſe-Caſſel.—4. Frederic, born Oct. 28, 1753.

CHAP. V.

LAPLAND.

Name, Extent, Boundaries, Diviſions, Subdiviſions, Climate, Soil, Mountains, Rivers, Foreſts, Vegetables, Animal and Mineral Productions, &c.

THE natives of this country were called Scritofinni by the ancients, by whom the appellation of Lapland, or Lappia, was unknown. They originally inhabited Failand, from whence they were driven more northward, after which they were called Lappes, which, in the Finick tongue, ſignified exiles driven to the moſt remote place. The natives, of courſe, deeming that appellation opprobrious, call themſelves Sabmienladfi.

This country is divided into ſix provinces, viz, 1. Angermanland-Lapmark; 2. Uma-Lapmark; 3. Pitha-Lapmark; 4. Lula-Lapmark; 5. Torno-Lapmark; and 6. Kima-Lapmark.

The known part of Lapland extends from the North Cape, in 71 deg. 30 min. north lat. to the White Sea, under the arctic circle. Part of it belongs to the Danes, and is included in the government of Wardhuys; part to the Swedes, which is by far the moſt valuable; and ſome parts in the Eaſt, to the Muſcovites or Ruſſians, and are ſituated between the lake Eparak and the White Sea, being divided into three diſtinct prefectures, viz. that of the ſea-coaſt towards the north, called Mourmankoi Leporic, Jerſhoi Leporic, and Bellamoſeſkoi Leporic. But as the moſt conſiderable and beſt-peopled diviſion of this country belongs to the Swedes, we ſhall therefore begin with a deſcription of it.

Swediſh Lapland is bounded on the eaſt by Ruſſian Lapland; on the weſt by a ridge of mountains that ſeparate it from Norway; on the north by Daniſh Lapland; and on the ſouth by Bothnia, Angermania, and Septerland. Its greateſt extent, from eaſt to weſt, is about 360 miles; in breadth it extends from 65 deg. 33 min. to 69 deg. of north latitude. It is divided into ſix provinces, or diſtricts, the names of which, as above noticed, are the following; viz. Angermanland-Lapmark, Uma-Lapmark, Pitha-Lapmark, Lula-Lapmark, Torno-Lapmark, and Kima-Lapmark.

Each of theſe provinces receives its name from the chief river that waters it; they are again ſubdivided into ſmaller diſtricts called biars, and theſe contain a certain number of families, called by the Swedes reckars. Every reckar, or family, is allowed a conſiderable tract of land, with foreſts, lakes, and brooks, for the maintenance of their families and cattle; but their lands are not encloſed, ſo that the property of one is often converted to the uſe of others.

Lapland is ſituated ſo near the pole, that the ſun neither ſets in ſummer, or riſes in winter. In the latter ſeaſon, the cold is ſo intenſe, that none of the natives are able to bear it. The moſt rapid rivers are then frozen up, and the ice is two or three, and ſometimes four or five feet thick. In ſummer the weather is as ſultry as it is cold in winter; for autumn and ſpring are unknown in this climate. The exceſſive heat, however, is qualified by the vapours that riſe from the ſea, and by the ſnow that continues all the ſummer on the tops of the mountains, and in ditches that are ſheltered from the ſun. It ſeldom rains in the ſummer, but the whole country is covered with ſnow in winter.

The beſt deſcription of the climate of this country is given by M. Maupertuis, who, with ſeveral other aſtronomers, was ſent hither by order of the king of France, to diſcover the figure of the earth at the polar circle. "In December, ſays he, the ſnow continually falling, or ready to fall, for the moſt part hid the ſun the few moments he might have appeared at mid-day. In the month of January the cold was increaſed to that extremity, that M. Reaumur's mercurial thermometer, which, at Paris, in the great froſt of 1709, it was thought ſtrange to ſee fall to fourteen degrees below the freezing point, was now got down to thirty-ſeven. The ſpirits of wine in the others was frozen. If we opened the door of a warm room, the external air inſtantly converted all the vapour in it into ſnow, whirling it round in white vortices. If we went abroad, we felt as if the air was tearing our breaſts in pieces; and the cracking of the wood, of which the houſes are built, as if ſplit by the violence of the froſt, continually alarmed us with an increaſe of cold. In this country you may often ſee people who have loſt an arm or a leg by the froſt. The cold, which is always very great, ſometimes increaſes by ſuch violence and ſudden degrees, as are almoſt infallibly fatal to thoſe who are ſo unhappy as to be expoſed to it; and ſometimes there riſe ſudden tempeſts of ſnow that are ſtill more dangerous.

"The winds ſeem to blow from all quarters at once, and drive about the ſnow with ſuch fury, that all the roads are in a moment rendered inviſible. Dreadful is the ſituation of a perſon ſurpriſed in the fields by ſuch a ſtorm: his knowledge of the country, and even the mark he may have taken by the trees, cannot avail him; he is blinded by the ſnow, and, if he attempts to find his way home, is generally loſt. In ſhort, during the whole winter, the cold was ſo exceſſive, that on the 7th of April, at five in the morning, the thermometer was fallen to twenty diviſions below the point of freezing, though every afternoon it roſe two or three diviſions above it; a difference in the height not much leſs than that which the greateſt heat and cold felt at Paris uſually produce in that inſtrument. Thus in 24 hours we had all the variety felt in the temperate zones in the compaſs of a whole year."

In winter the nights are very cold, long, and tedious, yet thoſe inconveniences are, in ſome degree, obviated by the ſerenity of the ſky, the brightneſs of the moon and ſtars, and the refulgent light of the aurora borealis, which is reflected from the white ſurface of the earth covered with ſnow; from all which ſuch a light is produced, that the inhabitants are enabled to diſcharge their ordinary occupations. The above writer, in ſpeaking of theſe nocturnal lights, ſays, "The days are no ſooner cloſed than fires of a thouſand figures and colours light up the ſky, as if deſigned to compenſate for the abſence of the ſun. Theſe fires have not here, as in more ſouthern climates, any conſtant ſituation. Though a luminous arch is often ſeen fixed towards the north, they ſeem more frequently to poſſeſs the whole extent of the hemiſphere. Sometimes they begin in the form of a great ſcarf of bright light, with its extremities upon

upon the horizon, which, with a motion reſembling that of a fiſhing-net, glides ſoftly up the ſky, preſerving, in this motion, a direction nearly perpendicular to the meridian; and moſt commonly after theſe preludes, all the lights unite at the zenith, and form the top of a crown. Arcs, like thoſe ſeen in France towards the north, are here frequently ſituated towards the ſouth; and often towards both the north and ſouth at once. Their ſummits approach each other; the diſtance of their extremities widens towards the horizon. I have ſeen ſome of the oppoſite arcs, whoſe ſummits almoſt joined at the zenith; and both the one and the other have frequently ſeveral concentric arcs beyond it. Their tops are all placed in the direction of the meridian, though with a little declination to the weſt; which I did not find to be conſtant, and which is ſometimes inſenſible. It would be endleſs to mention all the different figures theſe meteors repreſent, and the various motions with which they are agitated. Their motion is moſt commonly like that of a pair of colours waved in the air, and to the different tints of their lights give them the appearance of ſo many vaſt ſtreamers of changeable taffety; ſometimes they line a part of the ſky with ſcarlet. On the eighteenth of December I ſaw a phenomenon of this kind, that, in the midſt of all the wonders to which I was now every day accuſtomed, raiſed my admiration. To the ſouth a great ſpace of the ſky appeared tinged with ſo lively a red, that the whole conſtellation of Orion looked as if it had been dipped in blood. This light, which was at firſt fixed, ſoon moved, and changing into other colours, violet and blue, ſettled into a dome, whoſe top ſtood a little to the ſouth-weſt of the zenith. The moon ſhone bright, but did not in the leaſt efface it. In this country, where there are lights of ſo many different colours, I never ſaw but two that were red; and ſuch are taken for preſages of ſome great misfortune. After all, when people gaze at theſe phenomena with an unphiloſophic eye, it is not ſurpriſing if they diſcover in them the appearance of armies engaged, fiery chariots, and a thouſand other prodigies.

For the moſt part, the ſoil of this country is exceeding bad, being ſo intermixed with ſtones, that hardly any thing will grow in it; but in ſome places it is very moiſt, owing to the number of marſhes and brooks with which it abounds. The whole country is alſo full of rocks and mountains. Thoſe called the Dofrine Mountains, which ſeparate Lapland from Norway, are of a prodigious height; and the high winds that blow there prevent all trees from taking root. Beneath theſe mountains are large marſhes and extenſive foreſts, where there are many trees, though they ſtand at a great diſtance from each other. At the bottom of the hills are pleaſant vallies, which are the moſt fertile parts of the country, being well watered by a great number of brooks and ſprings.

Many of the rivers riſe from the mountains of Norway, and fall into the Bothnian Gulph. The chief of theſe are the Uma, Lula, Rima, and Torna. The Uma is greatly increaſed by the waters that flow into it from the rivers Vendilor and Skialfre. The Lula and Rima are both very conſiderable, and are ſwelled, in their courſe, by a great number of leſſer ones. The torna receives 29 rivers, one of which is a Swediſh mile in breadth. When the ſnow melts, all theſe rivers over-flow their banks; and the chief part of them have ſtupendous cataracts. Beſides the rivers, here are alſo many lakes, which abound with various kinds of fiſh, as well as the rivers.

There are a great number of trees in the foreſts of Lapland, among which are the birch, pine, and fir. Some parts of it alſo produce the ſervice-tree, willow, poplar, elder, and the corneil. They have ſeveral ſorts of plants; but the moſt uſeful are the angelica and ſorrel, which are greatly eſteemed by the natives, who uſe them in their food. They have likewiſe different kinds of graſs, heath, and fern: but the moſt plentiful, as well as moſt uſeful vegetable, is the moſchus, or moſs, of which there are ſeveral ſpecies, either adhering to trees, or growing on the ſurface of the earth. The rein-deer is almoſt wholly ſuſtained by this vegetable, which, indeed, he prefers to all others, and without which he cannot ſubſiſt. The natives not only uſe it as forage for their cattle, but boil it in broth as a cordial and reſtorative. Here are alſo great quantities of berries, ſuch as black currants; the Norwegian mulberry, which grows upon a creeping plant, and is much eſteemed as antiſcorbutic; raſberries, cranberries, and bilberries. Juniper-berries are alſo very plentiful, and ſome of the trees grow to a conſiderable height.

The animals of this country are ſtags, bears, wolves, foxes of ſeveral colours, ſquirrels, ermines, martens, hares, glittens, beavers, otters, elks, and rein-deer; but the laſt of theſe is the moſt uſeful to the natives, who, without them, could not poſſibly preſerve their exiſtence; for theſe animals not only afford them food and garments, but alſo ſupply the place of horſes, and travel in thoſe parts where the latter animals would be entirely uſeleſs. The rein-deer is a kind of a ſtag, with large branched horns, the tops of which bend forward like a bow. He is larger, ſtronger, and ſwifter than the ſtag, and his hair changes colour according to the ſeaſon of the year. His hoofs are cloven and moveable, for which reaſon he ſpreads them abroad as he runs along the ſnow, to prevent his ſinking into it. The horns are very high, and divided into two branches near the root. On each horn are three branches, one above another, which are again ſubdivided into ſmaller ones, inſomuch that no horned beaſt whatever has the like, either for bulk, branches, or weight. The horns are of a light colour, and there are veins, or blood-veſſels, running along them, under which there are furrows. When the beaſt runs he lays theſe horns upon his back; but there are two branches that always hang over his forehead, and almoſt cover his face. Moſt of theſe animals are wild; but ſome of them are tame, and exceeding ſerviceable to the natives.

Thoſe rein-deer which are produced between a tame doe and a wild buck are not only the largeſt, but by far the ſtrongeſt. Theſe animals are of infinite uſe to the Laplanders, for without ſubjecting them to the leaſt expence, they ſupply them with almoſt every neceſſary of life. From theſe creatures they are furniſhed with milk and cheeſe, as alſo fleſh, which they lay up for winter ſtore. The ſkins afford caps, clothes, boots, ſhoes, bedding, thongs, and many other articles. The nerves and ſinews are twiſted into thread. Their bows and arrows are tipped with the bones, and their boxes inlaid with the horn, which is likewiſe formed into curious ſpoons, toys, and utenſils. Theſe creatures are likewiſe uſed as beaſts of draught or burthen, and, far from demanding any proviſion or provender, dig with their feet among the ſnow for the moſs, which they prefer to every other kind of food. The dogs here are very ſmall, not being above a foot in height. They turn up their tails, which are ſhort; and their ears ſtand erect, like thoſe of wolves. They are of a red colour, and in hunting are very ſerviceable.

In Lapland, the birds are ſwans, geeſe, ducks, lapwings, ſnipes, moſt ſorts of water-fowl, heath-cocks, ſtock-doves, woodcocks, and partridges. Beſides theſe, they have two kinds of fowl peculiar only to this country. The firſt is called the kniper,

and

and is a kind of ſnipe, black on the head, back, and wings; but the breaſt and belly are white. It has a long red beak, ſet with teeth, and ſhort red feet, reſembling thoſe of water-fowl. The other is called the loom, and is never ſeen on the ground, but either in the water, or flying. The partridges here are as white as ſnow, and, inſtead of feathers, their bodies are covered with a kind of wool. The rocks and mountains are frequented by eagles, hawks, falcons, kites, and birds of prey of various kinds.

The principal inſects here are flies, which, in the ſummer, are hatched in the moraſſes and woods, and are frequently ſo numerous as to obſcure the light of the day. They are venomous, and exceeding troubleſome, inſomuch that the rein-deer fly to the tops of the mountains for ſhelter, and the inhabitants move to the ſea-ſide, thoſe parts being the leaſt infeſted by theſe peſtilent vermin. Monſieur Maupertuis ſays, that, while he was here, the flies were ſo troubleſome, that even the Finland ſoldiers, who are counted the moſt hardy troops in the ſervice of Sweden, were obliged to cover their faces with the ſkirts of their coats from the attacks of theſe animals, which ſwarmed to ſuch a degree, that the moment a piece of fleſh appeared, it was blackened all over. Some of theſe flies are very large, with green heads, and, where-ever they ſtrike, draw blood from the ſkin.

In the rivers and lakes there is abundance of delicious ſalmon, which come from the Gulf of Bothnia; alſo trout, bream, and perch, all of which are of an amazing ſize, and exquiſite flavour.

Mines of ſilver, lead, and copper, together with excellent veins of iron, are in ſome of the diſtricts, but they are not at preſent worked to any conſiderable advantage, their ſituation being almoſt inacceſſible. In the diſtrict of Torno there is a vein of gold and ſilver mixed, another of lead and ſilver, and a third of copper; and here they have both copper works and a foundery. They have alſo furnaces in the province of Lula, where they melt the ſilver which they dig in that part of the country. Theſe mines, however, are only worked for a ſhort time in the ſummer, the climate being ſo ſevere for the principal part of the year, that the engines cannot work them.

Beautiful cryſtals of a prodigious ſize are found in the rivers and lakes; theſe are ſo hard and fine, that, when poliſhed, they appear like real diamonds. Here are likewiſe a great variety of curious ſtones, ſome of which bear the reſemblance of animals, trees, &c. When the natives find theſe, they place them in ſome conſpicuous place, and worſhip them as idols.

The generality of the Laplanders are remarkably ſhort in ſtature, not being above four feet and a half high, and ſome of them even under that ſize; the cauſe of which is attributed to the ſeverity of the climate, and the poorneſs of their living. They are, in general, very diſagreeably formed, having a large head, a broad forehead, hollow and bleared eyes, a ſhort and flat noſe, and a broad face, with ſhort, black, and rough hair. They have broad breaſts, ſlender waiſts, and ſmall legs; but they are ſtrong, hardy, and active, inſomuch that they will bear incredible fatigue, and it is remarked, that the ſtouteſt Norwegian is not able to bend the bow of a Laplander. The women, however, are much leſs homely than the men; and the complexions of ſome of them are delicate and florid.

With reſpect to their diſpoſitions, they are very honeſt and hoſpitable; but ſo timorous, that they will fly the moment they perceive a veſſel at ſea, or the leaſt footſtep of a ſtranger. They are naturally haſty and paſſionate, and, when once provoked, not eaſily appeaſed. They indulge themſelves in lazineſs to ſuch a degree, that they neither plough or ſow, but leave their ground totally uncultivated; neither will they ſeek for provender either by hunting or fiſhing, till they are compelled to it from mere neceſſity. It hath been obſerved, that when they have been tranſported to more moderate climates, they have ſoon died, though in their own country they live to a great age. It is no uncommon thing to ſee a Laplander, upwards of an hundred years of age, hunting, fowling, ſkaiting, and performing with the moſt aſtoniſhing agility the ſevereſt exerciſes.

The Lapland houſes, or rather huts, are made of pieces of timber or rafters, jointed together, and covered with turf, or the branches of pine trees and coarſe cloth. Some of them are built upon trees to prevent their being overwhelmed with ſnow, and to ſecure them from the wild beaſts. Their huts have two doors, at the leſſer of which no woman muſt enter, becauſe from thence the men go to hunt; and ſhould they meet the woman at going out, it would be conſidered as a bad omen. They have no other chimnies than a hole at the top of their huts, which ſerves to let the ſmoke out, and the light in. Their ſtore-houſes are built in trees, to ſecure their proviſions from bears and other beaſts of prey.

In ſummer, their dreſs conſiſts of a cloſe garment reaching to the middle of the legs, and faſtened round the waiſt with belts. They have not any linen, and their clothes are made of coarſe wool, of a dark grey colour. The richer ſort have their clothes of various colours, but red is the moſt univerſally eſteemed. At their girdles they hang a Norway knife and a pouch, the latter of which contains flints, matches, and tobacco, with other neceſſaries; the girdle itſelf being decorated with braſs rings and chains. Their night-caps are made of the ſkins of the bird-loom, with the feathers on; and their ſhoes of the ſkins of rein-deer, with the hair outwards. In winter they are totally caſed up in coats, caps, boots, and gloves, made of the rein-deer's ſkin, with the hair inwards. The women's apparel differs but little from that of the men: they hang to their girdles many rings, chains, toys, and knives, with a needle caſe, and other trifles. Their thread is made of the ſinews of rein-deer; and in winter they lie in their ſkins. In ſummer they all cover themſelves at night with large pieces of coarſe cloth, to ſecure them from being ſtung by the gnats and flies.

Theſe people make all their own furniture, boats, ſledges, bows and arrows. The boards with which they make their boats, are faſtened together with twigs, the nerves of rein-deer, or the ſmall roots of trees twiſted together like ropes; and they calk them with moſs to keep out the water. They make boxes of their birch planks, which they neatly inlay with the horns of rein-deer; and they are very dexterous at making baſkets of the roots of trees, ſlit in long thin pieces, and twiſted together. Some of theſe are made ſo neat that they will hold water; and the Swedes greatly admire them. Theſe articles are made by the men, who alſo perform the office of cook, by dreſſing victuals for the family.

The women are employed as taylors and embroiderers; they make clothes, ſhoes, and boots, and harneſs for the rein-deer: they ſpin thread with fur, and knit it into caps and gloves, which are very ſoft and warm: they likewiſe draw tin into wire through a horn, and with this they cover their thread, which they uſe in embroidering on their caps and girdles the figures of beaſts, flowers, ſtars, and the like.

Thoſe who inhabit the mountains live chiefly on the fleſh and milk of the rein-deer: the former

of which they dry, and from the latter they make great quantities of cheeſe. Thoſe who live in the low country feed on veniſon and fiſh. They have neither bread or ſalt; but inſtead thereof uſe the inner rind of the pine-tree, dried and ground, and dried fiſh reduced to powder. They make broth of fiſh and fleſh boiled together; and their uſual drink is water heated in a kettle, which in winter hangs continually over the fire: but their greateſt dainty is bear's fleſh, which they eat on all particular feſtivals. On theſe occaſions likewiſe they indulge themſelves with brandy, and never think themſelves ſo happy as when they can enjoy a pipe of tobacco. Theſe commodities the better ſort purchaſe at Norway, as alſo a few cows and ſheep for the winter ſtore. They make decoctions of berries, angelica, and ſorrel, which they are not only fond of, but alſo deem them excellent preſervatives againſt all diſorders of a ſcorbutic nature.

The Laplanders, beſides their domeſtic buſineſs, employ themſelves in hunting, in which excurſions they travel through the ſnow with aſtoniſhing expedition. They wear a pair of ſkaits, or ſnow ſhoes, which are made of fir boards, covered with the rough ſkin of the rein-deer: one of theſe is uſually as long as the perſon who wears it, but the other is about a foot ſhorter. The feet are placed near the middle, and the ſhoes are faſtened to them with ſtrings, or thongs made with the ſinews of the rein-deer. When the Laplander travels in this manner he carries a long pole in his hand, near the end of which is a round ball of wood; and this not only ſecures him from penetrating too deep into the ſnow, but alſo enables him to ſtop himſelf when there is occaſion. A Laplander will travel in his ſnow ſhoes at the rate of ſixty miles a day without being fatigued. But the moſt expeditious method of travelling in this country is with a ſledge drawn by rein-deer. This carriage, which is called by the natives pulkha, is made in the form of a ſmall boat, with a convex bottom, that it may ſlide the more eaſily over the ſnow; the head of it is ſharp and pointed, but the hinder part is quite flat. The traveller ſits, or rather lays with his back againſt the end of the ſledge, and holds a ſtick in his hand, with a large wooden ball at the end of it, with which he diſengages the ſledge from ſuch obſtructions as he may happen to meet with in the courſe of his journey. He muſt likewiſe take care properly to balance the carriage with his body, otherwiſe he will be ſubject to be overturned. The traces, by which the ſledge is faſtened to the rein-deer, are fixed to a collar about the animal's neck, and run down over the breaſt, between the fore and hind legs, to be connected with the prow of the ſledge; the reins are tied to the horns, and the trappings are furniſhed with little bells, the ſound of which is very pleaſing to the animal. The rein-deer is ſo fleet that he will run with his carriage upwards of 100 miles a-day. Before a Laplander ſets out on his journey, he whiſpers in the ear of the animal the way he is to go, and the place at which he is to halt, from a perſuaſion that the beaſt underſtands his meaning; but, in ſpite of this intimation, he frequently ſtops ſhort, and ſometimes over-ſhoots the mark by ſeveral miles. Though this method of travelling is exceedingly expeditious, yet it is far from being eaſy, the perſon being coutinually in a confined poſture; neither is it exempted from the moſt imminent danger, on account of the uncertainty of the roads, and the drifts of looſe ſnow, which, if the wind blows high, are driven about with incredible fury, and in prodigious quantities.

When the winter commences, the Laplanders mark the moſt frequented roads by ſtrewing them with fir-boughs. Indeed, theſe roads are no other than pathways made through the ſnow by the rein-deer and ſledges: their being frequently covered with new ſnow, and alternately beaten by the carriage, conſolidates them into a kind of cauſeway, which is the harder if the ſurface has felt a partial thaw, and been cruſted by a ſubſequent froſt. It requires great caution to follow theſe tracks; for if the carriage runs either on one ſide or the other, the traveller is thrown into an abyſs of ſnow. In leſs frequented parts, where there is no ſuch beaten road, the Laplander directs his courſe by certain marks which he has made on the trees; but, notwithſtanding all his caution, the rein-deer very often ſinks up to his horns in ſnow; and ſhould a hurricane ariſe, which is ſometimes the caſe, the traveller would be in great danger of his life, were he not provided with a kind of tent, to ſcreen him in ſome meaſure from the fury of the tempeſt. But the rein-deer in winter is rather weak and diſpirited, ſo that he cannot travel with the ſame alacrity as in ſummer. In this ſeaſon the traveller is obliged to halt at different times, that the animal may reſt himſelf; and in theſe intervals be fed with a kind of cake made of moſs and ſnow, which ſerves him for drink and provender at the ſame time.

The chief employment of the Laplanders, excluſive of their domeſtic affairs, conſiſts in hunting and fiſhing. Thoſe who practiſe the latter have ſmall boats, ſo lightly conſtructed that they can carry them on their ſhoulders, which they frequently do, when interrupted on the rivers by whirlpools or cataracts. The boats are of different ſizes, from two to ſix yards in length, managed with oars, and calked with moſs ſo tight, as effectually to keep out the water. They ſteer with amazing rapidity, even among the rocks, and down the moſt rapid water falls; but when they go againſt the ſtream, and meet with a cataract, they take out their boat, and carry it on their ſhoulders, till they have paſſed it, when they launch it again, and proceed on their way.

Such as employ themſelves in hunting, perform it various ways. In ſummer, they hunt wild beaſts with ſmall dogs trained to the diverſion. In winter; they purſue them by their tracks upon the ſnow; ſkaiting with ſuch velocity, that they frequently run down their prey. They catch ermines in traps, and ſometimes with dogs. They kill ſquirrels, martens, and ſables, with blunt darts, to avoid injuring the ſkins. Foxes and beavers are killed with ſharp pointed darts and arrows, in ſhooting of which they are accounted the beſt markſmen in the world. The larger beaſts, ſuch as bears, wolves, elks, and wild rein-deer, they either kill with fire arms, or elſe enſnare by digging pits in places moſtly reſorted to by thoſe creatures.

The Laplanders have particular laws relative to the chace, which they obſerve with great punctuality. The beaſt becomes the property of the man in whoſe ſnare or pit he is caught; and he who diſcovers a bear's den has the excluſive privilege of hunting him to death. The conqueſt of a bear is the moſt honourable achievement that a Laplander can perform; and the fleſh of this animal they think more delicious than that of any other whatever. The bear is always diſpatched with a fuſil, ſometimes laid as a ſnare, ready cocked and primed; but more frequently by the hands of the hunter, who, on miſſing his aim, would run the moſt imminent danger of his life.

Theſe people celebrate the killing a bear with great rejoicings. The carcaſe is drawn to the cabin or hut of the victor, by a rein-deer, which, on this account, is afterwards kept a whole year without doing any work. The bear is ſurrounded by a great number of men, women, and children, who recite a particular ſong of triumph, in which they thank

thank the vanquiſhed enemy for having allowed himſelf to be overcome, without doing any miſchief to his conqueror: after this they addreſs themſelves to Providence, acknowledging the ſingular benefits they receive from his having created beaſts for their uſe, and endowed them with ſtrength and courage to attack and overcome them. The conqueror is ſaluted by the women, and is feaſted by the men of the village for three ſucceſſive days; beſides which, he is ever after diſtinguiſhed from the reſt, by having laces wrought with tin ware round his cap.

Nuptial ceremonies among the Laplanders are very remarkable and ludicrous. When a young man has made choice of a female, he employs ſome friends as mediators with the girl's parents; and theſe being provided with ſome bottles of brandy, the ſuitor accompanies them to the hut of his intended father-in-law, who invites the mediators to enter: but the ſuitor is left without, until the liquor be drank, and the propoſal diſcuſſed. After this he is called in, and entertained with ſuch fare as the hut affords, but without ſeeing his miſtreſs, who, on this occaſion, is obliged to retire. The ſuitor having at length obtained leave to make his addreſſes to the girl in perſon, he goes home, puts on his beſt attire, and then returns to the hut, when his miſtreſs appears, and he ſalutes her with a kiſs; after which he preſents her with the tongue of a rein-deer, a piece of beaver's fleſh, or ſome other kind of proviſion. The girl at firſt declines the offer, it being made in the preſence of her relations; but at the ſame time ſhe makes a ſignal to the lover to follow her into the fields, where ſhe accepts the preſents. Thus encouraged, he begs permiſſion of her to let him ſleep with her in the hut; if ſhe conſents, ſhe keeps the preſents; but if not, ſhe throws them with contempt on the ground.

When the lovers are agreed, the youth is permitted to viſit his miſtreſs as often as he thinks proper; but every time he comes he muſt purchaſe this pleaſure with a freſh bottle of brandy, a perquiſite ſo agreeable to the father, that he often poſtpones the celebration of the nuptials for two or three years. At length the ceremony is performed at the neareſt church, by the prieſt of the pariſh; but even after this, the huſband is obliged to ſerve his father-in-law a whole year, at the expiration of which he retires to his own habitation with his wife, and then receives preſents from all his relations and friends. From this time he ſequeſters his wife from the company of all ſtrangers of the male ſex, and watches over her conduct with a jealous eye.

In Lapland, as ſoon as a child is born, it is waſhed all over with ſnow or cold water, except the head, which muſt not be touched with water till after the child has been baptized. The woman does not remain in child-bed above four or five days, and in fourteen is generally quite recovered. She then carries the child to be baptized; but before ſhe can reach the reſidence of the prieſt, ſhe is often obliged to traverſe large foreſts, mountains, lakes, and wide extended waſtes of ſnow. The infant is faſtened in a hollowed piece of wood, ſtretched naked on a bed of fine moſs, covered with the ſkin of a young rein-deer, and ſlung by two ſtraps to the back of the mother, who always ſuckles her own child. At home this little cradle is hung to the roof of the hut, and the child is lulled to ſleep by ſwinging it from one ſide to the other. When the children grow up, their parents are very careful in teaching them moſt kinds of work; but they have a great averſion to ſchools. The boys, from their infancy, are taught to practiſe the bow; and they are not allowed to break their faſt till they have hit the mark. The girls are early initiated in the buſineſs peculiar to females.

There are no phyſicians among the Laplanders; neither have they, indeed, occaſion for any, not being ſubject to thoſe diſtempers common in other countries. The diſorder they are moſt ſubject to is ſore eyes, occaſioned by the ſmoke of their huts, and the fire to which they are almoſt continually expoſed. They are ſometimes afflicted with rheumatic pains, and the ſcurvy; and a few are ſubject to the vertigo and apoplexy. To cure all inward diſorders they uſe a drink made with the root of a certain ſpecies of moſs, which they call *jerth*; and when that cannot be procured, they boil the ſtalk of angelica in the milk of rein deer. When they feel a pain in any part of the body, they take a kind of muſhroom, which grows upon the birch-tree like a cake, and having ſet fire to it, apply it, burning hot, to the part affected; and this produces a bliſter, which is ſuppoſed to draw off the pecant humour. They have no other plaiſters for wounds, but the roſin which drops from fir-trees. When they have any limb frozen, the put a red hot iron into a cheeſe made of rein-deer's milk, and with the fat that drops from it, like a kind of oil, they rub the part affected, which is almoſt inſtantly cured by that means.

When a native of this country is ſuppoſed to be on his death-bed, ſuch friends as are advocates for the Chriſtian religion, give him Chriſtian exhortation. But thoſe who have no great zeal for the Chriſtian religion, forſake the dying perſon, and think of nothing but the funeral entertainment. As ſoon as the breath is out of the body, moſt of the company leave the hut, being of opinion they ſhall receive ſome injury from the ſpirit or ghoſt, which they believe remains with the corps, and takes all opportunities of doing miſchief to the living. The deceaſed is wrapped up in linen or woollen, according to his circumſtances, and depoſited in a coffin by a perſon ſelected for that purpoſe; but this office he will not perform till he receives a conſecrated braſs ring, which is placed on his left arm, and which he imagines ſecures him againſt receiving any injury from the ghoſt of the deceaſed perſon.

The Laplanders, before they embraced the Chriſtian religion, uſed to bury their dead in the firſt place they happened to think of, which they ſtill do when they are very far from any church. Many of them alſo preſerve the rites of heatheniſh ſuperſtition; for with the body they put in the coffin an axe, a flint and ſteel, a flaſk of brandy, ſome dried fiſh, and veniſon. With the axe the deceaſed is ſuppoſed to hew down the buſhes or boughs that may obſtruct him in the other world; the ſteel and flint are to furniſh him with a light, ſhould he find himſelf in the dark; and the proviſion is for him to ſubſiſt on during his journey thither.

Previous to the body being carried to the place of interment, the friends of the deceaſed, kindle a fire of fir boughs near the coffin, and expreſs their ſorrow in tears and lamentations. They walk in proceſſion ſeveral times round the body, demanding, in a whining tone, the reaſon of his leaving them on earth. They aſk whether he was out of humour with his wife? whether he was in want of meat, drink, clothing, or other neceſſaries? and whether he had not ſucceeded in hunting or fiſhing? Theſe, and other ſuch interrogatories, are intermingled with groans and hideous howlings; and between them the prieſt ſprinkles the corpſe and the mourners alternately with holy water. After theſe ceremonies are over, the body is conveyed to the place of interment, in a ſledge drawn by a rein-deer, and followed by the friends and relations, who ſhew their concern for the loſs of

the deceaſed, by dreſſing themſelves in the worſt garments they have, and keeping a continual howl during the proceſſion. As ſoon as the ceremony is over, the people retire; and the ſledge, with the clothes which belonged to the deceaſed, are left as the Prieſt's perquiſite.

Three days after the funeral, the relations and friends of the deceaſed are invited to an entertainment, where they eat the fleſh of the rein-deer which conveyed the corpſe to the grave. The animal being made a ſacrifice to the ghoſt of the deceaſed, the bones of it are collected together, put into a baſket, and interred with great ceremony. The effects of the deceaſed are divided between the brothers and ſiſters, the former having two-thirds, and the latter one; but the lands, lakes, and rivers, are held jointly by all the children of both ſexes, according to the diviſion made by Charles IX. of Sweden, when he aſſigned to each family a certain tract of land for their ſupport.

The Lapland language is altogether barbarous, and varies in different parts of the country, according to the correſpondence which the natives maintain with the different nations; ſuch as Norwegians, Swedes, Finlanders, and Ruſſians. The greater part of them are totally ignorant of letters: and the ſame may be ſaid alſo of arts, except ſuch as neceſſity has taught them to make uſe of for their own preſervation and convenience.

With reſpect to religion, Chriſtianity is firſt ſuppoſed to have been introduced into Lapland about the year 1300. However, no material progreſs was made in the eſtabliſhment of it till the laſt century, when miſſionaries were ſent for that purpoſe from Norway, Sweden and Ruſſia. Several churches were built in different parts of the country, and ſupplied with miniſters from Sweden and Ruſſia. Guſtavus Adolphus founded two ſchools, one in the province of Pitha, and the other in that of Ulma, for inſtructing the children of the Laplanders in the Chriſtian religion and in letters. He alſo ordered ſeveral pious books to be tranſlated from the Swediſh into the Lapland language; ſuch as the catechiſm, with ſome prayers, and the manual, containing the Pſalms of David, the Proverbs of Solomon, &c. That they might be encouraged to ſend their children to ſchool, an annual revenue was allotted for the maintenance of the ſcholars. Hence Lapland produced ſome preachers, which greatly promoted the knowledge of Chriſtianity in that country; for, heretofore, their clergy having been Swedes, whoſe language the people did not underſtand, it could not be reaſonably ſuppoſed that they ſhould profit much by their inſtructions. Since that time, however, many have intermixed idolatry with the pure profeſſion of Chriſtianity, and, from local cuſtoms, their particular fondneſs for omens, particular times and ſeaſons, diſtinguiſhed by the names of black and white days, &c. retain many of their former ſuperſtitions. They have ſome notion of the doctrine of the tranſmigration of ſouls; for they not only reſpect the ghoſts of their departed relations and friends, but dread them as being miſchievous, till they imagine the ſpirits of the dead have re-animated other bodies. They believe there are fairies that wander about among the rocks, mountains, rivers, and lakes, and give them alſo a ſhare of their devotion.

They own one Supreme Being, whom they arm with thunderbolts; they make the rainbow his bow, and have the ſame notion of him that the old Pagans had of their Jupiter. They have another ſubordinate deity, to whom they acknowledge they owe all the bleſſings of life, and never fail to worſhip him. The ſun is another of their divinities, becauſe of his influence on the bodies of men and beaſts. They have temples and images conſecrated to each of their gods. Their idols are either the trunks of trees rudely carved, or of ſtone. One of theſe is preſerved in the royal cabinet of antiquaries at Upſal. All their women are excluded from worſhip. They anoint the idol with the heart's blood of the ſacrifice; and when they cannot reach the top of a mountain conſecrated to Storjunkar, one of their deities, they dip a ſtone in the blood of the ſacrifice, throw it up to the mountain, and conclude their devotion by that act.

Theſe people were formerly deemed great magicians, and the credulous ſuppoſed them to be mightily ſkilled in divination. So exceſſively credulous, indeed, are theſe poor Laplanders, and ſo prepoſterouſly attached to their conjurors, that they implicitly follow their directions. If theſe pretended wizards tell them, that on ſuch a day they ſhall take plenty of fiſh or game, they will not fail to go out that day; and as there is moſt commonly abundance of both in this country, they uſually verify the prediction, by coming home loaded whenever they go out in ſearch of game. And if the wizards mark another day as unfortunate, they infallibly make it ſo, by not going abroad in queſt of any.

Different governors, or prefects, are deputed, by the three powers to whom Lapland is now ſubject, to preſide over their reſpective diſtricts. The Laplanders, however, had kings of their own till the year 1277, when the Swedes conquered part of the country, and the Ruſſians and Norwegians ſoon after followed their example, and ſubdued the remaining part.

As Swediſh Lapland is the moſt conſiderable diſtrict of the three, the laws of Sweden are obſerved; and three tribunals, or courts of juſtice, are erected: one for Angermanland-Lapmark; a ſecond for Uma, Pitha, and Lula-Lapmark; and the third for Torno and Kima Lapmark; in each of which courts there is a prefect, who determines all cauſes. They adminiſter juſtice in the king's name, and in the preſence of the prieſt belonging to the diſtrict.

Such of the Laplanders as live near the mountains which part Norway from Sweden, trade with the inhabitants of thoſe countries. Others, who are at a greater diſtance from thoſe mountains, trade only with the Swedes; and they who are ſituated towards the north and eaſt, trade with the Ruſſians and Finlanders. The commodities they receive from thoſe nations are rix-dollars, woollen ſtuffs, linen, copper, tin, flour, ſalt, hides, needles, knives, ſpirituous liquors, and eſpecially tobacco, of which they are extremely fond. They give, in return, rein-deer and fiſh, of the latter of which they take ſuch large quantities, that they ſtock whole reſervoirs with them, and put them afterwards into barrels, which they carry to the neighbouring countries; namely, the north of Bothnia, and White Ruſſia. They alſo trade in fine ermines, the ſkins of ſeveral wild beaſts, dried pikes, and cheeſe made of the milk of their rein-deer.

Formerly, the tribute paid by the Laplanders, conſiſted in ſkins of wild beaſts; but now they conſiſt in a certain coin, rein-deer, and in ſkins, either dreſſed for certain uſes, or raw; and are proportionable to the extent of land poſſeſſed by each head of a family. The largeſt are ſtiled entire territories, or territories of a full tribute; and the owner is obliged to pay yearly two rix-dollars, in coin, to the crown of Sweden. They who poſſeſs a territory, or land of half a tribute, pay only one rix-dollar. But as it happens very often, that many of them have no rix-dollars, they are allowed to give ſkins of foxes or ſquirrels inſtead of coin. Fifty ſquirrel ſkins, or one fox's ſkin, with a pair of ſhoes, after the faſhion of Lapland, are valued at one rix-dollar: beſides which, every head of a

family is obliged to give yearly a white fox's ſkin, or a pair of ſhoes; and if he cannot procure thoſe things, he muſt give half a pound of dried pikes. Part of theſe taxes are employed for the maintenance of the prieſts, who live in that country, to inſtruct the Laplanders. The inhabitants of the other diſtricts of Lapland trade much in the ſame commodities; and pay the revenues in a ſimilar manner to the reſpective ſtates, under whoſe particular dominion they are.

The Laplanders have neither caſtles, bulwarks, nor garriſons, for the defence of their country: nor indeed is there occaſion for any, its frightful aſpect forming a more effectual barrier than all the fortifications of art garriſoned by innumerable armies of veteran ſoldiers; the judges have no military to enforce their decrees, the people having a remarkable averſion to war, and, we believe, are never employed in any army. With reſpect to the ſecurity of their property, few diſputes happen.

CHAP. VI.

SWEDEN.

Extent, Boundaries, Climate, various Productions, Lakes, Soil, Beaſts, Birds, Fiſh, Minerals, and Mines. Account of a Deſcent into one, and the Manner of manufacturing the Iron.

THIS kingdom is ſituated between 56 and 69 deg. north lat. and between 10 and 30 deg. eaſt long. being 800 miles in length, and 500 in breadth; and is bounded on the ſouth, by the Baltic, the Sound, and the Categate, or Scaggerac; by the Daniſh or Norwegian Lapland, on the north; by Muſcovy, on the eaſt; and by the impaſſable mountains of Norway, on the weſt. Such a vaſt tract of country may naturally be ſuppoſed to contain a great number of inhabitants; but theſe bear a very ſmall proportion to the extent of Sweden, great part of it being rendered uninhabitable by ſeas, lakes, mountains, and marſhes.

It is divided into ſeven parts or provinces; viz. Sweden, properly ſo called, bounded by Norway and the gulf of Bothnia, Gothland, Livonia, Ingria, Finland, Swediſh Lapland, and the Swediſh iſlands. But it is neceſſary to obſerve, that Livonia and Ingria, though reckoned as part of Sweden, belong now to the Ruſſians, having been conquered by Peter the Great, and ceded by poſterior treaties.

SWEDEN PROPER contains the following provinces; namely, Uplandia, Sudermania, Weſtmania, Nericia, Geſtricia, Helſingia, Dalecarlia, Medelpedia, Angermania, Jemptia.

Gothland contains Eaſt Gothland, Weſt Gothland, Smaland, Wermeland, Dalia, Schonen, Bleking, Halland.

Swediſh Lapland contains Thorne-Lapmark, Kimi-Lapmark, Lula-Lapmark, Pithia-Lapmark, Uma-Lapmark.

In Weſt Bothnia, the principal places are Umea, Pitea, and Tornea.

Finland contains Eaſt Bothnia, Cajania, Savoloxia, Nyland, Travaſtia, Finland Proper.

Gothland, Oeland, Aland, and Rugen, are the Swediſh iſlands.

The climate, air, and ſoil of Sweden, are pretty ſimilar to thoſe of Norway and Lapland, already deſcribed; for in this, as in the other countries, there is an uninterrupted day-light of ſeveral weeks in ſummer, which is proportionably defective in winter. Spring and autumn are not known; the ſun is ſo exceſſively hot in ſummer, as ſometimes to ſet foreſts on fire; and the winter is ſo intenſely cold, that the noſes and extremities of the inhabitants are frequently mortified; and in ſuch caſes, the beſt remedy that has been found out, is, rubbing the part affected with ſnow; they endeavour to mitigate the ſeverity of the weather, by ſtoves and warm furs.

The ſoil is much the ſame with that of Denmark, and ſome parts of Norway, generally very bad, but in ſome vallies ſurpriſingly fertile. The Swedes, till of late years, had not induſtry enough to remedy the one, or improve the other. But ſince the days of Charles XII. they have been at incredible pains to correct the native barrenneſs of their country, by erecting colleges of agriculture, and in ſome places with great ſucceſs. The peaſants now follow the agriculture of France and England; and ſome late accounts ſay, that they raiſe almoſt as much grain as maintain the natives. In ſummer, a beautiful verdure, interſperſed with flowers, overſpreads the fields; currants, ſtrawberries, raſpberries, with other ſmall fruits, are produced ſpontaneouſly. Great plenty of pot-herbs and roots are reared in the kitchen-gardens. In dry ſeaſons, melons are brought to great perfection, and the orchards abound with cherries of different kinds, and of excellent flavour. Apples, pears, and plums are pretty ſcarce here; and the common people know, as yet, little of the cultivation of apricots, peaches, nectarines, pine-apples, and the like high-flavoured fruits.

In Sweden, the mountains are numerous, huge, and hoary; the principal among them are the Dofrine, which begin about Jemptland, and extend near four hundred Engliſh miles north. The face of the country is in a great meaſure overſpread by vaſt foreſts of fir, pine, alder, juniper, beech, birch, and ſome oak. Theſe trees grow ſo cloſe together, and ſuch a number of thoſe that fall are left to rot, that in many places the woods are entirely impaſſable. The timber is in general as good as that of Norway.

Their ſeas are the Baltic and the gulfs of Bothnia and Finland, which are arms of the Baltic; and on the weſt of Sweden are the Categate ſea, and the Sound, a ſtreight about four miles over, which divides Sweden from Denmark. Theſe ſeas have no tides, and are uſually frozen up four months in the year; nor are they ſo ſalt as the ocean, never mixing with it, becauſe a current ſets always out of the Baltic ſea into the ocean.

This country is watered by many navigable rivers, among which are the Lahla, Tornea, and Kima; but the chief of them is the Uma, which is augmented by many others.

The lakes in Sweden are of prodigious extent and depth, and are traverſed by the inhabitants in boats in the ſummer, and ſledges in the winter. The names of the principal of theſe are the Veller, the Wenner, and the Maeler. In the lakes, and along the ſea-coaſt, there are innumerable iſlands, of which ſix thouſand are inhabited, but the reſt are either bare rocks, or ſmall iſles covered with wood.

Sweden abounds with excellent mines of ſilver, many of copper, and vaſt numbers of iron. The principal of theſe is the great ſilver mine, into which workmen are let down in baſkets to the firſt floor, which is 105 fathoms under ground: the roof there is as high as a church, ſupported by vaſt arches of oak; thence the deſcent is, by ladders, or baſkets, to the loweſt mine, above 40 fathoms. They have no records ſo ancient as the firſt diſcovery either of this or the great copper mine, which muſt needs have been the work of many ages. The ore ſeldom yields above four per cent. and requires great pains to refine it. They are alſo at the charge of a water-mill to drain the

mines, and have the benefit of another to draw up the ore. This mine formerly produced between 20,000 and 30,000 of fine ſilver crowns, annually, and the king had a privilege in his favour, of being allowed to purchaſe whatever quantity he thought proper of it, and to pay one fourth leſs than the intrinſic value. A late traveller informs us, that this mine is, at preſent, much diminiſhed in value, by having been ſo greatly exhauſted. However, it may not be improper, in this place, to deſcribe the metal called ſilver, and the nature of the various ores from which it is produced.

Silver is a noble and perfect metal, of a white ſhining colour, ſonorous and ductile, but not ſo perfect as gold. It is ſometimes found in ſmall maſſes of many different ſhapes, but moſt commonly like filaments and ſcales in ſeveral ſorts of ſtones and moulds, and in many ſorts of land.

The Vitrean ſilver is of an irregular form, very weighty, and may be eaſily flatted with a hammer, for it is not much harder than lead, and is much of the ſame colour; for which reaſon it is often miſtaken for lead. It melts preſently, and ſoon grows red-hot. It conſiſts of ſulphur and pure ſilver, and above three quarters of it is ſilver. The horny ſilver ore is half tranſparent, and of a deeper yellow or brown colour, according as it conſiſts of larger or ſmaller lumps. It looks like roſin, and is of an irregular ſhape. When carefully examined, it appears to conſiſt of very thin plates. It is not very weighty or hard, for it may be eaſily ground, and when brought ſuddenly to the fire, it crackles, burſts, and exhales a ſulphureous ſmell, and ſometimes burſts lightly. This hard ſort contains two thirds of ſilver. The red ſilver ore is ſometimes of a lighter, and ſometimes of a deeper ſcarlet colour. The firſt caſe is tranſparent, like a garnet, and has been miſtaken for tranſparent cinnabar, and in the ſecond caſe it is of a deeper dye. It is heavier than the former horny ore, but burſts when brought near a candle or a mild fire, and the remaining part melts before it grows red-hot; then it emits a diſagreeable ſmell of arſenic, together with a thick ſmoke. It contains the ſame quantity of ſilver as the horny ore juſt mentioned.

The white ſilver ore is of a light grey colour, of an irregular figure, pretty weighty, and very brittle. It has not only copper in it, but ſometimes more of it than of ſilver, for it differs from the white copper ore in nothing but the quantity of ſilver it contains. Theſe are the principal ſilver ores hitherto known, though many others are looked upon by ſome as ſuch, becauſe they contain a conſiderable quantity of ſilver; but then there is always more of other metals along with them, therefore they cannot properly be called ſilver ores.

Silver is extracted from lead, by melting it in channels, made with aſhes in the furnace, and then blowing up the fire till it turns into glaſs, ſinks into the channels, and leaves the pure ſilver behind. It is harder than gold, but not ſo ductile, and is lighter than gold or lead, the weight, with regard to gold, being little leſs than five to nine. It will not ruſt, but will grow black by ſulphureous vapours, and will diſſolve in aqua fortis, but not in aqua regia. When it is mixed with common ſalt, and melted, it turns into a half tranſparent maſs like horn, which is hard to be brought back to ſilver again, becauſe it is volatile, and in a violent fire will all fly away. When ſilver is diſſolved in aqua fortis it may be cryſtallized, and the cryſtals are very corroſive, and of an exceeding bitter taſte. When applied to the ſkin, they leave an impreſſion like that of a burning coal, and make an eſcar of a black colour. The ſolution of ſilver will turn any think black, and therefore, when properly diluted, is often uſed to colour the hair. Theſe cryſtals will melt in a very moderate heat before they grow red, and form a blackiſh maſs: it is then proper for the uſe of ſurgeons, and is called the ſilver cauſtic.

The great copper mine is about 80 fathoms deep, of great extent, but ſubject to damages by the falling-in of the roof; yet that is ſometimes recompenſed by the abundance of ore which the ruined pillars yield, though moſt commonly the loſs is very great. The occaſion of theſe falls is aſcribed to the throwing the earth and ſtones, brought out of the mine, upon the ground over it; by which the pillars become overcharged, and give way. The reaſon of this is ſaid to be, that the profit ariſing to thoſe who are concerned is ſo little, that they are not able to work it off as they ought, and to remove the rubbiſh to a greater diſtance; and unleſs the king abates a conſiderable part of the profit ariſing to the crown from this mine, it is believed it will, in a few years, be at a ſtand, eſpecially if the deſigns of making copper, which are on foot elſewhere, take any tolerable effect. The copper yearly made out of this mine amounts to the value of about 200,000l. of which the king has a fourth part, not by way of preemption, but in kind; beſides which, he has upon the remainder a cuſtom of 25 per cent. when it is exported unwrought.

Several years ago a gentleman of Italy came into Sweden, with propoſals to make copper a ſhorter and cheaper way than had till then been practiſed, ſo as to make that in five days, which before required three weeks, and with one fifth part of the charcoal, and with fewer hands. The bargain was made, and his reward to be 100,000 crowns. The firſt eſſay he made ſucceeded to admiration; but when he came to work in earneſt, and had got his new ovens built to his mind, the miners, as he complained, picked out the very worſt ore, and were otherwiſe ſo envious and untractable, that he failed of ſucceſs, and loſt his reward, nor was it without difficulty that he obtained leave to buy ore, and practiſe his invention at his own charge.

Travellers tell us, this mine, in the laſt century, ſupplied the greateſt part of Europe with copper; but at preſent it is worked ſo very deep, that it is become extremely expenſive; and though the ore is uncommonly rich, the produce is conſiderably diminiſhed.

Copper is a hard, ignoble metal, ſofter than iron, and, when poliſhed, is of a ſhining reddiſh colour. It will melt in the fire, and is ſo ductile, that it may be beaten into exceeding thin leaves. It is more frequently found in its metallic form than iron, in various ſhapes, but its ore never diſtinguiſhes itſelf by any certain figure, for it is almoſt always irregular. But the fineſt colours of any kind, except the red and tranſparent, moſt commonly betray the preſence of copper; for this reaſon there is hardly any copper ore that is not mixed with iron, in a larger quantity than the ores of other metals commonly are. However, there is not ſo much in ſome as in others; and thoſe that contain the leaſt iron, are naturally more eaſily melted than the reſt. The vitreous copper ore is of a darkiſh violet ſky colour, like that of a piece of ſteel that has touched a red-hot iron. It is very heavy, and of a moderate hardneſs, but commonly variegated with ſpots and grey veins. One hundred weight of this ore contains from 50 to 80 pounds of copper. The azure copper ore is of a moſt beautiful blue colour, not ſoft, but very heavy, and, when broken, ſhines like blue glaſs. This is moſt free from iron, arſenic, and ſulphur; and a great quantity of excellent copper may be extracted out of it with eaſe. The green copper ore is like green cryſtal, and ſometimes very prettily ſtreaked; but in other things it has the

properties

properties of the former. The light duſky blue concretes, as well as the green, called by ſome copper okers, yield a great deal of very good copper when they are pure, which may be known from their colour and weight; but thoſe that are more light are mixed with unmetallic earth, and thoſe that are yellow contain iron oker; on which account they are the more difficult to be met with, and yield leſs copper of an inferior ſort.

The following extraordinary account of a deſcent into the copper mine of Fahlun in Sweden, is given by a Dutch officer. "During the four hours that I wandered into the bowels of Kopperberg, as I deſcended from gallery to gallery, ſometimes by ladders, and ſometimes by ſtairs, my aſtoniſhment increaſed at every ſtep. At firſt I went down by zigzag ſtairs, tolerably commodious, into a large cavity, about 300 feet deep, and 2000 paces in circumference. At the extremity of the the cave I ſaw, in a corner, a hut built of wood, ſix or ſeven feet in height, at the door of which ſtood two figures half naked, and as black as ink. I took them for the pages of Pluto. Each had a lighted torch in his hand. In this hut, is one of the entries into the ſubterraneous regions, and it is the moſt commodious of the four which communicated with the cave. I and my ſervant were immediately preſented with a black dreſs, a precaution that is generally taken to preſerve the clothes of the inquiſitive from being ſpoiled in the narrow paſſages of the galleries. This mournful apparel, together with a prayer uttered by my guides, imploring the divine aid, that we might eſcape unhurt from theſe regions, intimidated my ſervant, who was a young Frieze, in ſuch a manner, that he would ſcarcely ſubmit to be dreſſed *en Scaramouche*, much leſs deſcend into the mine.

"Paſſing at one time through alleys propped up by timber, at another, under vaults that ſupported themſelves, we came to immenſe large halls, the height or extremities of which could not be reached by the feeble lights that we carried. In ſome of theſe are forges, where the different tools uſed in working the mines are made and repaired. It was here ſo exceſſively hot, that the workmen were entirely naked. Other halls ſerved either for magazines of gunpowder, or cordage, and other utenſils neceſſary for their operations. Theſe communicate by means of the galleries, and theſe galleries communicate with each other by ladders or ſteps. There are alſo apertures made from the upper ſurface, in a perpendicular line to the loweſt gallery, without any interruption. Theſe ſerve at once to convey freſh air, and for the paſſage of any burdens, which, being placed in large veſſels, are moved upward and downward by means of pullies, that are in continual motion during the whole time of labour. The pullies are kept in motion by horſes on the top of the mountain. The veſſels are attached to chains of iron, common ropes being ſubject to ſpeedy eroſion by the vitriolic vapours which aſcend from the mines. The irons themſelves will not endure for a long ſpace of time, and therefore ropes of cows hair, or of hogs briſtles, are often made to ſupply their place.

"The apertures are not only convenient for the purpoſes above mentioned, and give vent to a peſtilential atmoſphere; but, co-operating with the heat proceeding from the forge, and other phyſical cauſes, they excite, even in the deepeſt parts, ſuch exceſſive draughts of air, that they reſemble the moſt violent hurricanes. The roofs that are not ſupported by art, afford, in many places, a very ſingular appearance. The vitriol diſtilling through the rocks, cryſtallizes on their ſurface, and forms priſms of different figures. Theſe are ſuſpended from a thouſand places, ten, twelve, twenty feet in length, and of a moſt beautiful green. The reflection of the light from their various ſurfaces, and from the minerals that ſurround the walls, produces an effect more eaſy to be conceived than deſcribed.

"In one of the paſſages, upwards of ſeven hundred feet below the ſurface of the earth, the vitriol is diſſolved, and it is pumped out of the mine by means of a curious hydraulic machine. The water which ſprings up at this depth very copiouſly, is ſet in motion of horſes, diſſolves the vitriol, and conveys it into a reſervoir, which contains a quantity of old iron. Twenty-four of theſe horſes have ſtables in the gallery, their mangers being cut out of the rock. This work continues night and day, horſes and men being relieved every ſix hours. Theſe animals are hoiſted up through the openings once in a year, to undergo a general review. Curioſity induced me to deſcend to about eleven hundred feet under the earth, to the loweſt gallery, where the principal exploſion is made. Notwithſtanding the exceſſive cold of this place, the men who were occupied in cleaving the rock, were not only naked, but in profuſe ſweats. The obſcurity of theſe regions, the diſtant fires ſpreading a viſible gloom, naked men, dark as the minerals which they work, ſurrounded by the ſparks that fly from their hammers; the horrid noiſe of their labour, and of the wheels of the hydraulic machines, joined with the tremendous figures which we met, from time to time, with lighted torches in their hands, made me doubt whether I was not really in Tartarus.

"Having at length arrived at a kind of hall, the roofs of which were ſupported by pillars hewn out of the rock, and ſurrounded with ſeats of the ſame nature, my guides deſired me to repoſe myſelf, and liſten to ſome muſic that would amuſe me. On my inquiring of what kind, they anſwered it was the noiſe which proceeded from blowing up the rocks, to facilitate their labour. I conſented, on condition that they ſhould remain with me. They readily agreed, as this was the only place totally free from danger. One of them went out for a moment to give the neceſſary directions, and returning, ſat by my ſide. After waiting about a quarter of an hour, trembling with cold, and my patience exhauſted, I threatened to renounce the muſic, if they were not more expeditious. While I was ſpeaking, the exploſion began. My ears had hitherto been ſtrangers to the like. The whole extent of theſe ſubterraneous regions, as far as our ſight could reach, was inſtantly illuminated, and we were immediately left in total darkneſs, for the preſſure of the air had extinguiſhed our torches. This obſcurity was only interrupted by a new exploſion on the right and left, accompanied with ſudden flaſhes of light. Echoes redoubled the ſtrokes with thundering noiſe. The vaults ſeemed to ſplit over our heads, the ground trembled, and our ſeats rocked under us. The recollection that we were eleven hundred and thirty-ſix feet under the ſurface of the earth; the ſight at every repeated flaſh, of our guides, and of myſelf, dreſſed in ſable hue; the fall of the rocks that were detached by the exploſion; and the ſmoke of the gunpowder, will plead my apology ſhould I candidly confeſs that I felt all the *toupee* which I had, ſtood erect. This concert continued about half an hour, and ſuddenly ceaſing, left us in profound ſilence; which, together with the obſcurity of the place, and the ſuffocating ſteam of the gunpowder, rather increaſed than diminiſhed the horror. This operation is repeated every day at noon.

There are many iron mines and forges towards the mountainous parts, where they have the conveniency of water-falls to turn their mills. From theſe, beſides ſupplying the country, there is yearly exported,

exported, iron to the value of near 300,000l. but of late years the number of theſe forges has been ſo much increaſed, that each endeavouring to underſell others, the price has been much lowered. Since the prohibition of foreign manufactures, in exchange for which iron was plentifully taken off, it is grown ſo cheap, that it is found neceſſary to leſſen the number of forges. Neither has that contrivance had the effect intended, but, on the contrary, many more are like to fall of themſelves, becauſe they cannot work but with loſs; in which caſe, many thouſands of poor people, whoſe livelihood depends upon thoſe forges and mines, will be reduced to a ſtarving condition.

Iron is an ignoble metal, remarkable for its hardneſs. It is of a whitiſh livid colour when poliſhed, but before that it is blackiſh. When it is cleanſed it is called ſteel. The ore of common iron is of no certain form, but moſt commonly of a ruſty colour. There is alſo an ore which is very heavy, and of a red bluiſh colour when broken. It is very rich in the beſt kind of iron, and uſually yields, at the firſt melting, from ſixty to eighty pounds out of an hundred weight.

There is alſo a ſingular kind of iron ore, of a yellowiſh colour, though ſometimes grey, and ſometimes of a kind of ſemi-tranſparent white. It will yield, when melted, about thirty pounds of iron out of an hundred weight. When iron is melted, it is formed into large maſſes, which are long and thick, and commonly called pigs. Theſe are melted over again, and ſtirred with an iron rod, in order to render them malleable. While they are yet red hot, they are placed under hammers, and by that means the heterogeneous particles are forced away by the repeated ſtrokes. One ſort of iron differs greatly from another, but that which is tougheſt is beſt, and that which is moſt brittle is worſt of all. However, all ſorts of iron are of the ſame nature, and they are only more or leſs tough, in proportion to the earthy, vitriolic, and ſulphureous particles mixed therewith. Iron being often melted and cleanſed, is turned into ſteel; though, in ſome caſes, little labour is required for that purpoſe, and in others a great deal. When iron is very good, they melt it in a furnace, and throw in gradually a mixture of equal parts of an alkalous ſalt, and filings of lead, with the raſpings of oxes horns; then they ſtir the melted metal, and at length place it on the anvil, where they beat it into rods.

A late traveller gives the following remarkable deſcription of his deſcent into the mines of Danmora:

"We lay, ſays he, at a pretty village, called Oſtarby, and went about three miles the next morning to ſee the mines of Danmora. They are celebrated for producing the fineſt iron ore in Europe, the iron of which is exported into every country, and conſtitutes one of the moſt important ſources of the national wealth and royal revenues of Sweden. The ore is not dug as in the mines of tin or coal which we have in England, but is torn up by powder. This operation is performed every day at noon, and is one of the moſt tremendous and awful it is poſſible to conceive. We arrived at the mouth of the great mine (which is near half an Engliſh mile in circumference) in time to be preſent at it. Soon after twelve the firſt exploſion began; I cannot compare it to any thing ſo aptly as ſubterraneous thunder, or rather vollies of artillery diſcharged under ground. The ſtones are thrown up by the violence of the powder to a vaſt height above the ſurface of the earth; and the concuſſion is ſo great as to ſhake the ſurrounding earth, or rock, on every ſide. I felt a pleaſure mixed with terror, as I hung over this vaſt and giddy hallow, to the bottom of which the eye in vain attempts to penetrate. As ſoon as the exploſions were finiſhed, I determined, however, to deſcend into the mine. There is no way to do this but in a large deep bucket, capable of containing three perſons, and faſtened to chains by a rope. The inſpector, at whoſe houſe I had ſlept the preceding night, took no little pains to diſſuade me from the reſolution, and aſſured me that not only the rope, or chains, ſometimes broke, but that the ſnow and ice, which lodged on the ſides of the mines, frequently tumbled in, and deſtroyed the workmen; nor could he warrant my abſolute ſecurity from one or both of theſe accidents. Finding, however, that I was deaf to all his remonſtrances, he provided me a clean bucket, and put two men into it to accompany me. I wrapped myſelf, therefore, in my great coat, and ſtepped into the bucket. The two men followed, and we were let down. I am not aſhamed to own, that when I found myſelf thus ſuſpended between heaven and earth by a rope, and looked down into the deep and dark abyſs below me, to which I could ſee no termination, I ſhuddered with apprehenſion, and half repented my curioſity. This was, however, only a momentary ſenſation, as before I had deſcended an hundred feet, I looked round on the ſcene with very tolerable compoſure. I was near nine minutes before I reached the bottom, it being 80 fathoms, or 480 feet. The view of the mine, when I ſet my foot to the earth, was awful and ſublime in the higheſt degree. Whether terror or pleaſure formed the predominant feeling, as I looked at it, is hard to ſay. The light of the day was very faintly admitted into theſe ſubterraneous caverns. In many places it was abſolutely loſt, and flambeaux ſupplied its place. I ſaw beams of wood acroſs ſome parts, from one ſide of the rock to the other, where the miners ſat employed in boring holes for the admiſſion of powder, with as much unconcern as I could have felt in any ordinary place, though the leaſt dizzineſs, or even a failure in preſerving their equilibrium, muſt have made them loſe their ſeat, and daſh them to pieces againſt the rugged ſurface of the rock beneath. The fragments torn up by the exploſion, previous to my deſcent, lay in vaſt heaps on all ſides, and the whole ſcene was calculated to inſpire a gloomy admiration in the beholder.

A confinement for life in theſe horrible iron dungeons, muſt ſurely, of all puniſhments which human invention has deviſed, be one of the moſt terrible. I remained three quarters of an hour in theſe gloomy and frightful caverns, and traverſed every part of them which was acceſſible, conducted by my guides. The weather above was very warm, but here the ice covered the whole ſurface of the ground, and I found myſelf ſurrounded with the colds of the moſt rigorous winter, amid darkneſs and caves of iron. In one of theſe, which runs a conſiderable way under the rock, were eight wretches warming themſelves round a charcoal fire, and eating the little ſcanty ſubſiſtence produced from their miſerable occupation. They roſe with ſurpriſe at ſeeing ſo unexpected a gueſt among them; and I was not a little pleaſed to dry my feet at their fire, which were wet with treading on the melted ice.

There are no leſs than 1300 of theſe men conſtantly employed in the mines, and their pay is only a common dollar, of three-pence Engliſh, a day. They were firſt opened about 1580, under the reign of John the Third, but have been conſtantly worked only ſince the time of Chriſtina. After having gratified my curioſity with a full view of theſe ſubterraneous apartments, I made the ſignal for being drawn up, and can moſt ſeriouſly affirm, I felt ſo little terror while re-aſcending, compared with that of being let down, that I am convinced,

convinced, in five or ſix times more, I ſhould have been perfectly indifferent to it, and could have ſolved a problem in mathematics, or compoſed a ſonnet to my miſtreſs, in the bucket, without any degree of fright or apprehenſion. So ſtrong is the effect of cuſtom on the human mind, and ſo contemptible does danger or horror become, when familiarized by continual repetition!"

Speaking of the manner in which the peaſants manufacture the iron, the ſame writer ſays, "I have viſited ſix or ſeven forges on my journey, each of which conſtantly employs from four to fourteen hundred workmen, only in iron. Wherever there is a country ſeat, you may be certain to ſee one of theſe fabrics, and no Cyclops were ever more dextrous in working their materials. I have ſeen them ſtand cloſe to, and hammer, in their coarſe frock of linen, a bar of ore, the heat and refulgence of which were almoſt inſupportable to me at 10 feet diſtance, and with the ſparks of which they were covered from head to foot. I had the pleaſure of viewing the whole proceſs uſed to reduce the ore into iron, and muſt own it is very curious. They firſt roaſt it in the open air for a conſiderable time; after which it is thrown into a furnace, and, when reduced to fuſion, is poured into a mould of ſand about three yards in length. Theſe pigs, as they are then denominated, are next put into a forge heated to a prodigious degree. They break off a large piece with prickers, when red hot, and this is beat to a leſſer ſize with hammers. It is put again into the fire, and from thence entirely finiſhed, by being laid under an immenſe engine reſembling a hammer, which is turned by water, and flattens the rude piece into a bar. Nothing can exceed the dexterity of the men who conduct this concluding part of the operation, as the eye is their ſole guide, and it requires an exquiſite nicety and preciſion. It is certainly a moſt happy circumſtance that Sweden abounds with theſe employments for her peaſants, ſince, from the ungrateful ſoil and inclement latitude, they muſt otherwiſe periſh by miſery and famine."

The animals in Sweden are elks, bears, wolves, deers, hares, foxes, wild cats, ſquirrels, &c. and theſe are hunted either for their fleſh, ſkins, or furs, the Swediſh huntſmen uſing guns, and being in general excellent markſmen.

The ſquirrel is ſomewhat thicker than a weaſel, but not quite ſo long. He is of a reddiſh colour on the upper part of the head and back, but on the belly is white. The tail is long and buſhy, which being turned over his back, is ſufficient to ſhade it; whence the Latin name *ſciurus*, which ſignifies a ſhade. This animal ſits upon his backſide when he feeds, laying hold of the proviſion with his fore feet, and putting it into his mouth. He lives upon nuts and acorns of all kinds, but is moſt fond of hazel nuts, which he gathers in the proper ſeaſon, and hoards up againſt winter. Squirrels are generally to be met with upon trees, where they build their neſts, and bring up their young. They can leap very readily from bough to bough, and ſometimes from tree to tree, at which time they uſe their tails inſtead of wings.

There are poultry of various kinds reared in Sweden. Of game there is plenty, both of land and water-fowl, particularly partridges, and a bird called yerper, which reſembles a partridge.

The orra is a fowl of the ſize of a hen, and the keder is very near as big as a turkey. In winter the Swediſh ſportſmen amuſe themſelves with killing black-birds, thruſhes, and ſydenſwans, the latter being beautiful birds, ſumptuouſly arrayed in gorgeous plumes, which are finely tipt with ſcarlet; they are about the ſize of fieldfares, and their fleſh is of a moſt exquiſite flavour. Pigeons are ſcarce, on account of the great number of voracious birds which deſtroy them.

The moſt remarkable bird of prey is the eagle. This bird is of a large ſize, very ſtrong, and can never be tamed like the hawk in order to purſue game; and it is much more majeſtic in appearance than the vulture.

The eagle principally inhabits inacceſſible mountains, and rooſts on the loftieſt trees, being fond of ſuch places as are leaſt frequented by mankind. However, as birds, as well as other animals, are found in greater plenty round the habitations of men, the eagle is ſometimes induced to frequent thoſe places for the convenience of its prey. They live much on fiſh, crabs, tortoiſes, wild ducks, poultry, pigeons, and the like. They have been known not to ſpare even their own ſpecies, when preſſed with hunger. They attack not only lambs and young goats, but ſometimes deer, ſheep, and even horned cattle. They build their neſts on the moſt inacceſſible parts of rocks, and the higheſt trees, ſome of which have been found near ſix feet in diameter. They are uſually lined with the hair of foxes, wool, or the fur of hares and rabbits, to keep the eggs warm, of which the female generally lays two, or ſometimes three at a time, and hatches them in thirty days, during which time the male ſupplies her with food. As ſoon as the young ones are produced, the old become remarkably miſchievous, and deſtroy lambs and poultry for ſeveral miles round them. They often bring hares and partridges alive to their young, to regale them with the reliſh of warm blood. The country folks ſometimes avail themſelves of theſe proviſions, by taking it from the eaglets in the abſence of the old ones, and carrying it home for their own uſe.

The vulture differs from the eagle in not having its beak turned immediately crooked from the root, it continuing ſtraight to the length of two inches, It is much more lazy than the eagle, and fond of carrion, which the eagle will not touch. However, they prey upon live birds, hares, kids, fawns, &c. if they can get them; and if not, eat any filth that comes in their way.

The hawk has wings ſo long as to reach to the end of the tail, which reſembles that of a ſparrow-hawk. The beak is partly blue and partly yellow; the feet are of a pale green; the toes are ſlender; the talons large, ſharp, and darkiſh; the breaſt, belly, and thighs, white, ſtreaked with black; the neck, back, wings, and head are brown, and the latter is flattiſh at the top: the tail is of a light brown, with black lines running acroſs it; and the legs and feet are of a yellow colour. Some years ago a hawk was killed in Finland, which had a plate of gold on one leg, and a plate of ſilver on the other. On the former was this French inſcription: "Je ſuis au Roi;" which, in Engliſh, implies, "I belong to the King;" and, on the latter, were theſe words in the ſame language: "Le Duc de Chevreuſe me garde;" which may be thus tranſlated: "The Duke of Chevreuſe keeps me."

The kite is diſtinguiſhed from all other rapacious birds by having a forked tail. It is uſually about 28 inches long, from the head to the tip of the tail, when the neck is ſtraight; but when the wings are extended, it meaſures, from extremity to extremity, 64 inches, or better. The head is of an aſh colour, the neck red, the back brown, and the wings are diverſified with red, black, and white. The beak is black, the tongue thick, the legs and feet yellow, and the talons of a ſable hue. It has always been famous for its rapacity, and is often mentioned by the ancients.

The ſeas of Sweden, as well as the rivers, abound

with a great variety of fiſh, particularly ſalmon, perch, pike, ſtreamling, trout, tench, eels ſeals, &c.

Pikes are ſo abundant, that vaſt quantities are ſalted and dried for ſale; and great numbers of ſtreamlings (which is a delicious fiſh, ſmaller than a pilchar, or pilchard) are pickled and barrelled, both for home conſumption and exportation. The train oil, extracted from the ſeals, is a valuable article of traffic in their exports.

The Swedes, in their perſons, are in general of a large ſtature, with white or yellow hair. There is a great diverſity with reſpect to their characters; and what is peculiarly remarkable among them, they are known to have had different characters in different ages. At preſent the nobility are brave, hoſpitable, fond of glory, and ſtrictly attached to the rules and punctilios of honour: but as a foil to theſe excellencies, they are proud, oſtentatious, jealous, and vindictive. The lower claſs of people are religious, ſober, loyal, induſtrious, and quiet; except when intoxicated with liquor, at which time they are furious and ungovernable; and ſome accuſe them of being over-reaching, rapacious, envious, and exceedingly averſe to foreigners. In their perſons they are uſually ſtrong and hardy; whereby they are capable of bearing great labour and fatigue, which are excellent qualifications towards the performance of the duties of a military life, and the Swedes have been ſuppoſed the beſt ſoldiers in Chriſtendom. They have no great genius, but they are indefatigable in executing whatever they undertake. Their great poverty obliges them to practiſe ſeveral mechanical arts, which neceſſity teaches them to exerciſe, and the peaſants make their own clothes, ſhoes, and implements of huſbandry; but the trading part of the nation continue in the paths trodden by their anceſtors, without ingenuity to diſcover, or ſpirit to purſue, new branches of commerce.

The Swediſh women are fair, well ſhaped, exceedingly fruitful, and more eminent for chaſtity before than after marriage. From the higheſt to the loweſt they are ſubſervient to the will of their huſbands, even to a degree of ſlavery. As to the meaner ſort, beſides the offices peculiar to their ſex, they perform all kinds of drudgery, ſuch as plowing the fields, threſhing the corn, rowing the boats, and carrying burdens.

Perſons of quality dreſs after the faſhion of France; but the peaſants, &c. wear clothes made of coarſe ſtuff, and lined with ſheep-kin, to defend them from the extreme cold of winter.

The marriages in Sweden generally take their riſe from the mercenary views of parents, and not from the leaſt degree of affection in the young couple, whoſe inclinations have perhaps never been once conſulted in the whole courſe of the affair. It is ſeldom that the children of noble families marry before the age of thirty, their parents having little to ſpare in their life-time. The wedding, as well as the funeral entertainments of this country, are performed with great pomp, and both are commonly attended with riot and exceſs.

The reformed religion, according to the tenets of Luther, is profeſſed with the utmoſt ſtrictneſs in Sweden; and owes its eſtabliſhment there to Guſtavus Vaſa, about the year 1523. An attempt having been once made to re-eſtabliſh Popery, to the great diſturbance of the kingdom, they have ever ſince had ſuch an averſion to that religion, that caſtration is the fate of every Roman Catholic prieſt diſcovered in their country. The common people are ſurpriſingly uniform and unremitting in religious matters, never inquiring into, or diſputing about controverted points of faith and doctrine, but ſubmitting themſelves entirely to the directions of their clergy, who by their morals, and the ſanctity of their lives, endear themſelves ſo much to the people, that the government would repent making them its enemies. Their revenues are very moderate, that of the archbiſhop of Upſal, the primate, not exceeding 400l. a year: he has under him 13 ſuffragans, beſides ſuperintendants, with moderate ſtipends. The church is governed by a body of eccleſiaſtical laws and canons, reviſed by a committee choſen from the different ſtates that compoſe the diet, and approved by the ſovereign. The clergy are not intruſted with the execution of their own laws, nor can they tranſact affairs of importance without the concurrence of the civil power. A converſion to Popery, or a long continuance under excommunication, which are puniſhed by impriſonment or exile, cannot paſs without the king's permiſſion, ſince in either caſe he would be deprived of a ſubject. Chriſtianity was introduced into Sweden by Anſgarius, biſhop of Bremen, in the year 829.

The language ſpoken in Sweden bears a near affinity to that of Denmark, being a dialect of the ancient Gothic, or Teutonic. This country has produced many perſons of learning, at the head of which claſs may juſtly be placed the celebrated Puffendorf, who was at once an hiſtorian, civilian, and philoſopher, and a native of Sweden. The name of Linnæus will be perpetuated to the lateſt poſterity, for having carried moſt of the branches of natural philoſophy, particularly botany, to the greateſt height; he was one of the greateſt ornaments to learning Europe could boaſt in this time.

The Swediſh nobility and gentry ſhewed their attention to the improvement of literature, by ſending Haſelquiſt, that excellent and candid natural philoſopher, into the eaſtern countries, in order to make diſcoveries, and where, unhappily for the learned world, he died. But, as this noble ſpirit is eminently encouraged by the royal family, his labours were not entirely loſt, the queen of Sweden having purchaſed his collection of curioſities at a great expence. The fine arts, particularly drawing, ſculpture, and architecture, are at this time known, and encouraged in that kingdom; and, ſince the decline of their iron manufacture, many of the people have applied themſelves to agriculture, which is carried to a great degree of perfection, and muſt be of infinite advantage to the nation. From the above inſtances it appears, that it has been chiefly owing to the Swedes not having had an opportunity to exert their talents, that they have been repreſented by ſome writers as a dull, heavy people, fit only for bodily labour.

Their principal univerſity is that of Upſal, inſtituted near 400 years ago, and patronized by ſeveral ſucceſſive monarchs, particularly the great Auguſtus Adolphus, and his daughter Chriſtina, whoſe paſſion for literature is well known to the public, and who may be accounted a genius in many branches of knowledge. This univerſity has a chancellor, a vice-chancellor, a rector, and twenty profeſſors, all provided with comfortable ſalaries, the largeſt of which is 140l. per ann. There are near 1500 ſtudents here; but, for the moſt part, they are extremely indigent, and lodge five or ſix together in poor hovels. At Abo, in Finland, there is a ſecond univerſity, which is neither ſo flouriſhing, nor ſo well endowed as that of Upſal; and at Lunden, in Schonen, there was a third, which is now entirely fallen to decay.

An academy of arts and ſciences was ſome years ſince eſtabliſhed at Stockholm, and is now in a flouriſhing condition. They have publiſhed ſeveral volumes of memoirs, which have been well received by the public.

Every dioceſe in Sweden is provided with a free-ſchool, wherein boys are qualified for the univerſity; and there are alſo inferior ſchools, where children

are

are taught to read, write, and inſtructed in the principles of the Chriſtian religion.

The common people in Sweden ſubſiſt principally by agriculture, mining, grazing, hunting, and fiſhing. Their materials for traffic and exportation conſiſt principally of bulky and uſeful commodities, ſuch as maſts, beams, deal-boards, and other ſorts of timber for ſhips; tar, pitch, bark of trees, pot-aſh, wooden utenſils, hides, flax, hemp, poultry, furs, lead, iron, braſs, copper, cordage, and fiſh. In exchange for theſe commodities, they import corn, ſugars, wines, ſpices, ſilk, and Engliſh cloths.

In the 16th century, the manufacturing of iron was introduced into Sweden; for till that time they ſold their old crude ore to the Hanſe-Towns, and brought it back again; but at preſent vaſt quantities of copper, braſs, ſteel, and iron, are wrought in Sweden; they have alſo foundaries for cannon, forges for fire-arms and anchors, armories, wire and flatting mills; alſo mills for pileing, and for boring and ſtamping; and of late they have built many ſhips for ſale. About the middle of the 17th century, by the aſſiſtance of the Dutch and Flemings, they ſet up ſome manufactures of glaſs, ſtarch, tin, woollen, ſilk, ſoap, leather-dreſſing, and ſaw-mills: bookſelling was at that time unknown in Sweden. They have ſince had ſugar-baking, tobacco-plantations, and manufactures of ſail-cloth, cotton, fuſtian, and other ſtuffs; of linen, alum, and brimſtone; paper-mills and gunpowder-mills.

The Swedes, about the year 1752, had greatly increaſed their exports, and diminiſhed their imports; moſt part of which arrive, or are ſent off in Swediſh ſhips, the Swedes having now a kind of navigation-act, like that of the Engliſh; but the jealouſies of the Swediſh government have injured theſe promiſing appearances.

Their curioſities and antiquities are the following: A few leagues from Gottenburg is a hideous precipice, down which a dreadful cataract runs with ſuch impetuoſity into a deep bed of water, that large maſts and other bodies of timber, which are precipitated, diſappear, ſome being half an hour, and others much longer, before they are recovered. Several hundred fathoms of line have been uſed in endeavouring to find the bottom of this bed, but it has never yet been diſcovered.

In various parts of Sweden a ſtone is found, of a yellow-colour, intermixed with ſtreaks of white, which give it the appearance of a compoſition of gold and ſilver. This ſtone yields ſulphur, alum, vitriol, and minium. In the ſouthern parts of Gothland is a remarkable ſlimy lake, which has the uncommon property of ſingeing every thing that is thrown into it.

The Swedes pretend to be in poſſeſſion of a manuſcript copy of the tranſlation of the Goſpel into Gothic, the work of a biſhop 1300 years ago. Two clocks, one at Upſal, and the other at Lunden, are eſteemed by them pieces of curious workmanſhip: that at Lunden ſhews the remarkable motions of the heavenly bodies, with all feſtivals, both fixed and moveable.

In the government of Sweden, many changes have happened. At the deceaſe of Charles XII. who governed as an abſolute prince in Sweden, his ſiſter, Ulrica Eleonora, aſcended the throne, and, knowing how unwary the deſpotiſm of Charles had rendered his ſubjects, the firſt action of her reign was, to iſſue a proclamation, declaring her intention of aboliſhing and renouncing, for herſelf and ſucceſſors, all abſolute power and dominion, and of re-eſtabliſhing the old form of government.

The ſtates of Sweden being aſſembled, in the year 1719, ſhe made a declaration that ſhe would accept the crown on no other condition than that of election; which reſolution was ſo agreeable to the ſtates, that they immediately exerted the power ſhe had given them, by unanimouſly chooſing her for their ſovereign; and ſoon after her huſband, the landgrave of Heſſe-Caſſel, was aſſociated with her in the government. This condeſcenſion of the queen has been juſtly blamed for the unbounded length to which ſhe carried it; for the ſtates now acquired more ample privileges than they had ever before enjoyed; and at the ſame time the power of the king of Sweden was ſo limited, that he could ſcarcely be called by that name, being cramped in every exerciſe of government, and even in the education of his own children. The great officers of the kingdom were appointed by the diet of the ſtates; and all employments of any value, eccleſiaſtical, civil, or military, were conferred by the king only with the approbation of the ſenate. The ſtates were formed of deputies from the four orders, nobility, clergy, burghers, and peaſants. The repreſentatives of the nobility, which included the gentry, amounted to above 1000, thoſe of the clergy, to 200, the burghers to about 150, and the peaſants to 250. Each order ſat in its own houſe, and had its own ſpeaker; and each choſe a ſecret committee for the diſpatch of buſineſs. The fixed time for convoking the ſtates was once in three years, in the month of January, and the ſeſſion was appointed to continue three months; but it might break up ſooner, if all the orders conſented to the ſeparation. The immediate buſineſs of the ſtates was, to regulate every thing of importance relating to the conſtitution, and to take cognizance of every circumſtance which was intereſting to the community.

When the ſtates were not ſitting, the affairs of the public were managed by the king and ſenate, which, in fact, was a committee of the ſtates, but choſen in a particular manner; the nobility, or upper houſe, appointed 24 deputies, the clergy 12, and the burghers 12; theſe choſe three perſons, to be preſented to the king, that he might fill the vacant ſeat with one of the three. The peaſants had no vote in electing a ſenator. Almoſt all the executive power was lodged in the ſenate, which conſiſted of 14 members, beſides the chief governors of the provinces, the preſident of the chancery, and the grand marſhal. During the receſs of the ſtates, thoſe ſenators formed the king's privy-council; but he had no more than a caſting vote in their deliberations. Appeals lay to them from courts of judicature, but each ſenator was accountable to the ſtates for his conduct.

In conſequence of this arrangement, the government of Sweden might be called republican, for the king's power was inferior to that of a ſtadtholder. The ſenate had even authority to impoſe on the king a ſub-committee of their number, who were to attend upon his perſon, and to be a check upon all his proceedings, to the very management of his family. Appeals were to be made to them from the different courts of judicature; and one half of the ſenate was conſtantly employed in the reviſion of ſentences, the adminiſtration of juſtice, and the regulaton of foreign affairs; while the other half was occupied with matters of leſs importance. Each ſenator, however, was reſponſible to the diet for his conduct relative to every affair in which his advice or vote was given. We ſhall only add, that though nothing could be more plauſible than the whole plan of their diſtributive powers, yet nothing was leſs practicable; inaſmuch as their officers and miniſters, under the notion of making them checks upon one another, were multiplied to an inconvenient degree; and by the tedious forms through which the buſineſs of government muſt neceſſarily paſs, it was greatly retarded, if not rendered altogether ineffectual.

By

By the new form of government, eſtabliſhed in 1772, the king is impowered to aſſemble and ſeparate the ſtates whenever he pleaſes; he is alſo to have the whole diſpoſal of the army, navy, finances, and all civil and military employments; and though by this new ſyſtem the king does not openly claim an authority to impoſe taxes on all occaſions, yet ſuch as already ſubſiſt are to be perpetual; and in caſes of urgent neceſſity, he may impoſe ſome, till the ſtates can be convened: but even theſe circumſtances depend wholly on his will and pleaſure, as likewiſe the ſubject of their deliberations when aſſembled; ſo that it may be plainly perceived that ſuch a government as this very nearly reſembles the moſt abſolute monarchy. The Swedes, however, notwithſtanding the great power veſted in the ſovereign, are ſtill amuſed with ſome ſlight appearances of a legal and limited government; for in the new ſyſtem, which conſiſts of 57 articles, a ſenate is appointed, conſiſting of 17 members, including the great officers of the crown, and the governor of Pomerania, who are required to give their advice in all affairs of ſtate, when required by the king. On this occaſion, if the queſtions agitated are of great importance, and their unanimous opinions ſhould be contrary to that of the king, he is required to follow their advice; though it cannot be eaſily imagined that ſo many great officers of the crown ſhould decide againſt the king: but in every other caſe the ſovereign is to hear their opinions, and afterwards act as he pleaſes.

The common method of execution in Sweden, is beheading and hanging. Malefactors are never put to death, except for very atrocious crimes, ſuch as treaſon, murder, adultery, houſe-breaking, highway robbery, or repeated thefts. Other crimes, many of which in ſome countries are conſidered as capital, are chiefly puniſhed by whipping, condemnation to live upon bread and water, impriſonment and hard labour, either for life, or for a ſtated time, according to the nature of the offence. For murder, the hand of the criminal is firſt chopped off, and he is then beheaded and quartered; women, after being beheaded, inſtead of being quartered, are burned. Criminals of the nobility or gentry are uſually ſhot to death. No capital puniſhment is inflicted before the king confirms the ſentence. Every priſoner is at liberty to petition the king within a month after the trial. The petition either complains of unjuſt condemnation, and in ſuch a caſe demands a reverſal of the ſentence; or elſe prays for pardon, or mitigation of puniſhment. Till the reign of the preſent king, criminals were tortured to extort confeſſion; but in 1773 his Swediſh Majeſty aboliſhed this cruel and abſurd practice. Duels are puniſhed with the utmoſt rigour: for if a perſon receives an affront, he is to complain to his national court, when the recantation of the offending party, and begging pardon in public, are generally awarded as a ſufficient reparation.

In Sweden, titles to eſtates are rendered perfectly ſecure by the regiſters of ſales, mortgages, and alienations, kept by every tribunal. Eſtates deſcend by inheritance in equal portions to the children, of which portions a ſon inherits two, and a daughter one. It is not in the power of a parent to alter this diſpoſition, unleſs a child proves vicious or diſobedient, and even in ſuch caſes, he muſt firſt obtain a judicial ſentence; but he may bequeath one-tenth of his acquired eſtate to his favourite child, whenever he pleaſes. If a man dies, whoſe eſtate is incumbered with debts, the heir is allowed three months to inquire into the circumſtances of the deceaſed; at the expiration of which, if he declines accepting the inheritance, the law becomes next heir, and always adminiſters.

§

The cities and principal towns in Sweden, moſt worthy of notice, are as follow:

Stockholm, the capital of this kingdom, ſtands 280 miles north-eaſt from Copenhagen, 224 from Gottenburg, 342 from Wyburg, 387 weſt from Peterſburgh, 465 from Warſaw, 660 north from Vienna, 840 from Paris, 790 north-eaſt from London: it is ſituated on a cluſter of ſmall iſlands; the houſes being built upon piles. If we include the two ſuburbs, one of which ſtands on the peninſula of Toren, and the other in Athundria, the town is as large and as populous as Briſtol. The iſland on which the greateſt part of the city ſtands, is ſurrounded by two branches of a river, that runs with great rapidity out of the lake Macler; and over each of theſe arms there is a wooden bridge. The proſpect from the city is very beautiful, owing to the lake being in view on one hand, and the ſea on the other.

About 300 years ago this place was only a barren iſland, with two or three cottages for fiſhers; but upon the building of a caſtle there, to ſtop the inroads of the Ruſſians, and the tranſlation of the court thither, it grew, by degrees, to ſurpaſs the other more ancient cities, and is now ſuppoſed to be as populous as Briſtol. The caſtle, which is covered with copper, is a place of no ſtrength or beauty, but of great uſe; for it is a ſpacious building, where the court reſides; and alſo furniſhes apartments for moſt of the great officers, the national court of juſtice, the colleges of war, chancery, treaſury, reduction, liquidation, commerce, and execution. Here is alſo an armoury, chapel, library, the public records, &c. It contains very few of the inferior officers and ſervants of the court; they, together with the foot-guards, being quartered upon the burghers, at their landlord's charge for lodging, fire, and candle.

In this city are nine large churches, built with brick, and covered with copper; and three or four wooden chapels.

The palace of the nobility, which is the place of their aſſembly at the convention of the ſtates, and the depoſitory of their privileges, titles, and ſuch other records as concern their body, is a very ſtately pile, and one of the fineſt in the kingdom. It is but one large pavilion, adorned on the outſide with marble figures and columns, and within with pictures and ſculptures; eſpecially in two large halls, where the nobility meet. Next to this palace is that of the lord high chancellor; and a little farther are two other palaces belonging to noblemen. Theſe four palaces ſtand on the banks of the lake, are built after the ſame manner of architecture, and are all covered with copper. The bank, built at the city's charge, is alſo a noble edifice, and, together with ſeveral magnificent houſes of the nobility, all covered with copper, affords a handſome proſpect.

Moſt of the burghers houſes are built with brick, except in the ſuburbs, where they are of timber, and thereby ſubject to the danger of fire, which commonly, when it gets a head, deſtroys all before it in the quarter where it happens. To repair this misfortune, they ſometimes ſend the dimenſions of the houſe they intend to build, into Finland, where the walls, and ſeveral ſeparations, are built of pieces of timber laid one upon another, and joined at the corners; and afterwards marked, taken down, and ſent by water to Stockholm, there to be ſet up and finiſhed; and, when they are kept in good repair, they will laſt 30 or 40 years; and are warmer, cleanlier, and more healthful, than thoſe of either brick or ſtone. To prevent the danger of fire, the city is divided into 12 wards; and in each of theſe there is a maſter, and four aſſiſtants; who, upon notice of any fire, are immediately to repair to it: as alſo all porters and

labourers

View of STOCKHOLM the Capital of SWEDEN.

labourers, who moſtly range themſelves under the maſter of their reſpective ward. There is, beſides, a fire-watch by night, who walk about only for that purpoſe; and in each church ſteeple is kept a watchman, who tolls a bell upon the appearance of fire.

The government of this city is in the hands of the great ſtadtholder, who is alſo a privy counſellor. He ſits once a week in the town-houſe, and preſides in the college of execution, aſſiſted by an under ſtadtholder, and a bailiff of the caſtle. Next to him are the four burgomaſters; one for juſtice, another for trade, the third for the polity of the city, and the fourth has the inſpection over all public and private buildings, and determines ſuch caſes as ariſe on that account. With them the counſellors of the city always ſit, and give their votes, the majority of which decides. Their number is uncertain, but uſually about twenty, moſtly merchants and ſhop-keepers, or ſuch as have ſerved the king in ſome inferior employment. Beſides their ſalary, they have an immunity from ſuch impoſitions as are laid on the inhabitants to ſupport the government of the city; which pays all its officers and ſervants, maintains a guard of 300 men, and defrays the charge of all public buildings and repairs. To ſupport this expence, beſides a duty belonging to the city, of goods imported and exported (which is about four per cent. of the cuſtoms paid to the king, and amounts to about 5000l. per ann.) the magiſtrates impoſe a yearly tax upon the burghers, in which they are aſſiſted by a common-council of forty-eight, which chuſes its own members, and meet every ſpring, to proportion the payments for the enſuing year. On the traders they uſually impoſe forty, fifty, or ſixty pounds ſterling; upon others of a meanner condition, as ſhoe-makers, tailors, &c. five or ſix pounds; and on no houſekeeper leſs than fifteen ſhillings; beſides quartering the guards, inferior officers, and ſervants of the court, with other leſſer charges; which, all together, would be thought a great burden, even in richer countries: neither is it otherwiſe eſteemed by the inhabitants of this city, who can ſcarce be kept in heart by the privileges they enjoy, as well in cuſtoms, as in the trade of the place, which muſt needs paſs through their hands; for the natives of other parts of the kingdom, as all foreigners are obliged to deal only with the burghers (except thoſe of the gentry, who make iron) have not the privilege to ſell it immediately to ſtrangers.

This city is, in a manner, the ſtaple of Sweden; to which moſt of the goods of their own growth, as iron, copper, wire, pitch, tar, maſts, deals, &c. are brought to be exported. The greateſt part of the commodities imported from abroad come to this port, where there is a haven capable to receive 1000 ſail of ſhips, and a bridge or quay near an Engliſh mile long, to which the greateſt veſſels may lie with their broadſides. The only inconvenience is, that it is ten miles from the ſea, the river very crooked, and no tides. It opens into the Baltic, but is of dangerous acceſs, by reaſon of the rocks. Within it is one of the moſt commodious harbours in Europe; for ſhips of the largeſt ſize lie cloſe to the quay, where they are ſo ſecure from the wind, that they need neither anchors or cables to hold them. Its entrance is defended by two forts.

Upſal ſtands on the banks of the river Sal, or Sala, which falls into the lake of Ekolen, and is forty-two miles diſtant from Stockholm towards the north-weſt. It is a very ancient city, formerly the capital of the north, and the ſeat of the king. It is divided into two parts by the river, which is here pretty large, and ſo hard frozen up in February, that a fair is yearly kept there upon the ice in that month. The town is large, but without any conſiderable fortifications. Here is to be ſeen the fineſt church in the whole kingdom, namely, the cathedral. It is covered with copper, and adorned with ſeveral tombs, eſpecially thoſe of the kings. In the chapel, behind the altar, ſtands the monument of King Guſtavus in marble, between the ſtatues of his two wives, who lie alſo buried here. In another chapel is the tomb of king John's wife, who was mother to Sigiſmund III. king of Poland: it is of white marble. Above the city, on a ſteep hill, there is a beautiful caſtle, which is fortified. It is very large, built after the Italian manner, and has a noble proſpect over the city, which it commands, and over the whole country.

Upſal was, at firſt, a biſhop's ſee, but afterwards converted into an archbiſhopric by pope Alexander III. at the requeſt of King Charles, ſucceſſor to St. Erick. Stephen, who died in the year 1158, was the firſt archbiſhop of this ſee; and John Magnus, who, at the reformation, refuſed to admit the Lutheran confeſſion, and removed to Rome, was the fifty-ſixth. Since his time, there have been only Proteſtant archbiſhops, who do not live with the ſame pomp and magnificence as the Roman Catholic prelates uſed to do; for the latter never appeared in public without a retinue of 4 or 500 people on horſeback.

The univerſity of Upſal was inſtituted near 400 years ago, and patroniſed by ſucceſſive monarchs, particularly by the great Guſtavus Adolphus, and his daughter queen Chriſtina. There are near 1500 ſtudents in this univerſity; but for the moſt part they are extremely indigent, and lodge, five or ſix together, in very poor hovels. The profeſſors in different branches of literature are about twenty-two; of whom the principal are thoſe of divinity, eloquence, botany, anatomy, chemiſtry, natural philoſophy, aſtronomy, and agriculture. Their ſalaries are from 70l. to 100l. per annum. This univerſity, juſtly called by Stillingfleet, "that great and hitherto unrivalled ſchool of natural hiſtory," is certainly the firſt ſeminary of the North for academical education, and has produced, from the time of its inſtitution, perſons eminent in every branch of ſcience. The learned publications which have lately been given to the world by its members, ſufficiently prove the flouriſhing ſtate of literature in theſe parts; and the theſes, compoſed by the ſtudents on their admiſſion to their degrees, would form a very intereſting collection. Many of theſe tracts upon various ſubjects of polite literature, antiquities, languages, &c. evince the erudition and taſte of the reſpective authors: among the works of this ſort which have widely diffuſed the fame of this learned ſociety throughout Europe, are the *Amænitates Academicæ*, or a Collection of Theſes upon Natural Hiſtory, held under the celebrated Linnæus, and chiefly ſelected by that maſter.

This great man, who was of a ſocial communicative diſpoſition, always received ſtrangers with the greateſt politeneſs, and was happy in ſolving any queſtions in the line of his botanical profeſſion, which they might propound. To him we are indebted for an account of the Swediſh turnip, a root of ineſtimable value in this country. He ſays, the farmers had it originally from Lapland. It ſpread by degrees through the northern parts of the kingdom. and was found of more uſe than all the other winter plants put together. The great property of it is reſiſting the ſharpeſt and moſt continual froſts known in the country. Beſides this, cattle are remarkably fond of them, and will thrive on them better than on any other winter plant. One of the greateſt advantages of the culture of this root, is its being as good a prepara-

tion for corn as a fallow of mere plowing, which is an object of infinite importance.

Gottenburg was erected in the year 1607, during the reign of Charles IX. whoſe ſucceſſors indulged it with many extraordinary pivileges, in conſequence of which it is become a place of conſiderable commerce. The Danes, in the year 1644, exerted their utmoſt endeavours for the deſtruction of this city, but they proved ineffectual; and it is at preſent one of the ſtrongeſt maritime towns in the kingdom. At Skaren, about eighty miles to the north-weſt of Gottenburg, was the ſeat of the ancient kings of Sweden. The ruins of the palace are ſtill to be ſeen; and, if any judgment may be formed from the walls and other remains of the ſtructure, it appears to have been a very ſtately edifice. Near this palace, ſtands the mountain Kendaculle, remarkable for its height and fertility; for it is covered with a great variety of trees, ſhrubs, herbs, and plants, affording at once a beautiful proſpect, and food and ſhelter to a vaſt number of birds that frequent it in ſummer.

Norkoping, the chief town of Eaſt Gothland Proper, ſtands about ſeventy-five miles to the ſouthward of Stockholm, on the bank of a ſtream which runs from the lake Velter to the gulf of Brawiken. The town is large, populous, and hath conſiderable commerce.

Calmer, capital of the diſtrict of Smaland, is a a very conſiderable city. It is ſituated 160 miles to the ſouthward of Stockholm, and built upon a ſtreight of the Baltic, called Calmar Sund, which is ſituated oppoſite to the iſle of Oeland. It is divided into the Old and New Town. Old Calmar is famous by a deed executed there in the year 1393, by which the three northern crowns of Sweden, Norway, and Denmark, were ſettled on the head of Queen Margaret. This is called in hiſtory the union of Calmar. Eric, Margaret's ſucceſſor, founded thirteen prebends here, and gave a decree, by which he put the church of Calmar among the collegiate ones. After the diviſion of the crowns, which the fatal union of Calmar had united, this city became a frontier town, with regard to the Danes, who were in poſſeſſion of Schonen. It was often taken, retaken, and plundered; and, to complete its ruin, it was burnt down to the ground in the year 1547; nothing eſcaped the fire but the church, and about threeſcore houſes. Soon after this misfortune, the new city was built at a muſquet ſhot's diſtance from the old town, in a little iſland called Owarnholm. This new city is large, the ſtreets are broad and ſtraight, and the houſes well built, but the town is not populous. The new fortifications conſiſt only of thick walls built with large pebble ſtones taken out of the ſea, and a few ramparts built only with ſand, and therefore ſupported by another wall, which the ſea ſurrounds almoſt on all ſides, except the gate. The ſituation of this city renders it very ſtrong, all the avenues to it being full of marſhes, or cut off by water from the ſea, which abounds here with rocks, between which there are, as it were, ſo many abyſſes, that it is impoſſible to approach the place either in boats, on horſeback, or on foot. On the ſea-ſide there is a long mole built with ſtone, along which boats and ſhips ride ſecure. This mole is defended by a fortreſs called Grimſkar, built at about fifty paces from it, on a rock ſurrounded by the ſea, and where a garriſon is conſtantly kept. Behind the Old Town ſtands the caſtle, which is of very difficult acceſs, having on one ſide the ſea, which is full of rocks, and, on the other, good ramparts, large baſtions, and ditches full of water. This city is at preſent the reſidence of a ſuperintendant for the government of the clergy, who is honoured with a place in the public conſiſtory of the kingdom. This is a town of good trade, and the paſſage from Sweden into Germany.

Abo, the capital of Finland Proper, is ſituated on the Bothnic gulf at the mouth of the river Aurojoki, oppoſite to the iſle of Aland. This is ſaid to be a wretched capital of a barbarous province. The houſes are almoſt all of wood, and the archiepiſcopal palace is compoſed of no better materials, and is painted red. Here is, however, an univerſity, which was founded and endowed by the celebrated queen Chriſtina.

Wiſby, or Wiſburg, the chief place of Gothland, or Gothia Inſula, is ſituated on the weſtern coaſt of the iſland. It is built on the declivity of a rock near the ſea ſhore, is ſurrounded with a ſtrong wall, and defended by a pretty ſtrong caſtle, erected near the harbour, where the governor of the iſland uſually reſides. This was formerly a conſiderable city, but is now very much decayed.

Carlſcrona, the capital of the province of Blekingen, and the reſidence of the governor, is ſituated on the ſhore of the Baltic, and built on a large rock, which forms an iſland. Charles XI. by whom it was founded, honoured it with his name, and gave it the privilege of being a ſtaple town, that is, a town having a magazine, or repoſitory for goods. To arrive at it, one muſt paſs two other iſlands, which are joined to the continent by large bridges. On theſe two iſlands there are two ſuburbs, which are pretty extenſive, but as they are inhabited only by the lower claſſes of people, they are ill-built and dirty. This, however, is not the caſe with the town itſelf, which is well built, though the greater part of the houſes are of wood. Several of them conſiſt of three ſtories, ornamented with ſculpture and colonades, and ſo neatly painted, that they exhibit a very handſome appearance. Great pains are beſtowed upon the embelliſhment of this place, and no expence is ſpared to render it in time one of prettieſt towns in Sweden. A church, built at one of its extremities, towards the dock-yard, will contribute much to ornament it, as well as the ſquare, in the centre of which it is erected. This ſquare is very extenſive, and, according to the plan laid down, will be bordered by ſeveral beautiful edifices, "Whilſt I was at Carlſcrona (ſays a late traveller) workmen were ſtill employed in levelling it, and during my ſtay there, I often heard exploſions, occaſioned by their blowing up the rocks, which rendered it rugged and uneven. The ſame operation was performed in different ſtreets, where the rock roſe in many places into points diſagreeable to the ſight, which were inconvenient for foot travellers, and prevented the uſe of carriages. Few of the ſtreets are paved, and as you tread upon the bare rock, walking here is extremely fatiguing. The inhabitants of Carlſcrona pretend that Blekingen is the moſt beautiful province in the whole kingdom. I am not, however, entirely of the ſame opinion; for towards Smoland it appears to be very mountainous, but towards Scandia the country becomes level, exhibits every mark of fertility, and is covered with beautiful trees, and among others the oak. I ſaw alſo ſeveral flouriſhing eſtates belonging to different proprietors, ornamented with manſions, which at a diſtance ſeem to be ſo many caſtles. Theſe houſes for the moſt part are built of wood, and have a magnificent aſpect. This province maintains no land ſoldiers, but is obliged to furniſh a regiment of marines.

"The marine militia, diſperſed throughout different parts of Sweden, amounts to about 13,000 men, of whom no more than a thouſand are employed in the time of peace, or when they are not exerciſed. The garriſon of Carlſcrona conſiſts of about ſixteen hundred men, divided into three companies.

"I was

"I was conducted to the port, which is capacious, very commodious, and ſurrounded by docks. Veſſels out of commiſſion are moored here cloſe to a long bridge, which affords one the pleaſure of walking acroſs the whole fleet. I counted here twenty veſſels, comprehending ſhips of the line and frigates, among which I ſaw one of 100 guns, one of 96, one of 84, two of 74, and ſeveral from 50 to 60. I ſaw nine veſſels which had been conſtructed in the courſe of four years. Five of theſe nine were entirely finiſhed, and fitting out; the other four were launched, but not rigged. There were ſeveral others on the ſtocks, either begun or having their inſide timbers put together. One in particular was pointed out to me, all the parts of which having been prepared beforehand, was conſtructed in the ſpace of ſix weeks. The plan for renewing the Swediſh navy was formed ſeveral years ago; part of 1782 was employed in procuring and preparing the materials, and in 1783 veſſels began to be built. It is intended to continue to conſtruct four ſhips annually, until the navy ſhall be put on a reſpectable footing. To defray the expence incurred by the execution of this plan, the king has ſuſpended the half of the works at the new dock, until the navy ſhall be in that ſtate which is deſired.

I was conducted to ſee the new dock, of which I formed a very high idea, from what I had heard; but I confeſs that what I ſaw far ſurpaſſed my expectation. This is a work worthy of the ancient Romans: workmen have been employed on it for twenty-nine years, and a conſiderable length of time will ſtill be neceſſary before it can be finiſhed. At the entrance of the dock there is a baſon cut out in the ſolid rock, about 50 feet in depth, and ſo large that four men of war may be loaded or unloaded together along its quays, which are built of cut ſtone. From this baſon each veſſel may enter its lodge by means of large ſluices, and canals of communication. Twenty of theſe lodges are deſtined for ſhips of the line, and ten for frigates.

"One of theſe lodges, with its canal and ſluice, is entirely finiſhed. The bottom of it is cut out in the rock, and the ſides are built of cut ſtone, joined together with Pozzolane, which is a kind of cement, brought from Italy at a very great expence. The bottom of it is ſhaped like the keel of a veſſel. Along each ſide of the lodge there are two rows of ſteps, which ſerve for ſupporting beams and ſcaffolding when the veſſel is dry, and has need of being repaired. The walls which ſupport the roof are of cut ſtone, joined with the ſame kind of cement as before. Theſe walls, which are at leaſt twenty feet in thickneſs to the top, where they muſt be on a level with the upper deck of the veſſel, ſeparate the different lodges. At that height they are converted into platforms, which communicate with the interior part of the lodge, by means of large arched windows. Theſe platforms are intended to receive the guns of each veſſel, which may be conveyed in or taken out through theſe windows, conſtructed in ſuch a manner as to be opened or ſhut according to circumſtances. The roof is of wood, covered on the outſide with large plates of iron, and formed ſo as to ſerve as a fulcrum or prop to different levers, employed in loading or unloading the veſſel. The ſluice of communication is made with ſo much art, that the ſmall force of two feet of water raiſes it, and makes it turn. When the canal and lodge have received the requiſite quantity of water, the veſſel enters; and when it may be neceſſary to leave it dry, a communication at the bottom of the lodge is opened by a machine made for that purpoſe, and the water runs into a baſon much lower than the lodge, and cut out alſo in the rock, from which it is conveyed into the baſon before mentioned by means of a windmill. Whilſt I was here, workmen were employed in conſtructing a ſecond lodge. The firſt may ſerve as a ſpecimen of the magnificence of the whole work. When finiſhed, theſe lodges will form a vaſt ſemicircle, but, according to every appearance, they never will be brought to perfection. The immenſe ſums which government is obliged to expend, will perhaps induce them, inſtead of finiſhing this, to complete rather the old dock, which will be of as much utility as the new, though ſhips cannot be laid up there under cover, and in lodges.

"The perſon who ſuggeſted the firſt idea of this new dock, which was begun in the reign of Guſtavus III. is a very old man, of the name of Thunberg. He has a ſon, who is reckoned to be equally expert as his father. This Thunberg has the direction of the works and ſluices, which have been conſtructed along the Gotha. The old dock was begun in 1715, after the plan of Polheim the engineer, and finiſhed in 1724. It is a kind of canal, 350 feet in length, and nearly 30 in depth, dug entirely out of the rock. It is ſituated between the port and the new dock, and communicates on the one ſide with the dock-yard and the port, and the other with the ſea, by two canals, ſufficiently large for a firſt-rate man of war to enter or go out. Theſe canals are ſhut by large ſluices. Before that which opens a communication to the ſea, there is a piece of machinery, very ingeniouſly conſtructed, which defends it from the efforts of a high tide. When a ſhip is brought in here, and when it is neceſſary to leave her dry, in order to be hove down, the ſluices are ſhut, and, by means of an immenſe pump, put in motion by ſeveral men or ſome horſes, the dock is rendered perfectly dry in the ſpace of twelve hours. The dykes, ſluices, canals, and mills, which the Dutch induſtry has executed, are juſtly admired, yet, when we conſider that all this is cut out of the ſolid rock, we are obliged to confeſs, that our works are nothing in compariſon of theſe, which, perhaps, are not equalled by any Europe.

"The entrance of the port of Carlſcrona is eaſy on account of its great depth, and it is ſo large as to be capable of containing an hundred ſhips of the line. It is defended by two very ſtrong forts, well mounted with artillery, which are ſo planted, that when fired, their ſhot croſs each other. Theſe forts, the one called *Kongſholm*, or the King's Iſland, and the other *Drotningſkiar*, or the Queen's Rock, are ſituated upon rocks in the ſea, and could ſink any ſhip which might attempt to paſs without their permiſſion.

"The ſailors belonging to the garriſon of Carlſcrona are employed in different works in the dock-yard, when they are not obliged to be on board their veſſels. The greater part of the officers are men of great experience, and muſt naturally be ſo, ſince, if they wiſh for promotion, or to be held in any eſtimation, they muſt travel, and ſerve for ſome time in foreign countries, and particularly in thoſe ſtates which are carrying on war. This, doubtleſs, is an excellent regulation, and muſt tend greatly to procure good naval officers to Sweden. I quitted Carlſcrona, delighted with the town, and its inhabitants, as well as with all the works, which I greatly admired.

"Three miles thence I ſtopped at a large village called Runneby, ſituated in Blekingen, half way between Carlſcrona and Carlſham, which is celebrated for its market, and which appeared to me to be in a very flouriſhing condition. At the diſtance of half a league from this place, the little river of Aune forms a very ſingular cataract through rocks, which exhibit nothing but devaſtation and ruin. The water precipitates itſelf between

tween two enormous fragments of rock, which appear to have once formed only one maſs, and which at preſent are at the diſtance of twenty or thirty feet from each other. They ſtand exactly parallel, and ſeem to be 40 or 50 feet in height. The one is as convex in the interior part as the other is concave, and a third of leſs ſize lies upon the top of them, which forms a moſt ſingular bridge. The road paſſes over it, and appears truly awful, on account of its ſituation, and the horrible noiſe occaſioned by the efforts of the river, which throws itſelf with great violence through the vacuity formed by theſe three maſſes. Below the cataract are found immenſe ſhelves of rock, around which the water in ſome places is upwards of forty feet in depth. Here I was in great danger of loſing my life, for as I was deſcending with much difficulty and danger, and jumping from one ſtone to another, in order to find a proper point of view for taking a ſketch of this pictureſque ſcene, I had the misfortune to fall, and had not my guide, by laying hold of me, given me an opportunity of clinging to the point of a rock, I ſhould have tumbled down the precipice, and been either drowned, or daſhed to pieces on the rocks by the force of the current. This place, ſo remarkable for the different parts of the rock, which are concave on the one ſide, and convex on the other, evidently announces that an earthquake or ſome other convulſion muſt have occaſioned here the moſt dreadful ravage. This river, which is not large, throws itſelf into the Baltic, near Runneby."

In Sweden, there are 24 towns, called ſtaple-towns, where the merchants are allowed to import and export commodities in their own ſhips. Thoſe towns which have no foreign commerce, though lying near the ſea, are called land-towns. A third kind are termed mine-towns, as belonging to the mine-diſtricts.

The revenues of Sweden formerly amounted to a million ſterling per annum, ariſing from crown-lands, poll-money, tythes, ſilver, copper, and iron-mines; but ſince the unfortunate wars of Charles XII. and that which was afterwards engaged in with Ruſſia, they have been greatly reduced. Livonia, Bremen, Verdun, and other places this kingdom was ſtripped of, contained about 78,000 ſquare miles. Her gold and ſilver ſpecie, in a former reign, aroſe chiefly from the king's German dominions. The payments that are made in copper, which is here the chief medium of commerce, is extremely inconvenient, ſome of thoſe pieces being as large as tiles; and a cart or wheel-barrow is often required to carry home a moderate ſum.

The current coin conſiſts of gold ducats, and eight-mark pieces of ſilver, valued at 5*s*. 2*d*. each: but theſe are very ſcarce, and the inhabitants of Sweden have now very little ſpecie, almoſt their only circulating money conſiſts of copper ſtamped, and ſmall bank-notes.

The ſtanding army of Sweden, which, before the loſs of Livonia, was 60,000, may now amount to about 40,000 men, horſes and foot, and is properly nothing more than a well regulated militia, under the immediate command of freeholders, whoſe intereſt is intimately connected with the liberty of their fellow-ſubjects. The cavalry is raiſed and maintained by the nobility and gentry, in proportion to the value of their eſtates; and are under ſuch regulations, that neither man nor horſe, after having been once liſted in the ſervice, can be put to any other employment than what are ſpecified in thoſe regulations, both being required to be kept, with proper arms and equipage, in continual readineſs for ſervice. The infantry is maintained by the peaſants: every farm of 60l. per annum or upwards, being charged with the ſupport of one foot ſoldier, finding him in diet, lodging, ordinary clothes, and about 20s. a year in money; or in lieu of all theſe, a little wooden hut is built for him by the former, who allows him hay, and paſturage for a cow, and ploughs and ſows land enough to ſupply him with bread. When embodied, the army is ſubject to the military law; but at other times to the civil law of the country. Each company is exerciſed once in a month, and every regiment reviewed twice or thrice a year; on which occaſions only they wear their uniforms, which, when the ſervice is over, are carefully depoſited in the churches.

Formerly, the navy of Sweden conſiſted of 40 ſail of the line; and, till of late years, their ſhips, togther with the docks, were ſuffered to run greatly to decay.

With reſpect to the political diſpoſition of the Swedes, and the nature of their conſtitution, the following obſervations naturally preſent themſelves:

It clearly appears, that theſe people have, at ſome periods, diſcovered an ardent love of liberty; at others, they have ſeemed fitted only for ſlavery: and when they were labouring to render themſelve free, they have wanted that ſound political knowledge, which would have pointed out to them the ſureſt methods for ſecuring their proper freedom. The moſt capital defect of the Swediſh conſtitution was the total want of a proper balance of its parts: and the diviſion of the Swediſh nation into three diſtinct claſſes, of nobles, burghers, and peaſants, whoſe intereſts were prepetually claſhing, has been a circumſtance very unfavourable to the liberty of the Swedes. The power of their kings was much reſtrained; but no ſufficient regulations were adopted for ſecuring the perſonal freedom of the ſubject. Theſe defects in the Swediſh conſtitution paved the way for the late revolution.

HISTORY OF SWEDEN.

The Goths, the ancient inhabitants of this country, joined by the Normans, Danes, Saxons, Vandals, &c. have had the reputation of ſubduing the Roman empire, and all the ſouthern nations of Europe. The introduction of Chriſtianity by Anſgarius, biſhop of Bremen, in 829, ſeems to preſent the firſt certain period of the Swediſh hiſtory.

The hiſtory of this kingdom, for many years after the eſtabliſhment of Chriſtianity, is very obſcure and unintereſting, unleſs a recital of murders, maſſacres, and ravages, deſerve attention; nor is there any conſiſtency in the accounts of hiſtorians till about the middle of the 14th century, when it aſſumes a more regular aſpect, and affords wherewith to recompenſe the attention of thoſe who chooſe to make it an object of their ſtudies. At this time, however, the government of the Swedes was far from being clearly aſcertained, or uniformly adminiſtered. The crown was elective, though in this election the rights of blood were not altogether diſregarded.

The whole wealth and lands of the kingdom were divided between the nobles and clergy. The peaſant toiled to ſupport a few worthleſs mortals in pomp and luxury. Agriculture was litttle known and leſs practiſed; commerce was in its cradle, and the arts and ſciences baniſhed from the kingdom. To complete the miſery of Sweden, there exiſted the moſt deadly diſſenſions between the clergy and nobility, and the blood of the people was ſplit in quarrels not their own. Sometimes the king joined one party, and ſometimes the other; but whether the eccleſiaſtical or civil power prevailed,

vailed, the people equally ſuffered, and their chains were as galling under the ſpiritual, as under the civil power. In this ſtate of debility and diſtraction, Sweden was in no condition to reſiſt the power of a foreign enemy. The Danes knew this, and, ever watchful to promote their own intereſt, and enlarge their territories, took advantage of the civil diſſenſions in Sweden, and ſubdued the kingdom.

Sweden continued in this deplorable ſituation for more than two centuries, ſometimes under the nominal ſubjection of its own princes, ſometimes united to the kingdom of Denmark, and in either caſe equally oppreſſed and inſulted. Magnus Zadulus, who aſcended the throne in 1276, ſeems to have been the firſt king of Sweden who purſued a regular ſyſtem to increaſe his authority; and to ſucceed in this, he made the augmentation of the revenues of the crown his principal object. He was one of the ableſt princes who had ever ſat on the Swediſh throne; by his art and addreſs he prevailed upon the convention of eſtates to make very extraordinary grants to him for the ſupport of his royal dignity. The augmentation of the revenues of the crown was naturally followed by a proportionable increaſe of the regal power; and Magnus, by the ſteady and vigorous exertion of this power, not only humbled the haughty ſpirit of his nobles, and created in the reſt of the nation a reſpect for the royal dignity, with which they appear to have been but little acquainted; but at the ſame time, by employing his authority in many reſpects for the public good, reconciled his ſubjects to acts of power, which, when exerciſed by former monarchs, they would have oppoſed with the utmoſt violence. The ſucceſſors of Magnus did not maintain their authority with equal ability; ſo that the government was for a conſiderable time in the moſt unſettled ſtate, and the nation thrown into great diſorder and confuſion, by the ſeveral commotions and revolutions it became ſubject to.

Margaret, daughter and heireſs of Valdemar, king of Denmark, and widow of Huguin, king of Norway, ſwayed the ſceptre of theſe united kingdoms in 1387, while Sweden was rent with faction. She was bleſſed with a penetration and vigour of mind neceſſary in conducting arduous enterprizes; projected the union of Calmar, ſo famous in the North. By the articles of this remarkable treaty, the three kingdoms of Sweden, Denmark, and Norway, were to remain united under one ſovereign, elected by each kingdom in its turn, and who ſhould divide his reſidence equally among them.

This union continued till the reign of Chriſtian II. who was not contented to reign over the northern nations in the manner of his predeceſſors; he diſdained the thought of being confined by any compact, and determined to become abſolute. He well knew that the nobility of Sweden would oppoſe his arbitrary meaſures with firmneſs and intrepidity; and therefore determined to put it out of their power to render his deſign abortive. Deaf to the dictates of conſcience, and regardleſs of all laws both human and divine, he formed the horrid ſcheme of maſſacreing all the Swediſh nobility. The deſign was executed, but not ſo completely as he intended; Guſtavus Vaſa, a young prince, deſcended from the ancient kings of Sweden, made his eſcape to the mountains of Dalecarlia. Chriſtian, dreading the return of this exile, who was greatly beloved by the people, took every method in his power to deſtroy him.

But he found means to elude every attempt; and after ſuffering a ſeries of unparalleled hardſhips, and ſurmounting a thouſand obſtacles, prevailed upon the ſavage but warlike inhabitants of Dalecarlia to oppoſe his deſpotic proceedings. The attempt ſucceeded; and Guſtavus was ſeated on the throne of his anceſtors. The late maſſacre had freed Vaſa from thoſe proud and haughty nobles, who had ſo long prevented the eſtabliſhing any regular government in Sweden: and though the dangerous power of the clergy ſtill ſubſiſted, yet the opinions of Luther, which then began to prevail in the North, together with the credit they had already acquired among the Swedes, gave the young king an opportunity of changing the religion of his country; and he accordingly eſtabliſhed the Reformation in 1544. A regular monarchical government was thus founded. The advantages of the change were ſoon viſible; arts and manufactures were eſtabliſhed and improved; letters and polite learning were introduced; navigation was ſtudied, and commerce began to flouriſh. Theſe advantages ſoon gave Sweden conſiderable weight in the political ſcale of Europe; and its friendſhip was courted by foreign princes.

Guſtavus paid the debt of nature in the year 1559, and was ſucceeded by his ſon, Eric, who fell far ſhort of his father in abilties either for peace or war. He introduced the titles of count and baron, and made them hereditary; but his imprudent and cauſeleſs jealouſy of his brothers ſoon put a period to his reign. The innocent princes were obliged to have recourſe to arms, and the ſenate joining them, the forces of Eric were defeated, and himſelf depoſed in 1566.

The throne being thus vacant, it was given to John, the brother of Eric. That prince, inſtead of ſtudying to promote the happineſs of his country, and cultivating the arts of peace, engaged in a ruinous war with Ruſſia. Diſappointed in executing his ſchemes, he turned his thoughts towards the church; and, by the advice of his queen, attempted to re-eſtabliſh the Romiſh religion in Sweden. His firſt ſtep was to reconcile himſelf to the Pope, which being accompliſhed, he made ſeveral efforts to eſtabliſh his favourite religion. He had however ſoon the mortification to find that all his attempts were ineffectual, and that it was neceſſary to deſiſt from his purpoſe. He notwithſtanding found means to place his ſon Sigiſmund on the throne of Poland in 1587. This event filled him with hopes of his being able to complete his former ſcheme; but he found ſo many difficulties to encounter, that he died before it was accompliſhed, in 1592.

On the death of John, his brother Charles, who was a zealous Proteſtant, was choſen adminiſtrator of Sweden. Sigiſmund could not behold this advancement of Charles without envy; and endeavoured to deprive him of the honours conferred upon him, but without effect. Exaſperated at the practices of Sigiſmund, the ſtates of Sweden excluded him and his family from the throne, and placed the crown upon the head of Charles. Sigiſmund, who was not only a powerful prince himſelf, but alſo at the head of a ſtrong party both in Sweden and Ruſſia, rendered the reign of Charles very troubleſome and uneaſy. The Danes, hoping to profit by theſe diſorders, invaded Sweden; but their progreſs was ſoon checked by Guſtavus Adolphus, heir apparent to the crown, then only a youth. Confounded at meeting with a very different reception from what they expected, the Danes returned to their own country. But this defeat did not reſtore peace to Sweden: Sigiſmund continued his practices; and Charles, after a troubleſome reign of eighteen years, expired, leaving the crown to his ſon.

Guſtavus Adolphus, though only in his 18th year when he aſcended the throne in 1611, was declared of age by the ſenate, and immediately applied himſelf to free his country from the troubles with which it was ſurrounded. He found himſelf,

at this early period of life, engaged in a war with all his neighbours; his finances low, and his army undiſciplined. But all theſe diſcouraging circumſtances did not intimidate Guſtavus; he ſurmounted every difficulty, and would have made himſelf maſter of the Ruſſian empire, had not the love of independency, the ruling paſſion of that people, rendred his ſcheme abortive. A peace was concluded between the Swedes and the Ruſſians in 1617, under the mediation of James I. of England, by which Guſtavus recovered Livonia, with four towns in the prefecture of Novogorod, and received a large ſum of money for reimburſing the charges of the war.

The Swediſh prince had now ſurmounted moſt of the difficulties which attended him at his acceſſion to the throne. His finances were in a more flouriſhing condition; his army conſiſted of warlike and the beſt diſciplined troops in Europe; he had himſelf ſeen a great deal of military ſervice, and was aſſiſted by the counſel and advice of La Gardie, one of the beſt generals, and wiſeſt ſtateſmen in Europe. With theſe advantages Adolphus was not to be intimidated by the power of Sigiſmund. He attacked and defeated the Poliſh army, and formed the ſiege of Dantzic, which muſt have fallen into his hands, had not a ſudden riſe of the Viſtula obliged him to abandon the enterprize.

The Proteſtants of Germany had for ſome time formed a confederacy in ſupport of their religion; but their army, under the command of Chriſtian IV. king of Denmark, had been hitherto unſucceſsful. The fame of Guſtavus pointed him out as the moſt proper perſon to command the confederate forces; and experience ſoon convinced the proteſtant princes, that they had not made an improper choice: the moſt rapid ſeries of victories attended the ſtandard of Guſtavus. He took Riga, over-run all Livonia, was victorious in Poland, drove the Germans out of Meclenburg, defeated and killed the famous count Tilly, the Auſtrian general, and over-ran all Franconia.

The houſe of Auſtria now trembled. Wallenſtein, another general of great reputation, was ſent to command the Auſtrian army, and a dreadful battle enſued at Lutzen, where Guſtavus was again victorious; but he received a mortal wound in the conteſt, and died on the field of battle, ſoon after the defeat of the enemy, in the year 1633. The death of Guſtavus ſaved the houſe of Auſtria; but he left behind him a ſet of generals, trained by himſelf, who nobly ſupported the proteſtant cauſe, and maintained the glory of the Swediſh arms with aſtoniſhing valour and ſucceſs.

Guſtavus was fiery and impetuous, very ſevere, but nevertheleſs juſt and equitable. The following anecdote is related concerning him: "One day, as his army was filing off before him, he grew angry with colonel Scato, who, endeavouring to excuſe himſelf for his miſtake, received a violent blow on the face from the hand of Guſtavus. This correction was the more cruel and diſhonourable, ſince, being given in public, it deprived the colonel of all hopes of retaliation. Scato, thus diſgracefully humbled, immediately demanded his diſcharge, which was granted, and he retired. Guſtavus, on his return to the palace, coolly reflecting on what had paſſed, ſoon perceived his error in thus diſhonouring an uſeful ſubject, and ordered the colonel immediately into his preſence; but Scato was gone, as ſuppoſed, to enter into the Daniſh ſervice. Guſtavus inſtantly quitted the palace, mounted his horſe, and, attended only by a few domeſtics, flew towards the frontiers which ſeparated Sweden from Denmark. Guſtavus, overtaking the colonel on the Daniſh borders, went up to him: "Colonel," ſaid he, "you have been injured, and I was the cauſe of it; I am ſorry for it, becauſe I eſteemed you: I am come here to give you ſatisfaction, being now out of my own dominions: here Scato and Guſtavus are equal; here are a brace of piſtols, and two ſwords; revenge the inſult if you can." Scato, aſtoniſhed at ſuch noble condeſcenſion, threw himſelf at the feet of Guſtavus, thanked him heartily for the ſatisfaction he had condeſcended to give him, and ſwore fidelity to his ſervice. Guſtavus embraced him, and they returned together to Stockholm, where the king himſelf, in the preſence of all his courtiers, related what had paſſed between him and Scato."

This prince, purſued ſtudy and the arts amidſt his military fatigues. He would ſometimes pleaſantly ſay, "I will ſhew Grotius the difference between theory and practice, and how eaſy it is to preſcribe rules, but how difficult to bring them into practice." As he expoſed himſelf to great danger during the ſiege of Riga, he was adviſed to be more careful of himſelf: "Kings (anſwered he, ſmiling,) ſeldom die in battles or ſieges."

While he was beſieging Ingoldſtat, his horſe was ſhot under him by a cannon ball: an officer having fled to his aſſiſtance, the king ſaid very coolly, "I have nicely eſcaped, but it is plain the pear is not yet ripe."

Chriſtina, the daughter and ſucceſſor of Guſtavus, was only ſix years of age when her father was killed; but the great chancellor Oxenſtiern, a conſummate politician and general, who had the care of her education, held the reins of government with ſuch prudence and diſcretion, that the peace of Weſtphalia, which eſtabliſhed a new ſyſtem in Europe, was in a manner dictated by the queen of Sweden. Nor did he neglect the young princeſs committed to his care; ſhe received a noble education, and gave ſufficient proofs of her ability to govern a powerful kingdom. She was fond of learning, and invited many celebrated perſons to her court; expreſſed a great regard for Grotius; and was an excellent judge of the polite arts. She had not ſat long on the Swediſh throne, before ſhe embraced the Romiſh religion, and knowing that her ſubjects would not ſuffer any perſon of that perſuaſion to ſit quietly on the throne, ſhe reſigned her crown to her couſin, Charles Guſtavus, ſon to the duke of Deux-Ponts, and retired to Rome, where ſhe died.

In the year 1659, Charles X. aſcended the Swediſh throne, on the reſignation of Chriſtina, and was very ſucceſsful in his wars againſt the Poles; he even received from them an oath of allegiance, but had no ſooner left their country, than they renounced it, unwilling, perhaps, to forfeit their character of inconſtancy. He died of a fever in the year 1660, leaving his crown to his ſon, Charles XI. who was only in his fifth year when his father died; which rendered it neceſſary for thoſe who were entruſted with the government of the kingdom during his minority, to conclude a peace with all the European powers, though attended with the loſs of the iſland of Bornholm, and Drontheim in Norway, which were ceded to the Danes. The Swediſh forces were however in a very reſpectable condition, ſo that, though the guardians of Charles did not think it prudent to carry on expenſive wars, the kingdom had great weight in the affairs of Europe.

When the young prince came of age, he concluded a ſubſidiary treaty with Louis XIV. but ſoon after abandoned his connections with that monarch, and joined in an alliance with England and Holland. Happy had it been for him, had he fulfilled his engagements with the maritime power; but he afterwards joined with France, was totally defeated at Felim-Bellin, and a powerful confederacy was formed againſt him. The elector of Brandenburgh

denburgh made himſelf maſter of Swediſh Pomerania, the biſhop of Munſter over-ran the duchies of Bremen and Verdun, and the Danes took Wiſmar, and ſeveral places in Schonen. Charles was however afterwards victorious, and, recovered by the treaty of St. Germain's all he had loſt, a few places in Germany only excepted. Determined to render his army ſtill more formidable, and himſelf deſpotic, inſtead of cultivating the arts of peace for the good of his country, he impoveriſhed and enſlaved his people: the ſtates loſt all their power, and Sweden was reduced to the ſame condition as Denmark.

The inhabitants of Livonia preſented a petition to the king, in which they pointed out, in the ſtrongeſt colours, the unjuſt proceedings of the parliament. This was, however, ſo far from procuring them the redreſs they expected, that they were conſidered as traitors to their country. The celebrated Patkul, whoſe great talents enabled him to place the impoveriſhed ſtate of his country, and the unjuſt proceedings of the government, in the moſt forcible point of light, was marked out for a ſacrifice to deſpotic vengeance; but he fortunately made his eſcape. Charles however was not to be diverted from his purpoſe by petitions: he ſaw, unmoved, the miſeries of his people, and determined to perſevere in his arbitrary meaſures, though founded on cruelty and injuſtice. He ſucceeded; and became one of the moſt powerful princes in Europe. He did not indeed long enjoy his arbitrary government: he died in 1697, a few years after he had trampled on the libertries of his country, and was ſucceeded by Charles XII. his ſon, who was a minor when he aſcended the Swediſh throne. His age of majority had been fixed by the will of his father to eighteen; but by the intrigues of count Piper, it was ſet aſide for a more early date.

The youth of Charles, on his aſcending to the throne, encouraged the kings of Denmark and Poland, and the czar of Muſcovy, to form a powerful confederacy againſt him; but he nobly oppoſed all their efforts, and, landing in Zealand, laid ſiege to Copenhagen. Reduced to extremity, the king of Denmark was obliged to ſign the peace of Travendahl, by which the duke of Holſtein was reeſtabliſhed in his dominions.

Peter the Great, czar of Muſcovy, in the mean time was ravaging Ingria at the head of 100,000 men, and had formed the ſiege of Narva. The Swediſh army did not exceed 20,000 men, and lay at a great diſtance from Narva; but the impatience of Charles was ſo great, that he marched directly, at the head of four thouſand horſe, and an equal number of foot, to attack the Ruſſian army. Peter had poſted 20,000 men at a league's diſtance from the town, in the road through which it was neceſſary for Charles to paſs, and at double that diſtance 30,000 more, and before them an advanced guard of five thouſand. Charles was obliged to force his way through theſe three detachments before he could aſſault the grand army, lying in a camp before Riga, fortified with a rampart and double ditch.

His intrepidity ſurmounted all theſe difficulties: without giving the Ruſſians time to know the number of his forces, he attacked all their poſts ſucceſſively. The advanced guard, imagining that the whole Swediſh army was advancing, fled immediately at his approach. Terrified at the flight of their countrymen, the troops occupying the ſecond poſt fled alſo in confuſion; and thoſe of the third followed their example. Charles loſt no time, but purſuing the fugitives as cloſe as poſſible, attacked and routed the grand Ruſſian army, leaving near 20,000 of the enemy dead on the field of battle. Terrified at the name of a prince, who, at the head of ſuch a handful of men, was able to defeat ſo numerous an army, the Ruſſians aſcribed his ſucceſs to magic; and accordingly addreſſed their prayers to St. Nicolas, to protect them againſt the horrid crew of ſorcerers, combined together to deſtroy their country. After defeating the czar's army, Charles marched into Saxony, where he performed actions equal at leaſt to thoſe of the great Guſtavus Adolphus; he dethroned Auguſtus king of Poland, and placed the crown on the head of Staniſlaus. His prodigious ſucceſs rendered his name terrible to all the princes of Europe, and his friendſhip was courted by the moſt reſpectable powers. His conduct however was often ſo imprudent, and his ſtubbornneſs and implacable diſpoſition ſo deſtructive of all peace, that he can only be conſidered in the light of an illuſtrious madman.

After his ſucceſs in Poland, he formed the romantic deſign of dethroning Peter the Great, and accordingly marched his army into Ruſſia, and beſieged the town of Pultowa. The czar's army had now ſeen a great deal of ſervice, were inured to diſcipline and hardſhips, and commanded by able and intrepid generals: it is therefore no wonder that Charles here ſuffered a reverſe of fortune; his army was totally ruined, and he himſelf, with a few followers, obliged to take refuge among the Turks at Bender. Here he reſided till the Mahometans found it neceſſary for their affairs for him to withdraw. He however refuſed to comply with repeated requeſts for that purpoſe, and even attempted to defend himſelf with three hundred men, againſt an army of 30,000 Turks, an action which proves him to have been worſe than frantic. Even this reverſe of fortune could not cure him of his military frenzy; for after his return to his own dominions he proſecuted his revenge againſt Denmark with the utmoſt fury, till he was killed in the trenches at the ſiege of Fredericſhall, in Norway. This event happened in 1718, when he was only thirty-ſix years of age.

On the death of Charles XII. his ſiſter Ulrica Eleonora, aſcended the Swediſh throne. We have already ſeen in what manner the Swedes recovered their liberty, and given the ſubſtance of the capitulation ſigned by the queen and her huſband, when they entered on the exerciſe of the government. She immediately made a peace with all the belligerent powers combined againſt Sweden; though this could not be effected without conſiderable ſacrifices made by Ulrica.

But the influence of the French court in Sweden, in conſequence of their ſubſidies and intrigues, has occaſioned conſiderable factions in that kingdom. In 1738, a moſt powerful party appeared in the diet in favour of French meaſures. The perſons who compoſed it, went under the denomination of *Hats*. The object they held out to the nation, was, the recovery of ſome of the dominions yielded to Ruſſia; and conſequently the ſyſtem they were to proceed upon, was, to break with that power, and connect themſelves with France. The party directly oppoſed to them was headed by count Horn, and thoſe who contributed to eſtabliſh the new form of government, which was ſettled after the death of Charles XII. Their object was peace, and promoting the domeſtic welfare of the nation: the ſyſtem, therefore, which they adopted, was, to maintain a cloſe correſpondence and friendſhip with Ruſſia, and to avoid all further connection with France: theſe were ſtiled the *Caps*. There was beſides a third party, called the *Hunting Caps*, compoſed of perſons who were as yet undetermined to which of the other two they would join themſelves. Theſe parties long continued; but the French party generally prevailed, greatly to the detriment of the real intereſt of the kingdom: during the laſt war, for inſtance, with the king of Pruſſia,

Pruſſia, the crown of Sweden, for the ſake of a ſmall ſubſidy from France, was forced to contract a debt of 3,500,000l. which has ſince been conſiderably augmented, ſo that this debt now amounts to near five millions. Some efforts were employed by the Engliſh court to leſſen or deſtroy the French influence in Sweden, and for ſome time they were ſucceſsful: but the Hat party again acquired the aſcendancy. Theſe parties, however, are now aboliſhed, in conſequence of the late king of Sweden having made that total change in the government.

At the death of Ulrica, who left no iſſue, the Swedes elected the prince of Holſtein Eutin, biſhop of Lubeck, who aſcended the throne in 1751. But he ſufficiently felt the weight of the Swediſh crown, and after a troubleſome reign of twenty years, occaſioned by the perpetual uſurpations of the ſenate, paid the debt of nature in 1771, and was ſucceeded by his ſon Guſtavus III. of Holſtein Gottorp, who was about twenty-five years of age when he was proclaimed king of Sweden: with an underſtanding much cultivated, he had a graceful and commanding elocution, and an inſinuating addreſs. At the time of his father's death, he was at Paris, from whence he wrote in the moſt gracious terms to the ſenate, repeatedly aſſuring them, that he deſigned to govern according to the laws. Not long after which, an extraordinary diet was convened to regulate the affairs of the government, and to ſettle the form of the coronation-oath.

In March 1772, being ſome time after his arrival in Sweden, his majeſty ſolemnly ſigned and ſwore to obſerve twenty-four articles, relative to his future adminiſtration of government; among which were the following: "The king promiſes, before God, to ſupport the government of the kingdom as then eſtabliſhed; to maintain the rights and liberties of the ſtates, the liberties and ſecurity of all his ſubjects, to reign with gentleneſs and equity according to the laws of the kingdom, and to preſerve the form of the regency as was eſtabliſhed in the year 1720, and conformable to the preſent act of capitulation.—In conſequence of the declaration of the ſtates, the king ſhall regard every perſon, who ſhall openly or ſecretly attempt to introduce abſolute ſovereignty, as a traitor to his country, and an enemy of the kingdom; and that before any perſon can take poſſeſſion of an employment, he ſhall be required to take an oath reſpecting this matter.—The king promiſes to follow the regulations of the year 1720, with regard to the affairs of the cabinet and ſenate, which were always to be directed by a majority of votes; and that he will never do any thing therein without, and much leſs contrary to their advice.—And in order that the council of ſtate may be ſatisfactorily convinced of the uprightneſs of his majeſty's deſigns, and of his ſincere love for the good of his people, he declares them to be entirely diſengaged from their oath of fidelity, in caſe he wilfully acts contrary to his coronation oath, and to the capitulation.—And laſtly, the king threatens any perſon with his higheſt diſpleaſure, who ſhall be ſo inconſiderate as to propoſe to him a greater degree of power and ſplendor than is herein marked out, as his majeſty deſires only to be the powerful defender of his ſubjects againſt any encroachments which may be made upon their lawful liberties, and to gain the affection of his faithful and loyal ſubjects."

Notwithſtanding the king had taken theſe ſolemn oaths, to rule according to the then eſtabliſhed form of government, and accepted the crown upon theſe conditions, it was not long before he formed a plan to govern as he thought proper, regarding theſe oaths only as matters of ceremony; and he made uſe of every art, the moſt profound diſſimulation, and the utmoſt dexterity and addreſs, in order to render this hazardous enterpriſe ſucceſsful.

At his firſt arrival at Stockholm, he adopted every method which might increaſe his popularity. He gave regular audience three times in the week, to all that preſented themſelves. He became eaſy of acceſs to all his ſubjects of whatever rank, liſtened to them with courteſy, and entered into the minuteſt details of their complaints; and by appearing, in various reſpects, to intereſt himſelf in their welfare and happineſs, was regarded and beloved as the common father of his people.

While the king laboured, by theſe means, to render himſelf generally popular, he alſo endeavoured to perſuade the leading men, that he was inviolably attached to the conſtitution, that he was perfectly ſatisfied with the ſhare of power allotted to him, and declared, on every occaſion, that he conſidered it as his greateſt glory to be the firſt citizen of a free people. He ſeemed intent only on baniſhing corruption, and promoting union: diſclaimed being of any party but that of the nation at large, and engaged to pay the moſt implicit obedience to whatever ſhould be enacted by the diet. Though theſe profeſſions charmed great numbers into ſecurity, they at the ſame time cauſed ſuſpicions in the breaſts of a few, who, rather, thought his majeſty promiſed too much to be in earneſt. In the mean time there happened ſome contentions between the different orders of the people; and no methods were left untried to foment their jealouſies.

Guſtavus having taken proper meaſures for bringing a conſiderable number of officers and ſoldiers over to his intereſt, all the military force of Stockholm being at his devotion, he planted grenadiers, with fixed bayonets, at the door of the council-chamber, in which the ſenate were aſſembled, and made all the members of it priſoners: and that no intelligence of the tranſaction, in which the king was engaged, might be conveyed to any other part of the kingdom till the ſcheme was completed, cannon were drawn from the arſenal, and planted at the palace, the bridges, and at all the avenues leading to the town. All communication with the country was cut off, no one being allowed to leave the city without a paſſport from the king. Some of the ſenators were then confined in ſeparate apartments in the palace. The king was employed in viſiting different quarters of the town, in order to receive oaths of fidelity to him from the magiſtrates, colleges, and city militia.

Soon after, oaths were tendered to the people in general, to whom he addreſſed a ſpeech, which he concluded by declaring that his only intention was to reſtore tranquility to his native country, by ſuppreſſing licentiouſneſs, overturning the preſent form of government, and reſtoring the ancient laws of Sweden, ſuch as they were before 1680. "I renounce now," ſaid he, "as I have already done, all idea of the abhorred abſolute power, or what is called *ſovereignty*, eſteeming it ſtill, as heretofore, my greateſt glory to be the firſt citizen among a truly free people." After theſe aſſurances on the part of his majeſty, heralds were ſent into the different quarters of the town, to proclaim orders for an aſſembly of the ſtates. This proclamation contained a threat, that if any member of the ſtate ſhould without juſt cauſe abſent himſelf, he ſhould be conſidered and treated as a traitor.

In the morning on the 21ſt of Auguſt, a large detachment of guards was ordered to take poſſeſſion of the ſquare where the houſe of nobles ſtands. Troops were alſo ordered to inveſt the palace

palace on all ſides, and cannon were planted in the court oppoſite the hall where the ſtates were to meet. By the king's command, the ſeveral orders of the ſtate were here compelled to aſſemble, and theſe military preparations were declared to be made in order to aſſiſt their deliberations.

The king being ſeated on his throne, ſurrounded by his guards, and a numerous band of officers, after having addreſſed a ſpeech to the ſtates, cauſed the plan of a new form of government to be read by a ſecretary, and offered it to the ſtates for their acceptance, who thought proper to comply with what was required of them. The marſhal of the diet, and the ſpeakers of the other orders, then ſigned the form of government, and the ſtates took the oath which the king had dictated to them. This tranſaction, which had been planned with great ſagacity and judgment, conducted with ſecrecy, and effected by eloquence, concluded in a manner no leſs extraordinary: the king drew a book of pſalms from his pocket, and, taking off his crown, began to ſing *Te Deum*, in which the whole aſſembly joined: the ſenate took a new oath of allegiance to the prince, who gave them to underſtand that he intended in ſix years time again to convene an aſſembly of the ſtates.

Thus this great revolution was completed, and tranquility reſtored, without any bloodſhed; very few perſons were impriſoned, and that only for a ſhort time; nor did any of them experience, in the ſmalleſt degree, a diminution of the royal favour, on account of their oppoſition. And this remarkable event, which had produced an almoſt total change in the Swediſh conſtitution, did not appear to have any influence on the conduct of Guſtavus III. who continued to exerciſe with moderation the power he had thus aſſumed.

The high ſpirit of the Swediſh nobility was particularly manifeſted in the diets, and the very firſt of theſe which met after the revolution plainly evinced that the ſeeds of diſſenſion had taken deep root in the minds even of thoſe who ſwayed the higheſt offices of the ſtate. In this diet, which met in 1778, the king attempted to re-eſtabliſh the ancient claſſes among the Swediſh nobles, viz. the high nobility, the equeſtrian order, and the gentry. Each claſs was to vote ſeparately, and every queſtion was to be decided by the majority of the claſſes, that is, by the union of any two. The higher orders, who felt more and more their own conſequence, proved untractable; and the lower houſe, who ſaw themſelves degraded by this arrangement, entered into a ſtate of implacable oppoſition.

A motion to aſcertain and limit the royal prerogative put a ſudden termination to the diet. The regiſters, &c. were ſealed up, and have ever ſince remained unopened. The diet which aſſembled in 1786, broke up with unequivocal ſymptoms of diſſatisfaction, and with mutual recriminations between the king and its leading members.

After ſuch experience of refractory conduct, the king was averſe to the aſſembling of the ſtates at the commencement of the late war. The revolt of the army at Frederickſtadt, and the urgent want of ſupplies, compelled him however to aſſemble a diet again in 1789. The diſcontents which had prevailed in the former ſeſſions ſeemed to increaſe in this. Some popular laws were notwithſtanding paſſed; in particular, the privileges which the nobility had before excluſively enjoyed, were by a law of this diet extended to all ſettled inhabitants of the kingdom.

Guſtavus, though averſe to theſe aſſemblies, his neceſſities in the beginning of 1792, compelled him once more to ſummon a diet, but every precaution was employed to render it as little injurious as poſſible to his authority. The proclamation for aſſembling the diet was iſſued only three weeks previous to its meeting, ſo that the elections were made in haſte, and the patriotic party had no time to make any arrangements with reſpect to their choice of repreſentatives. Inſtead of aſſembling in the capital, the ſtates were ordered to meet at Geffle, a ſolitary ſituation on the Bothnic Gulf, and 70 miles from Stockholm. The diet during the whole of its deliberations was ſurrounded by mercenary troops. Thus the expectations of the public were completely fruſtrated. No reform was effected, nor was there any cenſure paſſed upon the king for the manifeſt infraction of both the old and new conſtitutions, in entering into war without the conſent of the ſtates. In his great object, however, Guſtavus found himſelf in ſome meaſure diſappointed; the diet were ſtill too parſimonious to ſatisfy either his neceſſities or his wiſhes, and he was obliged to reſt contented with only a part of his demand.

On the diſſolution of the diet at Geffle, his majeſty returned to Stockholm, and on the 16th of March, as he was preparing to attend a maſquerade at the opera-houſe, he received the following anonymous letter:

"SIRE,

"Deign to liſten to the advice of a man, who, neither being attached to your ſervice, nor deſirous of your favour, flatters not your crimes, but is deſirous of adverting the danger with which your life is menaced.

"Be aſſured, that a plot is formed to aſſaſſinate you. Thoſe who have entered into it, are furious at being foiled laſt week, by the balls being countermanded. They have reſolved to execute their ſcheme this day. Remain at home; avoid balls during the preſent year; thus the fanaticiſm of criminality will be ſuffered to evaporate. Avoid the road to Haga (the king's country reſidence); in fine, be upon your guard for at leaſt a month.

"Do not endeavour to diſcover the author of this letter; the project againſt your life is come to his knowledge by accident; be aſſured, however, that he has not any intereſt whatever in forewarning you of your intended fate.

"If your troops had made uſe of any violence againſt the citizens at Geffle, the author of this letter would have fought againſt you ſword in hand; but deteſts aſſaſſination."

The king, it is ſaid, on reading the note, was obſerved to turn pale. He affected, however, to hear it with contempt, and to conſider it as an inſult to his courage, to attempt to deter him from enjoying his evening's entertainment. It was late before he entered the ball-room; but after ſome time he ſat down in a box with the compte D'Eſſen, and obſerved that he was not deceived in his contempt for the letter, for if there had been any deſign againſt his life, no time could be more favourable than the preſent. He then mingled among the crowd; and juſt as he was preparing to retire, in company with the Pruſſian ambaſſador, he was ſurrounded by ſeveral perſons in maſks, one of whom fired a piſtol at the back of the king, and lodged the contents in his body. A ſcene of confuſion immediately enſued. The conſpirators, amidſt the general tumult and alarm, had time to retire to other parts of the room, but one of them had previouſly dropped his piſtols and a dagger cloſe by the wounded king. An order was given to all the company to unmaſk, and the doors were immediately cloſed, but no perſon appeared with any particular diſtinguiſhing marks of guilt. The king was conveyed to his apartment, and the ſurgeon, after extracting a ball and ſome ſlugs, gave favourable hopes of his majeſty's recovery.

Suſpicions fell upon ſuch of the nobles as had been notorious for their oppoſition to the meaſures of the court. The anonymous letter was traced up to colonel Liljehorn, major in the king's guards, and he was immediately apprehended. But the moſt ſucceſsful clue that ſeemed to offer was, in conſequence of the weapons which had fallen from the aſſaſſin. An order was iſſued, directing all the armourers, gunſmiths, and cutlers in Stockholm, to give every information in their power to the officers of juſtice concerning the weapons. A gunſmith, who had repaired the piſtols, readily recogniſed them to be the ſame, which he had repaired ſome time ſince for a nobleman of the name of Ankarſtrom, a captain in the army; and the cutler, who had made the dagger, referred at once to the ſame perſon.

No ſooner was Ankarſtrom apprehended, than he confeſſed with an air of manifeſt triumph, that he was the perſon "who had endeavoured to liberate his country from a monſter and a tyrant." Suſpicions at the ſame time fell on the counts Horn and Ribbing, baron Pechlin, baron Ehrenſvard, baron Hartſmandorf Von Engerſtrom the royal ſecretary, and others. Baron Beilke, the king's private ſecretary, being alſo apprehended on ſuſpicion, declared without heſitation that he was privy to the plot, but added, that he had provided againſt the puniſhment which he knew awaited him, and againſt the riſk of being compelled by torture to betray thoſe who were aſſociated with him. He had in fact ſwallowed poiſon, and expired ſhortly after this declaration. His body was afterwards drawn on a hurdle, and expoſed to public view at the common place of execution.

From the confeſſion of Ankarſtrom, it appeared that he had been himſelf a principal in the conſpiracy from the beginning: That in conſequence of an intimacy which exiſted between him and count Horn, they had often been led to converſe upon political ſubjects, on which they were perfectly agreed. They deplored the annihilation of their country's liberty and conſtitution, and reſented the recent calamities which the falſe ambition of Guſtavus had brought upon the nation, and concluded, that the only means of redreſſing the grievances under which it laboured, and of reſcuing it from others which were ſtill more to be apprehended, would be to aſſaſſinate the king, or at leaſt remove him from the government.

Count Ribbing was informed of the conſpiracy through count Horn, and readily acceded to it. Ankarſtrom undertook to be the immediate agent for the aſſaſſination; and with this intention, in company with count Horn, he attended the theatre on the 16th of January, and ſat in the next box to the king's, but his majeſty did not appear at the theatre that evening. With the ſame purpoſe in view they went to the maſquerade, which was given by the king on the 19th of the ſame month; but as the concourſe of people did not appear ſufficient to afford them any hopes of concealment, the deſign was deferred.

The king was accompanied to the diet at Geffle by Ankarſtrom and Ribbing, who returned with him to Stockholm. On the fatal 16th of March, when Ankarſtrom had fired his piſtol, not ſeeing the king fall immediately, he drew his dagger, in order to effect his purpoſe, but was ſeized with a tremor, and dropped both the dagger and the piſtol on the floor. He, however, had preſence of mind to mingle immediately with the crowd, and to join in a cry of fire, which probably aroſe at firſt from the appearance of that confuſion which it afterwards contributed to increaſe.

The king languiſhed from the 17th to the 29th of March. On opening his body, a ſquare piece of lead, and two ruſty nails, were found unextracted within the ribs.

Thus fell, by the hand of treaſon, Guſtavus III. in his forty-ſixth year.

After a very fair and ample trial, Ankarſtrom was condemned to be publicly and ſeverely whipped on three ſucceſſive days, his right hand and his head to be cut off, and his body impaled, which ſentence he ſuffered not till the 17th of May, long after the death of the king. His property was given to his children, who, however, were compelled to change their name.

Counts Horn and Ribbing were condemned to loſe their right hands, and to be decapitated. Colonel Liljehorn, and lieutenant Ehrenjwerd, were alſo to be beheaded. All theſe conſpirators were degraded from the rank of nobles, and their property declared to be confiſcated. Major Hartmanſdorf was to forfeit his rank in the army, and to be impriſoned for one year. Engerſtrom was to ſuffer perpetual impriſonment, and baron Pechlin and ſecretary Lilleſtrahle to be impriſoned during pleaſure. Four others, accuſed of being concerned in the conſpiracy, were pardoned, and ſome were acquitted.

During the king's illneſs, and particularly after he was made acquainted with the certainty of his approaching diſſolution, Guſtavus continued to diſplay that unſhaken courage which he had manifeſted on every occaſion during his life. A few hours before his deceaſe he made ſome alterations in the arrangement of public affairs. He had before, by his will, appointed a council of regency; and being aware of the neceſſity of a ſtrong government in difficult times, he appointed his brother, the duke of Sudermania, ſole regent, till his ſon, who was then about fourteen, ſhould attain the age of eighteen years. Immediately on the death of the king, the young prince was proclaimed by the title of Guſtavus IV.

Guſtavus Adolphus IV. the preſent king of Sweden, was born November 1, 1778, and ſucceeded his father Guſtavus III. who was ſhot the 16th, and died the 29th of March, 1792; born January 24, 1746; married October 17, 1766, to the princeſs-royal of Denmark, by whom he had iſſue Guſtavus Adolphus, the preſent king.

Brothers and ſiſters to the late king:

1. Charles, duke of Sudermania, born October 7, 1748.
2. Frederic Adolphus, duke of Weſt-Gothland, born July 18, 1750.
3. Sophia Albertina, abbeſs of Quedlingburgh, born in October 1753.

CHAP. VII.

THE EMPIRE OF GREAT RUSSIA, OR MUSCOVY.

Situation, Extent, Provinces, Climate, Soil, Produce, Foreſts, Rivers, Fiſh, Population, Inhabitants, Cuſtoms, Laws, Government, &c.

RUSSIA is ſituated between the 47th and 72d deg. of north lat. and between the 23d and 65th deg. of eaſt long. It is ſuppoſed to be about 1550 miles from weſt to eaſt, and 1200 from north to ſouth: theſe limits, however, are not to be entirely depended upon, as the eaſtern part is a mere deſert, being entirely abandoned on account of the incurſions of the Tartars, and the northern parts are rendered almoſt inacceſſible by cold. We know, however, that the whole comprehends the northern

The Northern States of Europe, including Denmark, Norway, Sweden, Russia

northern parts of Europe and Aſia, ſtretching from the Baltic and Sweden, on the weſt, to Kamtſchatka and the eaſtern ocean; and on the north, from the Frozen Ocean to the 47th degree of latitude, where it is bounded by Poland, Little Tartary, Turkey, Georgia, the Euxine and Caſpian Seas, Great Tartary, Chineſe Tartary, and other unknown regions in Aſia.

This mighty empire, according to the moſt authentic accounts, conſiſts of 15 provinces or governments, beſides part of Carelia, Eſthania, Ingria, Livonia, and part of Finland, which were conquered from Sweden; the Crimea, or Crim Tartary, anciently the Taurica Cherſoneſus, a peninſula in the Euxine Sea, formerly ſubject to the Turks, but added in the year 1783 to the Ruſſian empire, with the iſle of Taman, and part of Cuban; by the ceſſion of which laſt the Ruſſians are ſaid to have gained above a million of ſubjects; alſo the duchy of Courland in Poland, of which the emperor of Ruſſia has now the entire diſpoſal.

The Ruſſian empire, in its moſt extenſive ſenſe, including all the acquiſitions in Tartary, now known by the name of Siberia, with the provinces above ſpecified, is nearly equal in its dimenſions to all the reſt of Europe, and greater than the Roman empire in the zenith of its power, or the empire of Darius ſubdued by Alexander, or both put together.

Ruſſia is ſubdivided into the following Provinces:

Northern Provinces.

1. Lapland.
2. Samoieda.
3. Bellamorenſky.
4. Meſeen.
5. Dwina.
6. Syrianes.
7. Permia.
8. Rubeninſki.
9. Belaeſeda.

Middle Provinces.

10. Rezan, or Poreſlaf.
11. Belozero.
12. Wolagda.
13. Jerazlaf.
14. Tweer.
15. Moſcow.
16. Belgorod.

Eaſtern Provinces.

17. Bulgar.
18. Kaſan.
19. Tſcheremiſſi.
20. Little Novogorod.
21. Don Coſſacs.

Weſtern Provinces.

22. Great Novogorod.
23. Ruſſian Finland.
24. Kexholm.
25. Kaleria.
26. Ingria.

Southern Provinces.

27. Livonia.
28. Smolenſko.
29. Zernigof.
30. Seefk.
31. Ukranic, or country of the Old Coſſacs.

The following nations, as comprehended in this vaſt empire, have been enumerated by Mr. Tooke, chaplain to the Britiſh factory at Peterſburgh, who has lately publiſhed an account of Ruſſia, &c.

The Mongols, Kalmucs, Tartars, Samoiedes, Oſtiacs, Burattians, Jakutans, Tunguſians, Voguls, Laplanders, Finns, Lettonians, Eſtonians, Lieffs, Ingrians, Iſcherimiſſes, Tſchouwaſches, Mordvines, Votiaks, Terptyaireis, Tartars of Kaſan and Oſenbury, Tartars of Tobolſk, Tartars of Tomſk, Nogayan Tartars, Tartars of the Ob, Iſchoulym Tartars, Katſchintz Tartars, Teleutes, Abinzes, Biryouſſes, Kurilians, Kiſtim and Toulibert Tartars, Vergho Tomſkoi Tartars, Sayan Tartars, Touralinzes, Bougharians, Baſchkirians, Meſtſcheraiks, Barabinzes, Kirkguiſions, Beltirians, Yakoutes, and Kamtſchedales, amounting, all together, to thirty-three nations, beſides various others; but ſome of theſe are not conſiderable enough to be ranked as nations, but ſhould rather be denominated diſtinct tribes.

The names of Ruſſia and Muſcovy, by which this empire is arbitrarily called, are probably owing to the ancient inhabitants, the Ruſſi or Boruſſi, and the river Moſca, upon which the ancient capital Moſcow was built. It hath likewiſe been called White Ruſſia, on account of the ſnow with which it is covered the greateſt part of the year, but at preſent it is uſually diſtinguiſhed by the name Ruſſia, the Ruſſias, or Great Ruſſia.

The climate of this vaſt empire varies according to the differences of ſituation. In the ſouthern parts of Muſcovy the longeſt day does not exceed fifteen hours and a half; whereas in the moſt northern, the ſun in ſummer is ſeen for two months continually above the horizon. Notwithſtanding theſe different climates, the air is in general exceeding cold in winter, and by the ſeverity of it many perſons are deprived of their limbs, and frequently of their lives, particularly towards the north, where the ground is covered three parts of the year with ice and ſnow. In this ſeaſon, which begins about the latter end of Auguſt, and continues till the month of May, the rivers are frozen to the depth of four, and ſometimes five feet; water ſprinkled upwards with the hand, will freeze before it reaches to the ground.

Dr. John Glen King, who reſided eleven years in Ruſſia, obſerves, that the cold in St. Peterſburgh, by Fahrenheit's ſcale, is, during the months of December, January, and February, uſually from 8 to 15 or 20 degrees below 0; that is, from 40 to 52 degrees below the freezing point; though commonly, in the courſe of the winter, it is for a week or ten days ſome degrees lower. The ſame writer remarks, that it is very difficult for an inhabitant of our temperate climate to have any idea of a cold ſo great. It is ſuch, that, when a perſon walks out in that ſevere weather, the cold makes the eyes water, and that water freezing, hangs in little icicles on the eye-laſhes. As the common peaſants uſually wear their beards, you may ſee them hanging at the chin like a ſolid lump of ice. The beard is therefore found very uſeful in protecting the glands of the throat: and the ſoldiers, who do not wear their beards, are obliged to tie a handkerchief under the chin to ſupply their place. All the parts of the face, which are expoſed, are very liable to be frozen: though it has often been obſerved, that the perſon himſelf does not know when the freezing begins, but is commonly told of it firſt by thoſe who meet him, and who call out to him to rub his face with ſnow, the uſual method to thaw it. It is alſo remarked that the part which has once been frozen, is ever after moſt liable to be frozen again. In ſome very ſevere winters, ſparrows, though a hardy ſpecies of birds, have been ſeen quite numbed by the intenſe cold, and unable to fly: and drivers, when ſitting on their loaded carriages, have ſometimes been found frozen to death in that poſture. When the thermometer has ſtood at 25 degrees below 0, boiling water thrown up into the air by an engine, ſo as to ſpread, has fallen down perfectly dry, formed into ice. A pint bottle of common water was found by Dr. King frozen into a ſolid piece of ice in an hour and a quarter. A bottle of ſtrong ale has alſo been frozen in an hour and a half: but in this ſubſtance there was about a tea cup full in the middle unfrozen, which was as ſtrong and inflammable as brandy and ſpirits of wine. But notwithſtanding the ſeverity of the cold in Ruſſia, the inhabitants have ſuch various means and proviſions to guard againſt it, that they ſuffer much leſs from it than might be expected. The houſes of perſons in tolerable circumſtances are ſo well protected, both without doors and within, that they are ſeldom heard to complain of cold. The method of warming the houſes in Ruſſia is by an oven conſtructed with ſeveral flues; and the country abounds with wood, which is the common fuel. Theſe ovens

ovens conſume a much ſmaller quantity of wood than might be imagined; and yet they ſerve at the ſame time for the ordinary people to dreſs their food. They put a very moderate faggot into them, and ſuffer it to burn only till the thickeſt black ſmoke is evaporated; they then ſhut down the chimney to retain all the reſt of the heat in the chamber; by this method the chamber keeps its heat twenty-four hours, and is commonly ſo warm that they ſit with very little covering, eſpecially children, who are uſually in their ſhirts. The windows in the huts of the poor are very ſmall, that as little cold may be admitted as poſſible: in the houſes of perſons of condition, the windows are caulked up againſt winter, and commonly have double glaſs frames. In ſhort, they can regulate the warmth in their apartments by a thermometer with great exactneſs, opening or ſhutting the flues to increaſe or diminiſh the heat. When the Ruſſians go out, they are clothed ſo warmly, that they almoſt bid defiance to froſt and ſnow; and it is obſervable that the wind is ſeldom violent in the winter; but when there is much wind, the cold is exceedingly piercing.

One advantage, which the Ruſſians derive from the ſeverity of their climate, is the preſerving of proviſions by the froſt. Good houſewives, as ſoon as the froſt ſets in for the winter, about the end of October, kill their poultry, and keep them in tubs packed up with a layer of ſnow between them, and then take them out for uſe as occaſion requires; by which means they ſave the nouriſhment of the animal for ſeveral months. Veal frozen at Archangel, and brought to Peterſburgh, is eſteemed the fineſt they have; nor can it be diſtinguiſhed from what is freſh killed, being equally juicy. The markets in Peterſburgh are by this means ſupplied in winter with all manner of proviſions, at a cheaper rate than would otherwiſe be poſſible; and it is not a little curious to ſee the vaſt ſtacks of whole hogs, ſheep, fiſh, and other animals, which are piled up in the markets for ſale. The method of thawing frozen proviſions in Ruſſia is by immerging them in cold water; for when the operation of thawing them is effected by heat, it ſeems to occaſion a violent fermentation, and almoſt a ſudden putrefaction; but when produced by cold water, the ice ſeems to be attracted out of the body, and forms a tranſparent incruſtation round it. If a cabbage, which is thoroughly frozen, be thawed by cold water, it is as freſh as if juſt gathered out of the garden; but if it be thawed by fire or hot water, it becomes ſo rancid and ſtrong that it cannot be eaten.

The quickneſs of vegetation in Ruſſia is pretty much the ſame as has been deſcribed in Scandinavia, or Sweden and Denmark. The ſnow is the natural manure of Ruſſia, where grain grows in plenty, near Poland, and in the warmer provinces. The bulk of the people, however, are miſerably fed; the ſoil produces a vaſt number of muſhrooms for their ſubſiſtence; and in ſome places, beſides oaks and firs, Ruſſia yields rhubarb, flax, hemp, paſture for cattle, wax, honey, rice, and melons. The boors are particularly careful in the cultivation of honey, which yields them plenty of metheglin, their ordinary drink; they likewiſe extract a ſpirit from rye, which they prefer to brandy.

Ruſſia is in general a flat, level country, except towards the north, where the mountains are almoſt innumerable, remarkably high, and of prodigious extent. In the provinces of Vogulezi is a ridge, or chain, called Zimnopoias, or the Girdle of the Earth, and ſuppoſed to be the Montes Riphæi of the ancients. On the weſtern ſide of the Dnieper comes in part of the Carpathian mountains; and between the Black Sea and the Caſpian, Mount Caucaſus borders a range of vaſt plains extending to the ſea of Oral. From Peterſburgh to the north part of France, by the road of Dantzick, Hamburg, and Amſterdam, we ſcarcely can perceive the ſmalleſt hill; and from Peterſburgh to Pekin, there is hardly a mountain to be ſeen on the road through Independent Tartary.

In this empire, foreſts and woods abound, and produce fir trees of various kinds, oak, beech, alder, juniper, and many other ſorts of inferior woods and ſhrubs; whereby the inhabitants are enabled to build very comfortable houſes, and at the ſame time are ſupplied with fuel at a very eaſy rate, which, in ſo cold a climate, may juſtly be eſteemed an infinite bleſſing. Their fir-trees are of the utmoſt advantage; it being from theſe they extract the tar and pitch. From the yellow mountain pine is extracted the common turpentine, and from that the oil of turpentine is extracted by diſtillation; the firſt running of which, being finer and more volatile, is uſually called ſpirits of turpentine. The ſediment left in the ſtill is the common roſin, which, if taken out before it is drawn too high, is termed the yellow roſin, but, if left to evaporate to a greater degree, becomes black roſin. From a ſpecies of fir and pine, they likewiſe extract frankincenſe.

In Ruſſia, the rivers are very conſiderable, and among the firſt of them is placed the Wolga, which, after traverſing the greateſt part of Muſcovy, and winding a courſe of above two thouſand Engliſh miles, falls into the Caſpian Sea. The ſource of this famous river is the lake of Uranow, near the city of Rzeva Ulodimerſki, on the frontiers of Lithuania. The Wolga begins to be navigable about ſix miles below its ſource. Along its banks are found truffles and wild aſparagus, of a moſt delicious flavour, and the only oaks which are produced in Muſcovy.

The Oby, formed by the junction of the Tobal and the Irtis, in the ſixty-fifth degree of northern latitude, runs northward into the Frozen Ocean, oppoſite to Nova Zembla, and is the boundary between Europe and Aſia.

The Don, or Tanais, divides the moſt eaſtern parts of this empire from Aſia. It has its ſource in the Rezan, and in its courſe towards the eaſt approaches ſo near the Wolga, that the czar, Peter I. attempted to cut a communication between them. The river then runs towards the ſouth-weſt, receives a great number of other rivers, waters ſeveral cities, forms many beautiful iſlands, and at laſt diſcharges itſelf into the Palus Mæotis, at the fortreſs of Aſoph, about four hundred miles from its riſe.

The Dwina riſes in the province of Wologda, and, after running a northerly courſe, falls into the White Sea below Archangel.

The Nieper, formerly known by the name of the Boriſthenes, riſes in the province of Moſcow, runs through Poland, re-enters Muſcovy, paſſes Kiof, waters the Ukraine, and, after a ſoutherly courſe through Tartary, falls into the Euxine Sea at Oczakow.

The other rivers of Ruſſia are the Mologago, Moſco, Kiomo, Ocka, Sama, Dwina, and ſeveral leſs remarkable.

Some of the lakes in Ruſſia extend above forty leagues in length. The lake Ladoga, on the borders of Finland, is formed by four rivers, the principal of which are the Voxen, or Corela, the Fair, which flows into it from the lake of Onega, and the Volchova, which falls into it from the ſouth. It has a communication by a channel with the Gulf of Finland. The lake Onega is likewiſe ſituated on the borders of Finland, and filled by a conſiderable number of rivers. This lake is forty leagues in length, and eighteen in breadth. The other con-

conſiderable lakes are Brela-Ozera, Iwa-Noſero-cargapol, both which give their names to two different provinces; and Honnet, in the neighbourhood of the Great Novogorod.

The wild beaſts in this country are much the ſame as thoſe already deſcribed in Lapland, Norway, Sweden, &c. ſuch as rein-deer, foxes, martins, hares, bears, ermines, ſables, and ſquirrels. The lynx, famous for its piercing eye, is a native of this empire; it makes a prey of every creature it can maſter, and is ſaid to be produced chiefly in the fir-tree foreſts. In the ſouthern provinces are bred black cattle, camels, ſmall horſes, goats, ſheep, &c. Their cows and ſheep, as well as their horſes, are ſmall: the czar Peter encouraged a breed of large horſes for war, and carriages.

The whole empire abounds with poultry, wild fowl, game, birds of prey, &c. moſt of which have been already deſcribed.

The different parts of this country are plentifully ſupplied with various kinds of fiſh, by means of the Northern Ocean, Baltic, Gulf of Finland, White Sea, Black Sea, Caſpian Sea, and innumerable lakes, rivers, rivulets, &c. Theſe produce immenſe quantities of ſalmon, trout, pike, ſturgeon, and beluga: the latter reſembles a ſturgeon, and is often called the large ſturgeon; it is from 12 to 15 feet in length, and weighs from 9 to 16 and 18 hundred weight; its fleſh is white and delicious. Of the roe, of the ſturgeon and the beluga the Ruſſians make the famous caviare, ſo much eſteemed for its richneſs and flavour, that it is often ſent in preſents to crowned heads.

In cutting up the beluga's, they often find a ſort of ſtone, which is concealed in that maſs of glandular fleſh which covers the poſterior part of the dorſal ſpine, ſupplying the place of a kidney in fiſh. The inſtant it is taken from the fiſh, it is ſoft and moiſt, but quickly hardens in the air. Its ſize is that of a hen's egg, ſhape ſometimes oval and ſometimes flatted, and commonly ſells for a ruble: it holds a conſiderable rank, though with little merit, among the domeſtic remedies of the Ruſſians, who ſcrape it, and, mixed with water, give it in difficult labours, in the diſeaſes of children, and in other diſorders. This ſtone is ſuppoſed by Profeſſor Pallas to belong to the genitals of the fiſh.

The ſummer's heat hatches innumerable inſects in the ſand, moraſſes, foreſts, &c. and they are indeed very troubleſome throughout the whole empire. Some are like thoſe before deſcribed in the northern countries of Europe which we have already conſidered; and others are ſo imperfect as not to have received a name, or at leaſt not to have been aſſigned to any particular ſpecies.

In Ruſſia, mines and minerals are as plentiful as in Scandinavia; and the people are daily improving in working them. Mountains of rich iron ore are found in ſome places, moſt of which produce the load-ſtone, and yield from 50 to 70 per cent. Rich ſilver and copper mines are found on the confines of Siberia. Here is alſo lead ore, which contains a ſmall quantity of ſilver. The green lead-ore is very rare; but, when found, it is variegated with a yellowiſh green colour, and is ſemi-tranſparent.

The population of this vaſt empire has been greatly miſcalculated by ſeveral authors; ſince nothing can be more injudicious, or remote from truth, than thoſe accounts which make the whole of it not to exceed, at moſt, ſeven millions. It is not a little ſurpriſing that writers ſhould remain ſo long under this miſtake, when we conſider the very numerous armies the ſovereigns of Ruſſia have brought into the field, and the long and bloody wars they have maintained in Europe and Aſia. But the public has been at length undeceived in this matter, by a liſt, taken in 1747, by Mr. Voltaire, of all the males who paid the capitation or poll-tax, and which amount to 6,646,490. Boys and old men are included in this number; but girls and women are not reckoned, nor boys born between the making of one regiſter of the lands and another. Now, if we only reckon triple the number of heads ſubject to taxation, including women and girls, we ſhall find near twenty millions of ſouls. There may be added to this account 350,000 ſoldiers, and 200,000 nobility and clergy; as alſo (the ſame writer obſerves) the inhabitants of the conquered countries, namely, Livonia, Eſthenia, Ingria, Carelia, and a part of Finland; the Ukraine, and the Don Coſſacs, the Kalmucs, and other Tartars. The Samoiedes, the Laplanders, the Oſtiacs, and all the idolatrous people of Siberia, a country of greater extent than China, are not included in this liſt: the new regiſter in 1764 contains 8,500,000 ſubject to the poll-tax.

A late ingenious writer, reſident ſome time in Ruſſia, has favoured us with the followed eſtimate:

Of the lower claſs of people paying the capitation tax, the whole number amounts to	18,000,000
Conquered provinces	1,200,000
Noble families	60,000
Clergy	100,000
Military	360,000
Civil	30,000
Ukraine, Siberia, Coſſacs, &c.	350,000
	20,100,000

To this calculation, we may reaſonably ſuppoſe that the acquiſitions of the Crimea and part of Cuban Tartary muſt have added near a million more, and at leaſt 1,500,000 in the provinces cut off from Poland.

As his Imperial Majeſty now poſſeſſes many of the countries formerly inhabited by thoſe prodigious ſwarms of barbarians who overthrew the Roman empire, there will be ſufficient reaſon to believe, not only that his dominions muſt have been formerly better peopled than at preſent, but that even twenty-four millions are a thin population for the immenſe tract of country under his government. The like decreaſe in the inhabitants of ſome other parts of the globe may probably ariſe from the ſame natural cauſes; and it is highly probable that the vaſt quantities of ſtrong and ſpirituous liquors, conſumed by the inhabitants of the North, which are univerſally allowed to be unfriendly to health and generation, together with the introduction of the ſmall-pox and venereal diſeaſe among them, muſt have greatly contributed to the depopulation of thoſe countries.

The Ruſſians are in general a perſonable people, hardy, vigorous, and patient of labour, eſpecially in the field, to an incredible degree. Their complexions differ little from thoſe of the Engliſh or Scots; but the women think that an addition of red heightens their beauty. Their eye-ſight ſeems to be defective, occaſioned, probably, by the ſnow, which for a long time of the year is continually preſent to their eyes. Their officers and ſoldiers always poſſeſſed a large ſhare of paſſive valour; but, in the late war with the king of Pruſſia, they proved as active as any troops in Europe; and in the late war with the Turks greatly diſtinguiſhed themſelves. They are implicitly ſubmiſſive to diſcipline, let it be ever ſo ſevere; endure extreme hardſhips with great patience; and can content themſelves with very hard fare.

Before the days of Peter the Great, the Ruſſians in general, were uncivilized, deſpicable, and much addicted

addicted to drunkenneſs: no leſs than 4000 brandy-ſhops have been computed in Moſcow. The common people, and alſo the boyars or nobles, had contracted a conſtant habit of indolence and intoxication; in conſequence of which, the moſt ſhocking objects of miſery and barbarity preſented themſelves in the ſtreets, while the court of Moſcow exceeded all others in ſplendour and pomp. The czar and grandees, dreſſed after the moſt ſuperb Aſiatic manner, exceeded every idea that can be conceived of modern grandeur; nothing but gold and precious ſtones were to be ſeen in the robes of the czar and his courtiers. Theſe, and all other luxuries, were furniſhed by Italians, Germans, and other foreigners.

When the czar Peter aſcended the throne, the bulk of his ſubjects appeared to him little better than beaſts of burden deſtined to ſupport the magnificence of the court. Struck with the impropriety of the ancient cuſtoms in theſe reſpects, he obliged his great men to lay aſide their long robes, and dreſs in a plainer mode, like other Europeans, and even ordered the laity to cut off their beards, beſides making other improvements in learning and the arts.

Before his time, the Ruſſians had hardly a ſhip upon their coaſts: they had no conveniences for travelling, no pavements in their ſtreets, no public places of diverſion, and entertained a ſovereign contempt for all improvements of the mind; but at preſent a French or Engliſh gentleman may live as comfortably and agreeably in Ruſſia, as in moſt other parts of Europe. During the reign of the late empreſs, their polite aſſemblies were put under proper regulations, and few of the ancient irregularities prevail. But notwithſtanding the ſeverity of Peter, and the prudence of ſucceeding governments, many barbarous uſages and exceſſes are not yet ſuppreſſed.

It is ſaid that the Ruſſian ladies were formerly as ſubmiſſive to their huſbands in their families, as the latter are to their ſuperiors in the field; and that they thought themſelves ill treated if they were not often reminded of their duty by the diſcipline of a whip, manufactured by themſelves, which they preſented to their huſbands on the day of their marriage.

The nuptial ceremonies of the Ruſſians are peculiar to themſelves, and formerly conſiſted of ſome very whimſical rites, many of which are now diffuſed. When the parents are agreed upon a match, though the parties perhaps have never ſeen each other, the bride is critically examined by a certain number of females, who are to correct, if poſſible, any defect they find in her perſon. After the prieſt has tied the nuptial knot, the bride is led home, with abundance of coarſe, and indeed indecent ceremonies, which are wearing off even amongſt the loweſt ranks; and the barbarous treatment of wives by their huſbands, which extended even to ſcourging or even broiling them to death, is either guarded againſt by the laws of the country, or by particular ſtipulations in the marriage contract. But, notwithſtanding the rigorous treatment which married women are ſtill ſubject to, they are ſaid to be in general looſe in their behaviour, and far from ſhy of their favours, and will even bear their huſbands company in their drunken debauches, which may in ſome meaſure juſtify theſe for the brutiſh jealouſy they are commonly addicted to: and ſo little gallantry, or even decency, is uſed towards the fair ſex in this whole country, that no reſpect is paid to them, though they are even of quality. The only chance they have in wedlock is, from the kindneſs of their parents, who take care to bind the huſband under ſome ſort of penalty, to uſe them well and kindly, to feed them with wholeſome food, and to forbear all unreaſonable correction and ill treatment. But all theſe precautions often prove ineffectual, ſo that it is not without reaſon that they crown the bride, on her wedding day, with a garland of wormwood, to put her in mind of the bitterneſs that attends the marriage-ſtate, and the bridegroom with one of hops, to intimate to him the fruitfulneſs of it; which is there paid ſo much regard to, that he may divorce her, and ſhut her up, for the very fault of her not bearing him any children.

An ingenious writer has left upon record an entertaining account of the ſame ceremony. "In 1713 the princeſs Natalia, only ſiſter to the reigning czar, by the ſame mother, ordered preparations to be made for a grand wedding, for two of her dwarfs, who were to be married. On this occaſion ſeveral ſmall coaches were made, and little Shetland horſes provided to draw them. All the dwarfs in the kingdom were ſummoned to celebrate the nuptials, to the number of ninety-three. They went in grand proceſſion through all the ſtreets of Moſcow. Before them went a large open waggon, drawn by ſix horſes, with kettle-drums, french-horns, and hautboys. Then followed the marſhall and his attendants, two and two, on horſeback. Then the bridegroom and bride, in a coach and ſix, attended by the brideman and maid, who ſat before them in the coach. They were followed by fifteen ſmall coaches, each drawn by ſix Shetland horſes, and each containing four dwarfs.

"It was ſurpriſing to ſee ſuch a number of little creatures in one company together, eſpecially as they were furniſhed with an equipage conformable to their ſtature. Two troops of dragoons attended the proceſſion, to keep off the mob, and many perſons of faſhion were invited to the wedding, who attended in their coaches to the church where the ſmall couple were married. From thence the proceſſion returned in order to the princeſs's palace, where a grand entertainment was provided for the company. Two long tables were covered on each ſide of a long hall, where the company of dwarfs dined together. The princeſs, with her two nieces, were at the trouble themſelves to ſee them all ſeated, and well attended, before they ſat down to their own table. At night the princeſſes, attended by the nobility, conducted the married couple to bed in grand ſtate; after which ceremony the dwarf company had a large room allotted them to make merry among themſelves. The entertainment concluded with a grand ball."

The Ruſſians may not marry any one that is related to them within the fourth generation. Thoſe of an equal degree of conſanguinity, call each other brother and ſiſter, with the diſtinction of firſt, ſecond, and ſo on to the fourth degree; and thoſe of a higher or lower degree, are called uncles, nephews, &c. with the ſame diſtinction. At their chriſtenings they commonly have three or four godfathers, with an equal number of godmothers, who, after that ceremony, deem themſelves ſo nearly related, that they can no more marry each other, than if they were children of the ſame parents.

The Ruſſians entertain many fantaſtic notions reſpecting the ſtate of departed ſouls. When a perſon dies, the ſervants, acquaintance, and relations of the deceaſed, being ranged round the room, take their leave, ſome by kiſſing the hand, others the face, ſpeaking to the corpſe, aſking pardon of it for any crime committed, and all making the moſt terrible noiſe imaginable, rather howling than crying. After the dead body is dreſſed, they hire a prieſt to pray for the departed ſoul, to purify it with incenſe, and to ſprinkle it with holy water, while it remains above-ground, which, among the better ſort, it generally does for eight or ten days. When the body is carried to the grave, which is done

done with many geſticulations of ſorrow, the prieſt produces a ticket, ſigned by the biſhop and another clergyman, as the deceaſed's paſſport to heaven. When this is put into the coffin between the fingers of the corpſe, the company return to the deceaſed's houſe, where they drown their ſorrow by intoxication; which laſts, among thoſe of higher rank, for forty days, with little intermiſſion. During that time, a prieſt is appointed to ſay prayers every day over the grave of the deceaſed; for though the Ruſſians do not believe in purgatory, they ſuppoſe that their departed friend may be aſſiſted, to the place of his deſtination, by their prayers.

The following is an account of the ceremonies of a Ruſſian funeral, as performed on the demiſe of a lady of the firſt rank, given by an eminent traveller then preſent. "She died in childbed, and was buried with great pomp. After the company had ſat ſome time, they all went into the room to the corpſe. The coffin was open. She was dreſſed in an undreſs, as ſhe died in that condition, (otherwiſe ſhe would have been full dreſſed,) in a night gown of ſilver tiſſue, tied with pink ribbons. On her head was a fine laced mob, and a coronet, as princeſs of the Roman empire. Round her forehead was tied a ribbon, embroidered with her name and age. In her left arm lay the child, who died a few minutes after its birth, dreſſed in ſilver tiſſue. In her right hand was a roll of paper, which was a certificate from her confeſſor to St. Peter, which ran thus. "We do certify by theſe preſents, that the bearer hereof has always behaved and lived among us as became a good Chriſtian, profeſſing the Greek religion; and although ſhe may have committed ſome ſins, ſhe has confeſſed the ſame, whereupon ſhe hath received abſolution: that ſhe has honoured God and his ſaints; that ſhe has not neglected her prayers, and has faſted on the hours and days appointed by the church: that ſhe has always behaved herſelf towards me, who am her confeſſor, in ſuch a manner, that I have no reaſon to complain of her, or deny her the abſolution of her ſins. In witneſs whereof we have given her thoſe teſtimonials, to the end that St. Peter, upon ſight of them, may not deny her the opening of the gate to eternal bliſs.

"When all the company were ranged in the room, her ſervants came to take their leave of her, the inferior firſt. They all kiſſed her hand, and the child, aſked her pardon for any crime they had committed, and made the moſt terrible noiſe imaginable, rather howling than crying. After that her acquaintance took their leave, with this difference, that they kiſſed her face, and made a hideous noiſe, though not ſo bad as the others. Then came her relations, the moſt diſtant ones firſt, When her brother came, I really thought he would have pulled her out of the coffin. But the moſt moving ſcene was the huſband, who had begged to be excuſed this diſmal ceremony; but his brother thought he ought to comply with the Ruſſian cuſtom, leſt, as he was a foreigner, it ſhould be deemed a ſlight. He was brought from his own apartment by two gentlemen as ſupporters, and they were really, in this caſe, more for uſe than ſhew. He had true but ſilent ſorrow painted in his face. When he came to the door of the room where the corpſe lay, he ſtopped and aſked for ſome hartſhorn; which, when he drank, and ſeemed to have armed himſelf, he advanced to the coffin, and there fainted. When he was taken out of the room, and recovered, the corpſe was carried down and placed in an open chariot. A great train of coaches followed; and, as a general officer's wife, a party of guards. She was carried to St. Alexander's monaſtery to be buried; and though the coffin lid was put on as the corpſe paſſed the ſtreets, it was taken off again when it came into the chapel; and the ſame ceremony of leave was taken over again, except by the huſband, who was carried home in a ſecond fainting fit, the moment the coffin was uncovered. When the corpſe was buried, all the company retired to the houſe, to a grand dinner, which had more an air of rejoicing than mourning, as every body ſeemed to have forgot their ſorrow: but the huſband was affected with too much real ſorrow to attend."

The Ruſſians are remarkable for the ſeverity and variety of their puniſhments, which are both inflicted and endured with a wonderful inſenſibility. Peter the Great uſed to ſuſpend the robbers upon the Wolga, and other parts of his dominions, by iron hooks fixed to their ribs, on gibbets, where they writhed themſelves to death, hundreds, nay thouſands, at a time. The ſingle and double knout have been inflicted upon ladies, as well as men of quality. Both of them are excruciating: but in the double knout the hands are bound behind the priſoner's back, and the cord being fixed to a pully, lifts him from the ground, with the diſlocation of both his ſhoulders; and then his back is in a manner ſcarified by the executioner, with a hard thong cut from a wild aſs's ſkin. This puniſhment has been ſo often fatal, that a ſurgeon generally attends the patient to pronounce the moment it ſhould ceaſe. It is not always the number of the ſtrokes, but the method of applying them, which occaſions the death of a criminal; for the executioner can kill him in three or four blows, by ſtriking him upon the ribs; though perſons are ſometimes recovered, in a few weeks, who have received three hundred ſtrokes, moderately inflicted. The boring and cutting out of the tongue are likewiſe practiſed in Ruſſia; and even the late empreſs Elizabeth, though ſhe prohibited capital puniſhments, was forced to give way to the ſuppoſed neceſſity of thoſe tortures.

According to the ſtrict letter of the law, there are no capital puniſhments in Ruſſia, except in the caſe of high treaſon: but there is much leſs humanity in this than has been ſuppoſed. For there are many felons who expire under the knout; and others die of fatigue in their journeys to Siberia, and from the hardſhips they ſuffer in the mines; ſo that there is reaſon to believe that no fewer criminals ſuffer death in Ruſſia than in thoſe countries where capital puniſhments are authoriſed by the laws.

Felons, after receiving the knout, and having their cheeks and forehead marked, are ſometimes ſentenced for life to the public works at Cronſtadt, Viſhnei-Volotchok, and other places: but the common practice is to ſend them into Siberia, where they are condemned for life to the mines at Nerſhink. There are, upon an average, from 1600 to 2000 convicts at theſe mines. The greateſt part are confined in barracks, excepting thoſe who are married: the latter are permitted to build huts, near the mines, for themſelves and families. The prohibition of the torture does honour to the late empreſs Catharine II.

The manner of travelling in Ruſſia is extremely commodious, eſpecially in winter, when their ſledges glide away on the ſurface of the ice or ſnow with incredible diſpatch, and ſo very little labour to the horſes, that they can eaſily perform a journey of 50 or 60 miles a day. Their ſledges are made of the bark of the linden tree, fitted to the ſize of a man, lined with ſome thick felt; and when a man is laid along in them, he is wrapt up, and quite covered, in good furs. The driver, for the moſt part, runs by the ſledge, to keep himſelf warm, or ſits at the feet of the perſon who travels. The ſledges being built ſo very low, ſhould they happen to overturn, there is little danger in the fall. In this mode of travelling the time is moſtly

ſpent

ſpent in ſleeping; the eaſy and almoſt imperceptibe motion favouring their repoſe. When they happen to paſs through deſerts, or great foreſts, where they are obliged to remain all night in the open air, they kindle a great fire, round which they range their ſledges; ſo that being well cloſed on all ſides, and well covered up with their furs, they reſt more commodiouſly than in a country cottage, where man and beaſts being lodged in one room, greatly diſturb a man's reſt.

The greateſt inconvenience in travelling in thoſe parts, is the want of inns on the road, which obliges travellers to carry proviſions along with them, and other neceſſaries they may ſtand in need of. But thoſe who travel ſingly, commonly go poſt, when they pay the whole expence of the journey at ſetting out, and have no more occaſion to put their hand in their pocket till they come to the end of it, which is very convenient. The poſt boy receives a written order, which he delivers to the next who ſucceeds him, and ſo on to the end. They go day and night, having freſh horſes every ten miles. They commonly travel an hundred and fifty miles in twenty-four hours, and ſometimes go three ſtages without waking.

In the ſummer they travel either by water, on the rivers, with which this country abounds, or by land, on horſeback, by coach, or ſleeping waggons; the roads in Ruſſia being very broad, beautiful, and eaſy for travelling. For paſſing the rivers they have a kind of floating bridges, made of large fir trees faſtened together, which can ſupport a great weight. But the violent heat of the ſummer, and the prodigious quanties of muſketos and flies, are very troubleſome, and greatly interrupt the pleaſure a ſtranger would otherwiſe have in paſſing through this country, from the beauty and variety of its foreſts, rivers, and lakes.

For ſome time paſt, inland navigation has been promoted in Ruſſia: Peter the Great well knew the uſe of it, and employed a prodigious number of men in works of that kind. The canal extending from Moſcow to Peterſburg, is one of the moſt ſtupendous works of that great prince. It begins at Nieva, and is continued from lake to lake, and from river to river, for near 100 leagues. What is properly conſidered as the artificial canal, begins at the city of Novogorod, and is carried on with incredible labour and expence through the territories of Bragnitz, Chriſtitz, Chilolova, Witſchora, Voloſcha, Torſchock, the province of Twere, and the diſtrict of Kiln. Another prodigious work of this kind is at the city of Veronis, in the province of Rezan, where the river of the ſame name is made navigable for ſhips of eighty guns, from that city to the Don. A navigable canal is alſo cut between the Wolga and the Don, in order to convey proviſions and materials to Azoph. The diſtance of this communication is about 140 Ruſſian miles, by way of two ſmall rivers, one called the Laffa, which falls into the Don; and the other the Camiſhinſka, which falls into the Wolga. Theſe two rivers are made navigable by means of locks and ſluices, and a canal of near four Ruſſian miles is cut through the neck of land between theſe two ſmall ſtreams. Peter employed two artiſts at different times to perform this work, who failed in the execution; but has been ſince completed.

The eſtabliſhed religion of Ruſſia is that of the Greek church, the tenets of which are by far too numerous and complicated to be diſcuſſed here; but the great article of faith by which that church has been ſo long ſeparated from the Latin or Catholic church, is the doctrine that the Holy Spirit does not proceed from the father and the ſon, but from the father only. They deny the pope's ſupremacy; and though they diſclaim image-worſhip, they retain many idolatrous and ſuperſtitious cuſtoms. Their churches are full of pictures of ſaints, whom they conſider as mediators. They obſerve a number of faſts and lents, ſo that they live half the year very abſtemiouſly: an inſtitution which is extremely convenient for the ſoil and climate. They have many peculiar notions with regard to the ſacraments. They oblige their biſhops, but not their prieſts, to celibacy. Peter the Great ſhowed his profound knowledge in government in nothing more than in the reformation of his church. He broke the dangerous powers of the patriarch and the great clergy. He declared himſelf the head of the church, and preſerved the ſubordinations of metropolitans, archbiſhops, and biſhops. Their prieſts have no fixed income, but depend, for ſubſiſtence, upon the benevolence of their flocks and hearers. Peter, after eſtabliſhing this great political reformation, left his clergy in full poſſeſſion of all their idle ceremonies; nor did he cut off their beards: that impolitic attempt was reſerved for the emperor Peter III. and greatly contributed to his fatal cataſtrophe. Before his time, and incredible number of both ſexes were ſhut up in convents: nor has it been found prudent entirely to aboliſh theſe ſocieties. The abuſes of them, however, are in a great meaſure removed; for no male can become a monk till he is turned of thirty; and no female a nun, till ſhe is fifty; and even then, not without permiſſion of their ſuperiors.

The conquered provinces, as already obſerved, retain the exerciſe of their own religion; but ſuch is the extent of the Ruſſian empire, that many of its ſubjects are Mahometans, and more of them no better than pagans, in Siberia and the uncultivated countries. Many ill-judged attempts have been made to convert them by force, which have only tended to confirm them in their infidelity. On the banks of the river Sarpa, is a flouriſhing colony of Moravian brethren, to which the founders have given the name of Sarepta; the beginning of the ſettlement was in 1765, with diſtinguiſhed privileges from the imperial court.

The common language of Ruſſia is a mixture of the Poliſh and Sclavonian; their prieſts, however, and the moſt learned clergy, make uſe of what is called modern Greek: and they who are acquainted with the ancient language in its purity, may eaſily acquire the knowledge of it in its corrupted ſtate. The Ruſſians have thirty-ſix letters, the forms of which have a ſtrong reſemblance to the old Greek alphabet.

The Ruſſians have hitherto made but an inconſiderable figure in the republic of letters; but the great encouragement lately given by their ſovereigns, in the inſtitution of academies and other literary boards, has produced ſufficient proofs that they are no way deficient in intellectual abilities. The papers exhibited by them at their academical meetings have been favourably received all over Europe; eſpecially thoſe that relate to aſtronomy, the mathematics, and natural philoſophy. The ſpeeches pronounced by the biſhop of Turer, the metropolitan of Novogorod, the vice-chancellor, and the marſhal, at the opening of the commiſſion for a new code of laws, are elegant and claſſical; and the progreſs which learning has made in that empire ſince the beginning of this century, with the ſpecimens of literature publiſhed both at Peterſburgh and Moſcow, is an evidence that the Ruſſians are not unqualified to ſhine in the arts and ſciences. The efforts to civilize them did not begin with Peter the Great, but were much older. A ſmall glimmering, like the firſt day-break, was ſeen under czar Iwan, in the middle of the 16th century. This became more conſpicuous under Alexius Michaelowitz; but under Peter it burſt forth with the ſplendor of a riſing ſun, and has

continued ever ſince to aſcend towards its meridian.

Three colleges were founded by Peter the Great at Moſcow; one for claſſical learning and philoſophy, the ſecond for mathematics, and the third for navigation and aſtronomy. To theſe he added a diſpenſary, which is a magnificent building, and under the care of ſome able German chemiſts and apothecaries, who furniſh medicines not only to the army but all over the kingdom. And within theſe few years, Mr. de Shorealow, high chamberlain to the empreſs Elizabeth, daughter to Peter the Great, has founded an univerſity in this city. The late empreſs Catharine II. alſo founded an univerſity at Peterſburgh, and invited ſome of the moſt learned foreigners in every faculty, who are provided with good ſalaries; and alſo a military academy, where the young nobility and officers' ſons are taught the art of war. It ought alſo to be mentioned, to the honour of the ſame royal benefactreſs, that ſhe founded a number of ſchools for the education of the lower claſſes of her ſubjects, throughout the beſt inhabited parts of the empire.

The government of Ruſſia is entirely deſpotic; and here, as in all other arbitrary monarchies, the laws, as well as the lives and properties of the ſubjects, depend wholly on the will of the ſovereign. Theſe, if males, were called czars; if females, czarinas; but at preſent the imperial title is aſſumed. The people are no leſs ſlaves than formerly, but much of the power of the nobility is ſwallowed up in the great importance and authority of the crown. The ſovereign appoints vaivods, or governors of provinces, and beſtows all offices of conſequence, whether eccleſiaſtical, civil, or military. The czar Peter introduced the titles of count and prince of the empire, and inſtituted an order of knighthood in honour of St. Andrew, the patron of Ruſſia, diſtinguiſhed by a blue ribbon and a ſtar.

Here ſtate priſoners are, in general, privately ſeized, partially adjudged, and ſecretly diſpatched, or ſent into baniſhment to Siberia, of which the following is a ſingular incident, as related by a character of eminence, who reſided many years in Ruſſia. "I was not long in Riga (ſays that perſon) when I received the following intelligence from good authority. One Dr. Fonderholſt, a German, was, a few years before my arrival, phyſician to the army. He was ſaid to be a man of learning, but of no great foreſight. Happening to receive an affront from one of the great men of the court, who was in favour with the empreſs, the doctor retorted ſeverely, and rendered him very ridiculous. The courtier had the addreſs to get the doctor ſent to Siberia in the following manner: One day, as the doctor was attending the field-marſhal, who was ſick, a captain of the guards arrived with expreſſes from St. Peterſburg, and demanded immediate audience. He was introduced, and whiſpered ſomething in the field-marſhal's ear, who deſired the doctor to amuſe himſelf in the great hall till he had finiſhed ſome buſineſs with the officer. When that was done, the doctor was again called upon; and when he had given the field-marſhal his advice about ſome diſorder which he at that time laboured under, and was going to retire, the count deſired him to come to dinner, as he might need his further aſſiſtance; and, at the ſame time, adviſed the captain of the guards to dine, telling him he was not able to ſit at the table himſelf, but the vice-governor, prince Dolgoruki, who was preſent, would bear him company. This was agreed to. At dinner the captain told the vice-governor, that a relation of his, in his way to the army, was ſuddenly taken ill, and obliged to remain in a houſe diſtant three or four verſts from the city; and that therefore he deſired him to appoint an able phyſician to attend him, for which he would be amply rewarded. The deputy-governor pointed to Dr. Fonderholſt, as phyſician to the army, and one of the ableſt profeſſors in Riga; and, at the ſame time, politely deſired him to viſit the officer. The doctor agreed, and was giving directions to his ſervants to get his coach ready, when the prince told him that was needleſs, as his coach was large enough to carry them all to ſuch an inconſiderable diſtance. After dinner, when they had arrived at the houſe where they pretended the patient was, and had taken a few glaſſes of wine, the doctor deſired to ſee him, but was anſwered, that he was a ſtate priſoner by order of the cabinet; and therefore they adviſed him to make no reſiſtance, but get into a travelling waggon ready at the door; telling him, at the ſame time, that if he offered the leaſt reſiſtance, he would be bound faſt with ropes, and might be very cruelly treated, on the way, by the ſoldiers who were appointed to convey him to his place of deſtination. Thus this man was conveyed to Siberia, and there long immured, or kept in a hole in the wall, with only a ſmall ſlit through which he received his proviſions. It ſeems he had ſome money about him when he was arreſted; but the captain took nothing from him except his ſword. The ſoldiers, on the way, robbed him of his watch; but he concealed from them what little money he had. Foreſeeing that his money could not maintain him long, and perſuaded that he could not long ſubſiſt upon the poor proviſions allowed to ſuch priſoners, he affected to be a fortune-teller; and appriſed the ſoldiers, who kept guard upon him, of his deſign, offering them the half of what he got by his art. The ſoldiers, being acquainted with many of the ſuperſtitious inhabitants, told the doctor every thing concerning them before they came to him, which he repeated to them, whereby his fame, as a wiſe man, ſpread far, and he acquired the means of ſupport. Having neither books or company to amuſe him in this miſerable ſituation, he got a few hens, and diverted himſelf with feeding them. He gave their eggs a black colour; and wrote upon them with a pin, *Den ungelucklick Doctor Fonderholſt*.. Ungelucklick ſignifies *unfortunate*. Theſe eggs he ſold to the inhabitants as charms. They knew not the meaning of the writing, but thought it rendered the eggs more valuable. After he had been many months thus confined, it happened that the governor's lady put up in this village, in her way from Ruſſia to Siberia, and wanted eggs, among other things, for dinner. The hoſteſs told her that there was, in the place, a priſoner, a very wiſe man, who ſold extraordinary eggs. She deſired to ſee them; and, as ſhe underſtood the German language, was ſurpriſed to ſee written upon them the name of the very phyſician who, a few years before, had recovered her from a very dangerous fever. She went to the hole, ſpoke to the doctor; then applied to her huſband, and cauſed his ſituation to be made much eaſier; and, as ſhe was a great favourite with the empreſs, wrote to her majeſty, and repreſented his undeſerved misfortune ſo pathetically, that the governor received orders to liberate him, and ſend him, at her expence, to Moſcow."

A gentleman who travelled over the greateſt part of this empire, has given us the following new and conciſe deſcription of the Ruſſians, and the arbitrary government under which they live:

"In Ruſſia the ſovereign is ſuppoſed to have no relations. No perſon is allowed to keep any coin ſtamped with the image of a depoſed prince; nor muſt any one paſs the palace without pulling off his hat, or letting down the glaſſes, if he is in a carriage. If you write the ſovereign's name in ſmall characters in a letter, you are liable to ſevere puniſhment.

niſhment. In a room upwards of thirty feet ſquare, in which there were but three Frenchmen, one of them aſked whether the prince Iwan was, or was not, ſtill alive. The anſwer was, that in Ruſſia nobody talked of that prince. When the empreſs Elizabeth was at the eve of death, none durſt make the leaſt inquiry concerning her health: and, when her death was univerſally known, all thought it dangerous to make it the ſubject of converſation. Every Ruſſian has a right to cry in public *ſlow drelow*, or, I declare you are guilty of treaſon in words and actions; and then every by-ſtander is obliged to aſſiſt in apprehending the accuſed.

"The father arreſts the ſon, and the ſon the father, and nature ſuffers in ſilence. Both parties are firſt conveyed to priſon, and then to Peterſburg, where they are tried by the court of Chancery, and if the accuſer ſubmits to the puniſhment of the knout without flinching, the culprit is condemned, though no proof of guilt can be produced. This juriſdiction is allowed to ſubſiſt for the ſake of cutting off with the greater eaſe any perſon that happens to be the object of court jealouſy. For this purpoſe the falſe accuſer is never puniſhed with death, and the knout is ſeldom exerciſed upon him with ſeverity. The nobility, having bowed to this dreadful ſlavery, do not fail to retaliate upon the people, who are abſolute ſlaves to them, to the ſovereign, and to the governors of the provinces. The ſlaves of the ſovereign pay tribute only to the crown; the ſlaves of the nobles pay tribute to the crown and their lords. They are not, indeed, allowed the power of life and death; but as they may puniſh them with the battogen, the difference is not conſiderable.

The Ruſſians are bigotted even to fanaticiſm in favour of the Greek faith, they make religion conſiſt in ceremony, and are, in fact, leſs moral than the Pagans. Except at Peterſburg and Moſcow, married women are ſeldom to be ſeen; and jealouſy is prevalent among them. A magician, and three or four ancient matrons, wait at every wedding, in order to determine, after conſummation, whether the bride has the true ſigns of virginity. When they are ſatisfied, the men ſit down, get drunk, and throughout the whole entertainment occaſion much embarraſſment and confuſion.

The Ruſſians, being ſlaves, are far from being naturally warlike and courageous; but, as they are ſtrong, hardy, and inured to very indifferent food, they have, according to the conſtitution of modern armies, all the ſtamina of ſoldiers. The recruiting parties have a right to pitch upon whom they pleaſe; ſo that the Ruſſian forces may with propriety be, after the example of the Romans, called legions.

The executive part of the government of Ruſſia is veſted in the ſovereign council of chancery, which is chiefly compoſed of the third claſs of the nobility, and divided into ſix departments, in which are ſeparately conſidered, foreign affairs, war, finances, public accounts, civil proceſſes brought by appeal, and criminal cauſes brought by appeal.

The determination of the two laſt mentioned, formerly depended upon the equity of the judge. In 1647 a code, or body of laws, was ordered to be compiled by the wiſeſt men in the empire, which was accordingly done, entitled, Sabrona Uloſienia, or Univerſal and General Right; and by this the judges were to regulate their ſentences. There is this great and ſingular advantage in the courts of judicature of this country, that they are neither expenſive or tedious; for a law-ſuit is begun and determined in the ſpace of ſix or ſeven weeks: nevertheleſs they are extremely venal.

The ſyſtem of civil laws eſtabliſhed in Ruſſia, is at preſent very imperfect, and, in many reſpects, barbarous; being an aſſemblage of laws and regulations drawn from thoſe of moſt ſtates in Europe, ill-digeſted, and, in many inſtances, not adapted to the genius of the Ruſſian nation. But the late empreſs indeed, made a very noble attempt to give her ſubjects a new code of laws. In order to this, ſhe aſſembled the ſtates of the kingdom in the year 1768, and preſented them with inſtructions for their proceedings. The code has ſince been drawn up, but was not then publiſhed. Very pleaſing ideas, have, however, been formed with regard to the rectitude of its precepts; and it has accordingly been for ſome time expected with impatience.

The conſtitution of Ruſſia differs little from that of other arbitrary empires. There is, indeed, a ſenate, compoſed of the moſt reſpectable perſons in the kingdom; and the czar treats the inſtitution with the higheſt regard and deference, ſubmits the greateſt concerns of his empire to their deliberations, but at the ſame time this parliament can be conſidered in no other light than the privy-council. They never preſume to canvaſs any of the meaſures of government, or even to give their ſovereign advice.

In Ruſſia, the ancient nobility conſiſted of three degrees, knezes, boyars, and vaivods. The knezes were ſovereigns in their own eſtates, till their exorbitant power was reduced by the czars. The boyars were the ſecond degree of nobility; and the vaivods were the governors of provinces. Peter the Great ſuffered theſe diſtinctions to continue; but the late empreſſes, perceiving that theſe titles too often revived the ideas of their ancient and deſtructive power, thought it prudent to introduce the titles of counts and princes, in conformity to the cuſtom of other European nations.

The Ruſſian coin at preſent conſiſts of gold ducats, rubles, half rubles, quarter rubles, griveners or 10 copecks, copecks of ſilver, five copecks, two copecks, half and a quarter ditto. The ducat is worth two rubles; and the ruble is, in value, about 4s. 6d. ſterling. The half and quarter rubles are expreſſive of their own value. A grivener is the tenth part of a ruble, and a copeck is an hundredth part of the ſame.

The pound weight in Ruſſia is exactly the ſame as our pound apothecaries weight: 40 pounds make a pood; 40 poods a berkwitz; 63 poods a tort.

The liquid meaſures are as follow: 8 cruſkas make 1 vedro, 1 half vedro 1 ſtackan; 2 ſtackans 1 anchor; 6 anchors 1 hog, which is exactly the ſame as an Engliſh hogſhead.

The principal meaſure of extenſion is the verſt, which is 3500 feet, and 104 verſts make a degree; and the Ruſſians reckon diſtances by verſts, as the Engliſh do by miles.

Nothing certain can be ſaid concerning the revenues of this mighty empire; but they are, undoubtedly, at preſent, far ſuperior to what they were in former times, even under Peter the Great. The vaſt exertions for promoting induſtry, made by his ſucceſſors, eſpecially her late imperial majeſty, muſt have greatly added to their income, which is little leſs than 30,000,000 of rubles, or nearly ſix millions ſterling annually; thus coputed:

	Rubles.
Capitation tax	8,500,000
Other taxes and duties	7,000,000
Her own eſtates, and other domains taken from the clergy	6,000,000
Produce of the mines	1,500,000
Monopoly of diſtilled liquors	4,000,000
Monopoly of ſalt	1,800,000
	28,800,000

According

According to Mr. Pleſcheef's computation, publiſhed in Engliſh by the reverend Mr. Smirnove, the revenues of Ruſſia exceed 40,000,000 of rubles; and the expenſes, even in time of war, are ſaid not to amount to 30,000,000.

When this ſum is conſidered relatively, that is, according to the high value of money in that empire, compared to its low value in Great-Britain, it will be found a very conſiderable revenue. That it is ſo, appears from the vaſt armies maintained and paid by the two late empreſſes, in Germany, Poland, and elſewhere, when no part of the money returned to Ruſſia; nor do we find that they received any conſiderable ſubſidy from the houſes of Bourbon and Auſtria, who, indeed, were in no condition to grant them any. In 1733, reckoning the tribute paid by the Tartars, with all taxes and duties in money, the ſum total is ſaid to have amounted only to thirteen millions of rubles (each ruble amounting to 4s. 6d. ſterling.) This income was at that time ſufficient to maintain 339,500 men, employed in the land and ſea ſervice. The other expenſes, beſide the payment of the army and navy of the late empreſs, the number and diſcipline of which were at leaſt equal to thoſe of her greateſt predeceſſors, were very conſiderable. Her court was elegant and magnificent; her guards and attendants ſplendid; and the encouragement ſhe gave to learning, the improvement of the arts, and uſeful diſcoveries, coſt her vaſt ſums, excluſive of her ordinary expenſes of ſtate.

Some of the Ruſſian revenues ariſe from monopolies, which are often neceſſary in the infancy of commerce. The moſt hazardous enterpriſe undertaken by Peter the Great, was his imitating the conduct of Henry VIII. of England, in ſeizing the revenues of the church. He found, perhaps, that policy and neceſſity required that the greateſt part of them ſhould be reſtored, which was accordingly done; his great aim being to deprive the patriarch of his exceſſive power. The clergy are taxed in Ruſſia; but the pecuniary revenues of the crown ariſe from taxes upon eſtates, bagnios, bees, mills, fiſheries, and other particulars.

The Ruſſian armies are raiſed at little or no expenſe, and, while in their own country, ſubſiſt chiefly on proviſions furniſhed them by the country people according to their internal valuation. The pay of a ſoldier ſcarcely amounts to thirty ſhillings yearly; in garriſon he receives only five rubles yearly. The pay of a ſailor and a gunner is a ruble a month, and they are found with proviſions when on ſhore.

The chief cities and towns in Ruſſia are the following:

The czar, Peter the Great, being deſirous of opening a communication between Archangel and the Baltic, by means of the gulf of Finland, in order to improve the commerce of his dominions, determined to make himſelf maſter of Ingria, which he accordingly did in the beginning of this century. To render it an European maritime power, he determined on one of the moſt ſtupendous undertakings that ever was entered upon by human reſolution, the building the city of PETERSBURG, which he deſigned to make not only the capital of Ingria, but of the whole Ruſſian empire, the centre of trade, and the principal ſeat of the imperial reſidence. It is ſituated between Ingria and Finland, in a fenny iſland, ſurrounded by the river Nieva, in 60 deg. north lat. and 31 deg. 34 min. eaſt long.

A late traveller, who calls this city a creation of the preſent century, ſays further of it, "I am ſtruck with a pleaſing aſtoniſhment while I wander among havens, ſtreets, and public buildings, which have riſen, as by enchantment, within the memory of men ſtill alive; and have converted the marſhy iſlands of the Nieva into one of the moſt magnificent cities on the earth. The imagination, aided by ſo many viſible objects, riſes to the wondrous founder, and beholds, in idea, the titulary genius of Peter yet hovering over the child of his own production, and viewing, with a parent's fondneſs, its riſing palaces and temples. The names on which ancient ſtory dwells with ſo much fondneſs, ſink on a compariſon with this immortal man; and the fabulous legiſlators of Greece and Egypt never preſumed to attempt the mighty transformation which the czar completed. The followers of Cadmus, of Theſeus, and of Romulus, were animated with the ſame ardor as their leader; but the Muſcovites (Ruſſians) wrapt in the moſt profound barbariſm, ſecluded by their illiberal prejudices from an intercourſe with European nations, and equally the ſlaves of ſuperſtition and long preſcription, were forcibly torn from this night of ignorance, and compelled to accept of refinement and civilization.

The iſland on which this fine city has been ſo wonderfully raiſed, was nothing but a heap of mud in the ſhort ſummer of theſe climates, and a frozen pool in winter, not to be approached by land but by paſſing over wild foreſts and deep moraſſes, and had been till then the habitation of bears and wolves, when it was, in 1703, inhabited by above 300,000 Ruſſian, Tartar, Coſſack, &c. peaſants, whom the czar called together from all corners of his vaſt empire, ſome near 1200 miles; and theſe made a beginning of this work. He was obliged to break through foreſts, open ways, dry up moors, and raiſe banks, before he could lay the foundation. The whole was a force upon nature. At firſt the workmen had neither ſufficient proviſions, or even pick-axes, ſpades, wheel-barrows, planks, or huts to ſhelter in; yet the work went on ſo expeditiouſly, that, in five months, the fortreſs was raiſed; though earth thereabouts was ſo ſcarce, that the greateſt part of the labourers carried it in the ſkirts of their clothes, or in bags made of old rags and mats, barrows being then unknown to them. It is computed full 100,000 periſhed at the place; for the country had been deſolated by war, and ſupplies by Ladoga lake were often retarded by contrary winds. The czar himſelf drew the main plan. While the fortreſs was going on, the city began gradually to be built. He obliged many of the nobility, merchants, and tradeſmen, to go and live there, and trade in ſuch commodities as they were ordered. Proviſions being ſcarce, and conveniences wanting, the place, at firſt, was not at all agreeable to perſons of diſtinction, who had in Moſcow large buildings, and ſeats in the country, with fiſh-ponds, gardens, and other rural elegancies: however, he little regarded the complaints of thoſe who only conſidered their own eaſe. The boyars (nobility) brought great retinues with them; and merchants and ſhopkeepers ſoon found their account in ſettling here. Many Swedes, Finlanders, and Livonians, from towns nearly depopulated by the wars, continued here. Artificers, mechanics, and ſeamen, were invited hither, to encourage ſhipping; who, having worked out the time agreed on for the czar, were hired by the boyars; and alſo built for themſelves, and ſettled; each man being allowed to pitch on the ſpot he liked. In one year 30,000 houſes were erected, and, in two or three more, double the number, which doubtleſs are very much increaſed ſince. Some, indeed, but chiefly in the ſlabodas, or ſuburbs, are mean, and may be taken to pieces in two or three hours, and ſet up elſewhere. To build this town, that of Nienſchans (a ſtrong fort on the Nieva, not far from Noteburg) was demoliſhed for the materials, and the inhabitants removed hither. As he intended to remove

the

the trade of Archangel to Peterſburg, in 1713 he made 1000 families come from Moſcow, and offered great advantages to all foreigners that ſhould ſettle there; and ordered that all goods uſually ſent to Archangel, to be ſold, &c. to ſtrangers, ſhould be ſent hither, and the duties to be in every reſpect the ſame. But the commerce, &c. were not entirely removed till ſome years after. In 1714 it was ordered that all houſes ſhould be built of brick, and tiled.

The citadel is a long and irregular hexagon, with ſix baſtions parallel to each other, except the two middlemoſt, one of which, oppoſite to Carelia, has two orillons or blinds; that over-againſt the river none; each of the four others one. They were all, at firſt, but earth and turf; but, in 1710, the czar reſolved to have them all lined with ſtrong walls. Thoſe on Carelia ſide were finiſhed in his life-time; and the work has been carried on and completed by his ſucceſſors. The wall is thirty feet high to the parapet, and the faces are all lined with large iron and braſs guns. On the flanks, which are pretty ſhort, are two rows of cazemattes, one above the other, arched over, and covered with beams and turf, bomb-proof. The curtain on the right of this citadel's gates has one of the fineſt royal diſpenſaries in Europe, both for the great quantity of drugs and medicines, and the large number of beautiful porcelane veſſels from China and Japan, which it contains. This citadel has two gates; one adorned with ſtatues, particularly St. Peter with his two emblematic keys, and on its inſide the black eagle of Ruſſia, with the globe and the ſceptre in its two talons; and below is the figure of the Ruſſian Saint Nicholas. Before that gate is a ravelin, from whence is a bridge, with two draw-bridges over an arm of the river. In this place gallies and ſmall veſſels are ſheltered from bad weather.

The academy eſtabliſhed by Peter the Great has a multiplicity of profeſſors in moſt ſciences, and the belles lettres, who have liberal ſalaries. The building is a ſuperb pile, containing two ſtories, with a beautiful cupola in the middle, and an obſervatory. Here is a good library, and all manner of natural and artificial curioſities. "In one of the galleries (ſays a curious obſerver) in a caſe, is the ſkin of a Frenchman tanned and ſtuffed. This has been the talleſt man I ever ſaw. In another caſe is his ſkeleton, and a pair of breeches made of his wife's ſkin, alſo dreſſed. The leather was like buff. On the bottom, or pavement, ſtands the ſkin of an Engliſh chefnut horſe, ſtuffed, ſaddled, and bridled, and beſide it the ſkeleton: Peter the Great uſed to ride this horſe. Here I ſaw the head of the unfortunate Miſs Hamilton, a Swediſh lady, who loſt it for having murdered her child unlawfully begotten; and this is the only murder of that kind I ever heard of in Ruſſia. This lady was maid of honour to the empreſs Catharine. It is ſaid Peter went and ſaw her executed. He wept much, but could not prevail upon himſelf to pardon her. He cauſed her head to be capped and injected. The forehead is almoſt complete. The face is the beautifulleſt my eyes ever beheld. The *dura mater*, and brain, are all preſerved in their natural ſituation. This is kept in ſpirits in a large cryſtal veſſel."

Beſides the above here are depoſited great quantities of earths, foſſils, ſtones, ores, natural metals, minerals, ſhells, moſſes, corals, &c. In one room is a figure of Peter the Great in wax-work, as large as life. He ſits in an elbow chair croſs-legged, dreſſed in a blue ſuit of clothes, white ſtockings, and has a hanger by his ſide. He has ſhort black hair, his head covered; and the figure is ſurrounded by mathematical, philoſophical, and mechanical inſtruments.

†

Peter the Great alſo formed regulations for the management of this ſeminary. Theſe referred to the profeſſors, the ſtudents, the reſpective ſciences, the ſucceſſion to offices, and other particulars conducive to the intereſt of the inſtitution in general.

Peterſburg is amazingly increaſed in ſize within theſe ſixty years. At the death of Peter the Great, it did not contain 80,000 inhabitants; and now the Ruſſians aſſert that there are 500,000; but this is deemed an exaggeration. It covers a very great extent of land and water. The ſtreets are ſome of them very broad, long, and with canals in the middle of them; and others are planted in the Dutch faſhion. The houſes are immenſely large. The palaces of the nobility exceed in ſize thoſe of moſt cities. That of the emperor is an amazing ſtructure. But theſe are rather great than beautiful: the ſize is all that ſtrikes; and the buildings are ſtuck ſo thick with ornaments, that there is hardly any ſuch thing as judging of their proportions. The Italian architecture is mixed with the Dutch, and the whole forms very inelegant piles, in which true taſte is totally ſacrificed to a profuſion of ornament. But if the eye does not ſcrutinize into the ſeparate parts of the buildings, but takes only the ſtreets at large, the city may be fairly pronounced a very fine one.

Among the public buildings there are many extremely worthy the attention of a traveller, particularly the dock-yards, the naval magazines, the arſenal, foundery, admiralty, &c. without inſiſting on the imperial palace, the cathedral, or many churches. In the docks they continually employ a great number of carpenters. They build here all ſorts of veſſels, from ſhips of 120 guns down to boats; and the number on the ſtocks at a time is conſiderable. After the death of Peter the Great the marine was neglected, inſomuch that the empreſs's naval ſtrength was not computed to be a fifth part of what that great monarch poſſeſſed; and this was owing to a want of trade, which can alone make ſeamen; unleſs when in the hands of ſuch a man as Peter, who created every thing. But the late empreſs, who has thrown the ſpirit of that great monarch into all the departments of the ſtate, has revived it wonderfully; ſo that, at preſent, the Ruſſians have a formidable navy.

There is ſcarcely any thing at Peterſburg more deſerving notice than the foundery. The iron is brought from Kexholm by water; and the number of cannon and mortars that are caſt here is very great; alſo cannon balls, and all ſorts of military implements in which iron is uſed; which are made here at as ſmall an expence as in Sweden, or any other part of the world. The arſenal is always well ſtored with them; and there are vaſt quantities made on a private account for exportation, forming a very conſiderable branch of commerce.

The grand market-place is on the ſouthernmoſt part of the city, with many warehouſes, to depoſit all kinds of commodities and merchandize, both domeſtic and foreign, for ſale. It is a large ſquare, with four entries, and a range of ſhops on each ſide, both within and without, with covered galleries, to ſecure thoſe who frequent it from the rain.

Woollen and linen manufactories were ſet up here, of which the latter is brought to great perfection, as we may obſerve by the linen of late imported from thence. Here is particularly a workhouſe, where an old Dutch woman has eighty young nymphs under her care, who are taught, with a whip, how to handle the ſpinning-wheel; and ſeveral regulations are made for improving the plantations of hemp and flax. Paper-mills and powder-mills have alſo been erected, with laboratories for gunneries and fire-works; and other places for preparing ſalt-petre and brimſtone. Rope-yards,

like

like thoſe in England and Holland, for making of cables and tackling for the navy, are alſo ſet up here. A printing-houſe is eſtabliſhed, and newspapers are now as regularly printed as in other countries of Europe. Several uſeful books have been tranſlated out of the High Dutch, and printed; the government encouraging their ſubjects to enquire into the ſtate of the world abroad, inſtead of keeping them in ignorance, according to their ancient maxims. As to their ſilk and woollen manufactures, they have not been able hitherto to bring them to any degree of perfection.

At a little diſtance from Peterſburg is a noble ſeminary for educating females only, founded by the late empreſs Elizabeth. The building is capacious and grand. Children of diſtinction are kept ſeparate from thoſe of an inferior rank; and the whole contains between 700 and 800 females.

Near the Nieva is a ſmall palace, built by the late empreſs, and called *The Hermitage*. When her majeſty reſided in this building, ſhe was in retreat, and there was no drawing room or court. Theſe apartments are very elegant, and furniſhed with great taſte. There are two galleries or paintings, which have been lately purchaſed, at an immenſe expence, in Italy. The crown, in the palace itſelf, is perhaps the richeſt in Europe. It is ſhaped like a bonnet, and totally covered with diamonds. In the ſceptre is the celebrated one purchaſed by prince Orloff for 500,000 rubles, (112,500l.) and preſented by him to his ſovereign miſtreſs. It far exceeds Pitt's diamond in ſize, and is not inferior in water. Lapidaries declare it the moſt beautiful and rare ever brought from Golconda. One of the nobleſt monuments of the gratitude and veneration univerſally paid to Peter I. is that which the empreſs Catherine II. had ordered to be erected: it is an equeſtrian ſtatue; in which production the artiſt has united the greateſt ſimplicity with trueſt ſublimity of conception. No other ſtatuary, whether ancient or modern, gave him the deſign, which is ſingular in its kind, and admirably adapted to expreſs the character of the man, and of the people over whom he reigned. Inſtead of a pedeſtal adorned with inſcriptions, or ſurrounded by ſlaves, he appears mounted on a rock, or ſtone of a prodigious ſize, upon the aſcent of which the horſe labours, and appears to have nearly reached its ſummit. This attitude has given him room to exert great anatomical beauty and ſkill in the muſcles of the horſe's hind parts and hams, on which the whole of his body is neceſſarily ſuſtained. The czar's figure is full of fire and ſpirit. He ſits on a bear-ſkin, and is clad in a ſimple habit, not characteriſtic of any particular country, but ſuch as may be worn without violation of propriety by an inhabitant of any country.

About twenty miles weſt from Peterſburg is the beautiful palace of Peterſhoff, ſituated on an eminence, in a large garden, commanding a fine view, and ſurrounded by many out-houſes, offices, &c. for ſervants and attendants. It faces the ſouth; and, in the front, there is a beautiful canal of clear tranſparent water, from which three *jets d'eau* are ſupplied, and conſtantly play. When the emperor is here, the guards are encamped in a part of the garden, where their tents make a very agreeable appearance. In ſpeaking of one of theſe *jets d'eau*, a curious traveller ſays, "Out of the water, much to my agreeable ſurprize, aroſe a dog and three ducks, made of copper, or iron, and, in appearance, all alive. The ducks flutter through the water quacking, the dog follows after them barking. There is, in a ſubterraneous place, a charming chime of cryſtal bells, which play by water. The grotto, which is covered before by a caſcade, has two entries, one on each ſide. The entries are guarded by ſtatues, which, when you are in, prevent any one from getting out, till the keeper, by turning a handle, puts a ſtop to them. Theſe ſtatues evacuate ſo much water, by vomiting and ſhooting out of ſtone piſtols and guns, that the keeper ſaid it would overwhelm any man. Beſides the curioſities before mentioned, there is a beautiful gallery full of the fineſt china in the world; in one end of which is a ſmall but commodious room, with a bed in it, whither the late empreſs ſometimes retired to repoſe herſelf.

The apartments here are all ſplendid and nobly furniſhed; and among the paintings there are five matchleſs portraits of the ſovereigns of Ruſſia, viz. 1. Peter the Great. 2. The Livonian Villager, whoſe virtues raiſed her from a cottage to an imperial diadem, and to ſhare the bed of Peter the Great. 3. The empreſs Anne. 4. The empreſs Elizabeth. 5. The late empreſs Catherine II.

Such was the foundation, and ſuch is the preſent ſtate, of the city of Peterſburg, as appears from the moſt authentic and modern accounts we could poſſibly ſelect. The only material circumſtance relative to it, which remains to be mentioned, is the dreadful inundation and hurricane which happened in 1777, and were productive of the moſt fatal effects.

An account tranſmitted from Peterſburg to London, thus ſtates the particulars of this calamitous event:

"An inundation happened here, more extenſive and deſtructive than has ever been remembered in theſe parts. A violent hurricane of wind, at weſt-ſouth-weſt, which began about two o'clock in the morning, raiſed the waters, in the ſhort time of four hours, to the height of fourteen feet above the ordinary level of the Nieva, by which the whole town, and a great extent of the country in the neighbourhood, was rapidly overflowed. The water remained about half an hour at its extreme height; but the wind getting a little to the northward between ſix and ſeven o'clock, it returned, in a very ſhort time, to its uſual bounds. It is impoſſible to eſtimate, with any degree of exactneſs, the loſs which the ſtate and individuals ſuffered. The number of perſons drowned amounted to ſeveral hundreds. In the beſt parts of the town many houſes were unroofed; and the loſs of liquors, and other proviſions, in the cellars and lower apartments, was very great. In the ſhops (which are all in the ſame quarter of the town), goods were deſtroyed to a very conſiderable amount. In the gardens of the ſummer-palace, great numbers of the fineſt trees were broken or torn up by the roots. The lower ſkirts of the town, where the houſes are moſtly of wood, and inhabited by the poorer ſort of people, preſented a ſcene of deſolation which can be more eaſily imagined than deſcribed. Many perſons were drowned in their beds; and others, who ſought for ſafety from the waters on the roofs of their houſes, were carried from thence by the violence of the wind; and thoſe who eſcaped with life, were left deſtitute of habitations and effects. Great damage was done at the quay of the exchange, and the lower magazines and warehouſes. Numbers of barks, laden with iron, hemp, grain, wood, &c. to a very great amount, were ſtaved, ſunk, or driven in pieces in the ſtreets or fields. Several large veſſels, lying between this place and Cronſtadt, were driven aſhore into woods and gardens. Many of the country houſes in the neighbourhood were deſtroyed. The village of Catherinehoff, and ſome others on the ſame coaſt, were entirely ſwept away, with all the cattle, and many lives were loſt there, as well as on the ſide of the Galley Haven, where the ground is very low. The great bridge of boats over the Nieva was carried away; and moſt of the bridges in the town, except

thoſe on the new ſtone quay, (no part of which ſuffered any material damage) were torn up.

"According to accurate obſervations, it appeared that the waters roſe a foot and a half higher than in the great inundation which happened here in the year 1752. The plays of the court theatre were ſtopped for ſome time, on account of this public calamity. Arrangements were made to give all poſſible relief to the poor ſufferers.

"The empreſs, with a degree of humanity that will ever do honour to her character, ordered the royal coffers to be opened to thoſe who had ſuffered moſt materially by the tempeſt."

After Peter the Great had laid the foundation of his new city of Peterſburg, and made ſome progreſs in the buildings, he thought it neceſſary to have a convenient harbour in which the ſhipping might ride ſecure, and pitched upon the iſland of Retriſari, at the mouth of the gulph of Finland. There he built a new town called Cronſtadt, and ſecured it with a caſtle called Cronſlot, ſituated on a ſand bank near the ſide of Ingria; ſo that between the caſtle and the town, the ſhipping ride in a ſafe, deep, and commodious harbour. The caſtle is built in the form of a round tower, and three tier of galleries, well furniſhed with cannon, ſurround it. In caſes of emergency, the piers of the harbour may be mounted with a conſiderable train of artillery; and two ſmall batteries at preſent are ſituated on the oppoſite iſland.

Between Cronſtadt and Peterſburg are many elegant houſes; and on an iſland formed by the river Nieva, near the weſtern banks of the lake Ladoga, is the ſtrong fortreſs and ſeaport of Noteburg, or Oreſco. It was taken from the Swedes by Peter the Great in the year 1702. With reſpect to the other towns, Nieuſchan is demoliſhed. Iwanogorod is a ſtrong caſtle oppoſite to Narva; from which, at the diſtance of 45 miles, is the fortreſs of Caporia, ſituated on the banks of a ſmall river.—Fifteen miles to the north-eaſt of Iwanogorod is Jama, another fortreſs, built on the river of the ſame name.

The building of Peterſburg, and raiſing it on a ſudden from a few fiſhing huts to be a populous and rich city, is perhaps an enterprize hardly to be paralleled in antiquity. The ſame may be ſaid of the fortreſs of Cronſtadt, in the neighbourhood of Peterſburg, which is almoſt impregnable. This fortreſs and city employed for ſome years 300,000 men in laying its foundation, and driving piles night and day; a work which no monarch in Europe (Peter excepted) could have executed. The whole plan, with a very little aſſiſtance from ſome German engineers, was drawn by his own hand. Equally wonderful was the navy which he raiſed to his people, at the time when they could hardly be ſaid to have poſſeſſed a ſhip in any part of the globe. What is more wonderful than all, he often wrought in perſon in all thoſe amazing works, with the ſame aſſiduity as if he had been a common labourer.

The adjacent country is covered with country houſes and gardens; but the ſoil is ſo extremely barren, that the town is obliged to be ſupplied with proviſions from a great diſtance, and of conſequence they are very dear. There are great quantities of woods, conſiſting of pine, fir, alder, poplar, birch, and elm; but the oak and beech are generally brought from Caſan. The weather in winter is exceeding cold, and exceſſive hot in ſummer. In June the length of the night does not exceed three hours, during which the natives enjoy a continued twilight; but in December the ſun is not viſible more than three hours above the horizon.

Moſcow, the capital, once the metropolis of, and the greateſt city in, the whole Ruſſian empire, lies in lat. 55. 42. long. 38. 45. eaſt, and is ſeated in a fine ſpacious plain, on the river of its name, over which it hath a ſtately bridge of twelve arches, of a prodigious height and breadth, becauſe that river often overflows. It was built by prince Gaſiſchin, from the deſign of a Poliſh monk. The town ſtands in a gravelly ſoil, and wholeſome air, and almoſt in the centre of the beſt provinces of Muſcovy. The population of this city cannot be aſcertained. In 1662, when lord Carliſle was ambaſſador there from king Charles II. it was twelve miles in compaſs, full of houſes and inhabitants, inſomuch that the number of the former is, by the loweſt calculations, ſaid to have amounted to 40,000; and by the Ruſſians affirmed to have been above double that number. According to Voltaire, Moſcow, when he wrote, was twenty miles in circumference, and its inhabitants amounted to 500,000; but it is almoſt impoſſible to form a preciſe eſtimate of their preſent number. The houſes are, in general, miſerable timber booths, which always have ſubjected the city to dreadful conflagrations.

This great city is of a circular form, and conſiſts of four diſtinct parts, or quarters, all ſurrounded with a diſtinct wall, viz. Cataigorod, Czargorod, Skorodom, and Strelitze-Slaboda, ſo called becauſe it was formerly the quarter of the Strelitzes, or czar's guards.

The Cataigorod, or middle city, is ſurrounded with a brick wall; and on this ſtands the caſtle, which is two miles in circuit, and fortified with three ſtout walls, ſtately towers, and a foſſe. In the caſtle are two palaces of the czar, one of timber, the other of ſtone, built after the Italian manner; the patriarchal palace, a large ancient building; the exchequer, chancery, and other offices; the grand magazine; two handſome monaſteries; five large churches, among which is that noble one of St. Michael, in which are the tombs of the grand dukes, or czars. There are ſeveral other ſtately buildings in this great caſtle. At the gate ſtands that ſtately ancient fabric called the church of Jeruſalem.

Near the churches are hung ſeveral large bells, one of which is of a ſtupendous ſize. Concerning the celebrated great bell of Moſcow, a learned traveller ſays, "I went to ſee the great bell, which was then in a large pit. A fire had, about two months before this, burnt down about two thirds of this great city, and the belfry, being all of timber, ſhared the ſame fate. The bell fell into the bottom of the pit, and had a piece broken out of its edge, large enough to permit any man to go into it. Its weight is 443,772 pounds, and its height about twenty-one feet four inches and a half. I then went to the top of a very high tower, called Iwan Veliki, or the Great John. From this tower I had a complete view of the whole city, which, indeed, made a very grand appearance.—The weather being very cold, the Ruſſians heat their ſtoves before day-light, and make uſe of a fire at no time of the day except to get dinner ready; ſo that the view is never but at thoſe times obſtructed by the ſmoke. Upon the top of this tower there are three bells, I think the leaſt of which is larger than the largeſt in London. Under the tower is the ancient imperial palace, a large Gothic ſtone building. All theſe which I have mentioned, and all the imperial ancient archives, and different courts of juſtice, are in that part of the city called the Crimline, which is ſurrounded by a high brick wall, ſaid to be about 2090 paces in circumference."

This quarter is called Cataigorod from Catai, the ancient and Ruſſian name of China, becauſe the chief merchandizes ſold in it come from that country: ſo that the name implies the ſame as the Chineſe city.

The

The Czargorod, or ducal city, contains, among other buildings, the great arſenal, and is watered by the Negliga, which runs through it, and thence flows into the ditch that ſurrounds the middle city.

The quarter called Skorodom, or Scoradum, is chiefly inhabited by timber-mongers and carpenters, who ſell houſes ready made. Theſe houſes are moveable, ſold very cheap, and in great numbers: and, indeed, conſidering the frequent fires that happen in this city, owing either to drunkenneſs, a reigning vice here, or to the neglect of putting out the candles, which they light to ſome favourite ſaint, in their houſes and chambers, they have need of ſuch a large market to repair to on thoſe occaſions. It is called Scoradum, which, in the Ruſſian language, ſignifies done in haſte, alluding to the ſpeedy raiſing of the mud wall that ſurrounds it.

The Strelitze-Slaboda, formerly the quarter of the ſoldiers, or guards, ſtands on the eaſt and ſouth-eaſt ſide of the Cataigorod and the caſtle; and is itſelf ſurrounded and fortified with wooden ramparts, and divided from the reſt by the river Moſcow; for which reaſon it is ſtiled a ſlaboda, or ſuburb.

Though the houſes of the people in common are poor huts, thoſe of the nobility and opulent, are fine fabricks of brick and ſtone; moſt of them having, on the back part, large courts and gardens, which are ſpacious, in ample order, and ſurrounded with high and ſtrong walls. The ſtreets are not paved with ſtones, but boarded with thick fir planks.

Churches and chapels here, including thoſe that belong to monaſteries, are computed to amount to above 1500. Some of them are very large and ſtately; that, particularly, which is in the Crimline, or grand imperial palace, is a vaſt, ancient building: on the right ſide of the altar is the czar's throne, and on the left that of the patriarch; and in the body of the church hangs a chandelier of immenſe weight and value. The very jewels, and other coſtly ornaments, that enrich a picture of the Virgin Mary here, are valued at half a ton weight of gold; beſides a vaſt number of chalices, pixes, patins, ſtatues, and other church utenſils of gold and ſilver, finely wrought, and enriched with precious ſtones; a vaſt number of other prieſtly veſtments of great value, and an immenſe quantity of donations and preſents offered to the relics of three eminent Ruſſian ſaints, which are here interred. So that the treaſure of this church is deemed equal to that of any church in Europe.

The ſuperb church of Saboor is 90 feet in length, hath a ſtately dome, ſupported by four large pillars, and is, though in the ancient ſtile, magnificent within and without. That of St. Michael is the repoſitory of the dead czars, and of all the royal family of the male ſex. The bodies of the princeſſes of the blood are interred in the ſtately abbey of the nuns, called Tzudoff Monaſtir, in the ſame caſtle, and near the church above mentioned. The tombs of the princes who never reigned, are in a ſeparate chapel. The palls with which their coffins are covered are ſuperb. Thoſe of the czars, eſpecially, are of the fineſt velvet, and have either a maſſy or embroidered golden crucifix upon them, of curious workmanſhip, and enriched with vaſt variety of coſtly ornaments, eſpecially inſcriptions, which are moſtly done with pearls and other precious ſtones.

Monaſteries of men and women are here numerous; and, in general, next to the palaces and noblemen's houſes, ſome of the beſt edifices in the city; the founders of them having ſpared no coſt to adorn them with curious architecture, paintings, gardens, and every thing that is convenient and beautiful. There is one called Dewitze Monaſtir, about a mile out of the city, in which the ambitious princeſs Sophia, who had concerted ſo many plots againſt her brother the czar Peter I. was at length confined, and ended her days. It is ſituated on a ſpacious plain, and hath 300 nuns belonging to it, who lead a very regular life, and never ſtir out of their limits, as ſome others are permitted to do. Theſe are only allowed, on holidays, to walk on the terraces round their gardens, which are raiſed to a convenient height for them to enjoy the proſpect of the adjacent plain.

Of the monaſtery, church of Jeruſalem, &c. a late traveller gives the following account: "The church, biſhops, prieſts houſes, &c. are all encloſed with high brick walls; the wall, forming one ſide of the biſhop's palace, is built on a beautiful detached hill; having on the eaſt, north, and weſt, the fineſt lawns in the world, through which glides a noble river. In the plain, upon the banks of the river, ſtands the builder's romantic houſe, all built of ſtone. It is quite alone, three ſtories in height, in every one of which are four rooms, except the ground ſtory, where are his kitchen, ſtore-room, and a room for his attendants. The area of each of theſe rooms is but about eight, or at moſt but nine feet ſquare. In every one is a ſmall ſtove. His bedſtead is of ſtone, as are his bed and pillow; his chairs are of the ſame materials. Every ſtory of his houſe is vaulted; and it is flat on the roof, for the conveniency of taking a view of the country. It has but one entry, and every room receives light from one window of the leaſt ſize. The builder was a hermit, and a religious devotee. The hoſpital is not large, but well provided with every neceſſary, but medicine, prayers being (in their opinion) ſufficient to cure all diſeaſes which appear in this holy place. At the weſt end of the church is a moſt capacious cupola. The dome is very magnificent and high, with a gallery which ſurrounds it near the top. The windows are large, and it is well lighted. The walls are all hung round with various pictures of the ſaints, very richly adorned with ſilver, gold, pearls, and precious ſtones; and the altar is very grand, and adorned with various pieces of curious workmanſhip.

The late czar Peter I. founded here three colleges, which he took care to fill up with men well verſed in arts and ſciences, and all kinds of literature, for the poliſhing of the next generation. The firſt is for humanity, rhetoric, and philoſophy; the ſecond for mathematics; and the third for navigation, aſtronomy, and other ſciences ſubſervient to them. In all theſe, youth are kept under ſtrict diſcipline, and have, at the ſame time, all due encouragement to excel in their reſpective ſtudies. To theſe the ſame prince added a diſpenſary, which is not only one of the fineſt ſtructures in Moſcow, but one of the beſt furniſhed with all ſorts of medicines, drugs, &c. in Europe. It is put under the care of ſome Germans, who are allowed the beſt maſters in that art, though the moſt ſlovenly in their compoſitions, never ſtudying to pleaſe the eye or taſte in their preſcriptions, as we do in England, but nauſeate their patients by the inelegance of their drugs, which could not poſſibly be taken by the people of any other country. This diſpenſary hath a yearly revenue of 20,000 rubles, to renew their *materia medica*; and furniſhes not only all the army, but likewiſe all the principal cities in the empire with medicines.

We cannot omit to mention, in this place, the foundling hoſpital, founded by the empreſs Catherine II. ſupported by voluntary contributions, well endowed, and conducted by very judicious regulations. It is a grand pile of building, and contained 3000 foundlings ſome few years ago; but

but their number is, in all probability, now much increaſed. The children are taken great care of, and, at the age of fourteen, have the liberty of chooſing any particular branch of trade; and for that purpoſe there are different ſpecies of manufactures eſtabliſhed in the hoſpital. When they have gone through a certain apprenticeſhip, they are allowed the liberty of ſetting up for themſelves. A ſum of money is beſtowed upon each foundling; and they are permitted to carry on trade in any part of the Ruſſian empire. This is a great privilege in Ruſſia, where the peaſants are ſlaves, and cannot leave their villages without the permiſſion of their maſters.

The courts of judicature, cuſtom-houſe, and other offices, are generally large, and built of ſtone, and reſemble gaols, and, indeed, are ſuch in ſome ſenſe; having apartments for debtors, as well as criminals, who are kept there chained up. Juſtice is, in general, adminiſtered with ſome ſtrictneſs and ſeverity; but the people here being naturally lazy, and given to drinking, the whole city ſwarms with beggars and vagabonds, and moſtly of ſuch a ſturdy breed, that it is dangerous to deny them alms. This makes it very hazardous to walk in the ſtreets in the night; for they frequently lurk in corners, with a ſhort truncheon, or bludgeon, in their hands, which they throw at the heads of paſſengers with ſuch dexterity, that they ſeldom fail of knocking them down, after which they rob and murder them, and go off. Theſe diſaſters have happened more frequently on holidays, and eſpecially during the carnival. When a perſon was found murdered, they carried the body to a certain place, where it lay expoſed a day or two; and, if it was not owned, it was flung into a deep large pit, made to ſerve on all ſuch occaſions. On the Whitſuntide holidays ſome prieſts come thither to ſay maſs for their ſouls.

Murders were formerly ſo frequent in Moſcow, that few nights paſſed without ſome people being found dead in the ſtreets in the morning. The villains went in ſtrong parties, and ſlew before they robbed. This they did with ſo little fear, that they often performed it before the perſon's own door; and the terror of theſe ruffians was ſo great, that none of the neighbours dared to aſſiſt the unhappy victim, for fear of being butchered themſelves, or, at leaſt, having their houſes burnt. This obliged people, who had occaſion to be in the ſteets in the night, to go in companies together, or have a ſufficient guard of ſervants on horſeback to attend them. The weapon uſed by theſe ruffians was called a *dubien*, which was a long ſtick, with a round knob at one end, and made heavy with iron, with which they ſtruck a man dead at one ſtroke; and if any one of them happened to be taken, a good ſum of money, from the gang they belonged to, would generally get them off.

The highways were alſo much infeſted by theſe *raſbonies*, as they were called, which made it very dangerous travelling in any part of Ruſſia; for they had their ſpies in the towns, who informed them when any perſon was to ſet out on a journey, and how they were to be attended. According to this information they prepared themſelves for an attack, and way-laid them in ſome wood through which they were to paſs.

The writer of this account was informed by a gentleman of rank and veracity, that the czar himſelf had been attacked in his younger days, in the following manner. Going upon a viſit one evening, attended by two ſervants, the one riding before, and the other ſtanding behind the ſledge, up came a ſledge with eight raſbonies in it, and were juſt going to faſten his ſledge to theirs with a grappling iron, which they commonly uſed on theſe occaſions; but the czar being then young, ſtout, and vigorous, got up and ſeized one of the robbers by the hair of the head, pulled him out of their ſledge, and keeping his hold, drove out of their reach, dragging the fellow along with him till he reached the houſe of the nobleman he intended to viſit, which he entered all in a ſweat, ſtill holding the fellow by the hair.

When the ruffian underſtood it was the czar they had attacked, he ſhook and trembled, ſaying, if they had known who he was, they would not have meddled with him; and then begged he might be put to death without being put to the torture. To this his majeſty conſented, on condition that he diſcovered the reſt of his gang; but this he would not do, without a promiſe of his life, and a reward, which was alſo granted him; and he went with a detachment of ſoldiers to the rendezvous of his companions, and, coming to the houſe, he called to them to open the door. On hearing his voice they directly opened it; ſo that the ſoldiers ruſhed in, and ſeized not only his ſeven accomplices, but thirteen others of the ſame gang, who were ſoon after all executed, except the informer.

At another time the czar was attacked on his way from Moſcow to Novogorod, when he was attended by four ſervants only. Going from Tever he was ſtopped by a ſtrong party of raſbonies, on which he immediately jumped out of his ſledge with a ſword drawn in one hand, and a cocked piſtol in the other, and told them he was the czar, aſking them what they wanted? They replied they were poor fellows, reduced to great want; and as he was their lord and maſter, he was the propereſt perſon to relieve them. He told them he had no money about him; to which they anſwered, if he had, they would take none from him; but deſired that he would give them a written order to the governor Novogorod, for what ſum he pleaſed to beſtow upon them; begging that it might be ſuch as would relieve them from their ſtraits. The czar then aſked them if 1000 rubles would be ſufficient; and on their ſaying it would, he wrote an order for that ſum, payable at ſight; for which they diſpatched one of their number, who very ſoon returned with the money. They then obliged the czar to return to Tever, and to pledge his royal word not to proſecute, or even inquire after them; promiſing to amend their lives, and become good ſubjects for the future. Inſtead of proceeding to Novogorod, the czar returned back to Moſcow.

The city of Moſcow is much decayed from its ancient grandeur and opulence, ſince the building of that of Peterſburg. However, it is full of inhabitants; and all kinds of proviſions are brought to it in great plenty, and ſold very cheap; fiſh being the only dear food, which is occaſioned both by the number of inhabitants, the four lents, and other faſts, that are obſerved by the Ruſſians. This cheapneſs hath ſo far lowered the price of land all about the country, that the nobility and gentry are great ſufferers by it, their eſtates being reduced to little more than one-third of what they formerly brought in, when the city was in its flouriſhing ſtate. The canal, made by the order and direction of the late Peter the Great, to open a communication between this metropolis and his new-built and favourite city of Peterſburg, and, by that means, to the Baltic and German Ocean, is a great and noble work, which hath been ſome time finiſhed, at an immenſe charge and labour, running between two cities, which, in a direct line, ſtand near 90 leagues aſunder. It begins at Peterſburg, on the river Niewa, or Nieva, which empties itſelf into the gulf of Finland, and going up that river quite to the lake of Ladoga, croſſes it at the ſouth end, and enters into the Woltoff, another river, which flows thither from the province of Novogorod.

gorod. From the capital of that province begins what is properly called the artificial canal, which, paſſing through the territories of Brognitz, Chreſtitz, Chilolova, Witſchna-Voloſcha, Torſchock, the province of Twere, and the diſtrict of Kiln, reaches, at length, the city of Moſcow, and enriches it by the vaſt quantities of merchandize that are brought to and from that capital.

There is a very conſiderable manufacture at Moſcow of various hemp fabricks, particularly ſail-cloth and ſheeting, which employs ſome thouſands of looms, and many thouſands of people.—The hemp is moſt of it brought from the Ukraine. There are alſo great numbers of conſiderable merchants here, who carry on a very extenſive commerce with all parts of the empire; for there is water-carriage from hence to the Black and Caſpian Seas, and with but few interruptions to the Baltic alſo, which are circumſtances that make it the centre of a very great commerce.

This city is much better ſituated for the metropolis of the empire than Peterſburg. It is almoſt in the centre of the moſt cultivated parts of it; communicating, in the manner above mentioned, with the three inland ſeas, not at a great diſtance from the moſt important province of the empire, the Ukraine; open to the ſouthern territories on the Black Sea; and, by means of the rivers Wolga and Don, commanding an inland navigation of prodigious extent. Its vicinity alſo to the countries which muſt always be the ſeat of any wars with the Turks, the enemies moſt to be attended to of all thoſe with whom the Ruſſians wage war, upon the whole made it infinitely a better ſituation for the ſeat of government than that of Peterſburg, which is at the very extremity of the empire, and poſſeſſing few of theſe advantages. Founding that city, and making it the ſeat of foreign commerce and naval power, was an admirable exertion of genius; but the ſeat of government, in our opinion, ſhould always have been at Moſcow.

It is almoſt impoſſible to make an exact eſtimate of the preſent dimenſions and population of Moſcow. Voltaire ſays, when he wrote, that it was twenty miles in circumference, and the inhabitants amounted to 500,000.

Riga is the capital, not only of Letten, but of all Livonia. It is the moſt conſiderable place for trade, next to Peterſburg, in the Ruſſian dominions. It ſtands very advantageouſly for commerce, near the mouth of the river Dwina, which, with its branches, extending a great way into Poland and Ruſſia, bring immenſe quantities of commodities, which are exported from this city. Among theſe the principal are hemp, flax, timber for maſts and other purpoſes, pitch, tar, and pot aſhes. All theſe commodities are produced in the provinces, or near them, through which thoſe rivers run; and ſome of them, by means of ſhort land carriage, from one river to another, much further; even from the Ukraine and the Poliſh provinces that border upon Turkey. Charles IX. king of Sweden, beſieged Riga unſucceſsfully in 1605, and again in 1609; but his ſon and ſucceſſor, Guſtavus Adolphus, was more fortunate, and took it in 1620. Riga is well fortified; having ſtrong walls, bulwarks, a very large trench on the land ſide, and a ſtrong caſtle on the river, where the governor-general of Livonia reſides. There is alſo a fort oppoſite the town, on the other ſide of the river, which is called fort Kobber, or Kobrums. The harbour is ſecurely guarded by the Dunamond Fort, or, as it is called, the Dunamunder-Schans, ſeated about ſix miles below the city, near the mouth of the river Dwina, as its name declares, and is a fortreſs of great importance, commanding the paſſage of Riga; ſo that, without leave from the governor, no ſhip can ſail thither.

The inhabitants of Riga are a frank kind of people, and very polite to ſtrangers. They live by their trade; and have, by their policy, kept up hitherto a ſhare of liberty. Their city is governed by four magiſtrates; and they have alſo a great number of counſellors, and a ſyndic. Their magiſtrates have a ſalary annexed to their office; and they are not permitted to trade during their magiſtracy, which, though elective, may continue as long as they live, provided they pleaſe their council. They have great power in the city; but if any think they have not juſtice done them, the appeal to St. Peterſburgh, and frequently get the magiſtrates ſentence reverſed. The women are handſome, rather bulky, but of fine features. The unmarried women are kept in good order; but, it is ſaid, that, after marriage, they do not pay a great regard to chaſtity. The ladies of quality are very vain, but at the ſame time polite to thoſe who pay them reſpect. Merchants wives, and other idle women, are to be ſeen at the doors of their houſes almoſt through the whole day, for no other reaſon than to ſee the gentlemen paſs by, and receive their compliments. To ſuch a length is this abſurd cuſtom arrived, that the men ſcarcely can be covered one moment, and therefore walk with their hats under their arms.

The bridge over the Dwina is one of the moſt ſurprizing in Europe, being 900 paces in length. It conſiſts of tranſverſe beams of timber joined together, and riſes or falls with the tide. It is always taken to pieces before the froſt ſets in, which happens in November, and put up as ſoon as the ice is gone. The inhabitants of the city of Riga itſelf are about 8000 in number, and the ſuburbs contain about as many more.

WOLOGDA, ſituated on both ſides of a river of the ſame name, is a large and populous city, inhabited by a rich trading people. This is the paſs through which all commodities muſt be conveyed to and from Archangel; and here are a number of magazines and ſtores, kept by the merchants of England, Holland, and other nations. The city is ſurrounded with a ſubſtantial ſtone wall, and defended by a fortreſs ſo ſtrong, that in times of danger the czars ſend hither their moſt valuable effects for ſafety. Wologda ſtands about ſeventy-five leagues to the northward of Moſcow, and is one of the moſt ancient archiepiſcopal ſees in all Ruſſia. The ſtreets are open and regular, the houſes well built, and the markets plentifully furniſhed with all kinds of merchandize. They are divided into four quarters, in one is ſold the fleſh, in another the wood, in the third the furs, and in the fourth the cloths. The cathedral, called Saboor, is a very noble ſtructure; it has five cupolas covered with tin, and ſurmounted with croſſes finely gilt. There are twenty churches in this city, built of ſtone, and forty-three of timber; there are likewiſe three nunneries, in each of which is an elegant ſtone chapel. The river, which is broad and navigable, contributes greatly to the traffic of the city.

NOVOGOROD VELIKI, called by the Dutch Newgarten, is ſituated on the banks of the Wolohowa; it is a large, populous, and well fortified city; but the houſes are mean, and all built of timber, and the town-walls are compoſed of the ſame materials. It is very evident from the ruins of towers, ſteeples, and old walls, without the circuit of the preſent city, that it was once much more magnificent and extenſive. It ſuffered greatly from the arms of the Ruſſians, Poles, and other nations. In the year 1477, John Baſilius Grotſden made himſelf maſter of Novogorod; he afterwards went there in perſon, and pillaged the city, from whence he is ſaid to have carried to Moſcow many hundred waggons loaded with gold and ſilver, precious ſtones, rich

 ſtuffs,

ſtuffs, and other valuables: he likewiſe removed the principal inhabitants to Moſcow and peopled Novogorod with Ruſſians. Since it became ſubject to the czar of Muſcovy, its trade and ſplendour have been greatly diminiſhed. It is however ſtill the ſee of an archbiſhop, and carries on a conſiderable trade. The cathedral, dedicated to St. Sophia, is an elegant Gothic ſtructure. The caſtle is ſituated on the oppoſite ſide of the river, and near it is the archiepiſcopal palace, and a monaſtery dedicated to St. Anthony of Padua. Beſides theſe there are near an hundred churches, and ſeventy monaſteries in this city, which is about two leagues in circumference.

The Duchy of NISI-NOVOGOROD is watered by the Volga and Occa, and abounds with foreſts; but is, nevertheleſs, pleaſant, populous, and fertile.

The capital, Niſi-Novogorod, is ſituated on a rock, at the confluence of the Volga and Occa, ſurrounded by a ſtone wall, and defended by a ſtrong citadel. Near the river ſide, and before the ſtately gate of the city called Iwanoffki, there is a ſpacious market-place. A noble ſtreet, interſected by others, runs through the whole town. The cathedral, which is built after the model of Santa Sophia at Conſtantinople, is a ſtately edifice, has five cupolas beautifully varniſhed with green, and adorned at the top with elegant croſſes. The ſuperb archiepiſcopal palace is near the cathedral, but contains a church within its own walls. The governor's palace, and the chancery, are noble fabricks; and the houſes, in general, are well built of timber. The city itſelf is ſmall, but the ſuburbs are large, and the whole has a good trade, and is well furniſhed with proviſions. The luxuries, as well as the neceſſaries of life, are remarkably cheap; but the inhabitants, in general, women as well as men, are abominable drunkards.

ARCHANGEL, by the Ruſſians called Archania, is ſituated on the eaſt ſide of the Dwina, about ſix leagues above the place where that river falls into the White Sea. The city extends about two miles in length, is rich, populous, and built in the modern taſte. It is a metropolitan ſee, and ſtands between the ſixty-fourth and ſixty-fifth degrees of north latitude. Archangel is indebted to the Engliſh for its great wealth and importance, by whom it was diſcovered in 1553. Richard Chancellor, maſter of one of the ſhips fitted out under the command of Sir Hugh Willoughby, who had received a commiſſion to go in queſt of the north-eaſt paſſage to China, was ſeparated from the reſt of the fleet, and obliged by diſtreſs of weather to put into the bay of St. Nicholas, on the White Sea. The czar Iwan Baſilowitz, being informed of his arrival, invited him to his court, where he was hoſpitably entertained, and the czar indulged the Engliſh with a free trade in his dominions. The houſes of Archangel are moſtly of wood, but well contrived; the fineſt edifice is a large town-houſe, built of ſquare ſtones after the Italian manner: it is divided into three parts; one of theſe conſiſts of four large commodious apartments, for the accommodation of merchants, ſtrangers as well as natives; here they are permitted to reſide with their merchandize till the month of October, when all the foreign ſhips ſet ſail for their reſpective countries to which they belong. The ſtreets are paved ſo extremely bad with broken pieces of timber and rubbiſh, that it is dangerous to walk along them, except when they are rendered ſmooth and equal by the ſnow that falls, and freezes in the winter.

CAZAN or CAZANUM, the capital of a duchy of the ſame name, ſtands in the latitude of fifty-ſix degrees fifty-four minutes, on the river Caſanka, in the midſt of a ſpacious and fruitful plain. It is a large and populous city, the ſeat of a Ruſſian metropolitan, abounding with a great number of churches, monaſteries, and ſpires, which afford a magnificent proſpect both from the land, and from the veſſels that are continually ſailing up and down the Volga, into which the Caſanka falls about four miles below the city. The houſes in general, as well as the ramparts and towers, are built of wood. The caſtle, however, is fortified with ſtone walls, ſurrounded by the river, which forms a formidable foſſe, well ſtored with artillery and ammunition, ſecured by a ſtrong garriſon of Ruſſian ſoldiers, under the command of its own vaivod, independent of the governor of the city. At the confluence of the Caſanka and the Volga there is a large commodious dock for building ſhips and other veſſels of conſiderable burthen, to carry on the commerce of the Volga and the Caſpian ſea. Cazan is well ſupplied, both by land and water, with all kinds of proviſions. Wine and fruits are brought hither from Turkey; various commodities, beſides groceries, from Moſcow; teas from China; and iron and furs from Siberia and Tartary. The ſituation is admirable for commerce, which is carried on not only with the abovementioned places, but with Perſia, and other parts of the eaſt. Large quantities of Ruſſia leather, bark for tanning, timber for ſhip-building, &c. are annually ſent hence to Peterſburgh, and other parts of Ruſſia.

RUSSIAN LAPLAND.

We have already preſented our readers with a general deſcription of Lapland, as to the country, inhabitants, cuſtoms, manners, &c. and have obſerved, that it is divided into three diſtinct ſovereignties, namely, thoſe of Denmark, Sweden, and Ruſſia; it remains for us, under the laſt article, to give a particular account of that part which is diſtinguiſhed by the appellation of Ruſſian Lapland.

This country is bounded, on the north, by the Northern Ocean, on the eaſt and ſouth, by the White Sea; and on the weſt, by Daniſh Lapland. It is further divided into three parts, according to their ſituation. One is called Leporia Mouremanſkoi, or Maritime Leporia; Terrſkoi, or Inland Leporia; and Bellamoureſkoi Leporia.

The whole territory of Leporia Mouremanſkoi is barren, woody, and mountainous; the air is extremely cold; the inhabitants rude and ignorant; and, in general, the country is much like the Swediſh and Daniſh Lapland, formerly ſpoken of. Moſt of the iſlands, cities, and towns, ſtand on the ſea-coaſts. The only obſervation worthy of mentioning concerning any of them is, that there are, in ſome of them, ancient monaſteries; and that the rivers contiguous abound with fiſh, and particularly ſalmon.

Terrſkoi Leporia, or the inland part of Ruſſian Lapland, is almoſt ſurrounded with the ſea, and is the land that makes the gulf of the White Sea. It is no leſs woody and barren than the reſt; and the chief town in it is Warſiga, ſituated on the ſouth coaſt, over-againſt Archangel.

Bellamoureſkoi Leporia lies at the bottom of the above-mentioned gulf, called the White Sea, and, like the reſt, is cold, barren, and thinly inhabited. The chief town is Soma, ſituated at the very entrance into the Ruſſian Lapland, on the White Sea.

The natives of Ruſſian Lapland are of a middling ſtature; they have generally a flattiſh face, fallen cheeks, dark grey eyes, thin beard, brown hair, are well built, ſtraight, and of a yellowiſh complexion, occaſioned by the weather, the ſmoke of their habitations, and their habitual filthineſs.

Their

Their manner of life renders them hardy, agile, and ſupple; but at the ſame time, they are much inclined to lazineſs. They have plain common ſenſe, are peaceable, obedient to their ſuperiors, not given to theft, not fickle, and cheerful in company; but miſtruſtful, cheats in commerce, proud of their country and conſtitution, and have ſo high a notion of it and themſelves, that, when removed from the place of their nativity, they ſometimes die with longing to return. Their women are ſhort, complaiſant, chaſte, oftent well made, and extremly nervous; which is alſo obſervable among the men, though not ſo frequently. It often happens, that a Lapland woman will faint away, or even fall into a fit of frenzy, on a ſpark of fire flying towards her, an unexpected noiſe, or the ſudden ſight of an uncommon object, though in its own nature not in the leaſt alarming. During theſe paroxyſms of terror, they deal about blows with the firſt thing that preſents itſelf; but, on coming to themſelves, are utterly ignorant of all that has paſſed. This probably ariſes from their amazing credulity in ſupernatural agents.

Notwithſtanding the introduction of Chriſtianity, the Laplanders have preſerved the manners of the Nomades, ſo that agriculture proſpers not much among them. They divide themſelves into Lapland-fiſhers, and Lapland-mountaineers. The former always make their habitations on the brink, or in the neighbourhood of ſome lake, whence they draw their ſubſiſtence. The others ſeek their ſupport upon the mountains and their environs, with their rein-deer, more or leſs numerous, according to the ſeaſon, and are almoſt always ambulatory. They are excellent and very induſtrious herdſmen, and are rich, in compariſon of the Lapland-fiſhers. Theſe laſt are alſo called Laplanders of the woods; becauſe in ſummer they dwell upon the borders of the lakes, and in winter in the foreſt; they live by fiſhing and hunting, and chooſe their ſituation by its convenience for either. They do not travel much on foot, as the greater part of them have ſome rein-deer, and they are active and expert in the chace. The introduction of fire-arms has almoſt entirely aboliſhed the uſe of the bow and arrow.

The men, beſides looking after their rein-deer, the fiſhery, and the chace; employ themſelves in the conſtruction of their canoes, which are ſmall, light, and compact. They alſo make ſledges, to which they give the form of a canoe, harneſs for the rein-deer, all ſorts of utenſils in wood, as cups, bowls, and ſuch like, which are ſometimes prettily carved, and ornamented with bones, braſs, or horn It is alſo the man's buſineſs to look after the kitchen, in which the women never interfere.

The employment of the women conſiſts in making nets for the fiſhery, in drying fiſh and meat, in milking the rein-deer, in making cheeſe, and in tanning hides. They prepare the nerves of the rein-deer in ſuch a manner, as to make them ſerve as thread; and they draw braſs-wire by the help of the horns of the rein-deer pierced, inſtead of a drawing-iron. They embroider their clothes, which they make themſelves, with braſs-wire, ſilver, ſham gold, or wool, which they have the art of dying in all colours.

Theſe people live in huts in the form of tents. —The carcaſe of the hut is compoſed of poles ſtuck in the ground, and bent up at top in ſuch a manner as to compoſe a vault almoſt round. A hut is about four or five fathom in diameter, and not much obove in height. They cover them according to the ſeaſon and the means of the poſſeſſor; ſome with briers, bark of birch, and linen; others with turf, coarſe cloth, felt, or the old ſkins of rein-deer. The door is of felt, made like two curtains, which open aſunder. A little place ſurrounded with ſtones is made in the middle of the hut for the fire, over which a chain is ſuſpended to hang the kettle upon. Round the fire they lay boughs of fir, which they cover with ſkins, felt, and the like. They are not able to ſtand upright in their huts, but conſtantly ſit upon their heels round the fire. At night, they lie down quite naked; and, to ſeparate the apartments, they place upright ſticks at ſmall diſtances. They cover themſelves with their clothes, or lie upon them, and in winter they put their feet into a fur bag.

Their houſehold furniture conſiſts of iron or copper kettles, wooden cups very neatly cut, bowls, ſpoons, and ſometimes tin, or even ſilver baſons, to which may be added the implements of fiſhing and hunting. That they may not be obliged to carry all theſe things with them in their excurſions, they build in the foreſts, at certain diſtances, little huts made like pigeon-houſes, and placed upon a poſt, which is the trunk of a tree cut off at about the height of a fathom from the root. In theſe elevated huts they keep their goods and proviſions, and they are never plundered, though they are never ſhut.

They uſe no kind of linen in their dreſs. The men wear cloſe breeches, reaching down to their ſhoes, which are made of untanned ſkin, pointed, turned up before, and in winter they put a little hay in them. Their doublet is made to fit their ſhape, and open at the breaſt. Over this they wear a cloſe coat with narrow ſleeves, whoſe ſkirts reach to the knees, and which is faſtened round them by a leather girdle, ornamented with plates of tin or braſs. To this girdle they tie their knives, their inſtruments for getting fire, their pipes, and the reſt of their ſmoking apparatus. Their clothes are made of fur, leather, or cloth; the cloſe coat, of cloth or leather, is always bordered with fur, or bindings of cloth of different colours. Their caps are edged with fur, pointed at top, and the four ſeams adorned with liſts of a different colour from that of the cap. The ſkins of rats are generally uſed for the borders of the caps of the Ruſſian Laplanders.

The women wear breeches, ſhoes, doublets, and cloſe coats, in the ſame manner as the men; but their girdle, at which they carry likewiſe the implements for ſmoking tobacco, is commonly embroidered with braſs wire. Their cloſe coat has a collar, which comes up a little higher than that of the men. Beſides theſe, they wear kerchiefs, and little aprons, made of Ruſſia painted cloth, rings on their fingers, and ear-rings, to which they ſometimes hang chains of ſilver, which paſs two or three times round the neck. They are often dreſſed in caps, folded after the manner of turbans. They wear alſo caps of the ſhape of the head; but all are ornamented with the embroidery of braſs wire, or at leaſt with liſt of different colours, which, in their opinion, make an elegant appearance.

The greateſt part of the food of the Laplanders is the rein-deer; the chace and the fiſhery furniſh the reſt. Among their game, the wild rein-deer is very uſeful, and in plenty; but the fleſh of the bear is their moſt delicate meat. They eat every kind of fiſh, even the ſea-dog, as well as all ſorts of wild animals, not excepting birds of prey, and carnivorous animals. Their winter proviſions conſiſt of fleſh and dried fiſh in the open air, both of which they eat raw, without any ſort of dreſſing. They put the milk of the rein deer into the ſtomachs of that animal, and ſo let it freeze. The cold alſo preſerves their proviſions, which conſiſt of all ſorts of wild-fruits, myrtle-berries, gooſeberries, and a kind of cranberries, which grow in the moſs in the foreſts. In the winter, when they want to uſe their frozen milk, they chop off pieces with a

hatchet. A ſort of ſweet milk, curdled, and retaining all its cream, is one of the greateſt dainties of a Laplander. Their common drink is water, ſometimes mixed with milk, and they alſo make broths and fiſh ſoups; but brandy, which is very ſcarce with them, is the higheſt article of their luxury.

The moſt conſiderable branch of their commerce is the traffic they carry on with the Norwegians. This trade was formerly carried on in the way of barter; but coin is now more current among them. The balance is always in favour of the Laplanders; becauſe they can furniſh more merchandize in ſkins and furs, than they buy flour, oatmeal, cloth, knives, hatchets, and other utenſils and hardware goods. Hence it is that they commonly pay their taxes in current coin, though they might pay them in ſkins and furs, if they choſe it.

Whenever they are inclined to eat, the head of the family ſpreads a mat on the ground, for they never lay their meat on the bare ground. Men and women ſquat round this mat, which is covered with diſhes; and every Laplander always carries about him a knife, a ſpoon, and a little cup to drink out of. Each has their portion ſeparately given them, that no perſon may be injured; for they are great eaters. Before and after the meal, they make a ſhort prayer; and, as ſoon as they have done eating, each gives the other his hand.

They bury in the earth all the money they have not immediate occaſion for, as well as their plate, and whatever they think of value; nor even at the point of death do they declare the ſpot where it is hidden, imagining that they ſhall want it in the other world. By theſe means, the beſt part of their property is entirely loſt. Many of their children die by the hardy manner in which they are brought up; but ſuch as ſurvive are generally robuſt and alert. What may contribute much to the ſtrength of their conſtitution is their living free from care, their temperance, and continual exerciſe; yet, after all, it is very rare that any of them live to be far advanced in years.

Sterility, among the Lapland women, is a ſort of reproach. They are generally delivered without difficulty; the huſband aſſiſts at the labour, and affords his wife the neceſſary help. Without this practice they would often be diſtreſſed, as the inhabitants are frequently at ſuch a diſtance from one another as to preclude the aid of any woman. Their cradle, formed out of wood, is ſmall, light, and made in the ſhape of a ſhuttle, or of a canoe pointed at two of the extremities. Into this the child is put, quite naked, upon moſs, and is covered with a piece of fur faſtened to the cradle by a piece of ſtring. The Laplanders ſuſpend theſe cradles in their huts, or, if the ſeaſon permit, to the branch of a tree; but the women carry them at their backs when they go a journey.

The father preſents his new-born ſon with a female rein-deer, on which he makes ſome figure as a diſtinctive mark. This mark becomes afterwards the proper and peculiar ſignature of the new citizen; and all the produce of this female rein-deer is the unalienable property of the child, and makes no part of the family poſſeſſion. On the child's cutting its firſt tooth, the father, if he be rich, or in eaſy circumſtances, gives him a ſecond rein-deer. In general, the fathers beſtow an extravagant fondneſs on their children; the conſequence of which is, in Lapland, as well as every where elſe, that theſe too indulgent parents find themſelves, if not hated by their children, too frequently abandoned by them in that period of life, when they ſhould have moſt to expect from their gratitude and duty.

The marriages of the children are directed by the fancy of the parents, and in this they have no other view than intereſt. Hence the moſt contemptible woman may make a good match, if ſhe poſſeſs but ſome property. A young man is not permitted to marry until he be able to take and kill a rein-deer; and in ſome provinces, they manage the contract of marriage with all the formality of a bargain, when the pretenſions on both ſides frequently riſe very high on the firſt propoſal. They reckon ſeverally whatever the young man is to give in order to obtain his fair-one, which moſt commonly conſiſts of rein-deer, or different kinds of ſkins.

The wedding is celebrated at the bride's houſe; ſhe is dreſſed in the beſt manner, and appears before the gueſts with her head quite uncovered, which, at other times, is never the cuſtom with either women or maidens. The feaſt is a kind of meſs, to which each of the gueſts bring meat and drink. Their diverſion at weddings, and other merry-makings, is the game of fox and gooſe, a kind of draughts, with thirteen men, twelve repreſenting geeſe, and the thirteenth a fox. They wreſtle, and jump over a ſtick held horizontally, and are fond of giving groteſque accounts of different adventures. They likewiſe dance and ſing, or rather howl in diſagreeable meaſures. The new-married people live with the woman's relations for the firſt year, at the end of which they retire to a hut of their own.

Theſe people bury their dead without coffins, in ſome cantons with their clothes on, in others quite naked. The Pagan Laplanders inter their moſt famous hunters near the places conſecrated to ſacrifice. Formerly their cuſtom was, to throw the body into the ground naked, and without ceremony; afterwards to ſurround the ſpot with ſtones, and to pile others upon it. They generally place a ſledge with its bottom upwards upon the grave, and ſome eatables and pieces of furniture near it. The rich give ſome little refreſhment to the funeral attendants; but the generality of people do not obſerve that cuſtom.

All the Swediſh and Norwegian, as well as the greater number of the Ruſſian Laplanders, bear the name of Chriſtians; but their religion is full of ſuperſtition, and a compound of Chriſtian and Pagan ceremonies. The heathens ſtill acknowledge, as their anceſtors heretofore did, an univerſal God. Beſides him they admit of inferior divinities, good and bad, gods and goddeſſes. Theſe deities, as they imagine, dwell and rule in heaven, and take to themſelves at death ſuch as have conducted themſelves well through life. Other gods inhabit the air, ſuch as the ſun; and their celebrated Thor, who rules the thunder. They have other divinities, who direct the ſtorms, and terreſtrial deities, who preſide over hunting. Maderakko is a goddeſs, who, with her three daughters, direct every thing relating to women. Jabme Akko, or the mother of the dead, has her abode on the ſurface of the earth, and takes care of departed ſouls till the final deciſion of their doom. They have their infernal and malevolent gods, who dwell in the centre of the earth, where theyplace their hell; and alſo evil dæmons, who have their habitations in the waters. They are afraid of fiery goblins and ſpectres, ſatyrs or dæmons of the woods, and malevolent fairies of the lakes. There is, however, a great difference in matters of faith; one man believes in all theſe divinities, while another admits a larger ſtock, and ſome reduce their number conſiderably.

Inſtead of temples, they have conſecrated mountains, and have lakes and rivers that are ſacred. There are alſo conſecrated trees, on which figures are carved, and around them are little ſcaffoldings, for the offerings, from three to five feet high. Even the Chriſtian Laplanders have ſo much veneration

ration for theſe places, that they never approach them without making ſome offering; nor will they, upon any account, hunt or make their habitation in the neighbourhood of them. Here are to be ſeen miſ-ſhapen idols of wood and ſtone, or carved out of roots of trees. The ſtone idols are chiefly found near lakes and rivers, and conſiſt of a great heap of ſtones, ſhaped and piled up in the moſt whimſical manner. While they are fiſhing in theſe holy waters, they are forbidden, among other things, to ſpeak, to have a dog with them, or to be aſſiſted by women.

In caſes of ſickneſs, of unfruitful marriages, in times of epidemical diſeaſes among the rein-deer, and other temporal adverſities, they make their offerings, always conſulting a magician, to which of the gods they ſhall ſacrifice, what offering they ſhall make, in what place they ſhall depoſit it, and many more particulars. For this purpoſe, the magician makes uſe of his magical drum, which is a box of an oval ſhape, covered on one ſide with a ſkin, and furniſhed on the other ſide with ſeveral ſtrings and pieces of iron, to rattle and make a noiſe. Strange figures, intended to repreſent the heavenly bodies, ſuch as beaſts and birds, are drawn on the ſkin. The ſorcerer puts a ring upon his drum, beats on it with his drum-ſtick, which is made of the moſſy horn of a rein-deer; and, according to the figure on which the vibration of the ſkin cauſes the ring to fall, he anſwers all queſtions concerning former or future events. At the ſame time, he invokes the ſpirits to aſſiſt his drum, and, during this mummery, he falls into a fit, when his ſoul is ſuppoſed to be with the ſpirits of the air, hearing their converſe, and learning the decrees of heaven.

Every perſon carries his offering himſelf. Previous to this, the votary performs his purifications, ties up all his dogs, that they may not croſs his way, and proceeds, without ſpeaking, towards the holy place, bearing the bones, or the horns, of the animal preſcribed by the ſorcerer; and, as ſoon as he comes within ſight of the place appointed for the offering, he falls down on his hands and knees, and crawls up to it. He then places his offering on the ſcaffold, and makes his prayer, continuing all the while proſtrate with his face upon the earth. This done, the buſineſs is over, and the votary returns home.

It is not at all ſurpriſing that people of ſuch principles ſhould be fertile in viſions, apparitions, ſuperſtitions and childiſh tales, which the Laplanders are in a great degree. They imagine their magicians poſſeſs the power of controlling the winds and the rain, of producing and deſtroying inſects, of ſpeaking to ſpirits, and a thouſand other fooleries; but they believe, at the ſame time, that the thunder is inimical to the magicians; and hence their proverb, "If it were not for thunder, the world would be deſtroyed by magic." They attribute ſingular effects to certain words and phraſes, and ſcarcely undertake any thing without a previous charm.

NOVA ZEMBLA.

The above name was given by the Ruſſians to their new-diſcovered tract, and in their language ſignifies New Land, It is ſeparated from the northern part of Ruſſia by the ſtreight called Veigatz, or Wygatz, which lies in north lat. 70 deg. The land that forms this ſtreight is a promontory, advancing ſouthward from the main country, which is ſuppoſed to extend itſelf much further north. It was long doubted, whether this country joined to the continent of Greenland on the weſt, or of Tartary on the eaſt, but it is now known to be an extenſive iſland.

This inhoſpitable region was firſt diſcovered by the Engliſh, anno 1553, when captain Hugh Willoughby ſailed thither with three veſſels, and advanced from the north cape of Finmark, as far north as the 72d deg. of lat. where he thought he had deſcried this land; but being obliged, through ſtreſs of weather, to put into a port of Lapland, he there periſhed with cold, with all his company. Captain Burroughs ſailed in ſearch of it three years after, and having doubled the above-mentioned cape, diſcovered the ſtreight of Wygatz, between the ſouth part of Nova Zembla and the north coaſt of Samoieda. Since that time it hath been often viſited, both by Dutch and Engliſh, in hopes of finding out the north-eaſt paſſage; but the coldneſs of the climate, and the mountains of ſnow which covered that whole country, prevented their making any great diſcoveries. Some Dutchmen wintered there, anno 1596, but found the cold ſo exceſſive, that they, with great difficulty, kept themſelves alive till the next ſummer. They ſaw no ſun from January 4 to June 24, during which long and dark interval they had no light, but what the moon gave them from the firſt to the laſt quarter, in which ſhe ſhone by day as well as night. The account they gave of it is, that ſome parts of that country is inhabited by a people of low ſtature, who are idolaters and barbarous.

The attempts made afterwards by Barentz, a Hollander; by Hudſon, Wood, and Flaws; proved likewiſe of little or no conſequence to the public, and of deſtructive conſequence to themſelves. Wood, indeed, made ſome remarks, which gave him reaſon to think there was a paſſage between this country and that of Greenland. Nova Zembla he repreſents as the moſt forlorn ſpot in all the world, the greateſt part of which is laid under ſnow and ice; and that where there are neither of theſe, nothing preſents itſelf to the view but diſmal quagmires, covered with moſs, and ſome blue and yellow flowers. Upon digging two or three feet into the earth, they found the ice as hard as marble, which ſhews how vain it would be to attempt to winter there in caves dug under ground. In other northern countries the ice and ſnow is obſerved to melt much ſooner on the ſea-coaſts than in the inland parts, but here it proves the reverſe; and the ſea, which beats againſt mountains of it of a prodigious height, hath ſo undermined it, that it ſeems to hang in the air, and diſcovers ſuch monſtrous chaſms, as cannot be beheld without horror.

Nova Zembla, ſo far as our author had an opportunity to view it, breeds ſome ſorts of wild creatures, ſuch as large white bears, foxes, ſome ſmall creatures like rabbits, larger than rats, large penguins, &c. The penguin is of the ſize of a gooſe, and the feathers are ſomewhat like hairs, and of an aſh colour. The wings are very ſhort in proportion to the body; the bill is black, and the legs are of a bright green. They keep in the water all the day, where they feed upon fiſh. As they cannot fly, they cannot ſhun their enemies, except by leaping along, which they do pretty well by the help of their ſhort wings. However, this bird is active upon the water, and ſeems to be very ſkilful in catching its food. When the ſun begins to ſet, they retire to the rocks near the ſea, where they continue till morning, at which time they are eaſily taken. They build their neſts upon the rocks, on the craggy points, to which theſe birds can get up very eaſily. Their eggs are very good, but the fleſh has a diſagreeable fiſhy taſte, and is never eaten but in caſes of great neceſſity. It is worthy of remark, that the bird penguin, which is not only common to theſe northern parts, but likewiſe in ſeveral countries of North America, is every where known by the ſame name, with little or no variation; and that the word penguin, in the Celtic, and in our preſent Welſh, ſignifies a white head, as that bird actually hath. This, together with ſome great affinity which is found in many of the radical words and proper names, uſed by thoſe diſtant regions, confirms a curious conjecture of the authors of the Univerſal

Hiſtory, which is, that the deſcendants of Gomer, the eldeſt ſon of Japhet, were not only the firſt peoplers of Europe, even in its remoteſt parts, but have preſerved their ancient language more than any other nation we know of, except the Chineſe.

The ſouthern part of this country has been ſince found to be inhabited by a ſquat, ſwarthy ſort of people, who clothe themſelves with ſeal-ſkins, or with the ſkin of the bird penguin, with the feathers outward. They live upon what game or fiſh they catch; they worſhip the ſun and moon, and have ſome little wooden idols, in human ſhape, but monſtrouſly carved or rather notched.

A variety of romantic tales, and manifeſt abſurdities, having been publiſhed by many of the Dutch voyagers, theſe, together with the ridiculous relations of Ferdinand Mendez and Pinto, and the improbable ſtories of Sir John Mandeville, gave riſe to a witty and ingenious ſatire, written by the celebrated Sir Richard Steele, and publiſhed in the Tatler, as if from a manuſcript of Sir John Mandeville. The ſcene being founded in Nova Zembla, the humour being admirable, and the ſatire pointed againſt all travellers and voyagers who attempt to impoſe upon the public, we ſhall make an extract from it without further apology.

Sir John Mandeville is ſuppoſed to be the narrator, and to relate as follows: "We were ſeparated by a ſtorm, in the latitude of 73, inſomuch that only the ſhip in which I ſailed, with a Dutch and French veſſel, got ſafe into a creek of Nova Zembla. We landed in order to refit our veſſels, and ſtore ourſelves with proviſions. The crew of each veſſel made themſelves a cabin of turf and wood at ſome diſtance from each other, to fence themſelves againſt the inclemencies of the weather, which was ſevere beyond imagination. We ſoon obſerved, that, in talking to one another, we loſt ſeveral of our words, and could not hear one another at above two yards diſtance, and that too when we ſat very near the fire. After much perplexity, I found that our words froze in the air, before they could reach the ears of the perſon to whom they were ſpoken. I was ſoon confirmed in the conjecture, when, upon the increaſe of the cold, the whole company grew dumb, or rather deaf; for every man was ſenſible, as we afterwards found, that he ſpoke as well as ever; but the ſounds no ſooner took air, than they were condenſed and loſt. It was now a miſerable ſpectacle, to ſee us gaping and nodding at one another, every man talking, and no man heard. One might obſerve a ſeaman that could hail a ſhip at a league's diſtance, beckoning with his hand, ſtraining with his lungs, and tearing his throat, but all in vain.

"We continued here three weeks in this diſmal plight. At length, upon a turn of wind, the air about us began to thaw. Our cabin was immediately filled with a dry clattering ſound, which I afterwards found to be the crackling of conſonants that broke above our heads, and were often mixed with a gentle hiſſing, which I imputed to the letter *S* that occurs ſo frequently in the Engliſh tongue. I ſoon after felt a breeze of whiſpers ruſhing by my ear; for thoſe being of a ſoft and gentle ſubſtance, immediately liquified in the warm wind that blew acroſs our cabin. Theſe were ſoon followed by ſyllables and ſhort words, and at length by entire ſentences, that melted ſooner or later, as they were more or leſs congealed; ſo that we now heard every thing that had been ſpoken during the whole three weeks that we had been ſilent, if I may uſe that expreſſion. It was now very early in the morning, and yet, to my ſurpriſe, I heard ſomebody ſay, "Sir John, it is midnight, and time for the ſhip's crew to go to bed." This I knew to be the pilot's voice; and, upon recollecting myſelf, I concluded, that he had ſpoken theſe words to me ſome days before, though I could not hear them till the preſent thaw. My reader will eaſily imagine how the whole crew was amazed, to hear every man talking, and ſee no man open his mouth. In the midſt of this great ſurpriſe we were all in, we heard a volley of oaths and curſes, laſting for a long while, and uttered in a very hoarſe voice, which I knew belonged to the boatſwain, who was a very choleric fellow, and had taken his opportunity of curſing and ſwearing at me, when he thought I could not hear him; for I had ſeveral times given him the ſtrappado on that account, which I did not fail to repeat for theſe his pious ſoliloquies when I got him on ſhipboard.

"I muſt not omit the names of ſeveral beauties in Wapping, which we heard every now-and-then in the midſt of a long ſigh that accompanied them, as Dear Kate! Pretty Mrs. Peggy! When ſhall I ſee my Sue again? This betrayed ſeveral amours which had been concealed till that time, and furniſhed us with a great deal of mirth in our return to England.

"When this confuſion of voices was pretty well over, though I was afraid to offer at ſpeaking, as fearing I ſhould not be heard, I purpoſed a viſit to the Dutch cabin, which lay about a mile further up in the country. My crew were extremely rejoiced to find they had again recovered their hearing, though every man uttered his voice with the ſame apprehenſions that I had done.

"At about half a mile's diſtance from our cabin, we heard the groanings of a bear, which at firſt ſtartled us; but, upon our inquiry, we were informed by ſome of our company that he was dead, and now lay in ſalt, having been killed upon the very ſpot about a fortnight before, in the time of the froſt. Not far from the ſame place, we were likewiſe entertained with ſome poſthumous ſnarls and barkings of a fox."

HISTORY OF RUSSIA.

IT is the received opinion of hiſtorians, that ſome of the moſt neglected parts of this country were early peopled, and poſſibly much richer than at preſent; but the few accounts we have of this northern nation are ſo enveloped in fable and fictitious relations, that it is hardly poſſible to form a conſiſtent narrative, founded on truth, before the introduction of Chriſtianity, about the tenth century, when Olha, a Ruſſian princeſs, was baptized at Conſtantinople, and called Helen. Her example, however, was not generally followed till the year 987, when Volodimer her grandſon, having formed an alliance with Baſil, emperor of Conſtantinople, patriarch Photius, ſo famous for his amazing erudition, his diſputes with the Roman church, and his misfortunes, ſent proper perſons to baptize the Ruſſian prince, and add that part of the world to his patriarchate.

John or Iwan Baſilides, a man of courage and intrepidity, aſcended the Ruſſian throne in the year 1450, and delivered his country from the yoke of the Tartars, and increaſed his territories by the acquiſition of Novogorod, and the city of Moſcow. He even extended his conqueſts into Finland, which has ſo often been the ſource of wars between Ruſſia and Sweden. It is ſaid that this emperor brought back from Moſcow three hundred cart loads of gold, ſilver, and precious ſtones.

His grandſon, John Baſilides, who mounted the Ruſſian throne in 1540, purſued the ſteps of his predeceſſor, and cleared his country from the incurſions of the wandering Tartars: he ſubdued the kingdoms of Kaſan and Aſtracan, in Aſia, and annexed them to his dominions, but could not maintain his ground on the ſide of Finland; his forces were always defeated by the regular troops of Sweden.

John Baſilides II. who died in 1584, left two ſons, the one named Fedor, or Theodore, the other Demetrius. Fedor ſucceeded his father, and Demetrius was confined to a village called Uglis, with the czarina, his mother. The rude manners of the Ruſſian court had

had not yet adopted the policy of the Turkiſh ſultans, in ſacrificing the princes of the blood to the ſecurity of the throne. Boris-Godonow, the prime miniſter, whoſe ſiſter was married to Fedor, perſuaded his maſter that he could never reign quietly unleſs he imitated the Mahometan court, in aſſaſſinating his brother. Fedor liſtened to his advice, and an officer was diſpatched to execute his inhuman reſolution. The officer at his return to court declared that he had put Demetrius to death, and demanded the reward that had been promiſed him for this ſanguinary ſervice; but Boris, inſtead of a reward, put him to death, in order to ſuppreſs every poſſible proof of the murder.

About the ſame time there appeared in Lithuania, a young man, who pretended to be prince Demetrius, aſſerting that he had eſcaped from the hands of the aſſaſſin. Several who had ſeen him at his mother's houſe, knew him again by particular marks. He perfectly reſembled the prince; he ſhewed the croſs ſet with diamonds which had been tied about the neck of Demetrius. The palatine of Sandomir acknowledged him immediately for the ſon of John Baſilides, and for the lawful czar. The diet of Poland made a ſolemn inquiry into the proofs of his royal extraction, and finding them abundantly ſufficient, furniſhed him with an army to drive out the uſurper, and recover the throne of his anceſtors.

However, in the mean time, Demetrius was treated in Ruſſia as an impoſtor, and even as a magician. The Muſcovites could not believe that Demetrius, who was ſupported by the Poles, a catholic nation, and who had two jeſuits in his council, could be their king. So little did the boyars queſtion his being an impoſtor, that, upon the death of the czar Boris, they made no difficulty of placing his ſon, then only fifteen years of age, on the Ruſſian throne.

During theſe tranſactions Demetrius was on his march into Ruſſia, at the head of a Poliſh army: and all thoſe who were diſſatisfied with the government, declared in his favour. A Ruſſian general advancing within ſight of Demetrius's army, cried out, "He is the only lawful heir of the empire," and immediately joined his ſtandard with the forces under his command. The revolution was ſudden and complete, and Demetrius was no longer a magician. The inhabitants of Moſcow ran to the palace, and dragged the mother and ſon of Boris to priſon. Demetrius was unanimouſly proclaimed czar; and it was given out, that both young Boris and his mother had killed themſelves in confinement. Probably they were put to death by Demetrius. This event happened in 1605.

The widow of John Baſilides, mother of the real or pretended Demetrius, had been long ſince baniſhed to the northern parts of Ruſſia; and the new czar now ſent a magnificent carriage to bring her to Moſcow. He went himſelf part of the way to meet her; they embraced each other with tranſports and tears of joy, in the preſence of a prodigious multitude of people, ſo that none doubted but Demetrius was the lawful emperor. In 1606, he married the daughter of the palatine of Sandomir, his firſt protector, and this brought on his ruin. Shocked at ſeeing a catholic empreſs, a court compoſed of foreigners, and, above all, a church erected for the jeſuits, the people no longer conſidered Demetrius as a Ruſſian, the ſon of John Baſilides, and determined to drive him from the throne.

In the midſt of the entertainments at the marriage of the czar, a boyar, whoſe name was Zuſki, put himſelf at the head of a number of conſpirators, and entering the palace with a ſword in one hand, and a croſs in the other, cut the Poliſh guards in pieces, hurried Demetrius to priſon, and loaded him with chains. He was ſoon after confronted with the dowager czarina, who had ſo ſolemnly acknowledged him for her ſon. The clergy obliged her to ſwear upon the croſs, and to declare whether Demetrius was or was not her ſon. Accordingly ſhe affirmed, that the czar was not her child; that the real Demetrius was murdered in his infancy; that ſhe had only followed the example of the whole nation in acknowledging the new czar, and to be revenged for the blood of her ſon upon a family of aſſaſſins. Demetrius was now ſaid to have been originally nothing more than a peaſant named Griſka Utropoya, who had for ſome time lived as a monk in a Ruſſian convent. But however that be, Zuſki killed him with his own hand, and took his place on the throne in the year 1606.

The reſt of the boyars, however who had before been Zuſki's equal, but now his ſubjects, could not behold his exaltation with patience. They aſſerted that the late czar was not an impoſtor, but the real Demetrius, and that the murderer was unworthy of the throne. The name of Demetrius now became dear to the Ruſſians; and the chancellor of the murdered czar declared, that he was ſo far from being dead, that he would ſoon recover of his wounds, and appear again at the head of his loyal ſubjects.

Accordingly, the chancellor traverſed every part of Muſcovy, with a young man in a litter, whom he called Demetrius, and treated as a ſovereign. At the very name of Demetrius the people flew to arms; they fought ſeveral battles in his favour, without ſeeing him; but the chancellor's party having been defeated, the ſecond Demetrius diſappeared. The people however were ſo fond of this name, that a third Demetrius ſoon after aroſe in Poland. This man was more fortunate than the reſt. He was ſupported by Sigiſmund, king of Poland, and laid ſiege to Moſcow, where Zuſki reſided. The tyrant was ſhut up in his capital, but he had ſtill the widow of the firſt Demetrius, and the palatine of Sandomir, her father, in his power. The third Demetrius demanded the princeſs his wife. Zuſki delivered up both the father and the daughter, hoping, perhaps, to ſoften the king of Poland, or flattering himſelf that the palatine's daughter would diſown him. He was however miſtaken; the widow of the firſt, declared this third Demetrius to be her real huſband; the palatine ſwore that this was his ſon-in-law, and the people made no doubt but it was true. The boyars, divided between Zuſki and the impoſtor, would acknowledge neither. They depoſed Zuſki, and ſhut him up in a convent, where he finiſhed his days; and Demetrius was aſſaſſinated at a public entertainment by a gang of Tartars, in the year 1610.

The throne of Ruſſia being thus vacant, the boyars offered it to prince Uladiſlaus, ſon to Sigiſmund, king of Poland. But before he had finiſhed the neceſſary preparations for his journey to Moſcow, a fourth Demetrius ſtarted up, and claimed the crown of Ruſſia. This impoſtor pretended that God had conſtantly preſerved him, though he had been aſſaſſinated at Uglis by the orders of the tyrant Boris, at Moſcow by the uſurper Zuſki, and afterwards by the Tartars. This ſtory, however improbable, was countenanced by many of the people; it was conſidered as a miracle, and as ſuch it was believed. The town of Pleſkou acknowledged him as czar; and there, for a few years, he fixed his reſidence. During this interval, the Ruſſians repenting they had called in the Poles, drove them back to their own kingdom, and Sigiſmund renounced all hopes of ſeeing his ſon Ladiſlaus placed on the Ruſſian throne.

In the midſt of theſe diſturbances, Michael Federowitz, the ſon of the patriarch Fedor Romanzow, or Philaretes, was made czar, at the age of ſeventeen, by the great influence of his father. All Ruſſia acknowledged him for its ſovereign, and the city of Pleſkou delivered up to him the fourth Demetrius, who was hanged upon a gibbet. A fifth Demetrius however ſtill remained. He was the ſon of the firſt of that name, by the daughter of the palatine of Sandomir. His mother removed him from Moſcow, when ſhe went to meet the third Demetrius, and pretended to acknowledge him for her real huſband.

She

She afterwards retired with this child into the country of the Coſſacks; and he was always conſidered, and probably really was, the grandſon of John Baſilides. But Michael Federowitz was no ſooner ſeated on the Ruſſian throne, than he obliged the Coſſacks to deliver up the mother and child, who were both drowned.

It would hardly be expected that a ſixth Demetrius ſhould appear; but this was really the caſe. During the reign of Michael Federowitz, ſome young men bathing with a Coſſack of their own age, they took notice of certain Ruſſian characters on his back, pricked with a needle; and, on a more careful examination, found them to be, "Demetrius, ſon to the czar Demetrius." This perſon was immediately ſuppoſed to be the prince whom the czar Federowitz had cauſed to be drowned: a miracle had been wrought in his favour; and he was treated as the czar's ſon at the court of Uladiſlaus, in order to excite freſh diſturbances in Ruſſia. The untimely death of his protector, however, blaſted all his hopes; he retired to Sweden, and afterwards to Holſtein. Unfortunately for him, the duke of Holſtein having ſent an embaſſy into Ruſſia in order to open a communication for a ſilk trade with Perſia; but failing in the attempt, and having contracted conſiderable debts at Moſcow, the duke of Holſtein, in order to diſcharge theſe incumbrances, ungenerouſly delivered up Demetrius, who was quartered alive.

Theſe kind of impoſtures ſufficiently diſplayed the deſpicable ſtate of ignorance in which the Ruſſians were then immerſed. But the time was now arrived when that empire began to know its own power, and to ſupport that independence which was on the point of being extinguiſhed.

It has been already obſerved, that the Ruſſians had offered their crown to Uladiſlaus. This offer was carried by Philaretes; and during his ſtay at the Poliſh court, his ſon was raiſed to the throne. Exaſperated at the behaviour of the boyars, Sigiſmund committed Philaretes to priſon: but being afterwards exchanged for ſome Poliſh priſoners, he held the reins of government for his ſon, with great prudence and diſcretion.

The czar Michael Romanzow, having declared his intention to marry, moſt of the celebrated beauties in his dominions were ſent for to court, and entertained in a very elegant manner. The czar ſaw them often, the wedding-day was fixed, and the neceſſary preparations for the ſolemnity was finiſhed, before it was known on whom the happy lot had fallen. On the morning when the nuptial ceremony was to be performed, the fortunate lady was preſented with a wedding robe and a caſket of magnificent jewels; the other candidates alſo received valuable preſents, and were ſent to their reſpective places of abode. The name of the lady's father who pleaſed Michael was Streſehmen, and he was ploughing his own little farm when the czar's chamberlains informed him that his daughter was placed upon the Ruſſian throne.

On the death of Michael Romanzow, which happened in 1645, his ſon Alexis Michaelowitz, then in his ſeventeenth year, aſcended the throne. He married in the ſame manner as his father, and choſe the moſt amiable among the beauties preſented to him. The tranquility of his reign was diſturbed both by bloody and furious commotions and foreign wars. He was not, however, ſo wholly taken up with wars and military tranſactions, but he found leiſure to draw up a code of laws, which, though imperfect, ſufficiently proved that he had formed a proper idea of legiſlation and diſtributive juſtice. He cultivated a polite correſpondence with moſt of the powers of Europe, introduced manufactures of ſilk and linen into his dominions, and peopled the banks of the Volga and Kama with Lithuanian, Poliſh, and Tartar families taken in his wars. Before his time all priſoners became the ſlaves of thoſe into whoſe hands they fell; Alexis made them huſbandmen. Their labours enriched his country, and many of the Ruſſians followed their example. Other ſchemes equally advantageous to his people were formed by this great prince, but before they could be carried into execution, death put a period to his life, in the beginning of the year 1675.

The death of this great prince was a dreadful blow to the Ruſſian empire; confuſion once more prevailed, and the blood of innocent perſons again ſtained the ſtreets of Moſcow. Alexis left three ſons and ſix daughters; the ſons were Fædor or Theodore, Iwan or John, and Peter; the laſt was by a ſecond marriage. Among the daughters one only deſerves attention in the hiſtory of Ruſſia. Her name was Sophia, a princeſs famous for her talents, and ſtill more for her ambition and intrigues. Alexis, dreading the conſequence of leaving the Ruſſians, ſo prone to rebellion, without a prince upon the throne, had cauſed Theodore, his eldeſt ſon, to be acknowledged emperor ſome time before his death.

Theodore took poſſeſſion of the government on the deceaſe of his father, without the leaſt oppoſition. He was a prince of a weak and ſickly conſtitution, but theſe infirmities had no effect upon the vigour of his mind. He formed ſeveral ſchemes for the good of his people; but the war in which he was engaged againſt the Turks, or rather the Crim Tartars, which continued during his whole reign, prevented him from carrying them into execution. Theodore ſoon perceiving that the crown of Ruſſia was a burthen too heavy for a perſon of his weak conſtitution, and that his brother Iwan, who was almoſt blind and dumb, was ſtill leſs able to ſupport it, he nominated Peter, his ſecond brother, then only ten years of age, as his ſucceſſor to the throne.

Peter had already given many indications of extraordinary abilities, but his youth rendered him incapable of holding the reins of government; and the ambitious Sophia, perceiving her brother Theodore could not long ſupport the fatigues of royalty, determined, if poſſible, to aſcend the Ruſſian throne, at leaſt to ſway the ſceptre during the minority of Peter. Accordingly, ſhe formed a ſtrong party among the Strelitzes, or ſtanding forces of Ruſſia, by bribes and promiſes, and immediately on the death of Theodore convened a meeting of the princeſſes of the blood, the generals of the army, the boyars, the patriarchs, the biſhops, and even the principal merchants. In this aſſembly ſhe expatiated on the injuſtice of appointing Peter ſucceſſor to the throne in oppoſition to the natural right of his brother Iwan; that the talents of the latter for government were far from being contemptible; and that Peter was too young to hold the reins of government.

Theſe repreſentations produced the deſired effect; a dreadful ſedition was raiſed by the Strelitzes; many of the nobles, who were thought to favour Peter, were maſſacred with circumſtances of cruelty ſhocking to humanity; and Moſcow again experienced all the horrors of anarchy and confuſion. But at laſt the ſword of aſſaſſination was ſheathed, and Iwan and Peter declared joint ſovereigns of Ruſſia, though Sophia acquired the whole power, and was, in every thing but title, the czarina of the empire. Her buſt was ſtruck upon the coin, ſhe preſided in the council, ſhe planned and ſigned all expeditions, and her will became the law of Ruſſia.

Soon after Iwan was placed on the throne, he married a young lady called Soltikoff; but during the rejoicings that followed his eſpouſals, the Strelitzes fomented a dangerous ſedition on account of ſome religious diſputes. The inſurrection did not however long continue, but ſoon after broke out with much greater violence, under the influence of a popular nobleman, to revenge himſelf on Sophia for her ingratitude, who had totally neglected his intereſt,

reſt, though it was principally to him that ſhe owed her elevation.

Sophia, aware of the conſequences that might probably attend this popular inſurrection, retired with her two brothers and the other branches of the royal family, to the monaſtery of the Trinity, ſituated about twelve leagues from Peterſburg. This monaſtery, which belongs to the monks of St. Baſil, is ſurrounded with large ditches, and ſtrong ramparts mounted with a numerous artillery. In this place of ſafety Sophia entered into a negotiation with the leader of the rebels; and, under pretence of granting him his own terms, ſhe prevailed on him to repair to a certain town in the neighbourhood in order to ſign the treaty. Deceived by the artifices of Sophia, the nobleman, attended by one of his ſons, and thirty-ſeven of the officers of the Strelitzes, repaired to the place, where they were all immediately ſeized and beheaded. This rebellion however convinced Sophia, that ſhe wanted power to ſway the ſceptre of Ruſſia conformable to her own will, and therefore determined to marry the prince Galitzin, a man of ſenſe, ſpirit, and ſome learning. She had already placed him at the head of the army, made him prime miniſter, and keeper of the ſeals.

Peter, who was now in his eighteenth year, being alarmed at the partiality of Sophia for Galitzin, determined to aſſert his right to the crown. Iwan and Sophia were at Moſcow when this reſolution was taken; but Peter had retired to the convent of the Trinity, where he declared that a conſpiracy was formed againſt his life. He was immediately joined by the Strelitzes, and many of the moſt powerful nobility; upon which he marched directly for Moſcow, and Sophia, with her brother Iwan, were obliged to retire to the monaſtery of the Trinity. All the conſpirators were puniſhed with a ſeverity common in that country, except Galitzin, who was ſtripped of his immenſe fortune, and baniſhed into Siberia. His ſentence was very curious, it was as follows: "Thou art commanded by the moſt clement czar to repair to Karga, a town under the pole, and there to continue the remainder of thy days. His majeſty, out of his extreme goodneſs, allows thee threepence per day for thy ſubſiſtence." The princeſs Sophia was confined to a monaſtery in Ruſſia; a puniſhment ſufficient to a woman of her ambition. Nor had Iwan any other ſhare in the government, except that of having his name in the public acts. He led a private life at Moſcow, and died in 1696.

On Peter's acceſſion to the throne, he aſſociated himſelf with foreigners, and laboured aſſiduouſly to improve his education, which had been greatly neglected through the ambition of his ſiſter. He was, even from his infancy, fond of the arts, and ſhocked at the rude manners and ignorance of his ſubjects. His favourite Le Fort, a Piedmonteſe, encouraged this diſpoſition; and at the ſame time raiſed and exerciſed a body of 12,000 men, among whom he introduced the French and German exerciſe, in order to render them capable of oppoſing the inſolence of the Strelitzes; while general Gordon, a Scotchman, diſciplined the czar's own regiment, conſiſting of 5000 foreigners.

This great prince, after providing for the internal peace of his dominions, began his travels into foreign parts, as an attendant on his own ambaſſadors. By working as a common ſhipwright in the yards of Deptford and Saardam, he completed himſelf in ſhip-building and navigation; and prevailed on ſeveral ingenious men to ſettle in Ruſſia, in order to introduce the arts into his empire. At the ſame time he procured a great number of manufacturers from Germany to remove to Moſcow, and other cities, in order to carry on their reſpective trades, to the great advantage of his ſubjects. The troops diſciplined by Le Fort and Gordon, were ſoon in a condition of cruſhing all inſurrections and ſeditions, and even of exterminating the two feeble regiments of Strelitzes. Peter, in the mean time, preferred men of ability only; he paid no regard to nobility or fortune; merit alone was the paſſport to his favour; and poſſeſſed of merit, no man, however poor or depreſſed, ever applied in vain. He himſelf roſe gradually through every rank and ſervice both in the fleet and army; and the many defeats he met from Charles XII. ſerved only to extend the ſphere of his ambition. After the fatal battle of Narva, the czar was ſo far from abandoning himſelf to deſpair, that when advice arrived of this alarming misfortune, he only ſaid to his officers, "I expected to be defeated by the Swedes, and ſhall poſſibly be again defeated; but they will, in time, teach us to be conquerors." He was not deceived, the battles he loſt added experience to his courage; and Charles, in his turn, was ſoon after totally defeated at Pultowa. The military and naval triumphs which readily ſucceeded one another, after that deciſive victory, are far from forming the chief glories of Peter's reign. His aſſiduous application to the improvement of commerce, arts, and ſciences, by which his people were enriched and civilized, place him in a more diſtinguiſhed point of light; even among the few princes who have laboured for the benefit of mankind, and whoſe names will be mentioned with gratitude by poſterity. Always intent on the civilization and happineſs of his people, and knowing that the life of any perſon is too ſhort for completing ſo noble a deſign, he married a young Lithuanian woman, called Catherine, who had been betrothed to a Swediſh ſoldier; becauſe, after a long cohabitation, he found her poſſeſſed of a ſoul capable of executing his plans, and aſſiſting his counſels.

The wiſeſt and moſt fortunate princes are, however, not exempt from misfortunes. Peter experienced one of the ſharpeſt of this kind in the undutiful behaviour of his ſon; who not only married without his royal parent's conſent, but was alſo guilty of dangerous practices againſt his perſon and government. He was tried, and condemned to death; but died in priſon before his ſentence was carried into execution. Soon after the death of his ſon, he cauſed Catherine to be crowned with all the pompous ceremonies uſed by the Grecian princes while the eaſtern empire ſubſiſted, and to be recognized as his ſucceſſor. He died on the 28th day of January, 1725.

Catherine, who aſcended the Ruſſian throne on the death of the czar, governed that great empire by the ſame principles on which it had been founded; and during her whole reign was reſpected, both by her own ſubjects and all the powers of Europe, as the worthy ſucceſſor of Peter the Great. She did not, however, long enjoy this high dignity; for ſhe paid the debt of nature in 1727, after a ſhort but glorious reign.

Peter II. grandſon of Peter the Great, then a minor, aſcended the throne on the death of Catherine. This reign, though ſhort, was attended with many domeſtic revolutions; but the moſt remarkable was the diſgrace and exile of prince Menzikoff, the principal favourite in the two laſt reigns, and eſteemed the richeſt ſubject in Europe. He was a perſon of boundleſs ambition, and had formed a deſign of marrying his daughter to the czar. Probably he might have ſucceeded, had he not, by an act of inſolence, incurred the diſpleaſure of the emperor, who diſgraced and baniſhed him into Siberia. He died of the ſmall-pox, on the 19th of January, 1730.

The Ruſſian ſenate, upon the death of Peter II. notwithſtanding the deſpotiſm of Peter and his wife, ventured to ſet aſide the ſucceſſion, as it had been eſtabliſhed by the empreſs Catherine. According to the will of that princeſs, the ſon of her eldeſt daughter, Anne Petrowna, ducheſs of Holſtein, ought to have been called to the throne; but he being at that time not more than two years old, it was thought prudent, in order to avoid ſo tedious a minority, to

place Anne Iwanowna, ducheſs of Courland, on the Ruſſian throne, contrary to all the rules of ſucceſſion; for ſhe was the ſecond daughter of the emperor Iwan, and her eldeſt ſiſter, the ducheſs of Mecklenburg, was then alive. Her reign was however at once proſperous and glorious. She indeed accepted of the crown under limitations; but ſhe ſoon cancelled them all, and baniſhed the nobles who had impoſed them upon her. She made choice of grave and wiſe perſons for her miniſters, and gave the command of her army to able and experienced generals. By purſuing theſe wiſe methods, ſhe was enabled to govern her empire with reputation, and to maintain the credit of Ruſſia, with regard to the reſt of Europe, in as great a degree as any of her predeceſſors. She nobly aſſiſted the emperor Charles VI. againſt the houſe of Bourbon; ſhe placed Auguſtus, the late king of Poland, on the throne of that kingdom; ſhe raiſed her favourite Biron to the duchy of Courland; ſhe carried on a very ſucceſsful war againſt the Turks, and, in the courſe of it, totally ruined the power of the Crim Tartars.

Anna's death happening in October 1740, John, ſon of her ſiſter the princeſs of Mecklenburg, was placed on the Ruſſian throne; but being then only two years old, Biron was appointed adminiſtrator of the empire during his minority. This deſtination was diſagreeable not only to the princeſs of Mecklenburg, but alſo the people themſelves. Biron was therefore ſoon arreſted, tried, and condemned to die; but his ſentence was changed into baniſhment. Nor was the adminiſtration of the princeſs of Mecklenburg and her huſband agreeable to the Ruſſians, on account of their German connections; and ſchemes were ſoon formed for changing the government.

Peter the Great left a daughter called Elizabeth Petrowna, a princeſs of diſtinguiſhed accompliſhments, and then about 38 years of age. She had lived at court in a manner far from being ſuitable to her birth: and the prudence of her behaviour, joined to that magnanimity with which ſhe ſupported her misfortunes, had ſuch an influence on the whole nation, that ſhe had long reigned in the hearts of the people, though others were inveſted with the enſigns of royalty. At laſt, the whole Ruſſian nation, princes, nobility, ſenators, ſoldiers, and even the populace, teſtified ſuch an affection for her perſon, that ſome who had ſerved her father with fidelity, and enjoyed the rewards of their ſervices, determined to hazard their lives and fortunes in her defence, and either place her on the throne of her anceſtors, or periſh in the glorious attempt. They ſucceeded; and one night put an end to the conteſt; the ſun at his ſetting ſaw her nothing leſs than a priſoner in the palace, and at his riſing beheld her placed on the throne. The young emperor, his father and mother, were made priſoners, and ſent to the caſtle of Riga.

No ſooner was Elizabeth poſſeſſed of the reins of government, than ſhe diſplayed thoſe virtues which rendered her worthy to fill the throne of her illuſtrious anceſtors. She aboliſhed capital puniſhments; and introduced into all civil and military proceedings a moderation till her time unknown in Ruſſia. She made peace with Sweden, and ſettled the ſucceſſion to that crown, as well as of her own dominions, on the moſt equitable foundation. In a word, few princes ever enjoyed a more uninterrupted career of glory than Elizabeth. She was completely victorious over the Swedes. Her alliance was courted by Great Britain, at the expence of a great ſubſidy; but many political, and perhaps ſome private reaſons, determined her to take part with the houſe of Auſtria againſt the king of Pruſſia. Her armies turned the ſcale in favour of the empreſs-queen; and ſeemed to threaten deſtruction to Pruſſia, which was ſaved by her critical death on the 5th of January, 1762.

Peter III. grand duke of Ruſſia, and duke of Holſtein Gottorp, aſcended the throne. This prince is accuſed of having obſerved no rules of prudence or moderation; either in his public or private proceedings. It is certain that he mounted the throne poſſeſſed of an enthuſiaſtic admiration of his Pruſſian majeſty's virtues, and whoſe principles he ſeemed to have adopted as rules to direct his future reign. One of his firſt acts of government was that of making peace with Pruſſia, which gave ſome uneaſineſs to the Ruſſians. But in all probability he would have ſurmounted the effects of this, and other particulars, unpopular as they were in Ruſſia, had not he aimed at reforming the church. He even ventured to cut off the beards of his clergy, which even Peter the Great had attempted in vain. He highly offended the Ruſſian nobility by his warm attachment to the Germans. He has alſo been accuſed of certain domeſtic infidelities, which were too provoking for a princeſs of ſpirit and fortitude to bear; and it is even ſaid that he had formed a deſign of ſhutting his conſort up in a convent, and raiſing his miſtreſs, the counteſs of Woronzoff, to be his partner in the throne. Whatever truth there may be in theſe ſuggeſtions, it is certain that ſo ill was the czar ſerved, that the conſpiracy was become general, without his receiving the leaſt notice of it; and he remained in perfect ſecurity, whilſt the ſenate and clergy were aſſembled to paſs the ſentence of his depoſition. He was indulging himſelf in indolent amuſements, and lulled in the moſt profound ſecurity, at a houſe of pleaſure called Oraniebaum, on the ſea-ſhore, when he received news that his kingdom was taken from him. After ſome ſhort and tumultuous deliberations, he reſolved to throw himſelf on the compaſſion of the empreſs; and accordingly ſent letters to her, containing a renunciation of the empire, and ſtipulating no other terms than leave to return to Holſtein, and the ſatisfaction of taking with him, as the companion of his retreat, the counteſs of Woronzoff, and one ſingle friend. His terms were rejected, and he was required to ſign an unconditional reſignation of his crown, according to a form that was prepared for him. After he had ſigned this abdication, which was in July 1762, he gave up his ſword, and was conducted to priſon, where in a ſhort time he died of a diſorder called the hæmorrhoidal cholic. Thus was a revolution of ſuch immenſe importance effected in a ſingle day, and without ſhedding a ſingle drop of blood; the unfortunate emperor having enjoyed the power, of which he made ſo imprudent an uſe, only ſix months. His conſort, without any hereditary claim, was immediately placed on the Ruſſian throne, and has ſince ſwayed the ſceptre of that vaſt empire under the title of Catherine II.

This princeſs always purſued a very different conduct. She ſtudied the Ruſſian language, aſſiduouſly complied with the cuſtoms and manners which prevailed in that empire, and expreſſed, on all occaſions, a remarkable zeal for the Greek church. By this method ſhe obtained ſo great an influence over the minds of the Ruſſians, that it was no difficult taſk to bring about a revolution which placed her on the throne. The moſt remarkable domeſtic tranſaction of her reign, was the death of prince Iwan, ſon to the princeſs of Mecklenburgh, and, while in his cradle, emperor of Ruſſia. He loſt his life in an ill-concerted conſpiracy, formed by a few private officers to place him on the throne.

Ruſſia has always conſidered the internal quiet of Poland as a capital object; and this induced her imperial majeſty to take a principal part with regard to the election of the late prince to the throne, and to ſecure the rights which the treaty of Oliva had given to the Diſſidents, or the Greek and Proteſtant ſubjects of Poland. This gave great umbrage to the Roman Catholic Poles; and the Ruſſian troops ſtill continuing in their country, firſt occaſioned a civil war, and afterwards the forming of the moſt dreadful confederacies, which have rendered Poland a ſcene of ſlaughter and devaſtation.

The

The conduct of Ruſſia reſpecting Poland gave ſo much offence to the Ottoman court, that the grand ſignior ſent Obreſkoff, the Ruſſian miniſter, to the priſon of the ſeven towers, declared war againſt Ruſſia, and marched a very numerous army to the confines of Ruſſia and Poland, whereupon hoſtilities ſoon commenced between theſe rival and mighty empires.

In the months of February and March 1769, Crim Gueray, khan of the Tartars, at the head of a great body of thoſe people, ſupported by 10,000 ſpahis, having broken the Ruſſian lines of communication, penetrated into the province of New Servia, where he committed great ravages, burning many towns and villages, and carrying off ſome thouſand families captive. In April following, the grand vizier, at the head of a great army, began his march from Conſtantinople, and proceeded towards the Danube.

Mean time, prince Gallitzin, who commanded the Ruſſian army on the bank of the Nieſter, thought this a proper time to attempt ſomething deciſive, before the arrival of the great Turkiſh force in that quarter. Having accordingly croſſed the Nieſter with his whole army, he advanced to Choczim, where he encamped in ſight of a body of 30,000 Turks, intrenched under the cannon of the town. The prince attacked the Turks in their intrenchments, and, notwithſtanding an obſtinate defence, and a dreadful fire from the fortreſs, at length forced them from their trenches. The Turks endeavoured to cover their retreat, by detaching a large body of cavalry to attack the right wing of the Ruſſian army; but they had ſuch a warm reception from the artillery, that they ſoon retired in great diſorder. General Stoffeln and prince Dolgorucki were then ordered to purſue the fugitives, at the head of eight battalions; which they did ſo effectually, that they followed them into the ſuburbs of Choczim, and their purſuit was at length only ſtopped by the paliſadoes of the fortreſs. The town was ſoon after ſet on fire by red-hot balls; and a great number of Jews and Chriſtians took refuge in the Ruſſian camp. It might have been expected, from theſe ſucceſſes, that Choczim would have immediately fallen into the hands of the Ruſſians: but this was not the caſe, for prince Gallitzin thought proper to retire from the place, and paſs the Nieſter: but on the 13th of July, a very obſtinate battle was fought, in which the Turks were defeated. The Ruſſians immediately inveſted the town; but the garriſon being numerous, made frequent ſallies, and was greatly ſtrengthened by reinforcements from the grand vizier's camp, who was now conſiderably advanced on this ſide the Danube. Several actions enſued, and prince Gallitzin was at length obliged to retreat from before Choczim, and again repaſs the Nieſter. The Ruſſians are ſuppoſed to have loſt 20,000 men by the ſiege of Choczim and the actions conſequent to it. The army which the grand vizier commanded was extremely licentious, and his caution diſpleaſed the janiſſaries; ſo that in conſequence of their clamours, and the weakneſs of the counſels that prevailed at the Ottoman court, he at length became a ſacrifice; and Moldovani Ali Pacha, who poſſeſſed more courage than conduct, was appointed to ſucceed him in the command of the army.

During theſe tranſactions, the Ruſſian general Romanzow, committed great deveſtations upon the Turks, in the borders of Bender and Oczakow, where he plundered and burnt ſeveral towns and villages, defeated a Turkiſh detachment, and carried off a great booty of cattle. The Tartars alſo committed great ravages in Poland, where they almoſt totally deſtroyed the palatinate of Brucklaw, beſides doing much miſchief in other places.

In the beginning of September, the Ruſſian army appeared again on the banks of the Nieſter, in order to defend the paſſage of that river againſt the Turks, whoſe whole army, under the command of the new vizier, was poſted on the oppoſite ſhore. The two armies being thus ſituated, 8000 Turks, conſiſting entirely of janiſſaries and ſpahis, the two moſt celebrated corps of the braveſt and beſt diſciplined Turkiſh horſe and foot, paſſed the river in the night, and at break of day attacked a body of Ruſſians who were encamped on this ſide. Prince Repnin, who was poſted near the ſpot, marched immediately to the relief of this corps, and attacked the Turks at the head of four regiments with fixed bayonets. The engagement was furious and bloody; but at length the Turks were driven back, and purſued to the river, which they endeavoured to paſs in the utmoſt diſorder and confuſion; above 4000 of their number being either killed or wounded in this ill-judged attempt.

This misfortune was not ſufficient to convince the vizier, who was raſh and obſtinate, of the danger of ſending detachments acroſs a great river, in the face of a powerful enemy, without a communication with the main army, or the leaſt probability of ſupport. Having therefore laid three bridges over the Nieſter, the Turkiſh army, without making uſe of any ſtratagem or deception, began to paſs the river in the face of the enemy. Prince Gallitzin, having perceived this motion, immediately attacked thoſe troops that had croſſed the river in the night; who conſequently could neither chooſe their ground, nor have time to extend or form themſelves properly where they were. Notwithſtanding theſe great diſadvantages, the engagement was very ſevere, and continued from ſeven in the morning till noon. The Turks fought with great obſtinacy; but they were at length totally defeated, and obliged to repaſs the river with conſiderable loſs, and in the greateſt diſorder and confuſion. It was computed that about 60,000 Turks croſſed the river before and during the time of the engagement. Prince Gallitzian charged at the head of five columns of infantry, with fixed bayonets, who deſtroyed the flower of the Turkiſh cavalry. The loſs of the Turks, in this battle, is ſaid to have amounted to 7000 men killed upon the ſpot, beſides wounded and priſoners, and a great number who were drowned.

Though the ill conduct of the vizier had greatly contributed to this capital misfortune, yet this conſideration did not deter him from engaging in another operation of the ſame nature. He now laid but one bridge over the river, which he had the precaution to cover with large batteries of cannon, and prepared to paſs over with the whole army. Accordingly, on the 17th of September, 8000 janiſſaries, and 4000 regular cavalry, the flower of the whole Ottaman army, paſſed over a large train of artillery; and the reſt of the army were in motion to follow, when a ſudden and extraordinary ſwell of the waters of the Nieſter carried away and totally deſtroyed the bridge. The Ruſſians loſt no time in making uſe of this great and unexpected advantage. A moſt deſperate engagement enſued, in which the ſlaughter of the Turks was prodigious. Not only the field of battle, but the river, over which ſome few hundreds of Turks made their eſcape by ſwimming, was for ſeveral miles covered with dead bodies. The Ruſſians took 64 pieces of cannon, and above 150 colours and horſe-tails. The Turks immediately broke up their camp, and abandoned the ſtrong fortreſs of Choczim, with all its ſtores and numerous artillery, and retired tumultuouſly towards the Danube. Prince Gallitzin placed a garriſon of four regiments in the fortreſs of Choczim, and ſoon after reſigned the command of the army to general Romanzow, and returned to Peterſburgh, covered with laurels. The Turks were much exaſperated at the ill conduct of their commander; and it was computed that they loſt 28,000 of their beſt and braveſt troops within little more than a fortnight; and that 40,000 more abandoned the army, and totally deſerted, in the tumultuous retreat to the Danube.

The war continued to be carried on ſucceſsfully by the Ruſſians, who over-ran the great province of Moldavia;

davia; while general Elmpt took poſſeſſion of the capital city of Jaſſy without oppoſition: and as the Greeks in this province had always ſecretly favoured the Ruſſians, they now took this opportunity of their ſucceſs, and the abſence of the Turks, to declare themſelves openly. The Greek inhabitants of Moldavia, and afterwards thoſe of Wallachia, alſo acknowledged the empreſs of Ruſſia as their ſovereign, and took oaths of fidelity to her.

On the 18th of July 1770, general Romanzow defeated a Turkiſh army near the Larga: the Turks are ſaid to have amounted to 80,000 men, and were commanded by the khan of the Crimea; and on the 2d of Auguſt, the ſame general obtained a ſtill greater victory over another army of the Turks, commanded by a new grand vizier. This army, though very numerous, was totally defeated; above 7000 Turks are ſaid to have been killed on the field of battle, and that the roads to the Danube were covered with dead bodies. There fell into the hands of the Ruſſians ſome thouſand carriages laden with proviſions, 143 pieces of cannon, and a vaſt quantity of ammunition.

The war continued for ſome time to be carried on between the Ruſſians and Turks, both by land and ſea, to the advantage of the former. Some attempts were, however, at length made to negotiate a peace; but it was a long time before matters could be accommodated between theſe great contending powers; hoſtilities were repeated, ſuſpended, and afterwards renewed: but at laſt a peace was concluded, highly honourable and beneficial to the Ruſſians. and by which they obtained the liberty of a free navigation over the Black Sea, and a free trade with all the ports of the Ottoman empire.

The war with the Turks was not quite concluded, when a rebellion broke out in Ruſſia, which gave much alarm to the court of Peterſburg. A coſſac; whoſe name was Pugatſcheff, took upon him to perſonate the late unfortunate emperor Peter III. He appeared in the kingdom of Kaſan, and pretended that he made his eſcape through an extraordinary interpoſition of Providence, from the murderers who were employed to aſſaſſinate him; and that the report of his death was only a fiction invented by the court. He is ſaid to have greatly reſembled the late emperor in his perſon; which circumſtance induced him to engage in this enterpriſe. As he poſſeſſed abilities and addreſs, his followers ſoon became very numerous; and he at length found himſelf ſo powerful, and his followers being armed and provided with artillery, that he ſtood ſeveral engagements with able Ruſſian generals, at the head of large bodies of troops, and committed great ravages in the country: but he was at laſt totally defeated and taken priſoner; and, being brought to Moſcow in an iron cage, he was beheaded in that city on the 21ſt of January 1775.

Notwithſtanding the very unfavourable circumſtances the empreſs of Ruſſia was ſubject to, on her taking poſſeſſion of the government of that extenſive empire, it is on all ſides allowed that ſhe has, from the commencement of her reign, continued to govern with diſtinguiſhed reputation and ability. She has endeavoured greatly to extend the commerce of her ſubjects; and, as far as the Ruſſian government would permit, has given great encouragement to learning and the arts and ſciences. Many beneficial and important regulations have been made by her in the interior police of her vaſt empire; one of which is, the abolition of the uſe of torture; beſides adopting an excellent plan for the reformation of priſons. But one of the moſt remarkable tranſactions of her reign, is her eſtabliſhment of an armed neutrality, for the protection of the commerce of nations not at war, from any attacks or inſults from belligerent powers. In 1780, her imperial majeſty invited to it the powers not at war; and the kings of Sweden and Denmark and the States-General accordingly acceded to it the ſame year.

In the year 1790, the flames of war again broke out, in which the Ruſſians and Danes united their forces againſt the Swedes, whoſe bravery was greatly ſignalized againſt the enemy, particularly at ſea, under the conduct of the duke of Sudermania. The king of Sweden alſo attacked the Ruſſian fleet in the road of Revel on the 13th of May; in this engagement the Ruſſians had eleven ſhips of the line and five frigates, which were ſupported by the guns of the works and ſeveral batteries; notwithſtanding which, the Ruſſians received much damage, and had it not been for a ſtorm, during which the wind changed, and the Swediſh ſhips could not uſe their lower deck guns, and many of them could not keep their place in the line, the Ruſſian fleet muſt have been ruined.

The Swedes alſo, in the ſame month, entered the Ruſſian territories, and poſſeſſed themſelves of a very ſtrong poſt called Karnankoſky, on the borders of the lake Saima, where the Ruſſians, with 10,000 men, made an attempt to diſlodge them. The Swedes withſtood their aſſault, and repulſed the Ruſſians, who are ſaid to have left near 2000 men on the field.

After various ſucceſs in the courſe of this war, the contending parties ſeemed diſpoſed for peace. The ſame motives which, for a ſeries of years, had rendered Guſtavus the devoted inſtrument of France; the ſame motives which had induced him to ſacrifice the lives of his people in the preſent conteſt, might be employed to convert him from the enemy into the ally of Ruſſia; on the 14th of Auguſt, 1790, therefore, a convention was ſigned between the courts of Ruſſia and Sweden, and was ratified in ſix days after. The baſis of the convention was, a general treaty of peace and amity, an alliance of the ſtricteſt nature, and an agreement that the boundaries of their reſpective territories ſhould remain the ſame as confirmed by the treaties of Abo and Nyſtadt.

At the cloſe of the year 1790, the empreſs had the ſatisfaction to ſee her conqueſts no longer bounded by the courſe of the Danube. The capture of Iſmail was the laſt important action. Eight different times were the Muſcovites repulſed with the ſlaughter of many of their braveſt ſoldiers. At the ninth, general Suwarrow put himſelf at their head, and ſnatching a ſtandard out of an officer's hand, ran directly towards the town, paſſed the trenches, and clambering up the wall, planted it himſelf upon the ramparts. "There," cried he, "my fellow ſoldiers, behold there your ſtandard in the power of the enemy, unleſs you will preſerve it; but I know you are brave, and will not ſuffer it to remain in their hands." This ſpeech had the deſired effect. It was taken by ſtorm on the 22d of December, 1790; and it is ſaid that the ſiege and capture did not coſt the Ruſſians leſs than 10,000 men. The moſt ſhocking part of the tranſaction is, that the garriſon (whoſe bravery merited, and would have received from a generous foe, the higheſt honours) were maſſacred in cold blood by the mercileſs Ruſſians, to the amount of upwards of 30,000 men, by their own account; and the place was given up to the unreſtrained fury of the brutal ſoldiery. The moſt horrid outrages were perpetrated on the defenceleſs inhabitants; and the conduct of the conquerors was more like that of a horde of cannibals, than of a civilized people.

England and Pruſſia, after a long and extenſive armed negotiation, at length aſſented to the demand of the empreſs, which was ſtrengthened by the interference of Spain and Denmark, that Oczakow, and the territory between the rivers Bog and Nieſter, ſhall in full ſovereignty belong to Ruſſia; that the river Nieſter ſhall for the future determine the frontiers of Ruſſia and the Porte; that the two powers

may

may erect on the ſhores of that river what fortreſſes they think proper: and Ruſſia engages to grant a free navigation on the river Nieſter. This was concluded on the 11th of Auguſt, 1791. Thus has the Porte entered into a war, for the purpoſe of regaining the Crimea, and after reducing the Ottoman empire to extreme weakneſs, and internal ſymptoms of ruin, irretrievable by a government in a regular progreſs of deterioration, loſt an important territory, and left the exiſtence of the empire at the mercy of another Ruſſian war. By ſome advantages offered to Pruſſia and Poland, and a few intrigues, Ruſſia may change the fluctuating ſtream of European politics, and by one powerful campaign overturn the Turkiſh monarchy.

The final treaty with the Turks was concluded at Jaſſy, the 9th of January, 1792. Catharine then applied herſelf to the improvement of Oczakow, and rendered it a place of great ſtrength, importance and commerce. At the ſame time ſhe was not inattentive to European politics. When the coalition of ſovereign powers was formed againſt France, Guſtavus III. the late king of Sweden, was to have conducted that expedition which was afterwards made againſt France by the king of Pruſſia and the prince of Brunſwick. Catharine, on this occaſion, promiſed to aſſiſt him and the alliance, with twelve thouſand Ruſſian troops, and an annual ſubſidy of three hundred thouſand rubles. She aſſured the pope that ſhe would ſupport him in the reſumption of Avignon, and publiſhed a ſtrong manifeſto againſt the French revolution and the progreſs of liberty; but the only active part ſhe took againſt that revolution, was ſending twelve ſhips of the line and eight frigates to join the Engliſh fleet, which were paid for by a ſubſidy, victualled and repaired in the Britiſh ports, and then returned home without rendering any further ſervice. But her attention was principally directed to Poland, and the efforts which that people made in the cauſe of liberty. Whilſt ſhe amuſed the world with manifeſtoes againſt France, ſhe beheld, with pleaſure, the greateſt powers of Europe waſting their ſtrength and treaſure; and undiſturbed by any foreign interference, made a ſecond partition of Poland, the circumſtances of which the reader will find briefly narrated in our account of that unfortunate country.

By her intrigues, ſhe, in like manner, annexed to the crown of Ruſſia the fertile and populous country of Courland. She invited the duke of Courland to her court under the pretext that ſhe wiſhed to confer with him on ſome affairs of importance; and during his abſence the ſtates of Courland aſſembled, and the nobles propoſed to renounce the ſovereignty of Poland, and annex the country to the empire of Ruſſia. The principal members of the great council oppoſed this change; but the Ruſſian general Pahlen appeared in the aſſembly, and his preſence ſilenced all objections. The next day (March 18, 1795) an act was drawn up, by which Courland, Semigallia, and the circle of Pilten, were ſurrendered to the empreſs of Ruſſia. The act was ſent to Peterſburg, and the ſubmiſſion of the ſtates accepted by the empreſs. The duke of Courland was in no condition to refuſe his acquieſcence: he received very conſiderable preſents from the empreſs, in compenſation, and retired to live on ſome extenſive eſtates he had purchaſed in Pruſſia.

But the acquiſition, by intrigue and artifice, of countries incapable of reſiſtance, was not ſufficient to ſatisfy the ambition of Catharine. Inceſſantly anxious to extend her dominions, ſhe turned her arms againſt Perſia, under the pretext of defending Lolf Ali Khan a deſcendent of the race of the Sophis; but in reality to ſeize on the Perſian provinces which border on the Caſpian ſea. Her general Valerian Zouboff penetrated, at the head of a numerous army, into the province of Dagheſtan, and laid ſiege to Derbent. Having carried a high tower which defended the place, he put all the garriſon to the ſword, and prepared to ſtorm the city. The Perſians, terrified at the barbarous fury of the Ruſſians, demanded quarter; and the keys of the city were delivered up to Zouboff by the commandant, a venerable old man, a hundred and twenty years of age, who had before ſurrendered Derbent to Peter I. at the beginning of the preſent century. Aga Mahmed was advancing to the relief of Derbent, when he learned that the place was already in the power of the Ruſſians. Zouboff drew out his army, and gave him battle; but victory declared in favour of the Perſians, who forced the Ruſſians to retire into Derbent; in conſequence of which defeat, a ſtrong body of Ruſſian troops were ordered to reinforce the army of Zouboff.

Theſe martial preperations, and plans of ambition, were, however, interrupted by her death. On the morning of the 9th of November, 1796, ſhe appeared very chearful, and took her coffee as uſual. Soon after ſhe retired into the cloſet, where continuing unuſually long, her attendants became alarmed, and at length opened the door, when they found her on the floor in a ſtate of inſenſibility, with her feet againſt the door. Doctor Rogerſon, her firſt phyſician, was immediately called, who bled her twice. At firſt ſhe appeared rather to revive, but was unable to utter a word, and expired at ten o'clock at night.

Catharine II. in her youth had been handſome, and preſerved in the cloſe of life a graceful and majeſtic air. She was of a middle ſtature, well proportioned, and, as ſhe carried her head very erect, appeared taller than ſhe really was. Her forehead was open, her noſe aquiline, her mouth well made, and her chin ſomewhat long, though not ſo as to have a diſagreeable effect. Her countenance did not want for expreſſion; but ſhe was too well practiſed in the courtly habits of diſſimulation, to ſuffer it to expreſs what ſhe wiſhed to conceal.

With reſpect to her political character, ſhe was undoubtedly a great ſovereign. From the commencement of her reign ſhe laboured, and with the greateſt ſucceſs, to increaſe the power and political conſequence of her country. She encouraged learning and the arts, and made every exertion to extend, encourage, and enlarge the commerce of her ſubjects. She effected many and important regulations in the interior police, and particularly in the courts of juſtice. She aboliſhed the torture, and adopted an excellent plan for the reformation of priſons. The new code of laws, for which ſhe gave inſtructions, will contribute ſtill more to mitigate the rigour of deſpotiſm. In the execution, indeed, of her plans for the aggrandiſement of her empire, ſhe appears to have acknowledged no right but power, no law but intereſt. Of her private life, her panegyriſts, if prudent, will ſpeak but little. They will dwell lightly on the means by which ſhe mounted the throne. The only palliation of that conduct, which the moſt friendly ingenuity can ſuggeſt, will be derived from the frequent and bloody uſurpations which, ſince the death of Peter the Great, had almoſt become the habit of the Ruſſian court. But there are ſome acts, at the recital of which we ſhould ſhudder, even if the ſcene were laid in Morocco. The myſterious fate of prince Iwan, in 1763, cannot be obliterated from hiſtory; the blood ſpilt in the long-conceived ſcheme of expelling the Turks from Europe, and reeſtabliſhing the eaſtern empire in the perſon of a ſecond Conſtantine, will not be expiated, in the eſtimation of humanity, by the gigantic magnificence of the project. Above all the fate of Poland, the diſſenſions and civil wars induſtriouſly fomented in that unhappy kingdom, for a period of thirty years, —the horrible maſſacres which attended its final ſubjugation, and the impious mockery of returning ſolemn thanks to heaven for the ſucceſs of ſuch

atrocious crimes, will be a foul and indelible ſtain on the memory of Catharine.

The character of her ſucceſſor Paul I. as far as it has been diſplayed ſince the commencement of his reign, appears to be milder and more pacific than that of his mother. Immediately on his acceſſion to the throne, he ordered hoſtilities to ceaſe between Ruſsia and Perſia; and a peace was ſoon after concluded between the two countries. He has ſet at liberty the unfortunate Koſciuſko, the general of the Poliſh inſurgents, beſtowed on him a penſion, with liberty either to reſide in his dominions or retire to America, which latter country the general has choſen for his aſylum. He has behaved with an honourable liberality towards the depoſed king of Poland; and reſtored to their eſtates a great number of Poliſh emigrants and fugitives. Should his abilities, as ſome have ſuggeſted, be unequal to the extenſive ſchemes of unjuſt ambition, planned and partly executed by his predeceſſor, the good qualities of his heart, which theſe acts ſeem to evince, may ultimately tend much more to the proſperity and happineſs of his people.

Catharine II. the empreſs of all the Ruſsias, was born May 2, 1729, and aſcended the throne July 9th, 1762, upon the depoſition and death of her huſband. She was married to that prince while he was duke of Holſtein Gottorp, Sept. 1, 1745; and died Nov. 9, 1796.

Paul I. preſent emperor of Ruſsia, was born Oct. 1, 1754. He has been twice married, and by his preſent conſort, who was princeſs of Wirtemberg, has iſſue:

1. Alexander, born Dec. 23, 1777, married to the princeſs Louiſa of Baden, May 21, 1793.
2. Conſtantine, born May 8, 1779, married to the princeſs of Saxe Cobourg, February 14, 1796.
3. Alexander Powlowna, born in Aug. 1783.
4. Helena, born Dec. 24, 1784.
5. A princeſs, born in March, 1786.
6. Another princeſs, born in May, 1788.
7. Another princeſs, born in 1792.

CHAP. VIII.

ISLANDS OF SCOTLAND.

Situation, Extent, Climate, Inhabitants, Animal and Vegetable Productions, Curioſities, &c.

THE iſlands belonging to Scotland conſiſt of Shetland, Orkney, and the Hebrides or Weſtern Iſles.

SHETLAND ISLANDS lie north-eaſt of the Orcades, or Orkney Iſlands, between 60 and 61 deg. of north lat. and are part of the ſhire of Orkney. The Orcades lie north of Dungſby-Head, between 59 and 60 deg, of north lat. divided from the continent by a tempeſtuous ſtreight called Pentland Frith, twenty-four miles long and twelve broad. The Hebrides, or Weſtern Iſlands are very numerous, and ſome of them large, ſituated between 55 and 59 deg. of north lat. theſe lie ſcattered in the Deucaledonian ſea, to the north-weſt of of Scotland.

The air of theſe iſlands is ſalutary, but keen and piercing, except in ſummer, when it is very ſerene. During the months of June and Juiy, the inhabitants can ſee to read at midnight; but then they are ſubject to a winter of eight months, in which ſeaſon they are involved in darkneſs, ſtorms, and fogs. In ſummer their ſea is covered with fiſhing-veſſels belonging to different nations, who reſort thither to catch herrings, with which their coaſt abounds; but from October to May, they are deprived of every communication with other countries; and not a ſingle ſhip is ſeen on their coaſt. The ſoil is in general rocky and ſandy, and conſequently barren in many places.

Many of the Shetland iſlands (which are forty-ſix in number) are uninhabited, Mainland is the largeſt, being ſixty miles in length, and twenty in breadth. Larwick is the principal town, and contains 300 families; the whole number of families in the iſland not exceeding 500. Skalloway is another town, where may be ſeen the remains of a caſtle, and it is the ſeat of a preſbytery. The Dutch begin at Midſummer to fiſh for herrings on the coaſt of this iſland, and their fiſhing-ſeaſon laſts ſix months. The Shetlands derive a great advantage from this fiſhery. A great traffic is carried on between theſe iſlanders and the people of Hamburg and Bremen, who take in return for brandy, ſpices, &c. their live ſtock, hoſe, and mittens.

The ORKNEY ISLANDS are about thirty in number, but moſt of them unpeopled; the largeſt is called Pomona, being thirty-three miles in length, and nine in breadth, in ſome places. It contains nine pariſh churches, and has four excellent harbours. The cathedral of Kirkwall, the capital of the Orkneys, is a fine Gothic building, dedicated to St. Magnus, but now converted into a pariſh church. Its roof is ſupported by fourteen pillars on each ſide, and its ſteeple, in which is a good ring of bells, by four large pillars. The three gates of the church are chequered with red and white poliſhed ſtones, emboſſed and elegantly flowered.

MULL, one of the Hebrides, is twenty-four miles long, and in ſome places almoſt as broad. It contains two pariſh churches, and a caſtle, called Duert, which is the chief place in the iſland. The other principal weſtern iſlands are Lewis, or Harris, both which form one iſland, which belongs to the ſhire of Roſs, and is 100 miles in length, and thirteen or fourteen in breadth; its chief town is Stornvay.

Sky, belonging to the ſhire of Inverneſs is forty miles long, and thirty broad in ſome places; fruitful, and well peopled. Bute, about ten miles long, and three or four broad, is famous for containing the caſtle of Rothſay, which gave the title of duke to the eldeſt ſons of the kings of Scotland; as it now does to the prince of Wales. Rothſay is likewiſe a royal burgh; and the iſlands of Bute and Arran form the ſhire of Bute. Ila and Jura are part of Argyleſhire, and contain together 370 ſquare miles, but they have in them no remarkable towns. North Uiſt contains an excellent harbour, called Lochmaddy, famous for herring-fiſhing. Many other of the Hebrides iſlands are of ſmall importance either to the public or the proprietors, though, by the very improveable fiſheries upon their coaſts, it is not unlikely they may in future times be of great conſequence to both. Jona was once famous for being the ſeat and ſanctuary of ancient learning, and the burying-place of many kings of Scotland, Ireland, and Norway. St. Kilda, or Hirt, is the remoteſt of all the north-weſt iſlands, and very difficult of acceſs: it contains about thirty-five families.

The inhabitants of Shetland were originally emigrants from Norway, to which for many years they paid a tribute called Schet, from whence their new ſettlement derived the name of Schetland. But ſome centuries ago theſe iſlands were ceded to the king of Scotland, for a valuable conſideration, and have ever ſince been annexed to the Scottiſh crown, and, with the iſles of Orkney, form a ſhire. The Shetlanders are in general ſimple, honeſt, religious, hoſpitable, humane, and commonly live to a great age. Thoſe who poſſeſs eſtates, are of Scotch extraction, and live in as great elegance as the gentry of that kingdom: but the poorer ſort of people ſubſiſt chiefly upon fiſh, which ſupplies them with light as well as food; for they make an oil of it, which they burn in lamps during the continuance of their long winter; when, having

having no wood, they make fires of turf, peat, and heath. Their common drink is butter-milk mixed with water and whey; which latter, by a peculiar method of fermentation, acquires a vinous quality, when they barrel it for uſe.

The people who inhabit the leſſer iſles ſubſiſt upon the eggs and fleſh of ſea-fowl, the firſt of which they obtain at the imminent hazard of their lives, climbing up the rocks to the neſts, or being lowered down to them by ropes, over dreadful precipices. Theſe iſlanders, in general, enjoy an excellent ſtate of health, and, when attacked by any diſeaſe, ſeldom employ a phyſician. They are ſubject to the ſcurvy, which they cure with the cochlearia or ſcurvy-graſs, and their ſovereign remedy for the jaundice is powder of ſnail-ſhells.

The inhabitants of the Hebrides are deſcended from the ſame anceſtors with thoſe who live in the Highlands of Scotland, to whoſe cuſtoms they entirely conform; but are much more ſimple and induſtrious. They are in general ſtrong, vigorous, and healthy. The men are fond of tobacco to exceſs, and make uſe of it in all the different ways of chewing, ſmoaking, and ſnuff. They ſometimes eat fleſh, but their moſt common food conſiſts of oatmeal, cheeſe, butter, milk, and whey. The better ſort of people live very comfortably, but the poor dwell in wretched cabins built of looſe ſtones and mud, and thatched with ſtraw. The partitions within are no other than a kind of hurdle, plaſtered with clay, and they have neither glaſs in their windows, nor any other chimney, than a hole in the centre of the roof, immediately under which is a hearth made of ſtone, whereon they burn wood, peat, or turf. Around this hearth the family ſit in the day time, and lie at night, during the winter. At the further end of the ſame houſe, the cattle are ſtalled, and the children, calves, and pigs, frequently ſleep all together; for theſe people are exceedingly naſty, and to this ſluttiſhneſs in themſelves and habitations may be imputed that inveterate itch with which they are ſo generally infected. The attachment of theſe iſlanders to their chieftains is remarkably ſtrong, norwithſtanding great pains have been taken by the legiſlature of Great Britain to overcome connexions ſo dangerous to government. Both ſexes are exceedingly fond of dancing to their own muſic, and the men are very expert and agile in all the exerciſes of the field.

The reader would not pardon an author, who, in treating of this ſubject, ſhould omit that remarkable mantology, or gift of prophecy, which diſtinguiſhes the inhabitants of the Hebrides under the name of *ſecond ſight*. It would be equally abſurd to attempt to diſprove the reality of the inſtances of this kind that have been related by reputable authors, as to admit all that has been ſaid upon the ſubject. The adepts of the ſecond ſight pretend that they have certain revelations, or rather preſentations, either really or typically, which ſwim before their eyes, of certain events that are to happen in the courſe of 24 or 48 hours. I do not, however, from the beſt information, obſerve that any two of theſe adepts agree as to the manner and form of thoſe revelations, or that they have any fixed method for interpreting their typical appearances. The truth ſeems to be, that thoſe iſlanders, by indulging themſelves in lazy habits, acquire viſionary ideas, and overheat their imaginations, till they are preſented with thoſe phantaſms, which they miſtake for fatidical or prophetic manifeſtations. They inſtantly begin to propheſy; and it would be abſurd to ſuppoſe, that, amidſt many thouſand predictions, ſome did not happen to be fulfilled; and theſe being well atteſted, give a ſanction to the whole.

The iſlands of Orkney, which were originally peopled from Norway, were formerly ſometimes ſubject to the Norwegians, and at others to the Scots, juſt as the chance of war determined; but at length they were entirely ceded to Alexander, king of Scotland, by Magnus, king of Norway, for the ſum of 4000 marks ſterling, and an annual acknowledgement of 100 more.

In theſe iſlands the genteeler ſort of people are exceedingly polite, hoſpitable, frugal, ſagacious, circumſpect, and religious; conforming themſelves entirely to the manners of the Scots, from whom they are in general deſcended. The common people, particularly the mariners, are bold, active, dextrous, hardy, and inured to fatigue even from their infancy. Their common food is ſalt fiſh, which ſubjects them to ſevere attacks of the ſcurvy. In moſt diſorders they make uſe of plants, but being exceedingly ſuperſtitious, they put great faith in charms and amulets. Theſe people, like the Shetlanders, are remarkable for longevity.

The population of theſe three diviſions of iſlands cannot be given with certainty. They are repreſented by credible hiſtorians as having been much better peopled about 400 years ago, than they are at preſent: for the Hebrides themſelves were often known to ſend 10,000 fighting men into the field, without prejudice to their agriculture. It is ſaid, their numbers do not now exceed 48,000. The religion profeſſed in the Hebrides is chiefly Preſbyterian, as eſtabliſhed in the Church of Scotland; but great ignorance ſtill prevails among ſome of the iſlanders; whilſt they are extremely addicted to ſuperſtitious practices and cuſtoms. The language of the inhabitants of the Hebrides ſeems to be a compound of the Daniſh, Norwegian, and that of other northern people, but in no degree approaches to the purity of the Celtic, commonly called Erſe, which has been the received, though erroneous opinion, of many learned men.

Iron, tin, lead, and ſilver mines; marl, ſlate, free-ſtone, and even quarries of marble, have been found upon theſe iſlands; alſo talc, cryſtals, and numbers of curious pebbles; and they are not deſtitute of fine freſh water, nor of lakes and rivulets that abound with excellent trout. The preſent face of the ſoil is bare, and unornamented with trees, except a few that are reared in gardens; but experience daily ſhews, that, if the ſoil of the northern and weſtern iſlands was, till of late barren, cold, and uncomfortable, it muſt have been owing to its want of improvement by cultivation; for ſuch ſpots as are now cultivated, produce corn, vegetables, and garden-ſtuff, more than ſufficient for the inhabitants; and even fruit-trees are now brought to maturity. Many of theſe iſlands have been the habitations of the Druids, whoſe temples are ſtill viſible in moſt of them; and thoſe temples were ſurrounded with groves, though little or no timber now grows in the neighbourhood. The ſtumps of former trees, however, are diſcernable, as are many veſtiges of grandeur, even ſince the admiſſion of the Chriſtian religion; which prove the decreaſe of the riches, power, and population of the inhabitants.

The ſtaple commodities of theſe iſlands conſiſt of fiſh, eſpecially herrings, which are the beſt in the world, and, when properly cured, are ſuperior even to thoſe of the Dutch. They carry on likewiſe a conſiderable trade in down and feathers; and their wool, which they manufacture into coarſe cloths, ſtockings, and a variegated ſtuff called tartan, and the linen manufactures make no ſmall progreſs in theſe iſlands. They carry their black cattle alive to the adjacent parts of Scotland, where they are diſpoſed of in ſale or barter, as are large quantities of mutton, which they ſalt in the hide. From the Orkneys, they annually export, beſides cattle, ſkins of ſeals, otters, lambs, and rabbits; alſo corn, butter, tallow, ſalt, down, feathers, writing quills, and hams; to which we may add, wool and ſtuffs.

Moſt of the birds and fiſhes common to the northern countries are to be found here; beſides which,

which, here is a ſpecies of falcon or hawk, of a more docile nature than any that are to be found elſewhere. The Shetland iſlands are famous for a ſmall breed of horſes, which are exceedingly active, ſtrong, and hardy, and frequently ſeen in the ſtreets of London, yoked to the ſplendid carriages of the curious or wealthy. The Orkneys bear plentiful crops of barley, and oats will come to perfection. In theſe iſlands are alſo, beſides a great variety of cattle, all kinds of domeſtic animals, and poultry. Plenty of red deer, partridges, growſe, heath-cock, and plover, are found on the heaths and commons; and the waters abound in duck, teal, and widgeon. The ſea, beſides whales, ſeals, and otters, furniſhes the inhabitants with cod, ling, tuſk, herrings, crabs, oyſters, remarkable large muſcles and cockles. The rocks are covered with eagles, hawks, kites, wild geeſe, ſolan geeſe, barnacles, lipes, and other ſpecies of wild fowl.

The artificial curioſities conſiſt chiefly in the remains of Druidical monuments, ancient caſtles, and churches. The firſt are found in many of the iſlands; but the moſt remarkable is ſituated near the village of Claſſerniſs, in the iſland of Lewis. This monument conſiſts of thirty pyramidical ſtones ſtanding upright, about ſix or ſeven feet high above the ſurface of the ground; forming a kind of avenue eight feet wide, leading to a circle of twelve ſtones of the ſame dimenſions, and one in the centre. The central ſtone is thirteen feet high, and ſhaped like the rudder of a ſhip. On the eaſt, ſouth, and weſt ſides of this circle, are four ſtones ſimilar to thoſe which compoſe the circle and avenue, forming three right lines, or rays, iſſuing from the body of the circle. This is ſuppoſed to have been a Druid temple, and the inhabitants have a tradition that the chief Druid ſtood by the large ſtone in the centre, and harangued the audience.

The fortifications are thoſe principally erected by the Danes, and conſiſt of watch-towers, beacons, and a great number of caves, or caverns, ſome of which are capacious, and almoſt impregnable.

A great variety of eccleſiaſtical antiquities, conſiſting of the ruins of churches, convents, and other ſtructures dedicated to religion, are found in many of theſe iſlands; but the moſt remarkable are thoſe on Jona, or St. Columb-kill. According to ancient tradition, St. Columba firſt landed in this iſland from Ireland; and after converting the Picts by his preaching the Chriſtian religion, the king beſtowed this iſland on him, as a mark of his gratitude for the eminent ſervice he had done his country. But however that be, it is certain that he erected in that iſland two churches, and two monaſteries, and inſtituted a ſeminary which ſoon became famous for learning. Here the remains of ancient literature were cultivated and preſerved, when it was almoſt obliterated in other parts of Europe. Theſe foundations were richly endowed by the kings of Scotland, and lords of the iſles; Jona became the reſidence of the biſhop of the iſles, and, on account of its ſuppoſed ſanctity, was choſen as the burial place for kings, heroes, and eccleſiaſtical perſons.

The Church of St. Mary is built in the form of a croſs, and in the Gothic ſtyle of architecture. On each ſide of the choir are two chapels, adorned at the entrance with large pillars carved in baſſo-relievo; the ſteeple, doors, and windows are decorated with curious fretwork: the altar is large, magnificent, and compoſed of fine poliſhed marble. Several abbots are interred within the church, and among theſe, Mac-Ilikenich, whoſe ſtatue of black marble, as big as the life, is placed over his tomb, in an epiſcopal habit, with his mitre and croſier. Behind the church are the ruins of a cloiſter, library, and hall. At the weſt end of the church is a ſmall cell, where we find the tomb of St. Columba, but without any inſcription. Near it ſtands the Croſs of St. Martin, an entire piece of porphyry, eight feet high, placed on a pedeſtal, and exhibiting on the eaſt ſide the figure of a tree, and on the weſt a large crucifix. On the ſouth ſide of the Church of St. Ouran is the cemetry, where the kings and chieftains lie buried under ſhrines. Here are three vaults diſtinguiſhed by inſcriptions, now not legible. In that on the right hand, four kings of Ireland lie interred; in that on the left, eight kings of Norway; and in the middle-moſt, forty-eight kings of Scotland.

In a gloomy valley belonging to Hoy, one of the weſtern iſlands, is a kind of hermitage, cut out of a ſtone called a dwarf ſtone, thirty-ſix feet long, eighteen broad, and nine thick; in which is a ſquare hole, about two feet high, for an entrance, with a ſtone of the ſame ſize, for a door. Within this entrance is the reſemblance of a bed, with a pillow cut out of the ſtone, big enough for two men to lie on: at the other end is a couch, and in the middle a hearth, with a hole cut out above for a chimney. Barrows, as they are called in England, are frequently in theſe iſlands; and the gigantic bones found in many burial-places here, give room to believe that the former inhabitants were of larger ſize than the preſent.

In theſe iſlands, the natural curioſities are very numerous: they abound with rocks of various uncommon forms, prodigious caverns, and cataracts. But the whirlpool, or vortex, near Jurah, called Cory-Vreltan, muſt not be paſſed over without notice. It is ſituated between the north-end of Jurah, and the ſmall iſland of Scarba. In this vortex, which extends about a mile in breadth, the ſea begins to boil and ferment with the tide of flood, increaſing gradually to a number of whirlpools, which, in the form of pyramids, ſpout up the water with a great noiſe, as high as the maſt of a ſmall veſſel, agitated into ſuch a foam, as gives the ſea a white appearance, at two leagues diſtance. About half flood the violence begins to decreaſe, and continues gradually ſubſiding, till about half an hour after high-water, when the ſmalleſt fiſhing-boat may croſs it without the leaſt danger. And Sir Joſeph Banks, in relating his voyage through the Hebrides, anno 1772, gives us the following deſcription of one of the moſt aſtoniſhiſhing appearances in nature. "We were no ſooner arrived (ſays this gentleman) than we were ſtruck with a ſcene of magnificence which exceeded our expectations, though founded, as we thought, upon the moſt ſanguine probability: the whole of that end of the iſland (viz. Staffa, a mile in length, and half a mile in breadth) ſupported by ranges of natural pillars, moſtly above fifty feet high, ſtanding in natural colonades, according as the bays or points of land formed themſelves: upon a firm baſis of ſolid unformed rock, above theſe, the ſtratum which reaches to the ſoil or ſurface of the iſland, varied in thickneſs as the iſland itſelf formed into hills or vallies; each hill, which hung over the columns below, forming an ample pediment; ſome of theſe above ſixty feet in thickneſs from the baſe to the point, formed, by the ſloping of the hill on each ſide, almoſt into the ſhape of thoſe uſed in architecture." But the moſt ſtriking object in this field of ſcenery is Fingal's Cave, thus deſcribed by Mr. Banks: "We proceeded along the ſhore, treading upon another Giant's Cauſeway, every ſtone being regularly formed into a certain number of ſides and angles; till, in a ſhort time, we arrived at the mouth of the moſt magnificent cave that has probably ever been deſcribed by travellers. The mind can hardly form an idea more magnificent than ſuch a ſpace, ſupported on each ſide by ranges of columns, and roofed by the bottoms of thoſe which have been broken off in order to form it; between the angles of which, a yellow ſtalagmitic matter has exuded, which ſerves to define the angles preciſely, and at the ſame time vary the colour, with a great deal of elegance; and, to render it ſtill more agreeable, the

whole is lighted from without; ſo that the furtheſt extremity is very plainly ſeen from without, and the air within being agitated by the flux and reflux of the tide, is perfectly dry and wholeſome, free entirely from the damp of vapours with which natural caverns generally abound." The length of this wonderful cave, from the arch without, is 371 feet; from the pitch of the arch, 250; breadth at the mouth, 53; height of the arch at the mouth 117; at the end, 70; height of an outſide pillar, 39; of one at the N. W. corner, 54; depth of the water at the mouth, 18; at the bottom, nine feet.

On the weſt ſide of the iſland of Pabbay, a ſtream running down the face of a rock petrifies into a white hard ſubſtance, of which the natives make excellent lime.

For an account of learning, learned men, and hiſtory, the reader is referred to the enſuing deſcription of SCOTLAND.

CHAP. IX.

SCOTLAND.

Situation, Boundaries, Diviſions, Climate, Rivers, &c. Produce, Population, Inhabitants, Cuſtoms, Cities, Commerce and Manufacturies, Fiſheries, &c.

SCOTLAND, or NORTH BRITAIN, is ſituated between 54 and 59. deg. of north lat. and between 1 and 6 deg. of weſt long. It is about 300 miles in length, 190 in breadth, and contains an area of 27,794 ſquare miles; being bounded on the north by the Deucaledonian Ocean, on the ſouth by England, on the eaſt by the German Ocean, and on the weſt by the Iriſh Sea.

Scotland is divided into two parts, ſeparated by the Frith of Forth; Edinburgh is the capital of the ſouthern diviſion, and Aberdeen the chief town of the northern. The northern contains fifteen counties, and the ſouthern eighteen, and theſe counties are ſubdivided as follow:

Shires.	*Sheriffdoms and other Subdiviſions.*	*Chief Towns.*
1. Edinburgh	Mid-Lothian	Edinburgh, Muſſelburg, Leith, and Dalkeith.
2. Haddington	Eaſt-Lothian	Dunbar, Haddington, and North Berwick.
3. Merſe, anciently Berwick	The Merches and Bailiery of Lauderdale	Dunſe and Lauder.
4. Roxborough	Tiviotdale, Lidſdale, Eſkdale, and Euſdale	Jedburgh, Kelſo, and Melroſs.
5. Selkirk	Ettrick Foreſt	Selkirk.
6. Peebles	Tweedle	Peebles.
7. Lanerk	Clydeſdale	Glaſgow, Hamilton, Lanerk, and Rutherglen.
8. Dumfries	Nithſdale, Annandale	Dumfries, Annan.
9. Wigtown	Galloway, W. Part	Wigtown, Stranraer, and Whitehorn.
10. Kirkcudbright	Galloway, E. Part	Kirkcudbright.
11. Aire	Kyle, Carrick, and Cunningham	Aire, Kilmarnock, Irwin, Maybole, Stewarton, and Salcots.
12. Dumbarton	Lenox	Dumbarton.
13. Bute, and 14. Caithneſs	Bute, Arron, Caithneſs	Rothſay, Wick, Thurſo.
15. Renfrew	Renfrew	Renfrew, Paiſley, Greenock, and Port-Glaſgow.
16. Stirling	Stirling	Stirling and Falkirk.
17. Linlithgow	Weſt-Lothian	Linlithgow, Burroughſtonneſs, and Queen's Ferry.
18. Argyle	Argyle, Cowval, Knapdale, Kintire, and Lorn, with part of the W. Iſles, particularly Iſla, Jura, Mull, Wiſt, Teriff, Col, and Liſmore	Inverary, Dunſtaffnage, Killemor, and Campbel-Town.
19. Perth	Athol, Gowry, Breadalbane, Monteith, Strathern, Stormount, Glenſheild, and Raynork	Perth, Scone, Dumblain, Blair, and Dunkeld.
20. Kincarden	Mearns	Bervie, Stonhive, and Kincardin.
21. Aberdeen	Mar, Buchan, Garioch, and Strathbogie	Old Aberdeen, New Aberdeen, Frazerburgh, Peterhead Kintore, Strathbogie, Inverary, and Old Meldrum.
22. Inverneſs	Aird, Strathglaſs, Sky, Harris, Badenoch, Lochaber, and Glenmoriſon	Inverneſs, Inverlochy, Fort Auguſtus, and Boſbaw.
23. Nairne, and 24. Cromarty	Weſtern Part of Murray and Cromarty	Nairne, Cromarty.
25. Fife	Fife	St. Andrew's Cowper, Falkland, Kirkaldy, Innerkythen, Ely, Burnt-Iſland, Dumfermline, Dyſart, Anſtruther, and Aberdour.
26. Forfar	Forfar, Angus	Montroſe, Forfar, Dundee, Arbroath, Brechin.
27. Banff	Banff, Strathdovern, Boyne, Eury, Balveny, Strathawin, and part of Buchan	Bamff and Cullen.
28. Sutherland	Strathnaver and Sutherland	Strathy and Dornock.
29. Clacmannan, and 30. Kinroſs	Fife part	Culroſs, Clacmannan, Alloa, and Kinroſs.
31. Roſs	Eaſter and Weſter Roſs, Iſle of Lewis, Lochbroom, Lochcarren, Ardmeanach, Redcaſtle, Ferrintoſh, Strathpeffer, and Ferrindonald	Taine, Dingwall, Portroſe, Roſamarkie, and New Kelſo.
32. Elgin	Murray and Strathſpey	Elgin and Forres.
33. Orkney	Iſles of Orkney and Shetland	Kirkwall, Skalloway.

In all, thirty-three ſhires, which chooſe thirty repreſentatives to ſit in the parliament of Great-Britain; Bute and Caithneſs, Nairne and Cromarty, Clackmannan and Kinroſe, chooſe alternately.

Each of the fifteen royal boroughs chooſes one repreſentative. Theſe are, 1. Edinburgh; 2 Kirkwall, Wick, Dornock, Dingwall, and Tayne; 3 Fortroſe, Inverneſs, Nairne, and Forres; 4. Elgin, Cullen, Bamff, Inverary, and Kintore; 5. Aberdeen, Bervie, Montroſe, Aberbrothe, and Brechin; 6. Forfar, Perth, Dundee, Cowper, and St. Andrew's; 7. Crail, Kilrenny, Anſtruther Eaſt and Weſt, and Pittenweem; 8. Dyſart, Kirkaldy, Kinghorn, and Burnt-Iſland; 9. Innerkythen, Dumfermline, Queen's-Ferry, Culroſs, and Stirling; 10. Glaſgow, Renfrew, Rutherglen, and Dumbarton; 11. Haddington, Dunbar, North Berwick, Lauder, and Jedburgh; 12. Selkirk, Peebles, Linlithgow, and Lanerk; 13. Dumfries, Sanquebar, Annan, Lochmaben, and Kirkcudbright; 14. Wigtown, New Galloway, Stranraer, and Whitehorn; 15. Air, Irvin, Rothſay, Campbel-Town, and Inverary.

The air of Scotland is more temperate than could be expected in ſo northerly a climate. This ariſes partly from the variety of its hills, vallies, rivers, and lakes; but ſtill more, as in England, from the vicinity of the ſea, which affords thoſe warm breezes that not only ſoften the natural keenneſs of the air, but, by keeping it in perpetual agitation, render it pure and healthful, and prevent thoſe epidemical diſtempers which prevail in other countries. In the northern parts, day-light, at Midſummer, laſts eighteen hours and five minutes; and the day and night in winter are in the ſame proportion. The ſoil in Scotland varies, as it commonly does in every other country; the Lowlands are rich, and only want proper culture to produce good crops of wheat and other grain; but the finer particles of earth, inceſſantly worked down from the mountains, and depoſited in the vallies, afford them a vegetable nouriſhment capable of carrying the ſtrongeſt plants to perfection; though many vegetables and hortulan productions do not come ſo ſoon to perfection here as in England. The water naturally depends on the quality of the ſoil over which it paſſes; but it is for the moſt part very ſalutary; and, of late years, ſome mineral ſprings have been diſcovered in this country. The Uplands yield excellent paſture, but there are in them extenſive tracts of barren heath.

Though Scotland enjoys many large and long tracts of ground, fit for all the purpoſes of agriculture, yet it is in general very mountainous; from eaſt to weſt it is divided by a chain of theſe, known by the name of Grants-Bain, or the Grampian-Hills, which run through Lothian, and join the mountains of Tweedale. A third diſtinguiſhed by the name of Lammer-Muir, riſing near the eaſtern coaſt, runs weſtward through the Merſe; and, beſides theſe, there are a prodigious number of detached hills and mountains, remarkable for their ſtupendous height and declivity.

In this country, there are many rivers, lakes, rivulets, and fountains; the names of the principal rivers are the Tweed, the Forth, the Clyde, the Tay, and the Spey. The Tweed takes its riſe on the borders of Annandale, which ſerves as a boundary between Scotland and England; and, after a ſerpentine courſe of great length, diſcharges itſelf into the ſea at Berwick. The Forth riſes in Monteith, near Callendar, paſſes by Stirling, and, after a courſe of twenty-five leagues, runs into the arm of the ſea called the Frith of Forth, which divides the coaſt of Lothian from Fife. The Clyde takes its riſe from Errick-Hill, in the ſhire of Lanerk, traverſes the ſhire of Clydeſdale, waſhes the city of Glaſgow, widens in its paſſage to the caſtle of Dumbarton, and forms the Frith of Clyde, adjoining to the Iriſh ſea. The Tay derives its ſource from Loch-Tay in Breadalbane, and, after a ſouth-eaſt courſe, diſcharges itſelf into the ſea below Dundee. The Spey iſſues from a lake of the ſame name in Badenoch, and, running a north-eaſterly courſe, falls into the German Ocean near Aberdour. Beſides theſe capital rivers, there are a number of ſmaller ſtreams, that are very deep, and contribute greatly to the beauty and advantage of the country.

The lakes in Scotland are very numerous; the inhabitants ſometimes giving the name of lake, or loch, to an arm of the ſea; which is the caſe of Loch Fyn, famous for its excellent herrings, it being ſixty miles long and four broad. Loch An, Loch Lomond, and Loch Tay, preſent us with the moſt beautiful ſcenes, and their banks, like thoſe of many others, are adorned with woods. Near Lochneſs, on the top of a hill, two miles in perpendicular height, is a lake of freſh water, about 180 feet in length, unfathonable, and remarkable for never having been known to freeze; whereas Loch Anwyn, or Green Lake, which is not above ſeventeen miles diſtant from it, is perpetually covered with ice. The Loch of Spinie, near Elgin, is frequented by large flights of ſwans and cygnets, which are ſometimes ſo numerous as to cauſe a ſudden darkneſs in the air. Their fondneſs for this ſpot is, with great appearance of reaſon, attributed to their feeding on the plant Olorina, which grows in this lake, and riſes above the water with a long ſtraight ſtalk, bearing a cluſter of ſeeds at the top. The coaſts of Scotland are, in many parts, indented with large, bold, and navigable bays, or arms of the ſea; as the bay of Glenluce and Wigtown-Bay; alſo the Solway Bay or Frith, which ſeparates Scotland from England, on the weſt; the Frith of Forth, Murray, Cromarty, Dornock, &c.

It is ſuppoſed that Scotland was formerly over-run with timber; for, in every part of it, large trees are frequently dug up, and great logs of wood are found in the deepeſt moraſſes, as well as human bodies; by which it appears, that their waters, being impregnated with turpentine, have a preſerving quality. Very little timber grows in their foreſts except pines. The Scots oak, which grows in the Highlands, is eſteemed very good; but its diſtance from any water-carriage, renders that valuable article of very little benefit either to the nation or the owners. Fir-trees grow in great perfection in this country, and form beautiful plantations.

Small pieces of gold have often been found in brooks after a great torrent, which induce us to believe the accounts which hiſtorians give of the gold mines in Scotland. At the nuptials of James V. with a daughter of France, covered diſhes filled with coins of Scots gold, were repreſented to the gueſts by way of deſert: and, in the time of that monarch, the mines of Crawfurd-Moor were worked by Germans, under the direction of one Cornelius, their chief. But the civil wars, which happened in the reign of Mary, queen of Scots, obliged theſe people to abandon their works, which have never ſince been reſumed.

There are ſeveral lead mines in Scotland, which produce great quantities of ſilver: ſome copper mines have been diſcovered near Edinburgh: and no country boaſts of greater plenty of iron ore.

The eaſt, weſt, and northern parts of the country produce exceeding good coal, of which large quantities are exported: and, where there is a deficiency of this firing, the inhabitants ſupply its place by burning turf and peat. In many parts, however, they are reduced to the greateſt diſtreſs for fuel, being obliged to burn cow-dung, which they carefully dry and depoſit for that purpoſe. Lime-ſtone and free-ſtone are found here in great plenty, which, added to the exceeding low price of labour, enables the people to erect very elegant houſes. In Bamff-ſhire, alum mines have lately been diſcovered.

Variegated pebbles, cryſtal, and ſeveral other tranſparent ſtones are found in many parts of Scotland, which, when poliſhed, are proper for ſeals, ſnuff-

boxes,

boxes, ear-rings, and other toys; and in Lanerkſhire, or Clydeſdale, large pieces of lapis lazuli are frequently dug up. The country abounds in flint, talc, ſea-ſhells, fullers earth, and potters-clay. Here are vaſt numbers of ſmall ſtones of a particular ſpecies, which the inhabitants call elf-arrow heads, and to which they are ſtudious to aſſign a ſupernatural origin and uſe, and, at this period, it is difficult to determine what they originally were; but it is ſuppoſed, that they are the flint heads of the arrows, uſed by the Caledonians and ancient Scots.

Various improvements in huſbandry, have been lately made; ſo that the Lowlands produce variety of grain, fruits, and herbs, viz. wheat, barley, oats, rye, flax, hemp, and hay; apples, pears, cherries, plums, ſtrawberries, raſberries, gooſeberries, and currans; peaches, nectarines, apricots, and, ſometimes, even grapes, are brought to perfection here, though not ſo early as in England; all ſorts of kitchen roots, ſalads, and greens, particularly the Scots kail, or colewort. The trees and ſhrubs natural to this country are, the oak, fir, birch, poplar, alder, willow, elder, hazle, mountain-aſh, crab-tree, juniper, hawthorn, ſloe, and dog-roſe. The heaths are covered with furze, broom, fern, the bramble-berry, cranberry, wild ſtrawberries, and the myrtillis, the fruit of which is called bilberries. The ſea-coaſt produces a variety of ſea-plants, particularly the alga-marina, dulſe, or duliſh, which is a moſt wholeſome nutritive weed.

Salmon, trout, jack, and eels, are found in great plenty in the rivers in Scotland; and the ſea ſupplies them with every ſpecies of ſalt-water fiſh. Of late years, ſocieties have been erected for the improvement of fiſheries in that nation, and they are at preſent brought to ſuch a degree of perfection as falls very little ſhort of the Dutch themſelves: their ſalmon, in particular, is of infinite advantage to them, as they can cure it, and ſend it much earlier to the Levant and ſouthern markets than the Engliſh or Iriſh can, and conſequently find a quicker ſale for it.

The Highlands are well ſtocked with red-deer and roe-bucks, but their fleſh is not comparable to Engliſh veniſon; they have alſo hares, rabbits, foxes, wild cats, and badgers; and the hills in general are covered with black cattle and ſheep. Plenty of game is likewiſe found there, particularly growſe and heath-cock, which is a moſt delicious bird. Two remarkable birds, called the capperkaily and the tarmacan, are inhabitants of the Highlands. The capperkaily is about the ſize of a turkey, and eſteemed a great delicacy. The tarmacan is a ſpecies of pheaſant, and feeds upon the tender tops of the fir and pine branches, from which the fleſh contracts a turpentine flavour, very agreeable both to the palate and ſtomach. There are no animals in Scotland which are not to be found in England.

The horſes in Scotland are exceedingly ſmall. Formerly their kings and nobility endeavoured, by importing a larger ſpecies of that uſeful animal, to mend the breed; but they are found, by repeated trials, to degenerate both in ſize and ſpirit. The Lowlanders make uſe of a breed which came from England.

The number of inhabitants in Scotland, it is ſaid, amount to a million and a half; but there is reaſon to think they are far more numerous. By the records of the army, the number of ſoldiers furniſhed by Scotland in the American war were 80,000 men, and, conſidering the number of emigrants which daily leave that nation, we may from hence reaſonably conclude, that the inhabitants muſt greatly exceed the number aſcertained; above 60,000 have been raiſed in the iſlands and Highlands; ſo that it is probable that they amount to near two millions and a half. The Scots are in general brave, but paſſionate and vindictive; but, at the ſame time, ſober, induſtrious, circumſpect, and eaſily conform to any ſtation in life. In their perſons they are uſually raw-boned, hard-featured, lank, and muſcular; having long viſages, and red hair; they are clean-limbed and can indure incredible fatigues.

The family pride, which is perhaps not yet entirely extinguiſhed in Scotland, was owing to the feudal inſtitutions which prevailed there in all their horrors of blood and barbarity. Their family differences, eſpecially among the Highlanders, familiarized them to blood and ſlaughter; and the death of an enemy howſoever effected, was always a matter of triumph. Theſe paſſions did not only reign in the breaſts of the common people, but were authorized and cheriſhed by their chieftains, many of whom were men who had ſeen the world, were converſant in the courts of Europe, maſters of polite literature, and amiable in all the duties of civil and ſocial life. Their kings, excepting ſome of them who were endowed with extraordinary virtues, were conſidered in little other light than commanders of their army in time of war; for, in time of peace, their civil authority had ſo little weight, that every clan or family, even in the moſt civilized parts of Scotland, looked upon its own chieftain as the ſovereign. The late Archibald, duke of Argyle, was the firſt who had the patriotiſm to attempt to reform his dependents. His example has been followed by others; and it is probable that the Highlanders will be reconciled to all the milder habits of ſociety in a very few years.

The eſtates of Scotland, like thoſe of England, being generally confined to the elder branch, the younger ſons are obliged to ſeek that ſubſiſtence abroad, which the narrow bounds of their country will not afford them at home. Great numbers of them are in the land and ſea ſervice, and prove an honour to both. Education being exceedingly cheap in Scotland, there are few of the inhabitants, let their ſtation be what it will, but have received ſome learning; and many of them being excellent ſcholars, are thereby qualified for the different profeſſions of phyſicians, ſurgeons, apothecaries, merchants, and ſchool-maſters; in which capacities they are to be met with in moſt parts of the globe, and, happily for them, they aſſimilate with the greateſt eaſe and freedom to the manners of the people among whom they are ſettled.

The inhabitants in many parts live entirely by paſture, and among theſe are found numbers who have a natural taſte for poetry and muſic. The Scotch airs are ſoft, lively, and beautifully ſimple.

In general the Scots enjoy a great ſhare of health, the immediate effect of a ſalubrious air and temperate diet. Their common food is oatmeal, which they ſometimes make into a kind of flummery, termed by them ſowens; milk, cheeſe, and a ſpecies of ſoup-meagre, compoſed of greens, roots, oatmeal, and butter. They very ſeldom eat butcher's meat, but every family in tolerable circumſtances, kills a cow at Martinmas, which is pickled down, as we do pork, and uſed occaſionally in broth, or boiled with greens. Many of their diſhes are peculiar to the country, viz. the haggice, which is the lights, liver, and ſuet of a hog, or ſheep, haſhed, ſeaſoned, and boiled in the animal's ſtomach, ſo that, when it is ſerved to table, it has the appearanee of a full blown bagpipe. The hodge-podge, a rich ſoup, compoſed of beef, mutton, veal, lamb, and fowl, ſtewed rice or barley, green peas, lettuce, cabbage, turnips, and onions; to all theſe ingredients they ſometimes add a ſheep's head and feet, the wool of which is ſinged off ſmooth with a red-hot iron. Fiſh in ſauce, which is a kind of ſoup made with haddocks, or other fiſh, the head being ſtuffed with forced meat. Chicken broth, which is made very rich with eggs, and has the appearance of a ſpoiled fricaſſee, but is very delicate to the taſte, and nouriſhing to the ſtomach. Minced collops, made of the rump of beef, and ſuet, cut very ſmall, ſeaſoned with pepper, ſpice, and vinegar, and kept in a cloſe jar, to be fried occaſionally for the table. The uſe of theſe diſhes is ſtill retained

by

by the middling claſs of people; but thoſe of the higher rank conform entirely to the French cookery. The bread chiefly uſed in Scotland, is broad, thin, triangular cakes, made of oatmeal, firſt baked over the fire on a thin plate of caſt iron, and then toaſted until they become criſp.

The dreſs of the Highlanders conſiſts of the brechan, the cuoranen, the truiſh, the fillebeg, and a flat cap on their heads, which they call a bonnet. The brechan is compoſed of twelve or thirteen yards of a narrow ſtuff, wrapped round the middle, and reaching down to the knees; this, in cold weather, is large enough to wrap round the whole body from head to feet, and is often the ſole covering they make uſe of; not only within doors, but in the open air during the whole night. They gird it round their middle with a belt, and it is then called brechanſeal: at other times, it is faſtened on the ſhoulders, and before, with large pins of ſilver, and other metal. Their ſtockings, which are ſhort, are tied below their knee; and the cuoranen is a ſhoe made of a ſkin with the hairy ſide outwards, but now ſeldom worn. The truiſh were breeches and ſtockings made of one piece, and formerly worn by the gentry. The fillebeg, likewiſe called kelt, is a kind of ſhort petticoat, reaching only to the knees, and is a modern ſubſtitute for the lower end of the plaid, being leſs cumberſome, particularly in time of action, when they were formerly obliged to tuck their brechan into their girdle. Moſt of them have a great pouch of badger and otter ſkins, which hangs before them, where they keep their tobacco and money.

The dreſs of the women is the kirch, or a white piece of linen, pinned over the foreheads of thoſe that are married, and round the hind part of the head, falling behind over their necks. The ſingle women wear only a ribbon round the head, which they call a ſnood. The tannic, or plaid, hangs over their ſhoulders, and is faſtened before with a brotche; but, in bad weather, is drawn over their heads. It is common during divine ſervice for the women to keep continually drawing it forward, in proportion as their attention increaſes, ſo that at laſt the whole face is concealed; perhaps to exclude every external object, that their devotion may not be interrupted. In the county of Breadalbane, many wear, when in full dreſs, a great plaited ſtocking, of an enormous length, called oſſen; but, in other reſpects, they are dreſſed like the women in England.

The ancient arms of the Highlanders were the Lochaber axe, now only uſed by the town-guard of Edinburgh, the broad ſword, and target. With the laſt they covered themſelves, with the firſt reached their enemy at a conſiderable diſtance. Bows and arrows were uſed in war as late as the middle of the laſt century. The dirk was a ſpecies of dagger ſtuck in the belt, uſed by the ancient Caledonians.

The ancient ſports of the Highlanders, ſuch as archery, hunting, and fowling, are now for the moſt part diſuſed. Thoſe retained are the throwing the putting-ſtone, or ſtone of ſtrength, which occaſions a ſtrong emulation who can throw a heavy ſtone the furtheſt. Throwing the penny-ſtone is ſimilar to our quoit. The ſhinty, or the ſtriking a ball of wood, or of hair: this game is played between two parties on a large plain, furniſhed with clubs; whoever ſtrikes it firſt to their own goal, wins the match. The amuſements by their fire-ſides were, the telling of tales, the wildeſt and moſt extravagant imaginable. In former times, the harp, covered with leather and ſtrung with wire, was the favourite inſtrument, but is hardly known at preſent. Bagpipes are ſuppoſed to have been introduced by the Danes; the oldeſt are played with the mouth; the other, played with the fingers only, is of Iriſh original: the firſt ſuited the genius of this warlike people, rouſed their courage to battle, alarmed them when ſecure, and collected them when ſcattered. Vocal muſic was greatly in vogue among them, and their ſongs were chiefly in praiſe of their ancient heroes. They have ſtill fragments of the ſtory of Fingal, and others, which they ſing as they paſs along, or when employed in the field.

Singular cuſtoms attend the courtſhip of the Highlanders. After privately obtaining the conſent of the fair, he formally demands her of her father. The lover and his friends aſſemble on a hill allotted for that purpoſe in every pariſh, and one of them is diſpatched to obtain permiſſion to wait on the daughter: if he is ſucceſsful, he is again ſent to invite the father and his friends to aſcend the hill, and partake of a caſk of whiſkey, which is never forgot: the lover advances, takes his future father-in-law by the hand, and, having plighted his troth, the fair-one is delivered up to him. During the marriage ceremony, great care is taken that no dogs paſs between them, and particular attention is paid to the leaving the bridegroom's ſhoe without buckle or latchet, to prevent witches from depriving him, on the nuptial night, of the power of looſening the virgin zone.

It is uſual, on the death of a Highlander, to ſtretch the corpſe on a board, and cover it with a coarſe linen wrapper, the friends lay on the breaſt of the deceaſed a wooden diſh, containing a ſmall quantity of ſalt and earth, in ſeparate parcels. The earth is an emblem of the corruptible body; the ſalt, an emblem of the immortal ſpirit. All fire is extinguiſhed while a corpſe is kept; and it is reckoned ſo ominous for a dog or cat to paſs over it, that the poor animal is killed immediately.

Another ceremony uſed at funerals, is what they call the late wake. The evening after the death of any perſon, the relations and friends of the deceaſed meet at the houſe, attended by a bagpipe, or a fiddle. The neareſt of kin opens a melancholy ball, dancing and crying violently at the ſame time; and this continues till day-light, with the moſt unſeemly frolics among the younger part of the company. If the corpſe remains unburied for two nights, the ſame rites are renewed. The coranich, or ſinging at funerals, is ſtill in uſe in ſome places. The ſongs are generally in favour of the deceaſed, or a recital of the valiant deeds of his anceſtors.

In Scotland Chriſtianity was planted long before Auſtin the monk eſtabliſhed the pope's authority. When the Reformation was ſettled there by the preaching of John Knox, his brethren naturally imagined that they ſhould ſucceed to the revenues of the Romiſh clergy. But the nobility took care to monopolize all the church livings, leaving very little for the miniſters. Since that time their ſtipends have been conſiderably augmented. None indeed exceeds 150l. a year, but few fall ſhort of 60l. and none of 50l.

In Scotland the Preſbyterian government was eſtabliſhed by act of parliament, in the year 1690; and was afterwards ſecured by an expreſs article in the treaty of union between the two kingdoms of England and Scotland. No miniſter, conſidered as an individual, has an authoritative juriſdiction over another. Juriſdiction is competent for them only when they act in a collective body, or as a court of judicature, and then there is a ſubordination of one court to another, or inferior and ſuperior courts. The courts eſtabliſhed by law are the four following, viz. church ſeſſions, preſbyteries, provincial ſynods, and, above all, a national or general aſſembly.

A church ſeſſion is compoſed of the miniſter of the pariſh and certain diſcreet laymen, who are choſen and ordained for the exerciſe of diſcipline, and are called elders. The number of theſe elders varies according to the extent of the pariſh. Two of them, together with the miniſter, are neceſſary, in order to hold a legal meeting. The miniſter always preſides in theſe meetings, and is called moderator; but has no other authority than what belongs to the præſes of any

any other court. The church ſeſſion is appointed for inſpecting the morals of the pariſhioners, and managing the funds appropriated for the maintenance of the poor within their bounds. When a perſon is convicted of any inſtance of immoral conduct, or of what is inconſiſtent with the Chriſtian profeſſion, the church ſeſſion inflicts ſome eccleſiaſtical cenſure, ſuch as giving him an admonition, or rebuke: or, if the crime be of a groſs and public nature, they appoint him to profeſs his repentance in the face of the whole congregation, in order to make ſatisfaction for the public offence. The higheſt degree of church cenſure is excommunication, which is ſeldom inflicted but for contumacy, or for ſome very atrocious crime obſtinately perſiſted in. In former times there were certain civil pains and penalties, which followed upon a ſentence of excommunication; but, by a Britiſh ſtatute, theſe were happily aboliſhed. The church of Scotland addreſſes its cenſures only to the conſciences of men: and as they cannot, by the method of perſuaſion, reclaim offenders, they think it inconſiſtent with the ſpirit of true religion to have recourſe to compulſive methods, ſuch as temporal pains and penalties.

Any perſon who thinks himſelf aggrieved by the church ſeſſion, is permitted to ſeek redreſs, by entering an appeal to the preſbytery, which is the next ſuperior court. In like manner he may appeal from the preſbytery to the provincial ſynod, and from the ſynod to the aſſembly, whoſe ſentence is final in all eccleſiaſtical matters.

A preſbytery conſiſts of the miniſters within a certain diſtrict, and alſo of one ruling elder from each church ſeſſion within the diſtrict. In ſettling the boundaries of a preſbytery, a regard was paid to the ſituation of the country. Where the country is populous and champaign, there are inſtances of thirty miniſters, and as many elders, being joined in one preſbytery. In mountainous countries, where travelling is more difficult, there are only ſeven or eight miniſters, and in ſome places fewer, in a preſbytery. The number of preſbyteries is computed to be about ſeventy.

Preſbyteries review the procedure of church ſeſſions, and judge in references and appeals that are brought before them. They take trials of candidates for the miniſtry; and if, upon ſuch trial, they find them duly qualified, they licenſe them to preach, but not to diſpenſe the ſacraments. Such licentiates are called probationers. It is not common for the church of Scotland to ordain or confer holy orders on ſuch licentiates, till they are preſented to ſome vacant kirk, and thereby acquire a right to a benefice.

Preſbyteries are more ſevere in their cenſures upon their members for any inſtance of immoral conduct. If the perſon be convicted, they ſuſpend him from the exerciſe of his miniſterial office for a limited time; but, if the crime be of a heinous nature, they depoſe, or deprive him of his clerical character, ſo that he is no longer a miniſter of the church of Scotland; but forfeits his title to his benefice, and other privileges of the eſtabliſhed church. However, if the perſon thinks himſelf injured by the ſentence of the preſbytery, he may appeal to the provincial ſynod, within whoſe juriſdiction his preſbytery lies; and from the ſynod he may appeal to the national aſſembly. Preſbyteries generally hold their meetings every month, except in remote countries, and have a power of adjouring themſelves to whatever time or place within their diſtrict they may think proper. They chooſe their own præſes or moderator, who muſt be a miniſter of their own preſbytery. The ruling elders, who ſit in the preſbytery, muſt be changed every half year, unleſs they are re-choſen by their reſpective church ſeſſions.

The next ſuperior courts to preſbytery are provincial ſynods; theſe are compoſed of the ſeveral preſbyteries within the province, and of a ruling elder from each church ſeſſion. The ancient dioceſes of the Scottiſh biſhops are, in general, the boundaries of a ſynod. Moſt of the ſynods in Scotland meet twice every year, namely, in the months of April and October, and at every meeting they chooſe their præſes, or moderator, who muſt be a clergyman of their own number. They review the proceedings of the preſbyteries, and judge in appeals, references, and complaints, brought before them from the inferior courts; and, ſhould a preſbytery be found negligent in executing any of the eccleſiaſtical laws againſt their members, or any other perſon within their juriſdiction, the ſynod have power to call them to account, and cenſure them as they ſee cauſe.

The ſupreme court in eccleſiaſtical matters is the general aſſembly, from whoſe ſentence there is no appeal. As they have a power of making laws and canons concerning the diſcipline and government of the church, and the public ſervice of religion, the king always ſends a commiſſioner to repreſent his royal perſon, that nothing may be enacted inconſiſtent with the laws of the ſtate. The perſon who repreſents the king is generally ſome Scotch nobleman, whom his majeſty nominates annually ſome time before the meeting of the aſſembly, and is allowed a ſuitable ſalary for defraying the expences of this honourable office. He is preſent at all the meetings of the aſſembly, and at all their debates and deliberations. After the aſſembly is conſtituted, he preſents his commiſſion, and delivers his ſpeech. And when they have finiſhed their buſineſs, which they commonly do in twelve days, he adjourns the aſſembly, and appoints both the time and place of their next annual meeting, which is generally at Edinburgh in the month of May.

The general aſſembly is compoſed of miniſters and ruling elders, choſen annually from each preſbytery in Scotland. As the number of miniſters and elders in a preſbytery varies, ſo the number of repreſentatives muſt have a proportion to the number of miniſters and elders that compoſe the preſbytery. This proportion is fixed by laws and regulations for that purpoſe. Each royal borough, and univerſity in Scotland, has alſo the privilege of ſending a ruling elder to the general aſſembly; but all elections muſt be made forty days at leaſt before the meeting. Their juriſdiction is either conſtitutive or judicial. By the former they have the power of making eccleſiaſtical laws, by the latter they judge in appeals brought before them by the ſubordinate courts; and their ſentence is deciſive and final. One particular which employs a conſiderable part of their attention, is the ſettling of vacant pariſhes. The common people of Scotland are greatly prejudiced againſt the laws of patrimony. Hence, when a patron preſents a candidate to a vacant pariſh, the inhabitants frequently make great oppoſition to the preſentee, and appeal from the inferior courts to the general aſſembly. That body are not now much diſpoſed to indulge the pariſhioners in their unreaſonable oppoſition to preſentees. On the other hand, they are unwilling to ſettle the preſentee in oppoſition to the people, who refuſe to ſubmit to his miniſtry; becauſe, in this caſe, his labour among them muſt be uſeleſs and ineffectual. The aſſembly, therefore, generally delay their ſentence till they have uſed all their endeavours to reconcile the pariſhioners to the preſentee; but, if their attempts prove unſucceſsful, they procceed to ſettle the preſentee purſuant to the act of parliament concerning patronage. Upon the whole, it appears that, in the government of the church of Scotland, there is an annual repreſentation of the laity as well as the clergy; a great ſecurity to the former againſt the uſurpations of the latter.

The buſineſs of every miniſter in a pariſh is, to perform religious worſhip, and to preach to his flock in the language of his country, every Sunday, and on other extraordinary occaſions appointed by the

church. They likewiſe examine the pariſhioners annually. They go to the different towns and villages of the pariſhes; and, in an eaſy and familiar manner, converſe with them on the eſſential points of religion; making trial of their knowledge by putting queſtions to them on theſe heads. The adults, as well as the children, as catechiſed; and the miniſter endeavours, by every power of perſuaſion, to make up quarrels that may have happened among them, and reconcile the parties.

In the reign of queen Ann, a ſociety was incorporated by patent, for erecting ſchools in North-Britain and the Weſtern Iſles; which was afterwards eſtabliſhed by act of parliament, and a fund appropriated for carrying the deſign into execution: his preſent majeſty contributes 1000l. per ann. to this fund.

The principles of the church of Scotland, is principally modelled after the Calviniſtical plan eſtabliſhed at Geneva. This eſtabliſhment proved, at various periods, ſo tyrannical over the laity, by having the power of the greater and leſſer excommunication, which were attended by a forfeiture of eſtate, and ſometimes of life, that the kirk ſeſſions, and other bodies, have been abridged of all their dangerous powers over the laity, who are extremely jealous of their being revived. It is ſaid, that the obliging fornicators of both ſexes to ſit upon what they call a repenting-ſtool, in the church, and in full view of the congregation, begins to wear out; it having been found that the Scots women, on account of that penance, were the greateſt infanticides in the world. The power of the Scots clergy is at preſent very moderately exerciſed: ſince the Revolution they have been firm adherents to civil liberty, and the houſe of Hanover; and acted with remarkable intrepidity during the rebellion in 1745. They dreſs without clerical robes; but ſome of them appear in the pulpit in gowns and bands, after the Geneva form. They make no uſe of ſet forms in worſhip, but are not prohibited that of the Lord's prayer. The rents of the biſhops, ſince the abolition of epiſcopacy, are paid to the king, who commonly appropriates them to pious purpoſes. The revenues of the Preſbyterian clergy of late years, have been much augmented

The ſpirit of the Preſbyterians in Scotland, is mild and gentle, and the ſermons and other theological writings of many of the modern Scotch divines are equally diſtinguiſhed by good ſenſe and moderation; but this moderation has been too often interrupted by the fanatics not only of lay ſeceders but even of regular miniſters. Theſe are very numerous in the Lowlands. They maintain their own preachers; and though ſcarcely any two congregations agree with each other either in principle or practice, yet we do not know that they are diſpoſed to fly in the face of the civil power.

In Scotland, learning has flouriſhed for 1400 years paſt. The poems of Oſſian ſufficiently ſhew that the muſes were no ſtrangers there in the moſt remote ages. St. Patrick, the celebrated apoſtle of Ireland, was a native of this kingdom, which became, for ſome time, a refuge for the learned; eſpecially the little iſland of Jona, called St. Columb-Kill. The pure Latin ſtile of Buchanan is a ſufficient proof that the ſtudy of languages was cultivated in this time; but his writings are to this day the moſt claſſical of all modern productions. But the deſtruction of the Scottiſh monuments of learning and antiquities has rendered their early annals very imperfect, and in many reſpects fabulous.

Among the modern writers, we may rank Napier of Monhiſton, the inventor of logarithms; a diſcovery, which, in point of ingenuity and uſe, may vie with any that has been made in modern times. Keil, in his mathematical works, to the clearneſs of his reaſoning, has added the colouring of a poet. Gregory is, of all writers on aſtronomy, allowed to be one of the moſt perfect and elegant. Maclaurin, the companion and friend of Sir Iſaac Newton, was endowed with all that preciſion and force of mind, which rendered him peculiarly fitted for bringing down the ideas of that great man to the level of ordinary capacities, and for diffuſing that light through the world, which Newton had confined within the ſphere of the learned. His treatiſe on Fluxions is regarded by the beſt judges in Europe as the cleareſt account of the moſt refined and ſubtle ſpeculations on which the human mind ever exerted itſelf with ſucceſs. Maclaurin alſo purſued this new career, and the late Dr. Simſon was a geometrican no leſs famous than the former, for having diſtinguiſhed himſelf in the ſure but almoſt deſerted tract of antiquity, of which his illuſtration of the ancient geometry is a convincing proof. To theſe we may add, in medicine particularly, the names of Pitcairn, Arbuthnot, Monro, Smellie, Whytt, and others, who deſerve a diſtinguiſhed ſeat among the literati of Europe. The Scots have been equally ſucceſsful in cultivating the Belles Lettres. Foreigners who inhabit warmer climates, and ſuppoſe the northern nations incapable of tenderneſs and feeling, are aſtoniſhed at the poetic genius and delicate ſenſibility of Thomſon. Nor has learning declined ſince the death of theſe authors: Scotland can now boaſt of authors, eſpecially with regard to hiſtorical compoſition, whoſe labours will be handed down to poſterity with applauſe, and reflect honour on their country.

There are four univerſities in Scotland, viz. St. Andrew's, founded in 1411; Glaſgow, in 1454; Aberdeen, in 1477; and that of Edinburgh; in each of which are a certain number of profeſſors in various branches of literature, moral and natural philoſophy, mathematics, aſtronomy, divinity, &c.

Edinburgh, the capital of Scotland, naturally claims the firſt place in this diviſion. The caſtle, before the uſe of artillery, was deemed to be impregnable. It was probably built by the Saxon king Edwin, whoſe territory reached the Frith of Forth, and who gave his name to Edinburgh, as it certainly did not fall into the hands of the Scots till the reign of Indulphus, who lived in the year 953. The town was built for the benefit of protection from the caſtle; and a more inconvenient ſituation for a capital can ſcarcely be conceived; the High-ſtreet, which is on the ridge of a hill, lying eaſt and weſt; and the lanes running down its ſides north and ſouth. This ſituation ſuggeſted the idea of building very lofty houſes divided into ſtories, each of which contains a ſuite of rooms, generally large and commodious, for the uſe of a family; ſo that the High-ſtreet of Edinburgh, which is chiefly of hewn ſtone, broad, and well paved, makes a moſt auguſt appearance, eſpecially as it riſes a full mile in a direct line and gradual aſcent from the palace of Holyrood-houſe on the eaſt, and is terminated on the weſt by the rude majeſty of its caſtle, built upon a lofty rock, inacceſſible on all ſides, except where it joins to the city. The caſtle not only overlooks the city, its environs, gardens, the new town, and a fine rich neighbouring country, but commands a moſt extenſive proſpect of the river Forth, the ſhipping, the oppoſite coaſt of Fife, and even ſome hills at the diſtance of 40 or 50 miles, which border upon the Highlands. The caſtle has ſome good apartments, a tolerable train of artillery, and has not only a large magazine of arms and ammunition, but contains the regalia, which were depoſited here under the moſt ſolemn legal inſtruments of their never being removed from thence.

Facing the caſtle, at a mile's diſtance, ſtands the abbey, or rather palace of Holyrood-houſe. The inner quadrangle of this palace, begun by James V. and finiſhed by Charles I. is of magnificent modern architecture, built according to the plan and under the direction of Sir William Bruce, a Scotch gentleman of family, and one of the greateſt architects of that

†

A View of EDINBURGH

that age. Round the quadrangle runs an arcade, adorned with pilaſters; and the inſide contains magnificent apartments for the Duke of Hamilton, who is hereditary keeper of the palace, and for other noblemen. Its long gallery contains figures, ſome of which are from portraits, but all of them painted by modern artiſts, of the kings of Scotland down to the time of the Revolution. The chapel belonging to the palace, as it ſtood when repaired and ornamented by that prince, is thought to have been a moſt elegant piece of architecture. It had a very lofty roof, and two rows of ſtone galleries, ſupported with curious pillars. It was the conventual church of the old abbey. Its inſide was demoliſhed and rifled of all its rich ornaments, by the fury of the mob at the Revolution, which even broke into the repoſitories of the dead, and diſcovered a vault, till that time unknown, which contained the bodies of James V. his firſt queen, and Henry Darnley. The walls and roof of this chapel gave way and fell down on the 2d and 3d of December, 1768, occaſioned by the enormous weight of a new ſtone roof, laid over it ſome years before, which the walls were unable to ſupport.

The hoſpital, founded by George Herriot, goldſmith to James VI. commonly called Herriot's Work, ſtands to the ſouth-weſt of the caſtle, in a noble ſituation. It is the fineſt and moſt regular ſpecimen which Inigo Jones (who went to Scotland as architect to queen Anne, wife of king James VI.) has left us of his Gothic manner, and far exceeding any thing of that kind to be ſeen in England. One Balcanquhille, a divine, whom Herriot left his executor, is ſaid to have prevailed upon Jones to admit ſome barbarous devices into the building, particularly the windows, and to have inſiſted that the ornaments of each ſhould be ſomewhat different from thoſe of the others. It is, notwithſtanding, upon the whole, a delightful fabric, and adorned with gardens not inelegantly laid out. It was built for the maintenance and education of poor children belonging to the citizens and tradeſmen of Edinburgh, and is under the direction of the city magiſtrates.

Among the other public edifices of Edinburgh, before the Revolution, was the college, which claims the privileges of an univerſity, founded by king James VI. and by him put under the direction of the magiſtrates, who have the power of chancellor and vice-chancellor. Little can be ſaid of its buildings, which were calculated for the ſober literary manners of thoſe days; they are, however, improveable, and may be rendered elegant. What is of far more importance, it is ſupplied with excellent profeſſors in the ſeveral branches of learning: and its ſchools for every part of the medical art are reckoned equal to any in Europe. The college is provided with a library, founded by one Clement Little, which is ſaid to have been of late greatly augmented; and a muſeum belonging to it was given by Sir Andrew Balfour, a phyſician. It contains ſeveral natural and ſome literary curioſities, which one would not expect to find in Edinburgh.

The Parliament-ſquare, or as it is there called, Cloſe, was formerly the moſt ornamental part of this city; it is formed into a very noble quadrangle, part of which conſiſts of lofty buildings; and in the middle is a fine equeſtrian ſtatue of Charles II. The room built by Charles I. for the parliament-houſe, though not ſo large, is better proportioned than Weſtminſter-hall; and its roof, though executed in the ſame manner, has been by good judges held to be ſuperior. It is now converted into a court of law, where a ſingle judge, called the Lord Ordinary, preſides by rotation: in a room near it ſit the other judges; and adjoining are the public offices of the law, exchequer, chancery, ſhrievalty, and magiſtracy of Edinburgh; and the valuable library of the lawyers. This equals any thing of the kind to be found in England, or perhaps in any part of Europe, and was at firſt entirely founded and furniſhed by lawyers. The number of printed books it contains is amazing; and the collection has been made with exquiſite taſte and judgment. It contains likewiſe the moſt valuable manuſcript remains of the Scotch hiſtory, chartularies, and other papers of antiquity, with a ſeries of medals. Adjoining the library, is the room where the public records are kept: but both it, and that which contains the library, though lofty in the roof, are dark and diſmal. It is ſaid that preparations are now carrying on, for lodging both the books and papers in rooms far better ſuited to their importance and value.

The high church of Edinburgh, called that of St. Giles, is now divided into four churches, and a room where the general aſſembly ſits. It is a large Gothic building, and its ſteeple is ſurmounted by arches, formed into an imperial crown, which has a good effect to the eye. The churches, and other edifices of the city, erected before the union, contain little but what is common to ſuch buildings; but the excellent pavement of the city, which was begun two centuries ago by one Merlin, a Frenchman, deſerves particular attention.

The modern edifices in and near Edinburgh, ſuch as the exchange, public offices, its hoſpitals, bridges, and the like, demonſtrate the vaſt improvement of the taſte of the Scots in their public works. Paralel to the city of Edinburgh, on the north, the nobility, gentry, and others, have almoſt completed a new town, which does honour to the preſent age. The ſtreets and ſquares are laid out with the utmoſt regularity, and the houſes are built with ſtone, in an elegant taſte, with all the conveniences that render thoſe of England ſo delightful and commodious. The fronts of ſome are ſuperbly finiſhed, diſplaying at the ſame time the judgment of the builder, and the public ſpirit of the proprietor.

Between the old and the new town lies a narrow bottom or vale, which, agreeably to the original plan, was to have been formed into a ſheet of water, bordered by a terras walk, and the aſcent towards the new town covered with pleaſure gardens, ſhrubberies, &c. But this elegant deſign fell to nothing, through the narrow ideas of the magiſtrates, who finding greater benefits by letting the ground to inferior tradeſmen upon building leaſes, this ſpot, formed by nature as an agreeable opening to a crowded city, became a nuiſance to thoſe gentlemen who were ſo liberal in ornamenting the buildings upon the ſummit. A deciſion of the houſe of lords (in which a certain great luminary of the law, equally diſtinguiſhed for his taſte and good ſenſe, heartily concurred) put a ſtop to theſe mean erections. At the weſt or upper end of this vale, the caſtle, a ſolid rock not leſs than twenty ſtories high, looks down with awful magnificence. The eaſtern extremity is bounded by a ſtriking object of art, a lofty bridge, the middle arch being ninety feet high, which joins the new buildings to the city, and renders the deſcent on each ſide the vale (there being no water in this place) more commodious for carriages. The ſituation is pleaſant, ſtanding on an eminence, with a gentle declivity on each ſide, in the heart of a rich country; the view ſouthward, that of a romantic city, its more romantic caſtle, and diſtant hills riſing to an amazing height; while the proſpect northward gives full ſcope to the eye, delights the imagination, and fills the mind with ſuch ideas as the works of nature alone can inſpire. One agreeable proſpect, however, is ſtill wanting, a handſome clean inn or tavern, with a genteel coffee-room, towards the ſide that overlooks the Forth; and which might eaſily be accompliſhed by ſubſcription, and, from the great reſort of travellers, could not fail to bring a profitable return.

Edinburgh may be conſidered, notwithſtanding its caſtle, and an open wall which incloſes it on the ſouth ſide, of a very modern fabric, but in the Roman

Roman manner, as an open town; ſo that in fact it would have been impracticable for its inhabitants to have defended it againſt the rebels, who took poſſeſſion of it in 1745. Edinburgh contains a playhouſe, which has now the ſanction of an act of parliament; and concerts, aſſemblies, balls, muſic-meetings, and other polite amuſements, are as frequent and brilliant here, as in any part of his majeſty's dominions, London and Bath excepted.

Edinburgh is governed by a lord provoſt, four bailies, a dean of guild, and a treaſurer, annually choſen from the common-council. Every company, or incorporated trade, chooſes its own deacon, and here are fourteen; namely, ſurgeons, goldſmiths, ſkinners, furriers, hammer-men, wrights or carpenters, maſons, tailors, bakers, butchers, cordwainers, weavers, fullers, and bonnet-makers. The lord provoſt is colonel of the town-guard, a military inſtitution to be found in no part of his majeſty's dominions but in Edinburgh; they ſerve for the city-watch, and patrol the ſtreets, are uſeful in ſuppreſſing ſmall commotions, and attend the execution of ſentences upon delinquents. They are divided into three companies, and wear a uniform; they are immediately commanded by three officers under the name of captains. Beſides this guard, Edinburgh raiſes ſixteen companies of trained bands, which ſerve as a militia. The revenues of the city conſiſt chiefly of that tax which is now common in moſt of the bodies corporate in Scotland, of two Scotch pennies, amounting in the whole to two-thirds of a farthing, laid on every Scotch pint of ale (containing two Engliſh quarts) conſumed within the precincts of the city. This is a moſt judicious impoſt, as it renders the pooreſt people inſenſible of the burthen. Its product, however, has been ſufficient to defray the expence of ſupplying the city with excellent water, brought in leaden pipes from the diſtance of four miles; of erecting reſervoirs, enlarging the harbour of Leith, and completing other public works, of great expence and utility.

Leith, though near two miles diſtant, may be properly called the harbour of Edinburgh, being under the ſame juriſdiction. It contains nothing remarkable but the remains of two citadels (if they are not the ſame), which were fortified and bravely defended by the French, under Mary of Guiſe, againſt the Engliſh, and afterwards repaired by Cromwell. The neighbourhood of Edinburgh is adorned with noble ſeats, which are daily increaſing: ſome of them inferior to few in England, particularly the earl of Abercorn's, a ſhort way from the city, the duke of Buccleugh's houſe at Dalkeith, that of the marquis of Lothian at Newbottle, and Hopetoun-houſe, ſo called from the earl its owner. About four miles from Edinburgh is Roſlin, noted for a ſtately Gothic chapel, eſteemed one of the moſt curious pieces of workmanſhip in Europe; founded in the year 1440, by William St. Clair, prince of Orkney, and duke of Oldenburgh.

Glaſgow, in the ſhire of Lanerk, is ſituated about 30 miles from Edinburgh, on the deſcent of a gentle eminence, and the adjacent plain extending to the banks of the river Clyde, over which there is a bridge of ſeven arches. The chief part of this city is laid out upon a regular plan, the ſtreets croſſing each other at right angles. The houſes, which are lofty, are built of hewn ſtone, and, near the croſs, or market-place, ſupported upon arched pillars, which form a commodious piazza before the ſhops, and give an air of grandeur to the buildings. The ſtreets are ſtraight, ſpacious, well paved, and clean; and the whole city is adorned with a great number of public edifices, among which are the cathedral, and five or ſix other elegant churches, the Tolbooth, town-hall, and ſeveral hoſpitals.

The cathedral, which ſtands in the higheſt part of the city, is a vaſt pile of Gothic building, dedicated to St. Mungo, or Kentigern, who, in the ſixth century, was biſhop of Glaſgow, and lies buried in this church. This cathedral is ornamented with two ſpires, one of which, riſing from a ſquare tower in the middle of the croſs, is ſurpriſingly high and beautiful. In the other, there is a bell of vaſt dimenſions, which, when tolled, ſhakes the whole fabric. At preſent, this noble pile is divided into three ſeparate churches, where divine ſervice is performed every Sunday. The other churches are all ſtately buildings, and ſome of them erected on the beſt models of architecture.

The univerſity of Glaſgow forms one of it greateſt ornaments. Every branch of learning is taught by its own ſeparate regent, or profeſſor, who not only gives general lectures, but alſo attends aſſiduouſly to the buſineſs of his claſs, where he explains, impoſes taſks, and examines his pupils. Annually all the individuals of each claſs undergo a public examination, in preſence of all the regents; when, if found properly qualified, after a certain ſtanding they are admitted to the degree of maſter of arts. Great numbers of learned men have been educated in this univerſity, which may certainly be deemed the moſt flouriſhing in Scotland. The profeſſors, while in the exerciſe of their functions, wear black gowns with open ſleeves; and the ſtudents are all diſtinguiſhed by red or ſcarlet gowns, without which they are not allowed to appear in public. The rector of this univerſity, who is always a perſon of nobility, or diſtinguiſhed fortune, is elected annually. The edifice itſelf conſiſts of an outward and inner ſquare, with a lofty tower, and, towards the city, a front of hewn ſtone. It was built at the expence of William Turnbull, biſhop of Glaſgow. The inner quadrangle, beſides the divinity hall, the old library, and the common hall, which are large and ſpacious, contains a great number of commodious apartments for the ſtudents. The faculty have lately built an elegant library, which is tolerably well furniſhed with books, manuſcripts, and ſome ſtones with Roman inſcriptions, brought from the wall of Antoninus. Moſt of the regents reſide in an elegant row of houſes, a little detached from the college, behind which there is a pleaſant garden laid out in walks for the benefit of all the members of the univerſity. Adjoining to this is a botanical garden, well ſupplied with ſimples, claſſed alphabetically in their different tribes.

The town-houſe, which was built by the citizens of Glaſgow, is a very magnificent edifice: and, in the ſtreet oppoſite to it, ſtands an equeſtrian ſtatue of king William III. Adjoining to the town-houſe is the Tolbooth, or public jail, which is a venerable Gothic building.

The work-houſe and infirmary of Glaſgow, are built with elegant ſimplicity; and the inſtitution is founded upon ſo excellent a plan, conducted with ſo much prudence, and proves ſuch an effectual proviſion for the poor, that there is not a beggar to be ſeen within the precincts of the city. The number of inhabitants in Glaſgow have been computed at 50,000; and, beſides its churches, contains eight or ten meeting-houſes, for ſectaries of various denominations.

Aberdeen, the capital of Aberdeenſhire, is ſituated in the county of Mar, about eighty miles north of Edinburgh, and contains two towns Old and New Aberdeen. Old Aberdeen, which was formerly the ſeat of a biſhop, and now that of a preſbytery. There is a cathedral dedicated to St. Machas, the greater part of which was built by biſhop Elphinſtone, in the year 1500. The church is of hewn ſtone, with a lofty ſteeple, terminating in an imperial crown, with a round globe of ſtone and two gilt croſſes. Adjoining to the church a library is erected, furniſhed with a valuable collection of books: but Old Aberdeen is chiefly remarkable for a college, founded by James IV. New Aberdeen is the ſhire town, and though almoſt joined to the Old, by means of a long village, has

has no dependence on it. It is a neat, populous, and flouriſhing city, adorned with three churches; ſeveral eſpiſcopal meeting-houſes, hoſpitals, a fine wharf, a cuſtom-houſe, any many other ſtately edifices, built of hewn ſtone. The ſtreets are ſpacious and well paved; the private houſes lofty, well finiſhed, and provided with gardens and orchards, which, by being thus intermingled with the buildings, give it at a diſtance the appearance of a city built in a wood.

The principal public edifice in New Aberdeen is the college, which was originally a Franciſcan monaſtery, founded by George Keith, earl marſhal, in the year 1593, and from him called the Academia Mareſchallana. It conſiſts of a principal, four profeſſors of philoſophy, one for divinity, and one for mathematics. This, together with the old college, although entirely independent of each other, are termed the univerſity of Aberdeen. Beſides this college, there is a grammar ſchool, founded by Dr. Dune, conſiſting of a maſter and three uſhers. Here is likewiſe a ſchool for muſic, and a library, erected at the expence of the city, well ſupplied with books, and furniſhed with mathematical inſtruments. The other public buildings in this town are, a ſtone bridge of ſeven arches, built over the river Dee, at the expence of biſhop Gavin Dunbar; a bridge over the Don, conſiſting of one Gothic arch; the cathedral dedicated to St. Nicholas; an alms-houſe; and three hoſpitals.

Paiſley, a town in Scotland, in the county of Renfrew, on the river Cart, erected into a burgh in the year 1488 by James IV, and governed by three magiſtrates, and ſeventeen common-council. This town began to flouriſh by its manufactures, ſoon after the union; the principal articles, at firſt, were plaids and coarſe checks, and afterwards linen handerchiefs. Theſe were ſucceeded by fabrics of a lighter and more fanciful kind, conſiſting not only of plain lawns, but likewiſe thoſe that were ſtriped or checked with cotton, and others that were ornamented with a great variety of figures; ſome of which laſt articles ſtill continue to be manufactured there. The making of linen gauze was a conſiderable branch of trade in Paiſley, as likewiſe white ſewing-thread, known to the merchants by the name of ounce thread, as diſtinguiſhed from the different kinds of coloured and white thread which have been manufactured chiefly at Aberdeen and Dundee. About the year 1760, the making of ſilk gauze was firſt attempted at Paiſley, in imitation of that of Spittalfields, in London. The ſucceſs was beyond the moſt ſangine expectations of thoſe who engaged in it. Such nice and curious fabrics were deviſed, and ſuch a vaſt variety of elegant and richly ornamented gauze was iſſued from this place, as outdid every thing of the kind that had formerly appeared. Spittalfields was obliged to relinguiſh the manufacture. Companies came down from London, to carry it on at Paiſley, where it proſpered and encreaſed, it is believed, beyond any manufacture which any town of Scotland could boaſt of. Indeed, it not only became the great diſtinguiſhing manufacture of that town, but it filled the country round to the diſtance of twenty miles; and the gentlemen engaged in it, had not only warehouſes in London and Dublin, but they had correſpondents upon the continent, and ſhops for vending their commodities even in Paris itſelf. It appears from the beſt calculation that could be made, that in the year 1784, the manufactures of Paiſley, in ſilk, gauze, lawn and linen gauze, and white ſewing thread, amounted to the value of 579,185l. 16s. 6d. and that no fewer than 26,484 perſons were employed in carrying them on. It is difficult to give an exact account of the ſtate of its manufactures at preſent. The ſilk branch has evidently declined, but the muſlin has ſo far come in its room, and the thread manufacture has conſiderably increaſed. There are ſome others carried on there, of too much importance to be overlooked: for inſtance, conſiderable tan-works, four in number, two ſoap and candle-works, a manfacture of ribbons, and another of inkle or tape. Before the reformation, here was a rich monaſtery; and the town of Paiſley continued a part of the original or abby pariſh of Paiſley, till the year 1738, when the magiſtrates and council having purchaſed the right of patronage from the then earl of Dundonald, a new church was built, and the town was erected into a ſeparate pariſh. Since which time, two other churches have been erected; beſides which, there are two large diſſenting congregations in the town, thoſe of the Antiburgher perſuaſion, and the Relief. The number of inhabitants in the three pariſhes, is eſtimated at 24,600. The pariſh of Paiſley is in length, from eaſt to weſt, about nine miles, varying in breadth from half a mile to about three. There are five coal-mines, and free-ſtone quarries abound in the pariſh. In the various weaving branches there were employed at Whitſuntide 1791, in the ſuburbs of Paiſley 1108 looms, which, added to 2494 employed in the town, gives 3602 in all. But it is to be obſerved, that the extent to which the weaving branches are carried on, by the manufactures in Paiſley, is not to be judged of from the number of looms in the town and ſuburbs. Beſides about 150 in the country part of the pariſh, there are great numbers employed by them in the neighbouring villages, which are dependent on Paiſley: It is twenty-two miles N. Ayr, and ſeven W. Glaſgow.

St. Andrew's, in Fifeſhire, was formerly a moſt magnificent and flouriſhing city, and celebrated for being the burial place of St. Andrew, the tutelar ſaint of Scotland. But at preſent its only boaſt is the poſſeſſion of the oldeſt univerſity in that kingdom. It was founded, and endowed with many ample privileges, by biſhop Wardlaw. At preſent it conſiſts of three colleges, viz. St. Salvator, St. Leonard, and St. Mary. The firſt was built by biſhop Kennedy, grandſon to king Robert III. about the middle of the fifteenth century, and this prelate endowed his foundation with revenues ſufficient to maintain four profeſſors of philoſophy, a doctor, a bachelor and licentiate of divinty, together with eight poor ſcholars. There are three ſilver maces belonging to this college as ancient as the foundation; one of which, weighing ſeventeen pounds, is gilt and curiouſly chaſed. This building was repaired and augmented by Dr. Skene, one of the principals of the college, who likewiſe founded a library, which by liberal donations ſoon increaſed; and a fund was eſtabliſhed by the earl of Caſſils for the maintenance of a profeſſor of philoſophy.

St. Leonard's College was founded by James Hepburn, prior of St. Andrew's, before the Reformation, and afterwards endowed by the earl of Lenox. It conſiſts of a principal, four profeſſors of philoſophy, and eight poor ſcholars, who are maintained upon the foundation. Sir. James Scot afterwards eſtabliſhed a good ſalary for a profeſſor of philoſophy, and made conſiderable additions to the library, which in a ſhort time was augmented by a great collection of books bequeathed to it by Sir John Wedderburn, doctor of phyſic; and it now contains the manuſcript of Hordun's Scoti Chronicon. The ſtudents of this college, who are more numerous than in the other two colleges, ſhoot annually with bows for the prize of a ſilver arrow.

St. Mary's, or New College, was founded by the famous cardinal archbiſhop James Beaton, who was aſſaſſinated by Norman Leſly. It conſiſts of two profeſſors, doctors in divinty, and a profeſſor of mathematics. Here the ſtudents of the other colleges, having paſſed through a courſe of philoſophy, may be permitted to finiſh their education. An obſervatory is erected in the college garden by Mr. Gregory, the mathematical profeſſor, who, aſſiſted by a public

contribution, furniſhed it with proper inſtruments. According to the ſtatutes of this college, the rector, who is choſen annually, muſt be one of the three principals. The ſtudents of all the three colleges are diſtinguiſhed by wearing red gowns.

The principal fortifications in Scotland are the caſtles of Edinburgh, Stirling, and Dumbarton, beſides which are Fort William, Fort George, and Fort Auguſtus; but neither of theſe are capable of ſuſtaining a regular ſiege by an enemy furniſhed with a proper train of artillery. They ſerve as places of arms, and to bridle the inhabitants of the country, on any inſurrection; for which purpoſes they are kept in ſufficient repair, and each furniſhed with garriſons.

Stirling, with its caſtle, may be conſidered as a miniature of Edinburgh, being built on the ridge of a hill, or rock, riſing out of a plain, with the caſtle ſituated at the upper end. Within the walls of the fortreſs was the palace of ſeveral of the Scottiſh kings, a ſquare building, ornamented on three ſides with pillars reſting on groteſque figures projecting from the wall, and on the top of each pillar is a ſtatue, ſeemingly the work of fancy. Near it is the old parliament-houſe, a vaſt room, 120 feet long, very lofty, and had formerly a gallery running round it. A conſiderable battery of cannon commands the bridge, and in this, added to its advantageous ſituation, its principal ſtrength conſiſts.

Dumbarton-Caſtle is ſituated a little to the ſouthward of the town, on a double-pointed rock of a ſtupendous height, riſing in a ſtrange manner out of the ſands, and totally detached from all other objects. On one of the ſummits are the ruins of an old light-houſe, and on the other, a magazine of powder: in the hollow between them is a large well of excellent water, fourteen feet deep. The ſides of the rocks are immenſe precipices, and often overhang, except on the ſide where the governor's houſe ſtands, which is defended by ramparts mounted with a few cannon, and garriſoned by invalids.

In Scotland, the rivers are navigable to a very conſiderable diſtance, and moſt of the trading towns are ſituated on their banks, near enough to the ocean to enjoy the benefit of navigation; but there is no art uſed in any of the rivers in that kingdom; they flow on in their natural channels, and join their parent waters in the ocean. By the navigable canal cut between the Friths of Forth and Clyde, under the direction of the ingenious Mr. Smeaton, the goods imported by the ſea-port towns on one ſide of the kingdom are carried at a very ſmall expence to thoſe on the other.

In various parts of Scotland, roman antiquities are found in great numbers; but the moſt remarkable now remaining, is the pretenture, or wall, originally marked out by Agricola, and finiſhed by Antoninus Pius. Agricola erected a chain of forts, and Antoninus connected them with turf walls guarded by mounds and ditches, ſome parts of which are ſtill viſible. This wall extended from Carron upon the Frith of Forth, to Dunglas upon the Frith of Clyde, ſomething more than 37 Engliſh miles in length. The thickneſs of the wall, was about four yards. We learn from the inſcriptions on this wall, which are ſtill extant, that the whole of the legion called Secunda Auguſta, and the vexillations of the twentieth and the ſixth legions, were employed in completing this pretenture, which, according to the ſame inſcriptions, extended 39,726 paces. It was built while Antoninus Pius was the third time conſul. The country people call this work Graham's-Dyke, from a tradition that a Scottiſh warrior of that name was the firſt that broke over it.

Near the iron founderies, on an eminence above the river Carron, ſtood that celebrated antiquity, called Arthur's Oven, which is ſuppoſed to have been a ſmall chapel, a repoſitory for the Roman inſignia or ſtandards. Others think it was a Roman temple, and dedicated to the god Terminus. There is no reaſon to doubt of its being a Roman work; but by whom it was erected, is not certainly known, though it is generally imputed to Agricola. It was built in the form of the Pantheon at Rome, or the dome of St. Paul's at London. It was twenty-two feet in height, and its external circumference at the baſe eighty-eight feet, and was, upon the whole, one of the moſt complete Roman antiquities in the world. In the year 1742, the owner, a Gothic knight cauſed it to be demoliſhed, in order to make a mill-dam with the materials.

The inſcriptions, coins, urns, utenſils, and other remains of the Romans in Scotland, are very numerous; many of them are found at a great diſtance to the northward of the wall. Roman camps are alſo found in various parts; but the moſt perfect piece of military antiquity is that called the camp of Agricola, at Ardoch in Perthſhire, near the foot of the Grampian hills. It is generally thought to have been the camp occupied by Agricola before he fought the bloody battle, ſo finely deſcribed by Tacitus, with the Caledonian king Galgacus, who was totally defeated. No leſs than five rows of ditches, and ſix ramparts, are ſtill viſible on the ſouth-ſide; and of the four gates which led into the area, three of them are ſtill to be ſeen.

Various kinds of monuments are found in ſeveral parts of this kingdom. At a place called Aberlemno, near Brechin, are four or five ancient obliſks, called the Daniſh Stones of Aberlemno, having been erected in commemoration of the defeat of that people by the Scots. They are adorned with bas-reliefs of men on horſeback, and many emblematic figures and hieroglyphics, now unintelligible. One of the moſt ſtately monuments of this kind is a ſtone near the town of Fortroſe in Murray. It riſes about twenty-three feet in height above the ground, and is ſaid to be no leſs than twelve or fifteen below the ſurface; ſo that the whole height is, at leaſt, thirty-five feet, and its breadth near five. It is one ſingle and entire ſtone, adorned with a great variety of figures in relievo, ſome of them ſtill diſtinct and viſible. This monument has by ſome antiquaries been attributed to the Danes, and by others to the Scots.

Among other natural curioſities, mention is made of a heap of white ſtones, moſt of them clear like cryſtal, together with great plenty of oyſter and other ſea-ſhells, that are found on the top of a mountain called Scorna Lappich, in Roſsſhire, twenty miles diſtant from the ſea. Slains, in Aberdeenſhire, is ſaid to be remarkable for a petrifying cave, called the Dropping Cave, where water, oozing through a ſpongy porous rock at the top, quickly conſolidates after it drops to the bottom. Some caverns are to be found in Fifeſhire, and are probably natural, are of extraordinary dimenſions, and have been the ſcenes of inhuman cruelties. Beſides the above, other natural curioſities belonging to Scotland, have their deſcriptions and hiſtories; but they generally owe their extraordinary qualities to the credulity of the vulgar, and vaniſh when they are ſkilfully examined.

The milirary roads, by rendering the highlands acceſſible, have greatly contributed to their preſent improvement, and were owing to the induſtry of the ſoldiery. They were begun in 1723, under the directions of general Wade, who forced his way through rocks, before ſuppoſed to have been unconquerable. Many of theſe rocks were too hard to yield to the pick-axe, and the miner was obliged to have recourſe to gunpowder; and often was ſuſpended from above by ropes, on the face of the horrible precipice. The bogs and moors had alſo their difficulties to overcome, but all were at length conſtrained to yield to the perſeverance of the Engliſh troops. In ſome parts the ſoldiers, in imitation of the Romans, left engraven on the rocks the name of the regiment to which each party belonged, who were employed in theſe works.

Nor

Nor were they leſs worthy of being immortalized than the vexillatio's of the Roman legions: for civilization was the conſequence of the labour of both.

The commerce and manufactures of Scotland have for ſome years paſt been in a very improving ſtate. Mr. Pelham, when at the head of the adminiſtration in England, after the extinction of the rebellion in 1745, was the firſt miniſter who diſcovered the true value of Scotland, which then became a more conſiderable object of governmental inquiry than ever. Mr. Pitt purſued Mr. Pelham's wiſe plan, and juſtly boaſted in parliament, that he availed himſelf of the courage, good ſenſe, and ſpirit of the Scots, in carrying on the moſt extenſive war that Great Britain ever was engaged in; and it may be ſaid, to the honour of the Britiſh government, that the Scots have been ſuffered to avail themſelves of all the benefits of commerce and manufactures they can claim, either in right of their former independency, the treaty of union, or by acts of parliament ſince that period. This is manifeſt, from the extenſive trade they lately carried on with the Britiſh ſettlements in America and the Weſt-Indies, and with all the nations to which the Engliſh themſelves trade; ſo that the increaſe of their ſhipping within theſe thirty years paſt has been very conſiderable. The exports of thoſe ſhips are compoſed chiefly of Scots manufactures, fabricated from the produce of the ſoil, and the induſtry of the inhabitants. In exchange for theſe, they import tobacco, rice, cotton, ſugar, and rum, from the Britiſh plantations, and alſo the products of other countries, to the immenſe ſaving of their nation. The proſperity of Glaſgow and its neighbourhood, has been greatly owing to the connection and trade with Virginia and the Weſt-Indies.

There are ſeveral uſeful manufactures carrying on in Scotland, particularly their iron, linen, and woollen manufactures. Their thread manufacture is equal to any in the world, and the lace fabricated from it has been deemed worthy of royal wear and approbation. Some years ago the exports from Scotland to England and the Britiſh plantations, in linens, cambrick, check, oſnabrugs, inkle, and the like, amounted annually to 400,000l. excluſive of their home conſumption. The woollen manufactures eſtabliſhed in Scotland are alſo in a very promiſing way; and their exports of caps, ſtockings, mittens, and other articles of their own wool, begin to very conſiderable. Though the Scots cannot rival the Engliſh in their finer cloths, yet they make at preſent ſome broad cloth proper for the wear of people of faſhion in an undreſs, and in quality and fineneſs equal to that called Yorkſhire cloth. The Scots have alſo made vaſt progreſs in working the mines, and melting the ores of their country. They alſo reap a conſiderable profit from the coals they export to England, and have lately turned even their ſtones to account, by their contracts for paving the ſtreets of London.

Some of their manufactures, employ an incredible number of hands in fabricating a particular kind of flowered and ſtriped lawns, which are a reaſonable and elegant wear. Sugar-houſes, glaſs-works of every kind, delft-houſes, and paper-mills, are erected everywhere. The Scots carpeting makes neat and laſting furniture; and ſome eſſays have been lately made, with no inconſiderable degree of ſucceſs, to carry that branch of manufacture to as great perfection as is found in any part of Europe.

The moſt remarkable herring fiſhery in Scotland, is that of Loch Fyn, which is above ſixty-three miles in length, but in breadth ſcarce four; the depth is from ſixty to ſeventy fathoms. The higheſt ſeaſon of the fiſhery is from September to Chriſtmas, when near ſix hundred boats, with four men in each, are employed. A chain of nets is uſed (for ſeveral are united) of one hundred fathoms in length. As the herrings ſwim at very uncertain depths, ſo the net is ſunk to the depth the ſhoal is found to take. The ſucceſs therefore depends much on the judgment or good fortune of the fiſhermen in taking their proper depths; for it often happens that one boat will take multitudes, while the next does not catch a ſingle fiſh, which cauſes the boatmen to be perpetually inquiring of each other with regard to the depth of their nets.

The herrings are either ſalted and packed in barrels for exportation, or ſold freſh to the country people, two or three hundred horſes being brought every day to the water-ſide from very diſtant parts. A barrel holds 500 herrings, if they are of the beſt kind; at a medium 700; but if more, they are reckoned very poor.

The great rendezvous for the veſſels employed in the fiſheries of the weſtern iſlands, is at Cambel-Town, in Cantyre, where they clear out on the 12th of September, and ſometimes 300 buſſes are ſeen there at one time. They muſt return to their different ports by the 13th of January, where they are to receive the premium of 2l. 10s. for each ton of herrings.

The principal ſalmon fiſheries in Scotland are thoſe of the Tweed, the Tay, the Spey, Caſtle-Hill, and in the ſand bays below Slains. Thoſe of the Tweed are very conſiderable, and bring in vaſt ſums. They lie on each ſide of the river, and are all private property, except what belongs to the dean and chapter of Durham, which in rent, and tythe of fiſh, brings in 450l. per annum; all the other fiſheries are liable to tythes. The common rents of theſe fiſheries are fifty pounds a year, for which the tenants have as much ſhore as is ſufficient for ſhooting and landing their nets. One man goes off in a ſmall flat-bottomed boat, ſquare at one end, and, taking as large a circuit as his net will admit, draws it on ſhore at the extremity of his boundary, where others aſſiſt in landing it. The beſt fiſhery is on the ſouth ſide. Very fine ſalmon trout are often taken, which come up here to ſpawn from the ſea.

The fiſhery in the Tay is near Perth, where great abundance of fiſh is taken; 3000 have been caught in one morning, weighing one with another 18 pounds, the whole capture amounting to 48,000lb. The fiſhery begins on St. Andrew's Day, and ends on the 26th of Auguſt, old ſtile. The rents of the fiſheries amount to 3000l. per annum. The fiſhery in the Spey is very great; about 1700 barrels of ſalmon are caught in a ſeaſon, and the ſhore is rented for about 1200l. per. annum. Great quantities are caught at Caſtle-Hill, Dunet, Wick, and Thurſo. The miraculous draught once made, was no leſs than 2500 in one tide. A very ſucceſsful ſalmon fiſhery has, for ſome years, been carried on below Slains. It is remarked of theſe fiſh, that they ſwim againſt the wind, and are of much finer flavour than thoſe taken in the freſh waters.

There was, near the mouth of the Tay, a very valuable fiſhery for pearls, taken out of the freſh water muſcles. From the year 1761 to 1764, ten thouſand pounds worth were ſent to London, and ſold from 10s. to 30s. per ounce. It is ſaid that a pearl was found there weighing 33 grains. But this fiſhery is at preſent exhauſted.

The fiſheries of Scotland are not confined to their own coaſts: they have a conſiderable ſhare in the whale-fiſhery carried on at Spitzbergen; and their returns are valuable, as the government allowed them a bounty of 40s. for every ton of ſhipping employed in that article. They alſo take great quantities of cod on the banks in the north ſeas, and export it to different parts of Europe.

There is but one order of knighthood peculiar to Scotland, which is ſtiled the order of the Thiſtle, inſtituted, according to ſome of the Scotch writers, by king Achaius, on his making an offenſive league with Charlemagne, king of France, in the eighth century. It conſiſts of the ſovereign and twelve companions.

They wear a green ribbon over their ſhoulder, and on their breaſt an embroidered ſtar, repreſenting St. Andrew, the tutelar ſaint of Scotland, irradiated, and this motto, *Nemo me impunè laceſſet*, "None ſhall provoke me with impunity." This order was dropped about the time of the Reformation, but was again reſtored to its former luſtre by queen Anne.

In the reign of Edward II. there was no difference between the value and denomination of the coins of England and Scotland. About the end of the reign of James II. a Scotch ſhilling was equal to no more than an Engliſh ſix-pence; and in the reign of Mary, queen of Scotland, was only worth a groat. Soon after the acceſſion of James I. to the crown of England, the Scotch ſhillings was equal to no more than an Engliſh penny; their crowns and marks, which are only imaginary money, fell in the ſame proportion. A Scotch penny is now rarely met with; and the bodle, by which its uſe was ſupplied, though of double the value, begins to be ſcarce. There are ſtill halfpennies, or babies, current in Scotland; but the Engliſh coin is now moſt common, and the currency in Scotland and England is the ſame.

The ancient form of government of Scotland, appeared excellently adapted to the preſervation of liberty; and it muſt be allowed, that the power of the king was thereby greatly limited, and that there were many checks in the conſtitution upon him, which were well calculated to prevent his aſſuming or exerciſing too much authority. The king's authority was ſufficiently reſtrained; but the nobles, chieftians, and great landholders, had it too much in their power to tyrannize over and oppreſs their tenants and the lower claſs of people. The king of Scotland had no negative voice in parliament; nor could he declare war, make peace, or conclude any other public buſineſs of importance, without the advice and approbation of parliament. The prerogative of the king was ſo bounded, that he was not even intruſted with the executive part of the government; and ſo late as the minority of James IV. who was cotemporary with, and ſon-in-law to Henry VII. of England, the parliament pointed out to him his duty, as the firſt ſervant of the people; as appears by the acts ſtill extant.

The laws of Scotland are now party deduced from the feudal ſyſtem of government, partly from the civil law, and partly from the laws of nature and nations. The higheſt court of judicature in this kingdom is called the college of juſtice, and conſiſts of fifteen judges, ſtiled lords of ſeſſion, who ſit twice a year to adminiſter juſtice according to equity, and determine cauſes appealed to them from inferior tribunals. The ſentence of this court is not however final, an appeal lying to the Houſe of Lords in England. This court was originally inſtituted by James V. All matters are determined by the civil law, unleſs they come within the cognizance of the municipal laws of the kingdom. The lords of council and ſeſſion act alſo as a court of equity.

In Scotland, the higheſt criminal tribunal is called the juſtice court, and conſiſts of a juſtice-general, juſtice-clerk, and five other judges, who are lords of ſeſſion. Theſe, aſſiſted by a jury, or pannel of fifteen, hold the aſſizes yearly, when all cauſes are tried, and decided by a majority of the pannel.

They have alſo, a third court, called the court of Exchequer; which enjoys the ſame power, authority, privilege, and juriſdiction, over the revenue of Scotland, as the court of Exchequer in England, and all matters and things competent to the court of Exchequer in one of theſe kingdoms, are likewiſe competent to the Exchequer of the other: but certain powers are veſted in the judges of the Exchequer in Scotland, which formerly belonged to the treaſury, and ſtill appertain to that board in England.

In the reign of Charles II. the court of admiralty in Scotland was, in all cauſes competent to its own juriſdiction, declared to be a ſupreme court. The lord high admiral is acknowledged the king's lieutenant and juſtice-general upon the ſeas, and in all ports, harbours, and creeks of the ſame; and upon freſh waters, and navigable rivers, below the firſt bridge, or within low-water-mark, ſo that nothing competent to his juriſdiction can be interfered with, in the firſt inſtance, but by the lord high admiral, and the judges of his court. Sentences paſſed in all inferior courts of admiralty may be brought again before this court, but no appeal lies from it to the lords of ſeſſion, or any other court, unleſs in caſes not maritime. In this court cauſes are tried by the civil law, which in ſuch caſes is likewiſe the common law of Scotland. The office of lord admiral of Scotland is now little more than nominal. The judge of the admiralty is generally a perſon of diſtinction, to whom conſiderable perquiſites belong.

The college, or faculty of advocates, are within themſelves an orderly court, having under their ſubordination a body of inferior lawyers, or attorneys, who term themſelves writers to the ſignet, becauſe they alone can ſubſcribe the writs which paſs the ſignet. This college, in ſome degree, anſwers to the Engliſh inns of court, and no candidate can be admitted without a ſtrict examination.

In every county, a ſheriff's court is held, in which he, or his deputy, preſides, and adminiſters juſtice in all cauſes civil and criminal. Formerly the office of ſheriff was hereditary; but by a late act of parliament, all high ſheriffs, or ſtewards, are nominated and appointed annually by his majeſty, his heirs and ſucceſſors. Alſo the ſheriff's deputies, and ſteward's deputies, in each county, or ſtewartry, muſt have been an advocate ſeven years. Theſe deputies are to be nominated by the king for the term of ſeven years, with ſuch further continuance as his majeſty ſhall think fit; after which they are to enjoy their offices for life.

The baron courts in civil matters, extend to cauſes not exceeding forty ſhillings ſterling; and in criminal cauſes, to petty actions of aſſault and battery. Theſe courts belong to every perſon who holds a barony of the king; and they had formerly the power of life and death; but at preſent they can only inflict a fine, not exceeding twenty ſhillings, or ſet the offender in the ſtocks for three hours in the day.

The commiſſaries courts are ſimilar to thoſe of the Engliſh dioceſan chancellors. The higheſt of theſe is kept at Edinburgh, wherein four judges preſide, who hear and determine all cauſes relative to wills and teſtaments, the right of patronage to eccleſiaſtical benefices, tithes, divorces, &c.

The juſtices of peace in Scotland poſſeſs much the ſame power as thoſe in England.

The royal burghs form a ſort of commercial parliament, which meets once a year at Edinburgh, and conſiſts of a repreſentative from each burgh, to conſult upon the common good of the whole. The trade between Scotland and the Netherlands is ſubject to their regulation; and they fix the ſtaple-port, which has been removed from Dort to Camphere. Their conſervator is nominated by the crown, but then they regulate his power, approve his deputies, and appoint his ſalary; ſo that in fact the whole ſtaple trade is ſubject to their management.

The conſtitution of Scotland has varied at different times, according as the power of the king, the nobles, or the commons happened to be moſt prevalent; but at laſt it ſettled in a limited monarchy. The Scots enjoyed their own parliament, conſiſting of king, lords, and commons, though differently modelled from that of England; but the two nations being incorporated by the act of Union, the Scottiſh parliament ceaſed of courſe, and that kingdom is now repreſented by ſixteen peers, and forty-five commoners, who ſit and vote in the Britiſh parliament. Theſe peers are elected every parliament from the whole

whole body of the Scotch nobility; and the commons are chofen by the fhires and certain boroughs claffed for that purpofe. The great officers of the crown are ftill maintained and beftowed upon the noblemen of North-Britain.

By an article of the treaty of Union, the land-tax of Scotland is fettled at a certain fum; but the cuftoms and other branches of the revenue, are on the fame footing there as in England.

HISTORY OF SCOTLAND.

The writers of ancient Scotch hiftory, like thofe of moft other nations, are too much inclined to fables and uncertain traditions; yet it is eafy to collect from the Roman authors, that Scotland was formerly inhabited by different people, diftinguifhed by the names of Caledonians, Scots, and Picts. The Caledonians were the original inhabitants of the country; the Scots, moft probably, were a nation of adventurers from ancient Scythia; and the Picts were the original natives of Britain, and driven out by the Belgic Gauls. Chriftianity was planted in Scotland by Donald I. about the two-hundredth year of the Chriftian æra.

We have very little account of Scotland till the time when the famous Agricola commanded in Britain. That great general totally defeated the combined army of thefe northern people, led againft him by a powerful prince, called Galdus, or Galgacus.

In the year 448, when the Romans left Britain, the Picts and Scots invaded the northern parts of that country, and practifed fuch inhuman barbarities on the inhabitants, that they called in the Romans to their affiftance. Reinforced by thefe foreign auxiliaries, they attacked, routed their enemies, and drove them back to their own country.

The Picts, about the year 843, who had long fubfifted as a feparate nation, were totally fubdued by Kenneth Mac Alpin, king of Scotland, and obliged to incorporate themfelves with their conquerors, by taking their name, and adopting their laws.

Malcolm III. commonly called Malcolm Canmore, who mounted the Scottifh throne in the year 1057, married Margaret, fifter to Edgar Atheling, the heir to the Engliſh crown. Alarmed at this alliance, and the popularity of Edgar, William the Conqueror, who then fwayed the Engliſh fceptre, invaded Scotland at the head of a powerful army, and forced Malcolm to pay him homage. This peace introduced a total alteration of manners among the Scots, in which queen Margaret, at once the pattern of piety and politeneſs, laboured inceffantly. She began with her own court, which fhe new-modelled, by introducing into it the offices, furniture, and modes of life, which were ufual among the more polite nations of Europe. She difmiffed from her fervice all who were noted for impiety and immorality; and charged Turgot, her confeffor, under pain of her difpleafure, to give her his real fentiments upon the ftate of the kingdom, after the beft inquiry he could make. Turgot's report was by no means favourable to the reputation of the Scots. He informed Margaret, that faction raged among the nobles; rapine among the commons; and incontinence among all degrees of men. He complained, that the kingdom was deftitute of a learned clergy, capable of reforming the people by their doctrine and example. This report, however, did not difcourage the queen; fhe foon made her hufband fenfible how neceffary it was for his glory and fafety, to fecond her efforts for reforming his fubjects. She repreſented to him particularly the corruption of juſtice, and the inſolence of the ſoldiery; and found in him a ready diſpoſition for reforming all abuſes. He began the great work, by ſetting the example in his own perſon, and obliging his nobility to follow it. But ſuperſtition had too great a ſhare in theſe reformations: Malcolm waſted the riches of his kingdom in founding biſhoprics, building churches, monaſteries, and other eccleſiaſtical ſtructures, adorning them with veſſels of gold and ſilver, and endowing them with ample privileges and revenues.

Soon after Malcolm invaded England, and laid ſiege to the caſtle of Alnwick; but before he could reduce it, he was attacked by Robert de Mowbray, earl of Northumberland, at the head of an army, and killed in the conteſt; and queen Margaret, who was then ill at Edinburgh, ſurvived him only four days. Theſe events happened in the year 1093, in the thirty-ſixth year of Malcolm's reign.

Donald VII. the uncle of Malcolm, mounted the throne of Scotland, on the death of his nephew. He expelled all the foreigners out of the kingdom, and obliged them to ſeek refuge in England. But finding himſelf unable to defend his territories againſt the oppoſition formed in favour of Edgar, Alexander, and David, the ſons of Malcolm, he invited the Danes and Norwegians to his aſſiſtance; offering to cede to them the Orkney and Shetland iſlands, by way of indemnification. The offer was accepted; and Magnus, king of Norway, after taking poſſeſſion of the iſlands, marched an army to the aſſiſtance of Donald. Theſe people ſoon became ſo inſolent, that they were deteſted by the Scots, who complained that their country was in danger of becoming a province to Norway.

In the mean time, William Rufus, who then filled the throne of England, ſent Duncan, a natural ſon of the late Malcolm, at the head of an army, againſt Donald; and the Scots, imagining he was come to place Edgar on the throne, joined his ſtandard. The uſurper was obliged to fly to the iſlands for protection. But the Scots ſoon perceived their miſtake; Duncan, inſtead of inveſting Edgar with the inſignia of government, repaired to Scone, where he was ſolemnly crowned. He did not however long ſurvive his exaltation, being ſlain by Malpedir, earl of Mearns, who replaced Donald upon the throne.

Rufus now ſent Edgar into Scotland, at the head of an army, aſſiſted by his uncle Edgar Atheling, and ſoon obliged Donald to ſeek his ſafety in flight; but he was not fortunate enough to eſcape; he was overtaken and brought back to Edgar, who cauſed his eyes to be put out, and condemned him to perpetual impriſonment, where he died.

Soon after the acceſſion of Edgar to the Scottiſh throne, his ſiſter Matilda, who had been carried by her aunt Chriſtiana into the monaſtery of Wilton, was married to Henry I. by which the crowns of England and Scotland were ſtrongly cemented. Edgar, after a reign of nine years and three months, died at Dundee in 1107.

Alexander, his brother, aſcended the throne, and exerted himſelf in puniſhing the enormous crimes committed by his nobility in every part of the kingdom. He afterwards applied himſelf to works of piety, and after a reign of ſeventeen years, and twenty-one days, (he died in the year 1124.)

He was ſucceeded by his younger brother David, who, with his ſiſter queen Matilda, had been educated in England. He married Maud, the daughter of Waltheof, by Judith, the niece of William the Conqueror; and afterwards became poſſeſſed of the great earldoms of Huntingdon and Northumberland: ſo that he was, at the time of his acceſſion to the throne of Scotland, the moſt powerful ſubject in England. He cultivated his family friendſhip with Henry I. and having foreſeen the oppoſition which his niece, the empreſs Maud (heireſs to the crown of England by the death of her elder brother) would encounter, he took an oath to maintain her and her iſſue in that ſucceſſion.

Accordingly when Stephen, on the death of Henry, ſeized the crown, he not only gave all her friends an hoſpitable reception, but raiſed an army, at the head of which he marched into England, ſeized upon Carliſle and Newcaſtle, and obliged the nobility in the north of England to give hoſtages for their fidelity to the empreſs and her young ſon, afterwards Henry II. He was however ſoon after obliged to make a peace with Stephen, and his ſon did homage for his Engliſh eſtates.

About two years afterwards he again invaded England, where his army committed the moſt ſhocking barbarities, which neither David nor his ſon could reſtrain. This conduct ſo exaſperated the northern barons againſt the Scots, that they marched at the head of an army againſt David, and advanced towards Northallerton, where they erected their ſtandard. Its body was a kind of box placed upon wheels, in the centre of which the maſt of a ſhip was erected, ſurmounted by a ſilver croſs, and round it were hung the banners of St. Peter, St. John de Beverly, and St. Wilfred. The Engliſh placed the utmoſt confidence in the fortune of their ſtandard, and its ſupernatural efficacy. Both armies met on a plain called Catton-Moor, and after a dreadful conteſt the Scots were defeated, and David and his ſon ſaved themſelves in Carliſle. The Scottiſh monarch, however ſtill continued to be the principal ſupport of Maud, and, in conjunction with the earl of Glouceſter, would in all probability have placed the crown on her head, had not her own haughtineſs and imprudence fruſtrated every attempt made in her favour. After a reign of twenty-nine years, David died at Carliſle, and was buried with his anceſtors at Dumferling, in the year 1153.

He was ſucceeded in the throne by his grandſon Malcolm IV. This prince attended Henry II. in a campaign in the county of Thouloufe, where he gave ſufficient proofs of his valour; but ſoon after applied himſelf to the founding and endowing of religious houſes, and died in the year 1165, being the twelfth of his reign, and the twenty-fifth of his age.

He was ſucceeded by his brother William, who invaded England, and was taken priſoner, while he was beſieging the caſtle of Alnwick. Henry ſent him, with other ſtate priſoners, to the caſtle of Falaiſe in Normandy; but afterwards ſet him at liberty, on his doing homage for the crown of Scotland, and acknowledging that he held that kingdom as a fief of England. But this was afterwards abrogated by Richard I. He died in the year 1214, in the 49th year of his reign, and the 74th of his age.

He was ſucceeded by his ſon Alexander II. who died in 1249, leaving the crown to his ſon Alexander III. a very good prince, who made the happineſs of his people his chief care. He firſt married Margaret, daughter to Henry III. of England, by whom he had Alexander (who married the daughter of the earl of Flanders,) David, and Margaret. She married Hangowan, ſon to Magnus IV. king of Norway. That princeſs was delivered of a daughter, named Margaret, generally called the Maiden of Norway; by whoſe death, without iſſue, all the poſterity of William failed, and the crown of Scotland returned to David, earl of Huntingdon, brother to William and Malcolm IV.

Upon the death of Alexander III. John Baliol, great grandſon to David, earl of Huntingdon, by his elder doughter Margaret, and Robert Bruce, grandſon to the ſame earl of Huntingdon, by his younger daughter Iſabel, became competitors for the crown of Scotland. The deciſion was referred to Edward I. of England. After a long diſcuſſion, Edward awarded the crown to Baliol, who agreed to do homage for it to the king of England. Baliol was accordingly crowned at Scone, but ſoon after ſurrendered his crown to Edward, who detained him priſoner.

After this, Edward obliged the Scots to ſign inſtruments of their ſubjection to him, and carried off or deſtroyed all the hiſtorical records of their kingdom, taking with him the fatidical ſtone on which the kings of Scotland had long been crowned, and depoſited it in Weſtminſter-Abbey. Enraged at the loſs of every thing they valued, the Scots determined to periſh rather than wear the chains of the victor. Edward perceiving his miſtake, changed his meaſures; he treated them on the footing of ſubjects, and projected an union between the two kingdoms. Happy had it been for both had this treaty took place, but the Scots patriots treated it with diſdain. They united themſelves under Sir William Wallace, one of the greateſt heroes of that age; but he being only a private gentleman, his ſucceſs ſoon cauſed him to be envied by the Scotch nobility.

In the mean time Edward prepared another formidable army for the invaſion of Scotland. It conſiſted of 80,000 foot, 3000 horſe, and 4000 light armed troops, and was attended by a fleet to ſupply it with proviſions. This army, when joined by the troops already in Scotland, formed an irreſiſtible body. Edward divided it into two parts, one of which, conſiſting of 40,000 men, he commanded in perſon. Wallace was at the head of the Scotch army, encamped at Falkirk; but before the Engliſh appeared, the general was deſerted by Cummin, the moſt powerful nobleman in Scotland, at the head of the beſt diviſion of his countrymen. Betrayed by his friends, and abandoned by a large part of his army, was obliged to retreat, and found means to croſs the Carron, along whoſe banks he marched in ſafety.

Bruce (who was then but a youth, and had hitherto ſerved in the Engliſh army, where he had given proofs of his aſpiring genius) appeared on the oppoſite banks; and diſtinguiſhing the Scottiſh chieftain, as well by his majeſtic port as by the intrepid activity of his behaviour, called out to him, and deſired a ſhort conference. He repreſented to Wallace the fruitleſs and ruinous enterprize in which he was engaged, and endeavoured to perſuade him to ſubmit to ſuperior power. Wallace laboured to convince him of his error in joining with the enemy of Scotland; adding, that as the intereſts of his country, no more than thoſe of a brave man, could never be ſincerely cultivated by a ſacrifice of liberty, he was determined, as far as poſſible, to prolong his freedom, and was deſirous that his own life, as well as the exiſtence of the nation, might terminate, when they could no longer be preſerved but by receiving the chains of the victor. Fired with theſe ſentiments, Bruce determined to purſue the ſame path of glory, and either free his country from their ſtate of ſervitude, or periſh in the attempt. Wallace ſtill continued in arms, and performed many gallant actions againſt the invaders of his country; but being at laſt betrayed by one of his pretended friends, he was carried to London, and executed as a traitor. Bruce did not live to put his reſolutions in practice; he died ſoon after the battle of Falkirk, conjuring his ſon, with his laſt breath, to revenge the injuries of his bleeding country, and ſupport her independence.

He obeyed the dying injunctions of his father, and making his eſcape from the Engliſh court, where he was detained a priſoner at large, repaired to Scotland, and killed Cummin with his own hand, for his attachment to Edward. Bruce flew to different quarters, excited his partiſans to arms, attacked with ſucceſs the diſperſed bodies of the Engliſh, and drove them once more out of the kingdom. Exaſperated at this unexpected attack of the Scots, and the death of Cummin, Edward vowed revenge againſt the whole Scottiſh nation, and aſſembled a very powerful army, in order to make them the victims of his ſeverity. In the mean time he ſent Aymer de Valence with a conſiderable force to check the progreſs of the inſurgents; and that general, falling unexpectedly upon

upon Bruce, at Methven, in Perthſhire, threw his army into ſuch confuſion, that a total defeat was the conſequence. Bruce himſelf, attended with a few of his followers, had the good fortune to eſcape the dreadful carnage, and took ſhelter in the weſtern iſles. Edward ſoon after marched his powerful army to Carliſle, in order to enter the Scottiſh kingdom, and carry his threats into execution: but death put a period to his expedition and his life, after having deſtroyed, according to the beſt hiſtorians, 100,000 of the inhabitants. He died on the 7th of July, 1307.

Soon aftewards, Bruce quitted his retreat in the weſtern iſles, where he had ſuffered inexpreſſible hardſhips, and appeared again at the head of a ſmall army of his friends and followers. His firſt exploit was an important advantage which he obtained by ſurpriſe over Aymer de Valence, who commanded the Engliſh forces; ſo that the Scots began to entertain hopes of recovering their independence.

Edward II. perceiving at length the neceſſity of acting with vigour, accordingly aſſembled a powerful army, in order to finiſh this important enterprize by one dreadful blow. He entered Scotland at the head of a numerous body of forces, and advanced towards Bruce's army, encamped near Stirling. His chief officers were, the earls of Glouceſter, Hereford, Pembroke, and Sir Giles Argenton. Thoſe under Bruce were, his own brother Sir Edward; his nephew Randolf, earl of Murry; and the young lord Walter, high ſteward of Scotland. The Scottiſh general, knowing that he was unable to face the Engliſh in the open field, without ſome advantageous circumſtances in his favour, drew up his army near Bannockburn, having a hill on his right flank and a moraſs on his left. In the front of his army was a wide rivulet, on the banks of which he cauſed deep pits to be dug, and ſharp ſtakes to be planted in them, and the whole to be carefully covered with turf. Theſe precautions had the deſired effect; the Engliſh cavalry, eager to engage the enemy, fell into the pits, and were driven off the field of battle, before they had time to rally. This unfortunate accident ſtruck the army of Edward with a panic, and Bruce obtained a complete victory. The Scotch writers make the loſs of the Engliſh to amount to 50,000 men, and their own to 4000. The flower of the Engliſh nobility were either killed or taken priſoners; their camp, which was immenſely rich, fell into the hands of the Scots; and Edward himſelf, with a few followers, were purſued by Douglas to the gates of Berwick, from whence he eſcaped in a fiſhing-boat. This great and deciſive battle happened in the year 1314.

By this fortunate acquiſition, Bruce was eſtabliſhed on the Scottiſh throne, and the remainder of his reign was a ſeries of the moſt glorious ſucceſſes. He ſent his brother Edward into Ireland, at the head of a conſiderable army, who obtained very great advantages over the natives, but was at laſt ſlain in battle. Robert, who knew that the events of war are always uncertain, made peace with England, and died in the year 1328, leaving his country in the greateſt proſperity.

David II. the ſon and ſucceſſor of Robert Bruce, was a virtuous prince; but his abilities as a king were greatly eclipſed by thoſe of Edward III. of England, whoſe ſiſter he married. The Engliſh monarch eſpouſed the cauſe of John Baliol, ſon to the original competitor for the Scottiſh throne, and defeated David's forces in ſeveral bloody battles. That prince himſelf was taken priſoner at the battle of Durham. After eleven years impriſonment in England, he obtained his liberty, on paying a ranſom of 100,000 marks, and died without iſſue, in the year 1371. By the death of David, the laſt of the Brucean line, the crown devolved upon the Stuart family, whoſe chief had married the niece of Robert Bruce.

The firſt monarch was Robert II. a wiſe and brave prince. He was an excellent judge of mankind, and always employed generals of the moſt diſtinguiſhed abilities. He was fifty-ſeven years of age when he mounted the throne, and ſeventy when the firſt war broke out againſt England.

He died in 1390, and was ſucceededby his ſon Robert III. a prince innocent and inoffenſive in his conduct. But Scotland was at that time very ill inclined to cheriſh, or even to endure, ſovereigns of that character. The duke of Albany, Robert's brother, a prince of more abilities, at leaſt of a more boiſterous and violent diſpoſition, aſſumed the government of the ſtate; and, not ſatisfied with his preſent authority, entertained the horrid purpoſe of extirpating his brother's children, and of fixing the crown in his own family. Accordingly he threw David, his eldeſt nephew, into priſon, and ſuffered him there to periſh with hunger. James, the younger brother of David, now only ſtood between him and the throne; and Robert, ſenſible of his ſon's danger, embarked him on board a ſhip, with a view of ſending him into France, and intruſting him to the protection of that power; but unfortunately the veſſel was taken by the Engliſh, and Prince James, a boy about nine years of age, was carried to London; and though there ſubſiſted a truce at that time between the two kingdoms, Henry refuſed to reſtore the young prince to his liberty. Robert, worn out with cares and infirmities, was unable to bear the ſhock of this laſt misfortune, and ſoon after paid the debt of nature, leaving the government in the hands of the duke of Albany.

James I. being ſet at liberty in the year 1424, on paying a ranſom, aſcended the throne of his anceſtors; and having received an excellent education in England, determined to abridge the power of his nobility. He was alſo deſirous of recovering the crown lands which had been unjuſtly wreſted from his family during his reſidence in England. But theſe attempts coſt him his life; ſome of the chief nobility formed a conſpiracy againſt him, and he was murdered in his bed, in 1437, and the forty-fourth year of his age.

The death of James I. was ſucceeded by a long minority, attended with all the diſtractions too common in thoſe events. When the young prince became old enough to hold the reins of government, theſe diſtractions ſubſided, and James gave many indications of his inheriting the ſpirit of his anceſtors. Soon after his acceſſion to the throne, the quarrel commenced between the houſes of York and Lancaſter, and became abſolutely incurable, but by the extinction of one party. This was too great an advantage not to be ſeized by James, who hoped now to recover thoſe places the Engliſh had formerly conquered. In the year 1460, he laid ſiege to Roxborough, and had provided himſelf with a ſmall train of artillery for the enterprize: but his cannon was ſo ill framed, that one of them burſt as he was firing it, which put an end to his life.

His ſon and ſucceſſor, James III. being alſo a minor, the uſual diſtractions enſued in the kingdom; the queen-dowager, Anne of Gueldres, aſpired to the government, and the family of Douglas oppoſed her pretenſions. Nor was the nation greatly relieved when James came of age to take the government into his own hands. Suſpicion, indolence, immoderate attachment to favourites, with many other errors of a feeble mind, too plainly mark the reign of this prince. His adminiſtration was cloſed by a rebellion of his ſubjects, and he was ſlain in battle, in the year 1488, in the thirty-ſixth year of his age.

James IV. who aſcended the throne on the death of his father, was one of the moſt accompliſhed princes of his age: he was naturally generous and brave; and encouraged the commerce of his ſubjects. In the year 1502, he married Margaret, eldeſt daughter of Henry VII. and it was hoped that this alliance would remove all ſource of diſcord between the

the two kingdoms. But this flattering idea was deceitful: he cheriſhed the fatal error of his family, a predilection for the French. He joined that nation againſt Henry VIII. led an army into England, and was ſlain, together with the flower of his nobility, in the battle of Flodden, which happened in the year 1513, and the fortieth of his age.

The minority of his ſon, James V. was long and turbulent: and when he grew up, he married two French ladies; the firſt being daughter to the king of France, and the latter of the houſe of Guiſe. He inſtituted the court of ſeſſion, enacted many ſalutary laws, and greatly promoted the trade of Scotland, particularly the working of the mines. At this time the balance of power was ſo equally poiſed between the contending princes of Europe, that James's friendſhip was courted by the pope, the emperor, the king of France, and his uncle Henry VIII. of England, from all whom he received magnificent preſents. But James took little ſhare in foreign affairs; he ſeemed rather to imitate his predeceſſors in their attempts to humble the nobility; and the doctrine of the Reformation beginning to gain ground in Scotland, he liſtened to the inſtigations of his clergy, and gave way to a religious perſecution. Some time after, a war broke out with England, and the duke of Norfolk, at the head of a numerous army, entered the Scottiſh territories, and committed ſome diſorders; but hearing that James was at the head of a ſtrong body of forces, retreated into England. Inflamed with a deſire of military glory, and determined to revenge the affronts he had received, James gave the ſignal for purſuing them, and carrying the war into England. But his nobilty oppoſed this reſolution, and refuſed to attend him in his projected enterprize. Enraged at this defection, he reproached them with cowardice, and threatened them with the effects of his anger. He however determined to purſue his purpoſe, and entered England at the head of a few forces that adhered to him. He had not advanced far, before his troops were ſeized with a panic, on hearing that a ſmall detachment of the Engliſh was approaching, and fled in the utmoſt confuſion. This diſtaſter ſo deeply affected James, that he loſt all command of his temper. Rage againſt his nobility, who he believed had betrayed him; ſhame for a defeat of ſuch unequal numbers; regret for the paſt, and fear for the future, ſo wrought upon him, that he would admit of no conſolation, but abandoned himſelf wholly to deſpair, of which he died, in the year 1542.

His daughter and ſucceſſor Mary, was only a few hours old when her father died. She was ſent to France when an infant, and married, during her minority, to the dauphin, who died before ſhe aſcended the throne of Scotland. This princeſs, famous at once for her beauty and misfortunes, ſoon after ſhe obtained the crown of her anceſtors, married lord Darnly, whoſe untimely death produced a rebellion in her kingdom. Mary's forces were defeated, and ſhe herſelf obliged to take refuge in England, where ſhe was detained a priſoner eighteen years by queen Elizabeth, and afterwards beheaded by order of that princeſs, in the year 1587, and in the forty-ſixth of her age.

James VI. ſucceed his mother on the Scottiſh throne; and, after the death of queen Elizabeth, aſcended that of England, after ſhewing great abilities for governing in Scotland. By this means the two crowns became united.

James, after a ſplendid but troubleſome reign over his three kingdoms, left them, in 1625, to his ſon, the unfortunate Charles I. That prince, by his arbitrary principles and conduct, induced both his Scottiſh and Engliſh ſubjects to take up arms againſt him; and indeed, the ſword was firſt drawn againſt Charles in Scotland. But when the royal party was totally defeated in England, the king put himſelf into the power of the Scottiſh army, who at firſt treated him with reſpect, but afterwards delivered him up to the Engliſh parliament, on condition of their paying 400,000l. to the Scots, which was ſaid to be due to them for arrears. However, the Scots afterwards made ſeveral bloody but unſucceſsful attempts to reſtore his ſon, Charles II. who was finally defeated by Cromwell, at the battle of Worceſter, in 1651; after which, to the time of his reſtoration, the common-wealth of England, and the Protector, gave law to Scotland.

At the acceſſion of queen Anne to the crown of England, the Whigs again made application to the Scots, and offered them their own terms, if they would agree to the incorporate Union as it now ſtands The majority of the Scots parliament for a conſiderable time rejected the propoſal; but were at length prevailed on to agree to it, partly from conviction, and partly by the diſtribution of money among the needy nobility; ſince which the hiſtories of England and Scotland become one and the ſame.

Sir John Sinclair computes the preſent population of Scotland (1793) at 1,700,000.

The armorial bearing of Scotland is ſol, a lion rampant, gules, with a double teſſure flowered and counter-flowered; the creſt, a lion crowned imperial.

CHAP. X.

ENGLAND.

Boundaries, Extent, Situation, Diviſions, Soil, Climate, Rivers, Produce, Fiſheries, Manufactories, Religion, Learning, Hiſtory, &c.

ENGLAND, including WALES, is bounded, on the north, by Scotland; on the eaſt, by the German Ocean; on the weſt, by St. George's Channel, and on the ſouth, by the Engliſh Channel, which ſeparates it from France. It is about 380 miles in length, and 300 in breadth; ſituated between 50 and 56 deg. north lat. and between 2 deg. eaſt, and 6 deg. 20 min. weſt longitude. It is of a triangular form; the Land's-End in Cornwall, Dover-Head in Kent, and Caithneſs on the borders of Scotland, forming three angular points.

England is waſhed by the ſea on all ſides, except where it joins to Scotland; which ſituation renders the country liable to great uncertainty of weather, ſo that the inhabitants on part of the ſea-coaſts are often viſited by agues and fevers; but the warm vapours which continually ariſe from the ſea, qualify the natural ſharpneſs of the air, and cauſe the earth to be clothed with a perpetual verdure. The ſpring begins in March, and in May the whole country is covered with bloſſoms. The cold, however, too often continues; ſo that while the trees diſplay all the pomp of vernal bloom, they, as well as the human nerves, are frequently chilled with the coldneſs of the atmoſphere. However, the ſituation of England near the ſea renders it friendly to the longevity of the inhabitants in general, eſpecially thoſe who live on a dry ſoil.

In the time of the Romans, the whole iſland went by the name of Britannia. The word Brit, according to Mr. Camden, ſignifies painted or ſtained; the ancient inhabitants being famous for painting their bodies; though ſome antiquaries do not agree on this etymology. Some derive it from a Celtic word, ſignifying a level country; but we prefer the common etymology, of its being derived from Anglen, a province now ſubject to his Daniſh majeſty, which furniſhed a great part of the original Saxon adventurers into this iſland.

When the Romans firſt landed in Britain, it was inhabited by ſeventeen tribes, viz. the Danmonii, Durotriges,

John and Mary Routh Married July 12th 1806

Mary Routh Daughter of John and Mary Routh Born April 25 day at 2 Minits past One a clock 1807

Mary Routh Died May 23rd at half past three a Clock Aged 2 years 3 mths And 5 Days 1809

Durotriges, Belgæ, Atrebatii, Regni, Cantium Trinobantes, Juni, Caticuchlani, Dobuni, Silures, Dimetæ, Ordovires, Cornavii, Coritain, Brigantes, Ottadini: but they afterwards becoming maſters of it, divided it into the four following provinces: 1. Britannia Prima, comprehending the ſouthern parts of England. 2. Britannia Secunda, comprehending the weſtern parts, and Wales. 3. Maxima Cæſarienſis, which reached from the Trent as far northward as the wall of Severus, between Newcaſtle and Carliſle, and ſometimes as far as that of Adrian in Scotland, between the Forth and Clyde. 4. Flavia Cæſarienſis, compriſing the middle counties. To each of theſe tribes a certain number of counties were allotted, with their chief cities.

When the Saxons invaded England, about the year 450, and when they were eſtabliſhed in the year 582, they divided the iſland into ſeven unequal parts, called kingdoms, generally ſtiled the Saxon heptarchy; each leader appropriating to himſelf the parts he had conquered, which are as follow:

1. Kent, founded by Hengiſt, in 457, and ended in 823. 2. South Saxons, founded by Elli, in 491, and ended in 600. 3. Eaſt Angles, founded by Uffa, in 575, and ended in 793. 4. Weſt Saxons, founded by Cerdic, in 512, and ended in 1060. 5. Northumberland, found by Ida, in 547, and ended in 792. 6. Eaſt Saxons, founded by Erchewin, in 527, and ended in 746. 7. Mercia, founded by Cridda, in 582, and ended in 874.

The great Alfred divided England into counties; and, ſince the Norman conqueſt, it has been divided into ſix circuits, each circuit containing a certain number of counties. Two judges are appointed for each circuit, which they viſit annually, in order to adminiſter juſtice to the inhabitants of each reſpective country, without the trouble and expence that muſt attend their coming to the capital. They are as follow:

1. The Home Circuit contains the Counties of Eſſex, Hertford, Kent, Surry, and Suſſex.

2. Norfolk Circuit contains Bucks, Bedford, Huntingdon, Cambridge, Suffolk, and Norfolk.

3. Oxford Circuit contains Oxon, Berks, Glouceſter, Worceſter, Monmouth, Hereford, Salop, and Stafford.

3. Midland Circuit contains Warwick, Leiceſter, Derby, Nottingham, Lincoln, Rutland, and Northampton.

5. Weſtern Circuit contains Hants, Wilts, Dorſet, Somerſet, Devon, and Cornwall.

6. Northern Circuit contains York, Durham, Northumberland, Lancaſter, Weſtmoreland, and Cumberland. In the Lent or Spring Aſſizes, the Northern Circuits extend only to York and Lancaſter; the aſſizes at Durham, Newcaſtle, Appleby, and Caliſle, being held only in the autumn, and diſtinguiſhed by the appellation of the *long circuit*.

Middleſex and Cheſhire are not comprehended in the above circuits; the former being the ſeat of the ſupreme courts of juſtice, and the latter a county palatine. The ſame may be ſaid of Wales.

The chief governors of all theſe counties were formerly impowered by charter to adminiſter juſtice as abſolutely as the king himſelf. There is ſtill a court of chancery in Lancaſter and Durham, with a chancellor; and there is a court of exchequer at Cheſter, of a mixed kind, both for law and equity, of which the chamberlain of Cheſter is judge: there are alſo other juſtices in the counties palatine to determine civil actions and pleas of the crown.

Circuits of Wales.—1. North-Eaſt Circuit contains the Counties of Flint, Denbigh, and Montgomery.

1. North-Weſt Circuit contains Angleſey, Caernarvon, and Merioneth.

3. South-Eaſt Circuit contains Radnor, Brecon, and Glamorgan.

4. South-Weſt Circuit contains Pembroke, Cardigan, and Caermarthen.

67	Cities and boroughs	15 burgeſſes.
	Total of the Britiſh Houſe of Commons	558

Beſides the fifty-two counties into which England and Wales are divided, there are counties corporate, conſiſting of certain diſtricts, to which the liberties and juriſdictions peculiar to a county have been granted by royal charter. Thus the city of London is a county diſtinct from Middleſex; the cities of York, Cheſter, Briſtol, Exeter, Norwich, Worceſter, and the towns of Kingſton-upon-Hull, and Newcaſtle-upon-Tyne, are counties of themſelves, diſtinct from thoſe in which they lie. The ſame may be ſaid of Berwick-upon-Tweed, which lies in Scotland, and has within its juriſdiction a ſmall territory of two miles on the north ſide of the river.

The ſoil of England differs in almoſt every county; but the great perfection to which the art of agriculture is arrived, has meliorated the very worſt, and improved the beſt eſtates in England. Many of the large moors and marſhy tracts have been drained, and inſtead of weeds and traſh, produce excellent corn and graſs. Many vegetables, formerly cultivated only in gardens, are now introduced into the fields, and raiſed in amazing plenty by the Engliſh farmers. The quantity of wheat, barley, rye, oats, peas, beans, and vetches, produced every year in this country, is very great. Nor does any nation exceed this in the productions of the garden, which have come to ſuch perfection, that the rareſt of foreign fruits have been cultivated here with ſucceſs; as a proof of which it need only be mentioned, that London and its neighbourhood, though peopled by 1,000,000 inhabitants, is plentifully ſupplied with all kinds of fruits and vegetables from grounds within twelve miles diſtance. The ſoil of England ſeems to be particularly adapted for rearing oak and other kinds of timber; and the plantations of trees round the houſes of noblemen and gentlemen, and even of peaſants, are delightful and aſtoniſhing.

It is chiefly owing to the variable quality of the air that the ſeaſons are extremely uncertain; but the greateſt irregularity, and moſt unfavourable appearances of them, are not, as in other countries, attended with famine, and very ſeldom with ſcarcity. A fortnight, or at moſt three weeks, generally make up the difference with regard to the maturity of the fruits

of the earth, in backward ſeaſons, and the inhabitants rarely ſuffer by a hot ſummer.

Several parts of England are ſupplied with excellent ſprings and fountains, though they frequently contain ſome mineral impregnation. In ſome very high lands, the inhabitants are diſtreſſed for water, and ſupply themſelves by trenches, or digging deep wells. England contains many mineral wells, as celebrated for their ſalubrity as perhaps any country in the world. The moſt diſtinguiſhed are the hot baths of Bath and Briſtol in Somerſetſhire, and of Buxton and Matlock in Derbyſhire; the mineral waters of Tunbridge, Epſom, Harrowgate, and Scarborough.

There are few mountains in England, though it abounds with delightful riſing grounds, and the moſt enchanting ſlopes covered with a ſmooth ſurf of the fineſt graſs; which, together with its level plains, meadows, corn-fields, woods and waters, flocks of ſheep, and herds of cattle, intermingled in the moſt agreeable manner, form landſcapes equal to the moſt luxuriant imagination. The moſt noted mountains in England are, the Peak in Derbyſhire, the Wolds and Black Mountains in Yorkſhire, the Endle and Wulf Cragg in Lancaſter, the Cheviot-Hill and Racy-Fall, on the borders of Scotland; Woodbery, and the Malvern-Hills in Worceſterſhire, the Brythen, Malagerin, and Wrekin in Shropſhire, Cotſwold in Glouceſter, Dover-Cliffs in Kent, Beachy-Head, and the South-Downs in Suſſex, White-Cliff, the Needles, and St. Catherine's, in the Iſle of Wight. The principal mountains in Wales are, Snowdon, Plinlimmon, Eltid, Penmallard, Manuchdeny, Dervaddo, Talſern, Carreg Wem, Brong, Trecaſtle, Moyddon, Keven-y-Gaer, and the Black Mountains.

The principal rivers in England are, the Thames, the Medway, the Severn, the Trent, the Ouſe, the Tyne, the Tees, the Tweed, the Lower Avon, the Derwent, the Ribble, the Merſy, and the Dee.

The Thames riſes on the confines of Glouceſterſhire, a little ſouth weſt of Cirenceſter; and, after receiving the many tributary ſtreams of other rivers, it paſſes to Oxford, then by Abingdon, Wallingford, Reading, Marlow, and Windſor. From thence to Kingſton, where formerly it met the tide, which, ſince the building of Weſtminſter-bridge, is ſaid to flow no higher than Richmond; from whence it flows to London, and after dividing the counties of Kent and Eſſex, it widens in its progreſs, till it falls into the ſea at the Nore, from whence it is navigable for large ſhips to London-bridge. It was formerly a reproach to England among foreigners, that ſo capital a river ſhould have ſo few bridges; thoſe of London and Kingſton being the only two it had, from the Nore to the laſt-mentioned place, for many ages. This inconveniency was in ſome meaſure owing to the dearneſs of materials for building ſtone bridges, but perhaps more to the fondneſs which the Engliſh, in former days, had for water-carriage, and the encouragement of navigation. The great increaſe of riches, commerce, and inland trade, is now multiplying bridges; and the world cannot parallel, for commodiouſneſs, architecture, and workmanſhip, thoſe lately erected at Weſtminſter and Black Friars. Batterſea, Putney, Kew, Richmond, Walton, and Hampton court, have now bridges likewiſe over the Thames, and others are projecting by public-ſpirited proprietors of the grounds on both ſides.

The river Medway, which riſes near Tunbridge, falls into the Thames at Sheerneſs, and is navigable for the largeſt ſhips as far as Chatham. The Severn, reckoned the ſecond river for importance in England, and the firſt for rapidity, riſes at Plinlimmon-hill, in North Wales; becomes navigable at Welſhpool; runs eaſt to Shrewſbury; then turning ſouth, viſits Bridgnorth, Worceſter, and Tewkeſbury; where it receives the Upper Avon; after having paſſed Glouceſter, it takes a ſouth-weſt direction; is, near its mouth, increaſed by the Wye and Uſtre, and diſcharges itſelf into the Briſtol Channel, near King-road, where lie the great ſhips which cannot get up to Briſtol. The Trent riſes in the Moorlands of Staffordſhire, and running ſouth-eaſt by Newcaſtle-under-Line, divides that county into two parts; then turning north-eaſt on the confines of Derbyſhire, viſits Nottingham, running the whole length of that county to Lincolnſhire, and being joined by the Ouſe and ſeveral other rivers towards the mouth, obtains the name of the Humber, falling into the ſea ſouth-eaſt of Hull.

The other principal rivers in England are, the Ouſe (a Gaëlic word ſignifying *water* in general), which falls into the Humber after receiving the waters of many other rivers. Another Ouſe riſes in Bucks, and falls into the ſea near Lynn, in Norfolk. The Tyne runs from weſt to eaſt through Northumberland, and falls into the German ſea at Tinmouth, below Newcaſtle. The Tees runs from weſt to eaſt, dividing Durham from Yorkſhire, and falls into the German ſea below Stockton. The Tweed runs from weſt to eaſt, on the borders of Scotland, and falls into the German ſea at Berwick. The Eden runs from ſouth to north through Weſtmoreland and Cumberland, and paſſing by Carliſle, falls into Solway Frith, below that city. The Lower Avon runs weſt through Wiltſhire to Bath, and then dividing Somerſetſhire from Glouceſterſhire, runs to Briſtol, falling into the mouth of the Severn below that city. The Derwent runs from eaſt to weſt through Cumberland, and paſſing by Cockermouth, falls into the Iriſh ſea a little below. The Ribble runs from eaſt to weſt through Lancaſhire, and paſſing by Preſton, diſcharges itſelf into the Iriſh ſea. The Merſey runs from the ſouth-eaſt to the north-weſt through Cheſhire, and then dividing Cheſhire from Lancaſhire, paſſes by Liverpool, and falls into the Iriſh ſea a little below that town. And the Dee riſes in Wales, and divides Flintſhire from Cheſhire, falling into the Iriſh channel below Cheſter.

There are but very few lakes in England; the principal are Soham-Mere, Wittleſea-Mere, and Ramſay-Mere, in the Iſle of Ely in Cambridgeſhire, and Winander-Mere in Weſtmoreland. Wittleſea-Mere, which is much the largeſt of thoſe in the Iſle of Ely, is about three miles in length, and one and a half in breadth; but when the fens are over-flowed in a rainy ſeaſon, the whole forms one vaſt lake, near 40 miles in circumference. Winander-Mere is ten miles in length from north to ſouth, and two miles in breadth from eaſt to weſt. There are ſeveral ſmall iſlands in it; the bottom is one continued rock.

England formerly contained no fewer than 39 foreſts; of which the principal now remaining are thoſe of Windſor, Epping, Dean, Sherwood, New Foreſt, Exmoor. There were in this country large woods, if not foreſts of cheſnut-trees, which exceeded all other kinds of timber for the purpoſe of building, as appears from many great houſes ſtill ſtanding, in which the cheſnut-beams and roofs remain ſtill freſh and undecayed, though ſome of them are above 600 years old. But the whole kingdom is ſo ſhaded by trees and plantations as give it almoſt the appearance of one continued foreſt.

The moſt conſiderable mineral produced in England is tin; and Cornwall has been famous for producinging it ever ſince the Phœnicians traded to Great-Britain. Since the Engliſh have found the method of manufacturing their tin into plates and white iron, their mines have become of immenſe benefit to the nation. An ore, called Mundic, is found in the beds of tin, which was little regarded, till Sir Gilbert Clark diſcovered the art of manufacturing it; and it is ſaid now to bring in 150,000l. a year, and to equal in goodneſs the beſt Spaniſh copper, yielding a proportionable quantity of lapis calaminaris,

laminaris, for making braſs. Thoſe tin works are under peculiar regulations, by what are called the ſtannary laws, and the miners have parliaments and privileges of their own, which are in force at this time. The number of Corniſh miners are ſaid to amount to 100,000. Free-ſtone is plentiful in Derbyſhire, and marble in the neighbourhood of Plymouth. Immenſe quantities of coals are dug out of the pits in Northumberland, Cumberland, Weſtmoreland, and the biſhoprick of Durham. The exportation of coals to other countries is a valuable article, and this trade furniſhes a great number of ſeamen for government ſervice. Northumberland and Cheſhire produce a great deal of alum and ſalt; and the kingdom abounds with fullers earth, which being of the utmoſt importance to the cloth manufactory, its exportation is prohibited under ſevere penalties.

The vegetable and animal productions of England are very numerous, and excellent in their kind. Indeed, the improvements in agriculture have been ſo many, and made in ſo rapid a manner, that the value of lands, in ſeveral parts of England, has been trebled within a few years. Noblemen, and gentlemen of the greateſt property in the kingdom, have nobly lent their aſſiſtance to the improvement of this uſeful art. Several ſocieties are founded for the ſame laudable purpoſe; and the example, intereſt, and great weight of the nobility and gentry, have, in a great meaſure, prevailed with the farmers, to alter their method of cultivation. Hence agriculture is every day making large ſtrides towards perfection; and corn, and other uſeful vegetables, are raiſed on ſoils formerly thought incapable of cultivation.

The ſoil of England ſeems friendly to many ſpecies of timber: the aſh, the elm, the beech, and the fir, flouriſh equally with the oak; and beſides theſe, here are plenty of walnut-trees, poplars, maples, ſycamores, horn-beams, hazles, willows, birch-trees, and many other ſpecies. Prodigious plantations of hops are ſeen in Kent, Surry, and Hampſhire; and the fineſt ſaffron in the world is raiſed in Eſſex, Suffolk, and Cambridgeſhire. Hemp and flax are alſo cultivated in ſome counties, and madder and woad for dyeing, in others. The artificial graſſes, particularly lucern, ſaintfoin, trefoil, cinquefoil, and clover, are now ſown to great advantage. The orchards of England, particularly thoſe of Herefordſhire, Devonſhire, Worceſterſhire, and Kent, produce incredible quantities of apples, pears, and cherries; and the cyder and perry made from the apples and pears in ſome counties, are equal to the French white wines.

Gardening is alſo carried to very great perfection in England: there is hardly a plant in the known world but may be found in ſome of the gardens of the curious. Even the fruits of the torrid zone are here brought to perfection. The pine-apple, formerly ſo difficult to be met with, is now plentifully produced in almoſt every gentleman's garden in England. Apricots, peaches, nectarines, plums, gooſeberries, currants, and raſpberries, are ſo common, that the bare mentioning their names muſt be ſufficient: in ſhort, the Engliſh gardeners are ſuch maſters of horticulture, that they perform things almoſt incredible; roſes and other flowers, fully and finely blown at Chriſtmas, are not uncommon in ſome of their gardens; cherries and other fruits, fully ripe, are alſo produced in that dreary ſeaſon. The common gardens, even thoſe of the peaſants, abound with all ſorts of greens, roots, and ſalads in perfection, particularly, artichokes, aſparagus, cauli-flowers, cabbages, coleworts, broccoli, peas, beans, kidney-beans, ſpinach, lettuce, celery, endive, muſhrooms, turnips, carrots, potatoes, radiſhes, leeks, onions, ſhallots, &c.

With regard to the animal productions of England, the horſe ſtands foremoſt. That noble and generous animal is found in this country in great perfection: indeed, all the valuable qualities of the Arabian, the Turkiſh, the Spaniſh, and other foreign horſes, are united in that of England, owing to the incredible pains taken by all ranks of men, for improving the ſpecies. Vaſt numbers of horſes are bred in England, and ſo many ſold into foreign countries, that their exportation is now become a conſiderable branch of commerce. The ſtrength, courage, ſwiftneſs, and intrepidity of the Engliſh horſe is ſo well known on the continent of Europe, that every prince is deſirous of having them in his army. Thoſe which draw equipages in the ſtreets of London are often particularly beautiful.

The Engliſh oxen are large and fat, and their fleſh has a delicious flavour, though ſome prefer that of the ſmall breed of Wales and Scotland. The ſheep are of two kinds, one bred on the Downs, and upland paſtures, and the other in the low lands of Eſſex and Lincolnſhire: the fleſh of the former is preferred, and the fleeces of the latter. Wool is one of the moſt valuable articles of the produce of this country, and conſtitutes the original ſtaple commodity of England. The fleeces of the Lincolnſhire ſpecies of ſheep are remarkably large, and it has been computed, upon very rational principles, that above twelve millions of fleeces are annually manufactured in England.

The Engliſh maſtiffs and bull-dogs, are ſaid to be far ſuperior to thoſe of any other country, both with regard to ſtrength and courage. They will engage any animal, and generally come off victorious. Two of theſe dogs being, by order of king James I. turned looſe upon one of the moſt dreadful lions in the Tower, they laid him on his back; but a ſtill more ſurpriſing circumſtance attending theſe creatures, is, that this innate courage degenerates in foreign countries. Nor is this change peculiar to theſe dogs; the ſame is obſerved with regard to the Engliſh game-cocks, ſo famous here for their ferocity and courage. The reſt of the animals of England are nearly the ſame with thoſe of other countries, as aſſes, mules, deer, hares, rabbits, hogs, foxes, ſquirrels, cats, ferrets, weazles, newts, otters, badgers, hedge-hogs, pole-cats, rats, mice, moles, &c.

Poultry of all kinds are here in great plenty and perfection, as turkies, peacocks, geeſe, ſwans, common poultry, of various kinds, ducks, and tame pigeons. England alſo abounds in different ſorts of wild fowl, as buſtards, wild geeſe, brent geeſe, wild ducks, wigeon, teel, pheaſants, plovers, partridges, woodcocks, quails, ſnipes, landrails, wood-pigeons, hawks, buzzards, kites, owls, ravens, herens, crows, rooks, jackdaws, magpies, jays, thruſhes, blackbirds, nightingales, goldfinches, bullfinches, larks, linnets, and a prodigious variety of ſmall birds; among which is the wheat-ear, a bird peculiar to England, the fleſh of which is by many preferred to that of the ortolan, and is reckoned a great delicacy.

Few countries in the world can boaſt of greater variety of fiſh. The rivers and ponds abound in ſalmon, trout, eels, pike, carp, tench, barble, perch, gudgeons, ſmelts, roach, dace, plaice, flounders, and craw-fiſh. In ſome of the lakes or meers of Cumberland and Wales, is found a very delicate fiſh called a char; it is of the trout kind, and thought to be peculiar to England. The ſeas which ſurround the kingdom are full of cod, mackerel, mullets, baſe, guard-fiſh, haddock, whiting, herrings, pilchards, ſkaite, turbot, ſoles, hallibuts, and, what are preferred to all others by the voluptuous, John Doris, and red mullets. Shell-fiſh are alſo found in plenty, as lobſters, crabs, prawns, ſhrimps, oyſters eſcallops, cockles, muſcles, wilks, periwinkles, &c. The coaſts are ſometimes viſited by whales, and by a vaſt number of porpoiſes; in ſome parts a few ſeals are ſeen upon the rocks, but not frequently. The principal reptiles of this country are adders, vipers, ſnakes, and worms; the inſects are, bees, humble-bees, hornets, waſps, beetles, ants, gnats, flies in great variety, and many other ſmall inſects common to other parts of Europe.

With

With reſpect to the population of England, political calculations muſt be very fallible; which is owing to the prodigious influx of foreigners hither, the emigrations of inhabitants to America and the iſlands, their return from thence, and the great number of hands employed in ſhipping. It will appear that England muſt be extremely populous, when we conſider, that the war with France and Spain, before the laſt, annually employed about 200,000 Engliſhmen, excluſive of Scots and Iriſh, by ſea and land, and its progreſs carried off, by various means, near that number. The decay of population was indeed ſenſibly felt, but not ſo much as it was during the wars in queen Ann's reign, though not half of the numbers were then employed in the ſea and land ſervice. If, with ſome, we calculate the inhabitants from the number of houſes in England, which are reckoned at near a million, and allow only ſeven or eight perſons to each houſe, there will then appear to be ſeven millions, or perhaps more. Some, however, will ſuppoſe this to be too large a calculation.

Engliſhmen, in their perſons, are generally well-ſized, regularly featured, rather fair than otherwiſe, and florid in their complexions. It is, however, to be preſumed that the vaſt number of foreigners that are intermingled and intermarried with the natives, have given a caſt to their perſons and complexions, different from thoſe of their anceſtors 150 years ago. The women, in their ſhape, features, and complexion, appear ſo graceful and lovely, that England may be termed the native country of female beauty. But beſide the external graces ſo peculiar to the women in England, they are ſtill more to be valued for their prudent behaviour, thorough cleanlineſs, and a tender affection for their huſbands and children, and all the engaging duties of domeſtic life.

Their nerves are ſo remarkably delicate, that they are ſuſceptible of the leaſt impreſſion, and are often very ſtrongly, too frequently mortally, affected by imagination only. They feel the whole weight of the evils they fear, and ſometimes ſink beneath the burden of mental ſuggeſtions. Yet, when real danger approaches, they meet it with aſtoniſhing intrepidity and conſtancy of mind. Fearleſs of death, becauſe they prefer it to ſlavery, they advance againſt the enemy in the field with a noble alacrity, and ſtand the moſt violent attacks with unſhaken firmneſs. The Engliſh ſeamen, are confeſſedly more active, ſkilful, and intrepid, than any other mariners in the world.

The humanity of the Engliſh is diſcovered in nothing more than in the large ſubſcriptions for public charities raiſed by all degrees of both ſexes. An Engliſhman feels all the pains which a fellow-creature ſuffers; and poor and miſerable objects are relieved in England with the greateſt liberality.

The honour and integrity of the Engliſh merchants in their dealings are known in every part of the commercial world. The word of an eminent merchant is conſidered as ſufficient for any ſum of money; and many thouſand pounds worth of goods are every day bought and ſold on the Royal Exchange, without any other ſecurity. But this ingenuous method of carrying on their commerce, too often lays them open to the arts of deſigning men.

The works of the Engliſh mechanics are ſuperior to thoſe of the ſame kind of any other handicrafts-men in Europe. They are not indeed famous for invention, but they never fail of improving upon thoſe of others. Nor is this want of invention general; many of the Engliſh artiſts excel in both, and ſome of the moſt capital diſcoveries of the laſt and preſent centuries owe their birth to the inhabitants of this country: among which may be reckoned the ſteam-engine, the horizontal watch, the quickſilver and gridiron pendulums, the artificial magnets, the ſpeculum top, the quadrant for taking the ſun's altitude at ſea by reflection, &c. &c. No people in the world think ſo cloſely as the Engliſh upon any ſubject. Bleſſed with a clear apprehenſion, and fearleſs of difficulties, they fix the attention on a ſingle point, and purſue it with aſtoniſhing perſeverance.

The diverſions and paſtimes of the Engliſh people may be divided into thoſe of the town and country; and again ſubdivided into the higher and lower claſes of people. The diverſions of the town are operas, ridottos, maſquerades, concerts of muſic, theatrical performances, and card aſſemblies, for perſons of faſhion. The paſtimes of the country, are horſe-races, ſtag, fox, and hare hunting. The game acts have taken from the common people a great fund of diverſion, though without anſwering the ſelfiſh purpoſes of the rich: for the farmers and country people deſtroy the game in their neſts, which they dare not kill with their gun. A ſpirit of gaming prevails with ſuch violence at a horſe-race, that one would imagine all the ſpectators were actually poſſeſſed. Hunting is the ſport of country gentlemen; and thoſe whom the world diſtinguiſh by the appellation of fox-hunters ſeem to be infatuated with the diverſion. The common people have likewiſe their town and country paſtimes, which they enjoy with great eagerneſs. Among theſe we number cock-fighting (that diſgrace to humanity,) cudgeling, wreſtling, duck-hunting, bowls, ſkittles, or nine-pins, archery, priſon-bars, cricket, ſhuffle-board, quoits, divers games of chance, and ſpectacles of various kinds, ſuch as tumbling, balancing, vaulting, feats of legerdemain, bear and bull-baiting, aſs races, collections of wild beaſts, muſic, dancing, drolls, puppet-ſhews, and the Gothic diverſion of bell-ringing.

In the dreſs of both ſexes, before the preſent reign of George III. they followed the French: but that of the military officers partook of the German, in compliment to his late majeſty. The Engliſh, at preſent, bid fair to be the dictators of dreſs to the French themſelves, at leaſt with regard to elegance, neatneſs, and richneſs of attire. People of quality and fortune, of both ſexes, appear, ou high occaſions, in cloth of gold and ſilver, the richeſt brocades, ſatins, ſilks, and velvets, both flowered and plain: and it is to the honour of the court, that the foreign manufactures of all theſe are diſcouraged. Some of theſe rich ſtuffs are ſaid to be brought to as great perfection in England as they are in France, or any other nation. The quantities of jewels that appear on public occaſions are incredible, eſpecially ſince the vaſt acquiſitions of the Engliſh in the Eaſt-Indies. The ſame nobility, and perſons of diſtinction, on ordinary occaſions, dreſs like creditable citizens, that is, neat, clean, and plain, in the fineſt cloth and the beſt of linen. The full dreſs of a clergyman conſiſts of his gown, caſſock, ſcarf, beaver-hat and roſe, all of black; his undreſs is a dark-grey frock, and plain linen. The phyſicians, the formality of whoſe dreſs, in large tie perukes, and ſwords, was formerly remarkable if not ridiculous, begin now to dreſs like other gentlemen and men of buſineſs. Few Engliſhmen, tradeſmen, merchants, and lawyers, as well as men of landed property, are without ſome paſſion for the ſports of the field; on which occaſions, they dreſs with remarkable propriety in a light frock, narrow-brimmed hat, &c. The people of England love rather to be neat than fine in their apparel; but ſince the acceſſion of his preſent majeſty, the dreſſes at court, on particular occaſions, are ſuperb beyond deſcription. In ſhort, none but the moſt abandoned of both ſexes are meanly dreſſed.

Chriſtianity, according to Euſebius, was planted in England by the apoſtles and their diſciples, and this country and our anceſtors are ſuppoſed to have been viſited by the apoſtle St. Paul, whoſe diligence, zeal, and fortitude were abundant. After a long interval of ignorance and ſuperſtition, John Wickliffe, an Engliſhman, educated at Oxford in the reign of Edward

ward III. has the honour of being the firſt perſon in Europe who publicly called in queſtion, and boldly refuted thoſe erroneous doctrines which had prevailed ſo many ages; ſince his time, the eſtabliſhed religion in England approaches nearer to the primitive Chriſtianity, being equally removed from ſuperſtition and indelicacy in its worſhip, and as void of bigotry as of licentiouſneſs in its practice.

The conſtitution of the church is epiſcopal, and it is governed by biſhops, each of whom, as a temporal baron, has a ſeat and vote in the Houſe of Peers. The benefices of the inferior clergy are now freehold; but in many places their tythes are impropriated in favour of the laity. The clergy of the church of England, are at preſent in a moſt flouriſhing ſituation, becauſe the value of their tythes increaſes with the improvements of lands, which of late have been great. The government of the church is veſted in two archbiſhops, and twenty-four biſhops, beſides the biſhop of Sodor and Man, who, not being poſſeſſed of an Engliſh barony, does not ſit in the houſe. The two archbiſhops are thoſe of Canterbury and York, who are both addreſſed by the appellation of "Your Grace." The former is the firſt peer of the realm, as well as metropolitan of the Engliſh church. He takes precedence, next to the royal family, of all dukes and officers of ſtate. Beſides his own dioceſe, he has under him the biſhops of London, Winchеſter, Ely, Lincoln, Rocheſter, Litchfield and Coventry, Hereford, Worceſter, Bath and Wells, Saliſbury, Exeter, Chicheſter, Norwich, Glouceſter, Oxford, Peterborough, Briſtol, and, in Wales, St. David's, Landaff, St. Aſaph, and Bangor. The annual income of the twenty-ſix biſhops, is ſuppoſed to be 72,000 pounds. The biſhoprics of London, Durham, and Winchеſter, take precedency of all others, and the reſt according to the ſeniority of their conſecration.

There are moreover, 28 Cathedrals, 26 Deans, 60 Archdeacons, and 544 Prebends, Canons, &c. Beſides theſe there are in all about 300 in orders belonging to the different Cathedrals, and about 800 Lay-officers, ſuch as ſinging men, organiſts, &c. who are all paid from the Cathedral emoluments; ſo that there are about 1700 perſons attached to the ſeveral Cathedrals.

There is a dean and chapter in every cathedral church. The dean is inſtalled by virtue of the king's letters-patent; and the chapter conſiſts of a certain number of prebends.

Other miniſters of the church are deans, archdeacons, rectors, or vicars, deacons and curates.

There are about 18,100 clergymen in England and Wales, of the eſtabliſhed religion, and near 10,000 pariſhes. The Rectories are 5,098; the Vicarages 3,687; the livings of other deſcriptions 2,970; in all 11,755.

The convocation is the higheſt eccleſiaſtical court; the clergy formerly had the greateſt power in this court, which was always ſummoned at the meeting of parliament, and continued ſitting during the whole ſeſſion: but having filled the nation with diſorder by their violent debates, they were diſſolved by royal prerogative in the beginning of the reign of George I. and have not been allowed to ſit long enough to tranſact any buſineſs ſince that period. The convocation is divided into two houſes; the higher houſe, in the province of Canterbury, conſiſting of twenty-two prelates, the archbiſhop being preſident; the lower houſe is compoſed of all the deans, archdeacons, and proctors, amounting in all to 166. The archbiſhop of York may hold a convocation of his own province in the ſame manner, and, by means of a regular correſpondence with the other, debate and determine the ſame queſtions which are canvaſſed in the ſynod of Canterbury; though the tranſactions and determinations of one convocation is not determined by thoſe of the other.

The next is the court of arches, ſo called from the arched church and tower of St. Mary-le-Bow, in London, where it was formerly held; it is the moſt ancient conſiſtory of the province of Canterbury, and to this, all appeals from the judgment of inferior eccleſiaſtical courts are uſually made. The judge, who is diſtinguiſhed by the appellation of dean of the arches, ſits without any aſſeſſors, and determines cauſes without a jury. He takes cognizance of appeals, in eccleſiaſtical matters, within the province of Canterbury; and all proceſſes are returnable before him in the common hall of Doctors-Commons. The pleaders and ſolicitors of this court are called advocates and proctors; the former are doctors of the civil law, and, by the ſtatutes of the court, the pleadings and petitions ought to be both in Latin.

Other eccleſiaſtical courts are, the court of audience, which has nearly the ſame authority with the preceding, and to this the archbiſhop's chancery was formerly joined: the prerogative court, wherein wills are proved, and adminiſtrations granted: the court of peculiars, relating to certain pariſhes, which have a juriſdiction among themſelves, for the probate of wills, and are therefore exempt from the biſhop's courts: and the court of delegates, which receives its name from conſiſting of commiſſioners delegated or appointed by the royal commiſſion; but it is no ſtanding court. Biſhops, archdeacons, and the dean and chapter of every cathedral, have each their reſpective courts; thoſe of the former are called conſiſtory courts.

The church of England is more tolerant than any other national church, with reſpect to its principles. Moderation being its governing character, no religious ſect here is prevented from worſhipping God in that manner which their conſciences approve. Hence, ſince the reformation, a number of ſects have ariſen under the ſeveral denominations of Puritans, or Preſbyterians, Independents, Baptiſts, Methodiſts, Quakers, &c.

The Puritans were originally Calviniſts, who made their firſt appearance in the reign of queen Elizabeth, when ſome biſhops, many of the laity of diſtinction, and numbers of the common people, having joined them, the church and ſtate both took the alarm, and endeavoured, in vain, to ſuppreſs them. Theſe Diſſenters had no diſtinct form either of diſcipline or worſhip, but every preacher was left to his own diſcretion. They affirmed, that their ſcheme of religion was more pure and unexceptionable than any other; and oppoſed the liturgy and authority of the biſhips with great force of argument, alledging, that theſe differed but little from the church of Rome, and they thought themſelves obliged to conform to the plan of Geneva. After ſome time, Cartwright, one of their divines, drew up a body of diſcipline for them, and this book was eſteemed the ſtandard of their public worſhip. This ſect is now better known by the different appellations of Independents and Preſbyterians; of whom the latter form the eſtabliſhed religion of Scotland, where their tenets have been more particularly conſidered.

The Baptiſts, or Anabaptiſts, ſprung up in Germany about the year 1521, and were formerly accuſed of many inconſiſtencies and indecencies; but by their confeſſion of faith, publiſhed in 1689, they confuted all thoſe aſperſions, and plainly proved that they did not differ in any material article from other Proteſtant Diſſenters, except in the ſingle one of baptiſm, which they maintain infants are incapable of receiving; and when they adminiſter this ſacrament, which is only to adults, they plunge them entirely under the water.

The Methodiſts may properly be diſtinguiſhed into two claſſes, the followers of the late Mr. George Whitefield, and thoſe of Mr. Weſley. They received the appellation of Methodiſts, at the Univerſity of Oxford, about the year 1736, from a peculiar method

they had adopted there, of living in a very preciſe, abſtemious way, and being much addicted to praying together, reading and expounding the Scriptures, and faſting at particular times appointed by the church. Mr. George Whitefield and his colleagues profeſſed themſelves divines of the church of England; but their main plan was, to revive primitive Chriſtianity, and recommend it, both in faith and practice, to perſons of all denominations. Their preaching was attended with very good effects, in reforming the morals of many of the lower claſs of people. Mr. Whitefield uttered his diſcourſes with great fervour and devotion: he did not ſtrictly adhere to the form of eccleſiaſtical worſhip; and, as he thought that prayers, whether taken from a common-prayer-book, or poured forth extempore, was a matter of indifference, he accordingly made uſe of both theſe methods. But this ſect of Methodiſts is now divided, ſome of them acknowledging Mr. Whitefield, and others Mr. John Weſley for their leader. Mr. Weſley and his followers held the Arminian doctrines, in oppoſition to the Calviniſtic, particularly thoſe of election, predeſtination, final perſeverence, &c. Mr. Whitefield died in America, in 1770; but the places of worſhip erected by him are ſtill frequented by perſons of the ſame principles, and they profeſs a great reſpect for his memory. Mr. Weſley died in March 1791, and in the courſe of his miniſtry, which was upwards of 50 years, he occaſioned many places of worſhip to be erected in different parts of the kingdom. He profeſſed himſelf a member of the Church of England; and had in connexion with him, a conſiderable number of preachers, whoſe zeal and ſucceſs in propagating the goſpel is manifeſt by the multitudes that have united with them. They hold a Conference yearly, at which time preachers are examined and admitted; and all matters relating to the ſociety are determined. They have lately ſent miſſionaries to the Weſt-Indies, where many have been converted to chriſtianity. There is alſo another claſs, many years patronized by the late Counteſs of Huntingdon: theſe hold the ſame opinions with the followers of Mr. Whitefield. In their chapels the church of England ſervice, with ſome few omiſſions, is uſed.

The Quakers was founded by George Fox, in the year 1650, who taught that the light within is more ſufficient to guide men to heaven than the holy ſcriptures; but they are now greatly reformed, and pay a great regard to God's word, but ſtill deny the two ſacraments, and all manner of ceremonies. They refuſe to take any oath before a magiſtrate, and therefore are indulged to give their affirmation when called upon as witneſſes. Their worſhip is very abrupt, any perſon riſing up to pray or preach according as he is moved. They pray and then preach, or inſtruct their congregations in all moral duties, and ſpeak continually againſt the modes, vanities, and vices of the age. They are very plain and ſimple in their dreſs, and as for order and diſcipline in governing their different aſſemblies and congregations, and for unity, harmony, and brotherly love, they really exceed any Chriſtian ſect of people or church in the univerſe.

The Roman Catholic religion is ſtill profeſſed by many Roman Catholic families in England, and its exerciſe is under very mild and gentle reſtrictions. Some of the penal laws againſt them have been lately repealed; and they now ſeem to be convinced, that a change of government, inſtead of bettering, would hurt their ſituation, becauſe it would increaſe the jealouſy of the legiſlature; which muſt expoſe them daily to greater burdens and heavier penalties; this conſideration has of late made the Roman Catholics to appear as dutiful and zealous ſubjects as any in his majeſty's dominions.

With reſpect to free-thinkers, deiſts, or infidels, there is abundant reaſon to believe, that this claſs are more numerous in other countries than in England. The writings of the Deiſts againſt Chriſtianity, inſtead of injuring it, have, on the contrary, cauſed the arguments in its favour to be uſed with greater force and clearneſs, and have been the means of producing ſuch clear defences of it, as all the acuteneſs of modern infidels has not been able to overthrow or confute.

Arians, or the followers of Arius, who in the time of Conſtantine the Great, A. C. 315, taught that the Son of God is not equal or conſubſtantial with the Father, but only the firſt of all created beings. His opinion was condemned as heretical by the council of Nice, in A. C. 325; but notwithſtanding this, the Arians infected the Eaſtern churches with their principles, and though they are not a church or ſect of themſelves, yet are they very numerous to this day in ſeveral churches, but particularly in that church, whoſe articles teach them quite the contrary.

Antinomians, a ſect who reject not only the Moſaic law of ceremonies, but aſſert alſo that all manner of good works, ſuch as honeſty, charity, ſobriety, temperance, chaſtity, &c. are of no ſignification, becauſe good or evil works neither forward nor hinder a man in his ſalvation; that our righteouſneſs is already fully complete in the offering of Chriſt, and that whoever believes faithfully that the work of redemption is already finiſhed, it is ſufficient, whatever may be his life and converſation. There are ſeveral leaders of this ſect in London, and the two moſt noted teachers among them were Cudworth, of Oxford-market, and the famous J. Relly, of Coachmaker's-hall, London.

Socinians, are thoſe who follow the doctrine of one Fauſtus Socinus, who taught that Jeſus Chriſt was only mere man, and had no exiſtence before the Virgin Mary.

The Engliſh language is compounded of ſeveral others, and more particularly of Saxon, Celtic, French, and Latin, but the former predominate. It enjoys all the properties, without many of the defects of other European languages. It is more energetic, manly, and expreſſive, than either the French or Italian; more copious than the Spaniſh, and more eloquent than the German, or the other northern tongues. The inhabitants of different countries vary in the pronouncing it; but this chiefly affects the loweſt claſs of the people. Perſons of fortune and education in England, alſo commonly either ſpeak or underſtand the French, and many of them the Italian and Spaniſh; but foreign nations find great difficulty to underſtand the few Engliſh, who ſpeak Latin, which may perhaps be owing to their not giving the vowels their proper tone, that of the Engliſh and French, &c. being very different in this reſpect.

England may be deemed the ſeat of the Muſes. Alfred the Great cultivated literature at a period when barbariſm and ignorance overſpread the reſt of Europe; nor has there, ſince his time, been wanting a ſucceſſion of learned men, who have diſtinguiſhed themſelves by their writings or ſtudies. The induſtrious and very learned Leland was the firſt who publiſhed a ſhort collection of thoſe learned perſons who preceded the reign of Henry VIII. among whom he has inſerted ſeveral of the blood royal of both ſexes. Roger Bacon, who lived under Henry III. and died at Oxford about the year 1294, wrote ſeveral treatiſes upon grammar, mathematics, phyſics, the flux and reflux of the Britiſh ſea, optics, geography, aſtronomy, chronology, chemiſtry, logic, metaphyſics, ethics, medicine, theology, philology, and upon the impediments of knowledge. The memory of ſome noble and royal Engliſh authors, who have done honour to learning and the Muſes, have been preſerved by the Hon. Mr. Walpole. Since the Reformation, England reſembles a galaxy of literature; and cardinal Wolſey greatly contributed to the revival of claſſical learning in England, and, by his example

ample and encouragement, laid the foundation of the polite arts. Edward VI. during his ſhort reign, did a great deal towards promoting learning in general, by encouraging learned foreigners to ſettle in England. During the reign of queen Mary, learning, as well as liberty, ſuffered an almoſt total eclipſe in England. Elizabeth, her ſiſter, who was herſelf a learned princeſs, advanced many perſons of conſummate abilities to high ranks both in church and ſtate. Though James I. was no great author, yet his example had a conſiderable effect upon his ſubjects; for in his reign flouriſhed thoſe great maſters of polemic divinity, whoſe works are almoſt inexhauſtible mines of knowledge. The ſecond Bacon was by him created viſcount Verulam, and lord high chancellor of England; he was likewiſe the patron of Camden, and other hiſtorians, as well as antiquaries; and though he had a very pedantic taſte himſelf, yet Engliſh learning, it muſt be allowed, is under ſome obligation to this prince. Charles I. had a taſte for the polite arts, eſpecially ſculpture, painting, and architecture; he was the patron of Rubens, Vandyke, Inigo Jones, and other eminent artiſts. Charles II. was a great promoter of natural knowledge, eſpecially by the inſtitution of the Royal Society. He loved painting and poetry; and England never abounded more with learned and able divines than in his reign. The incomparable Paradiſe Loſt, by Milton, was publiſhed in his reign, though not read or attended to in proportion to its merit. Boyle, Halley, Hooke, Sydenham, Harvey, Temple, Tillotſon, Barrow, Butler, Cowley, Waller, Dryden, Wycherley, and Otway, flouriſhed in his reign. To theſe we may add that celebrated architect, philoſopher, and mechanic, Sir Chriſtopher Wren; alſo ſeveral excellent Engliſh painters. The reign of James II. is chiefly diſtinguiſhed, in the province of literature by ſeveral excellent compoſitions publiſhed by Engliſh divines. Newton and Locke adorned the reign of William III. Improvements in learning, and all the polite arts was greatly augmented in the reign of queen Ann. Addiſon, Prior, Pope, Swift, Bolingbroke, Shafteſbury, Arbuthnot, Congreve, Steele, Rowe, and many other excellent writers, both in proſe and verſe, need but to be mentioned to be admired: natural and moral philoſophy kept pace with the polite arts, and even religious and political diſputes contributed to the advancement of learning. Erudition was patronized by the miniſters of George I. and the reign of his ſon, George II. yielded to none of the preceding in the numbers of learned and ingenious men it produced. After the rebellion in 1745, in the adminiſtration of Mr. Pelham, men of genius began to taſte the royal bounty; ſince which period, a great progreſs has been made in the polite arts in England. The Royal Academy has been inſtituted, ſome very able artiſts have ariſen, and the annual public exhibitions of painting and ſculpture have been extremely favourable to the arts, by promoting a ſpirit of emulation, and exciting a greater attention to works of genius of this kind among the public in general.

In the learned profeſſions, the Engliſh alſo excel. Their courts of juſtice are adorned with greater abilities and virtues, perhaps, than thoſe which any other country can boaſt of: a remarkable inſtance of which occurs in the appointments for the laſt 200 years of their lord chancellors, who hold the higheſt and the moſt uncontrollable judicial ſeat in the kingdom, and yet it is acknowledged by all parties, that, during that time, their bench has remained unpolluted by corruption, or partial affections.

The Engliſh lawyers, though they deal little in Ciceronian eloquence, are well verſed in rhetoric and reaſoning. No nation in the world can produce ſo many examples of true eloquence as the Engliſh ſenate in its two houſes. The ſpeeches made by both parties in parliament of late years, are a ſufficient proo of the abilities of the Britiſh ſenators.

Medicine and ſurgery, botany, anatomy, chemiſtry, and all the arts or ſtudies for preſerving life, have been carried to a great degree of perfection by the Engliſh. The ſame may be ſaid of muſic, and theatrical exhibitions. Even agriculture and mechaniſm are now reduced in England to ſciences, and that too without any public encouragement but ſuch as is given by private noblemen and gentlemen, who aſſociate themſelves for that purpoſe. The Engliſh hitherto ſtand unrivalled in ſhip-building, clock-work, and the various branches of cutlery.

The two univerſities of Oxford and Cambridge are inſtitutions not to be matched in the world, and were reſpected even amidſt the barbarous rage of civil war. Theſe ſeminaries of learning can boaſt of more perſons eminent by their erudition, than any other in Europe; and a degree conferred by either is, in foreign countries, eſteemed more honourable than the ſame degree obtained by any univerſity in Chriſtendom. Their magnificent buildings rival, in ſplendor and architecture, the moſt ſuperb royal edifices; the rich endowments, the liberal eaſe and tranquility enjoyed by thoſe who inhabit them, ſurpaſs all the ideas which foreigners, who viſit them, conceive of literary ſocieties. Each univerſity ſends two members to the Britiſh parliament, and their chancellors and officers have a civil juriſdiction over their ſtudents, the better to ſecure their independency. Their colleges, in their revenues and buildings, exceed thoſe of many other univerſities.

There are twenty colleges, and five halls, in Oxford, the former are very liberally endowed, but in the latter the ſtudents chiefly maintain themſelves. This univerſity is ſuppoſed to have been a conſiderable place even in the time of the Romans. Alfred built three colleges at Oxford; one for divinity, another for philoſophy, and a third for grammar. The number of officers, fellows, and ſcholars, maintained at preſent by the revenues of this univerſity, is about 1000; and the number of ſuch ſcholars as live at their own charge, is uſually about 2000; there are, beſides, a great number of inferior officers and ſervants belonging to the ſeveral colleges and halls. There are four terms every year for public exerciſes, lectures, and diſſertations, and ſet days and hours when the profeſſors of every faculty read their lectures; and in ſome of the colleges are public lectures, to which all perſons are admitted. The liberal foundations of the reſpective colleges have encouraged perſons of extraordinary merit to embrace the academical life.

There are libraries for the uſe of all the colleges; beſides which, there are two public libraries, the univerſity library, and the Radcliffe library. The univerſity library is uſually called the Bodleian library, from Sir Thomas Bodley, its principal founder. It is a large lofty ſtructure, in the form of a Roman H. and is ſaid to contain the greateſt number of books of any library in Europe, except perhaps the Vatican. The original library has been prodigiouſly increaſed by many large and valuable collections of Greek and oriental manuſcripts, as well as other choice and curious books. The Radcliffe library is a ſumptuous pile of building, and was built at the ſole expence of that eminent phyſician, who bequeathed 40,000l. for this purpoſe.

The univerſity of Cambridge conſiſts of ſixteen colleges, four of which are diſtinguiſhed by the name of halls, though the privileges of both are in every reſpect the ſame.

In this univerſity, there are 400 fellows, and 666 ſcholars, with about 236 officers and ſervants of various kinds, who are maintained upon the foundation. Theſe, however, are not all the ſtudents of the univerſity; there are alſo two ſorts of ſtudents called penſioners, the greater and the leſs; the greater

penſioners

penſioners are the ſons of the nobility, and of gentlemen of large fortunes, and are called fellow-commoners, becauſe, though they are ſcholars, they dine with the fellows: the leſſer penſioners dine with the ſcholars that are on the foundation, but live at their own expence. There are alſo a conſiderable number of poor ſcholars, called ſizars, who wait upon the fellows, ſcholars, and penſioners, by whom they are in a great degree maintained; but as the penſioners and ſizars are in a ſtate of perpetual fluctuation, their number cannot be aſcertained.

Trinity-College library at Cambridge is a very mangnificent ſtructure; and in Corpus Chriſti-College library is a valuable collection of ancient manuſcripts, which were preſerved at the diſſolution of monaſteries, and given to this college by archbiſhop Parker. The ſenate-houſe is alſo a moſt elegant edifice, executed entirely in the Corinthian order, and is ſaid to have coſt 16,000l.

"The late Mr. Norris left 9l. a year, for a medal and ſome books, as a premium for the beſt proſe Engliſh eſſay on ſubjects appointed agreeable to the directions contained in his will.

"The eſſays are to be ſent to one of the three ſtewards, who are, the maſter of Trinity-College, the provoſt of King's-College, and the maſter of Caius-College, on or before the 10th day preceding the Sunday in paſſion week 1787, with the names of the reſpective writers, ſealed up.

"Each candidate to be above 20 years of age, and under 30, muſt be, or have been, a ſtudent of the univerſity, and muſt produce a certificate, under the hand of the profeſſor, that he has attended twenty lectures in the courſe of ſome one year. That eſſay to which the prize ſhall be adjudged, muſt be publiſhed by the author within two months from the time of his receiving the medal and books."

In England, there are three royal academies, the firſt is at Woolwich, eſtabliſhed for the ſtudy of the military ſciences and the mathematics, eſpecially thoſe branches which relate to the attack and defence of fortified places. The ſecond royal academy is at Portſmouth, eſtabliſhed for the ſtudy of navigation, and the other ſciences relative to maritime affairs. The third is called the royal academy of painting and ſculpture, eſtabliſhed by his preſent majeſty, who has allotted apartments in Somerſet-Houſe for their reſidence. Beſides theſe, there is a royal obſervatory erected on the ſummit of a ſteep eminence in Greenwich-Park by Charles II. who furniſhed it with the moſt accurate inſtruments neceſſary in aſtronomical obſervations. This obſervatory has been ſucceſſively the reſidence of thoſe celebrated aſtronomers, Mr. Flamſtead, Dr. Halley, and Dr. Bradley. From the firſt, the obſervatory took the name of Flamſtead-Houſe, by which it is now commonly known.

At the head of the inſtitutions formed for the propagation of knowledge, is juſtly placed the royal ſociety, which conſiſts of a preſident, council, and fellows, incorporated by Charles II. and veſted with various privileges and immunities, for the purpoſe of cultivating and improving natural knowledge. They are governed by a body of ſtatutes, and hold weekly meetings for making experiments, diſcourſing on different ſubjects of natural philoſophy, reading papers, receiving letters, and anſwering correſpendents. This is the moſt famous inſtitution of the kind in the world, and can boaſt of many illuſtrious members, whoſe writings have caſt a glorious light on every branch of natural philoſophy.

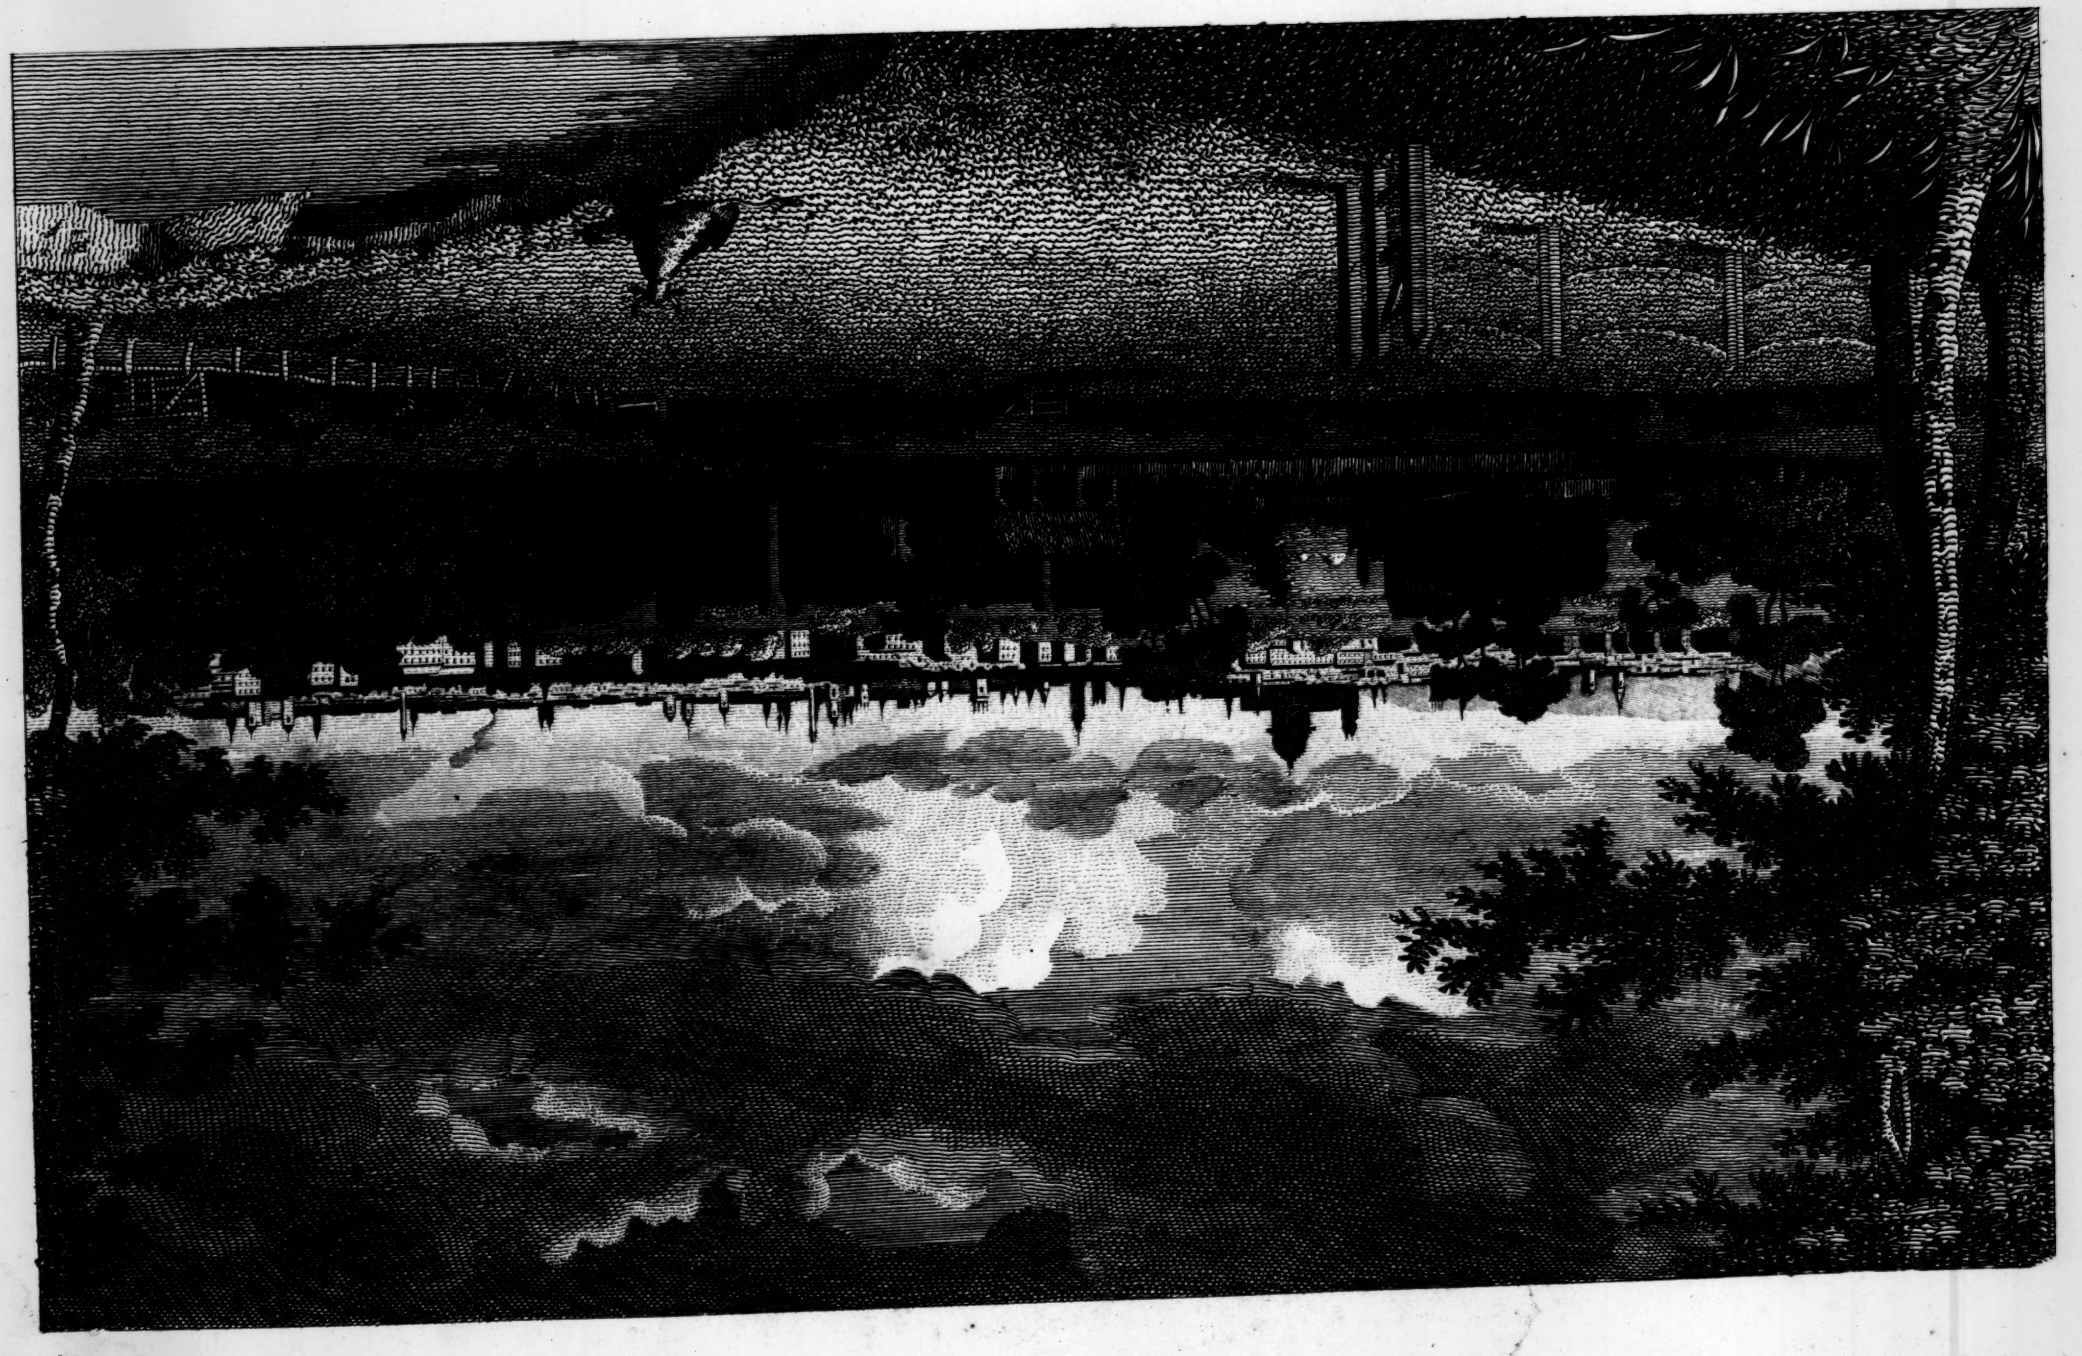
The moſt remarkable natural curioſities of England are thoſe found in Derbyſhire, and known by the appellation of the Wonders of the Peak. The following are the moſt extraordinary: Mam-Tor or Mother-Tower, the name of a mountain in the Peak, which, though it is perpetually mouldering away, and the earth and ſtones are falling from the precipice above in ſuch quantities, as to terrify the neighbouring inhabitants with their noiſe, yet of ſuch an enormous bulk, that the decreaſe is not to be perceived.

Eden-Hole, near Chapel in the Frith, is a vaſt chaſm in the ſide of a mountain, twenty-one feet wide, and more than forty feet long. In this chaſm, or cave, appears the mouth of a pit, the depth of which could never be fathomed. A plummet once drew eight hundred and eighty-four yards, which is ſomething more than half a mile, a line after it, of which the laſt eighty years were wet, but no bottom was found. Several attempts to fathom it have been ſince made, and the plummet has ſtopped at half that depth, owing probably to its reſting on ſome of the protuberances that ſtand out from the ſides. That ſuch protuberances there are, is proved by an experiment conſtantly made, to ſhew its great depth to thoſe that viſit the place, by the poor people attending them, who always throw ſome large ſtones down into it, which are heard to ſtrike againſt the irregularities of the ſides with a fainter and a fainter ſound, which is at length gradually loſt. The earl of Leiceſter, in the reign of queen Elizabeth, hired a poor man to venture down in a baſket, who, after he had deſcended two hundred ells, was drawn up again; but to the great diſappointment of the curious inquirer, he had loſt his ſenſes, and in a few days after died delirious. The cavern in which this pit is found, is contracted within the rock, and water is continually trickling from the top, where it alſo forms ſparry concretions.

Tideſwell is another curioſity of the Peak; it is ſituated near a market-town of the ſame name. The well is about three feet deep, and three feet wide, and the water, at different and uncertain periods of time, ſinks and riſes with a gurgling noiſe, two-thirds of the perpendicular depth of the well. Many conjectures have been formed to account for this phænomenon. Some have thought that in the aqueduct a ſtone ſtands in equilibrio, and produces the riſe and fall of the water, by vibrating backwards and forwards; but it is as difficult to conceive what ſhould produce this vibration at uncertian periods, as what ſhould produce the riſe and fall of the water. Others imagine that theſe irregular ebbings and flowings, as well as the gurgling noiſe, are occaſioned by air which agitates or preſſes the water from the ſubterraneous cavities; but theſe do not inform us what can be ſuppoſed firſt to move the air. Many have imagined the ſpring to be occaſionally ſupplied from the overflowings of ſome ſubterraneous body of water, lying upon a higher level; but whether either of theſe be the true cauſe of this phænomenon, cannot be determined. There are ſeveral ſprings of this kind in various parts of the kingdom.

Pool's-Hole is a large cave, which is ſaid to have taken its name from one Pool, a notorious robber, who ſecreted himſelf here from juſtice; this is another curious cavern in the Peak, and ſituated at the bottom of a lofty mountain, called Coitmoſs, near Buxton. The entrance is by a ſmall arch, ſo very low, that ſuch as venture into it are forced to creep upon their hands and knees, but gradually opens into a vault more than a quarter of a mile long, and, as ſome have pretended, a quarter of a mile high. It is undoubtedly very lofty, and in appearance not unlike the inſide of a Gothic cathedral. In a cavern to the right, called Pool's Chamber, there is a fine echo, and the ſound of a current of water, which runs along the middle of the great vault, being reverberated on each ſide, very much increaſes the aſtoniſhment of thoſe who viſit the place. There are great ridges of ſtones on the floor; and from the roof and ſides of this vault, water is perpetually diſtilling, the drops of which, before they fall, produce a moſt pleaſing effect, by reflecting numberleſs rays from the candles carried by the guides; they alſo, from their quality, form cryſtallizations of various forms, like the figures of fret-work; and in ſome places,

VIEW of LONDON



places, having been long accumulated one upon another, they have formed large maſſes, bearing a rude reſemblance to men, lions, dogs, and other animals. In this cavity is a column, as clear as alabaſter, called Mary Queen of Scot's pillar, becauſe it is believed ſhe entered no further. Beyond it there is a ſteep aſcent, for near a quarter of a mile, which terminates in a hollow in the roof, called the Needle's Eye, in which, when the guide places his candle, it appears like a ſtar. If a piſtol be fired near the queen's pillar, the report will be as loud as a cannon. There is another paſſage by which people uſually return. Not far from this place are two ſprings, one cold, and the other hot; but ſo near each other, that the thumb and finger of the ſame hand may be put into both ſtreams at the ſame time.

The laſt wonder of the Peak, is a cavern, unaccountably called the Devil's Arſe, and ſometimes the Peak's Arſe. It runs under a ſteep hill, about ſix miles north-weſt of Tideſwell, by an horizontal entrance, ſixty feet wide, and ſomething more than thirty feet high. The top of this entrance reſembles a regular arch chequered with ſtones of different colours, from which petrifying water is continually dropping. Here are ſeveral huts, which look like a little town, inhabited by a ſet of people who in a great meaſure ſubſiſt by guiding ſtrangers into a cavern, which opens at the extremity of this entrance. The outward part of this cave is very dark; it is alſo rendered extremely ſlippery, by a current of water which runs acroſs the entrance, and the rock hangs ſo low, that it is neceſſary to ſtoop in order to go under it; but having paſſed this place, and another current, which ſometimes cannot be waded, the arch opens again to a third current, near which are large banks of ſand: after theſe are paſſed, the rock cloſes. Another cavern of this kind, called Wokey-Hole, is found in Mendip-Hills, in Somerſetſhire, near a place of the ſame name, about a mile from the city of Wells. It has a very ſtrong echo.

Medicinal ſprings abound in England; theſe are juſtly conſidered as natural curioſities; but there are others of a different kind, which muſt not be paſſed over unnoticed. Among theſe the Dropping Well near Knareſborough, in Yorkſhire, is not the leaſt remarkable. The water, which is of a petrifying quality, riſes from a ſpring about two miles diſtance, and flows moſtly in a ſubterraneous paſſage to what is called the Well, or rather Baſon, into which the water falls from a rock about ſixteen feet high. The ſummit of this rock projects conſiderably over its baſe, ſo that the water does not run down the ſides, but drops very faſt from thirty or forty places of the top, into the well or baſon, hollowed in the ground. A great variety of petrifactions are found in the baſon.

There is a very remarkable fountain, near Richard's Caſtle, in Herefordſhire, called Bonewell, which is generally full of ſmall bones, reſembling thoſe of frogs, or fiſh, though often cleared out; and it is not eaſy to conjecture how they are collected here in ſuch quantities. The Burning-Well at Ancliff, near Wigan in Lancaſhire, has been long famous. The water is cold and without ſmell; but ſo ſtrong a vapour of ſulphur formerly iſſued out with it, that upon the application of a candle, &c. the whole ſurface was immediately covered with a blue flame reſembling that of burning ſpirits, and very hot. But a vein of coals which ran under the well having been lately taken away, this effect has, in a great meaſure ceaſed.

We ſhall now proceed to give ſome account of the chief cities and towns in England, with the moſt remarkable edifices.

London, the metropolis of the Britiſh empire, and the firſt city for trade in the known world, is ſituated on the banks of the Thames, about twenty miles from its mouth, in the latitude of 51 deg. 32 min. of north latitude, 400 miles ſouth of Edinburgh, and 270 ſouth-eaſt of Dublin; 180 weſt of Amſterdam, 210 north-weſt of Paris, 500 ſouth-weſt of Copenhagen, 600 north-weſt of Vienna, 790 ſouth-weſt of Stockholm, 800 north-eaſt of Madrid, 820 north-weſt of Rome, 850 north-eaſt of Liſbon, 1360 north-weſt of Conſtantinople, and 1414 ſouth-weſt of Moſcow.

London, in its extenſive ſenſe, comprehends the metropolis, properly ſo called, together with the city of Weſtminſter, the borough of Southwark, and part of Middleſex: but though all theſe are included under one general name, they have each a proper government, and diſtinct corporations; and each ſends members to parliament. The extent of London from Hyde-park Corner to Poplar, that is from eaſt to weſt, is upwards of ſeven miles. The breadth varies greatly. The circumference of the whole is about eighteen miles; and the number of its inhabitants are computed at one million; the number of houſes in 1784, amounted to 174,000. This city, when conſidered with all its advantages, is now what ancient Rome once was; the ſeat of liberty, the encourager of arts, and the admiration of the whole world. London is the centre of trade; it has an intimate connection with all the counties in the kingdom; it is the grand mart of the nation, to which all parts ſend their commodities, from whence they are again ſent back into every town in the nation, and to every part of the world. From hence innumerable carriages by land and water are conſtantly employed; and from hence ariſes the circulation in the national body, which renders every part healthful, vigorous, and in a proſperous condition; a circulation that is equally beneficial to the head and the moſt diſtant members. Merchants are here as rich as noblemen; witneſs their incredible loans to government; and there is no place in the world where the ſhops of tradeſmen make ſuch a noble and elegant appearance, or are better ſtocked.

It is ſituated on the banks of the Thames, a river which, though not the largeſt, is the richeſt and moſt commodious for commerce of any in the world; it being continually filled with fleets ſailing to or from the moſt diſtant climates; and its banks extend from London-bridge to Blackwall, almoſt one continued great magazine of naval ſtores, containing three large wet docks, 32 dry docks, and 33 yards for the building of ſhips for the uſe of the merchants, beſide the places allotted for the building of boats and lighters; and the king's yards down the river, for the building of men of war. As this city is about ſixty miles diſtant from the ſea, it enjoys, by means of this beautiful river, all the benefits of navigation, without the danger of being ſurpriſed by foreign fleets, or of being annoyed by the moiſt vapours of the ſea. It riſes regularly from the water-ſide, and, extending itſelf on both ſides along its banks, reaches a prodigious length from eaſt to weſt in a kind of amphitheatre towards the north, and is continued for near 20 miles on all ſides, in a ſucceſſion of magnificent villas, and populous villages, the country-ſeats of gentlemen and tradeſmen; whither the latter retire for the benefit of freſh air, and to relax their minds from the hurry of buſineſs. The regard paid by the legiſlature to the property of the ſubject has hitherto prevented any bounds being fixed for its extenſion.

London is governed by a mayor, who has the title of lord, and is choſen annually; two ſheriffs; twenty-ſix aldermen; a recorder; two hundred and thirty-ſix common-councilmen; and other officers. Weſtminſter is governed by a high ſteward; a deputy ſteward; a high bailiff; ſixteen burgeſſes, with their aſſiſtants; and a high conſtable. Both theſe cities abound in magnificent ſtructures, whoſe deſcription would require a volume.

The Tower of London was formerly a royal palace, but now the chief fortreſs of the city. It is ſituated on the margin of the Thames, and is ſuppoſed to have

been erected by William the Conqueror, about the year 1076, when it conſiſted of that part only known by the appellation of the White Tower, which was rebuilt in the year 1637 and 1638. It is a large, ſquare, irregular ſtone building, ſituated near the centre, and conſiſts of three very lofty ſtories, under which are ſpacious and commodious vaults, chiefly filled with ſalt-petre. It is covered on the top with flat leads, from whence there is an extenſive and delightful proſpect. In the firſt ſtory are two noble rooms, one of which is a ſmall armoury for the ſea-ſervice, containing various ſorts of arms very curiouſly laid up, ſufficient for more than ten thouſand ſeamen: beſides ſeveral cloſets and preſſes filled with warlike engines and inſtruments of death. Over this are two other apartments, one principally filled with arms, and the other with ſpades, ſhovels, pick-axes, chevaux-de-frize, &c. In the attic ſtory are kept match, ſheep-ſkins, tanned hides, and various other articles. On the top of one of the Towers is a large ciſtern or reſervoir for ſupplying the whole garriſon with water. It is about ſeven feet deep, nine broad, and about ſixty in length. The water which ſupplies it is raiſed from the Thames by means of an engine. Near the ſouth-weſt angle of the White Tower is the Spaniſh armoury, in which is depoſited the ſpoils of the Spaniſh Invincible Armada, defeated in the reign of Elizabeth.

The Grand Store-Houſe, northward of the White Tower is a noble building, extending 245 feet in length, and ſixty in breadth. On the north ſide is a ſtately door-caſe, adorned with four columns, with their entablature and triangular pediment of the Doric order. On entering the room the ſpectator is agreeably ſurprized with the ſight of arms ſufficient for eighty thouſand men, diſpoſed in the moſt beautiful order imaginable, all bright and fit for ſervice. Upon the ground floor, under the ſmall armoury, is a large room of equal dimenſions with that, ſupported by twenty pillars, hung round with various implements of war.

The Horſe Armoury, to the eaſtward of the White Tower, is a plain brick building, rather convenient than elegant. Here the ſight is entertained with a repreſentation of ſeveral Engliſh kings and heroes; moſt of them on horſeback, and ſome in the ſame armour they wore when they performed thoſe glorious actions which give them a diſtinguiſhed place in the Britiſh annals.

On entering the Tower, on the left hand, is an office appropriated to the coining of money, and called the Mint, which is managed by ſeveral officers formed into a corporation, conſiſting of a warden, a maſter and worker, a comptroller, the king's aſſay-maſter, the chief engraver, the ſurveyor of the meltings, a clerk of the irons, a weigher and teller, a provoſt, melters, blanchers, moneyers, &c.

Eaſtward of the grand ſtore-houſe or new armoury, ſtands the jewel-office, a ſtrong room wherein the crown jewels are depoſited. This office is governed by a maſter, two yeomen, a groom, and a clerk.

St. Paul's cathedral is allowed to be one of the grandeſt ſtructures in the world, and is ſuppoſed to have been originally founded by Ethelbert, a Saxon king, in the year 610; but in the ſucceeding reigns ſuſtained numberleſs alterations and accidents. In 1666, it was totally deſtroyed by the fire of London. The firſt ſtone of the preſent church was laid in 1675, by that famous architect Sir Chriſtopher Wren, after whoſe plan the whole ſtructure was finiſhed in 1710. The length of this ſtructure from eaſt to weſt, between the walls, is 463 feet, and, including the weſt portico, 500: the breadth of the weſt front 180; and in the centre, where it is wideſt, including the north and ſouth porticoes, it is 311; the height from the ground to the top of the croſs is 344 feet; the external diameter of the cupola 145, and the internal 100; the outward diameter of the lantern 18; the height of the turrets 208; and that of the body of the church 120. It takes up an area of ſix acres, including the church yard, which is railed round with iron baluſters, each about five feet and a half high. It is built of fine Portland ſtone, in form of a croſs, after the model of St. Peter's at Rome. The expence of rebuilding this cathedral, after the fire of London, is computed at a million ſterling, and was defrayed by a duty on coals.

Weſtminſter abbey, or the collegiate church of Weſtminſter, is a venerable pile of building. This church is in form of a long croſs; its length being 489 feet, and the breadth of the weſt front 66 feet; the length of the croſs aile is 189, and the height of the roof 92. At the weſt end are two towers; and the nave and croſs ailes are ſupported by fifty pillars of Suſſex marble, about twelve feet and a half aſunder, beſides pilaſters. There are ninety-four windows, in the upper and lower ranges, all which, together with the arches, roofs and doors are in the ancient Gothic taſte. The inſide of this church is much better executed than the out; the perſpective, particularly that of the grand aile, is remarkably good; and the choir, from which there is an aſcent by ſeveral ſteps to a ſuperb altar-piece, is paved with black and white marble, and contains twenty-eight ſtalls on the north ſide, as many on the ſouth, and eight at the weſt end. This is the repoſitory of the deceaſed Britiſh kings and nobility; and here are alſo monuments erected to the memory of many great and illuſtrious perſonages, commanders by ſea and land, philoſophers, poets, &c. In the reign of queen Anne, 4000l. a year, out of the coal duty, was granted by parliament for keeping it in repair.

Beſides the cathedral and abbey above deſcribed, in the cities of London and Weſtminſter, there are 102 pariſh churches, and an amazing number of chapels belonging to the eſtabliſhed religion; and likewiſe upwards of 300 places of public worſhip, for the uſe of Independents, Baptiſts, Methodiſts, &c.

That beautiful column, called the Monument, erected at the charge of the city, to perpetuate the memory of its being deſtroyed by fire, is juſtly worthy of notice. This column, which is of the Doric order exceeds all the obliſks and pillars of the ancients, it being 202 feet high, with a ſtair caſe in the middle to aſcend to the balcony, which is about 30 feet ſhort of the top, from whence there are other ſteps, made for perſons to look out at the top of all, which is faſhioned like an urn, with a flame iſſuing from it. On the baſe of the monument, next the ſtreet, the deſtruction of the city, and the relief given to the ſufferers by Charles II. and his brother, are emblematically repreſented in bas relief. The north and ſouth ſides of the baſe have each a Latin inſcription, the one deſcribing its dreadful deſolation, and the other its ſplendid reſurrection; and on the eaſt ſide is an inſcription, ſhewing when the pillar was begun and finiſhed. The charge of erecting this monument, which was begun by ſir Chriſtopher Wren in 1671, and finiſhed by him in 1677, amounted to upwards of 13,000l.

The Royal-Exchange is juſtly eſteemed a moſt noble and uſeful fabric. It was firſt erected at the ſole expence of Sir Thomas Greſham, but that ſtructure being deſtroyed by the fire of London, the preſent fabric was erected by parliament in 1669, and is ſaid to have coſt above 80,000l. The whole forms a parallelogram 203 feet in length, and 171 feet in breadth, encloſing an area 144 feet long and 117 broad.

The Britiſh Muſeum is a large and magnificent building, ſituated in Great Ruſſel-ſtreet, Bloomſbury, and formerly belonged to the Duke of Montague; but in the year 1753, the parliament having paſſed an act for purchaſing the Muſeum of the late Sir Hans Sloane, and the collection of manuſcripts of the late Lord Oxford, for the uſe of the public, twenty-ſix

truſtees

truſtees were appointed and incorporated, in order to provide a repoſitory for theſe and ſome other collections, under the title of the Britiſh Muſeum. Montague-houſe being fixed on for this purpoſe, the parliament purchaſed it for ten thouſand pounds; and expended fifteen thouſand more in repairs, alterations, and conveniences. They paid twenty thouſand pounds for the collection of Sir Hans Sloane, conſiſting of an amazing number of natural and artificial curioſities, valuable remains of antiquity, and a large library. Ten thouſand pounds were given for lord Oxford's manuſcripts; and thirty thouſand pounds veſted in the public funds, for ſupplying ſalaries for officers, and other neceſſary expences. This noble collection of curioſities, and excellent libraries, was opened in the year 1757, and greatly augmented by his preſent majeſty, being chiefly deſigned for the uſe of learned and ſtudious men, both natives and foreigners, in their reſearches into the ſeveral departments of knowledge.

St. James's palace is an old building, to which the court removed after the burning of Whitehall, in 1697; and ever ſince that period it has been the royal reſidence. It was built by Henry VIII. upon the ſite of an hoſpital formerly founded for fourteen leprous maids, and dedicated to St. James. This edifice contains ſome excellent and ſplendid apartments; but has a mean and irregular appearance when viewed from without.

The queen's palace, on the weſt ſide of St. James's park, was originally known by the name of Arlington-Houſe; but being purchaſed by the Buckingham family, it was rebuilt from the ground in 1703, and called Buckingham-Houſe, till the beginning of 1762, when it was purchaſed by his preſent majeſty, and preſented to the queen. Several alterations and additions have lately been made in the park and gardens. The palace itſelf has been conſiderably enlarged, and the apartments decorated with celebrated paintings, executed by the greateſt maſters.

Somerſet-Houſe was originally built by the duke of Somerſet, uncle to Edward VI. upon whoſe attainder it fell to the crown. It was the reſidence of queen Catharine, dowager of Charles II. and was ſettled on the late queen Caroline, in caſe ſhe had ſurvived her royal conſort. The apartments are now granted to ſeveral of the officers of the court, and its dependents; and lately a conſiderable part of it has been preſented to the royal academy of painting, to which a charter has been lately given by his preſent majeſty.

The other public buildings worthy of notice are the Manſion-Houſe, built at the expence of the city, for the reſidence of the lord-mayors during their mayoralties. The College of Phyſicians. The Bank of England. Moſt of the pariſh churches, eſpecially that of St. Stephen's in Walbrook. The Banquetting-Houſe at Whitehall, being part of a plan deſigned by Inigo Jones for a royal palace, but never executed. The Admiralty-Office. The Treaſury. The Horſe-Guards. Weſtminſter-Hall, ſuppoſed to be one of the largeſt rooms in England.—It is a Gothic ſtructure 220 feet long, and 70 broad. The coronation feaſts of our kings and queens are always held here; as are the courts of chancery, king's-bench, common-pleas, and exchequer. The Adelphi and the Pantheon, are proofs of the preſent improved taſte for architecture; the latter was lately deſtroyed by fire. There is hardly a houſe belonging to our nobility, but claims particular attention; while the royal palace, which ſhould certainly be the moſt magnificent ſtructure in the kingdom, is exceeded in elegance and convenience by the public offices, and the private houſes of almoſt every rich individual.

For the convenience of the cities of London and Weſtminſter, there are three bridges.

London-bridge was firſt built of ſtone in the reign of Henry II. about the year 1163, by a tax laid upon wool, which in the courſe of time gave riſe to the notion that it was built upon wool-packs: from that time it has undergone many alterations and improvements, particularly ſince the year 1756, when the houſes were taken down, and the whole rendered more convenient and beautiful. The paſſage for carriages is 31 feet broad, and 7 feet on each ſide for foot paſſengers. It croſſes the Thames where it is 915 feet broad, and has at preſent 19 arches of about 20 feet wide each; but the centre one is conſiderably larger.

Weſtminſter-bridge is reckoned one of the moſt complete and elegant ſtructures of the kind known in the world. It is built entirely of ſtone, and extended over the river at a place where it is 1,223 feet broad: which is above 300 feet broader than at London-bridge. On each ſide is a fine baluſtrade of ſtone, with places of ſhelter from the rain. The width of the bridge is 44 feet; having on each ſide a fine footway for paſſengers. It conſiſts of 14 piers, and 13 large and two ſmall arches, all ſemicircular, that in the centre being 76 feet wide, and the reſt decreaſing four feet each from the other; ſo that the two leaſt arches of the 13 great ones are each 52 feet. It is computed that the value of 40,000l. in ſtone and other materials is always under water. This magnificient ſtructure was begun in 1738, and finiſhed 1750, at the expence of 389,000l. defrayed by the parliament.

Black-friars-bridge is not inferior to that of Weſtminſter, either in magnificence or workmanſhip; but the ſituation of the ground on the two ſhores obliged the architect to employ elliptical arches; which, however, have a very fine effect; and many perſons even prefer it to Weſtminſter-bridge. This bridge was begun in 1760, and finiſhed in 1770, at the expence of 152,840l. to be diſcharged by a toll upon the paſſengers. It is ſituated almoſt at an equal diſtance between thoſe of Weſtminſter and London, commands a view of the Thames from the latter to Whitehall, and diſcovers the majeſty of St. Paul's in a very ſtriking manner.

The Engliſh are remarkable for the encouragement they give to public charities. Beſides endowments of this kind in ſeveral parts of the nation, there are, in and near the metropolis, twenty hoſpitals and infirmaries; one hundred alms-houſes; eight free-ſchools; and a hundred and thirty-one charity-ſchools; where upwards of five thouſand poor children are taken care of till a proper age, and then put into a method of providing for themſelves.

Among ſome of the moſt excellent and beneficial charities for mental improvement may be reckoned the Sunday-Schools, which are of immenſe utility; to which we may add that inſtituted by the Philanthropic Society, for promoting a reform among the moſt profligate and abandoned of our indigent youth of both ſexes: they have now upwards of an hundred under their care, and it is deſervedly encouraged and ſupported by the benevolent.

There are fifteen fleſh-markets in London; one market for live cattle; two markets for vegetables; and twenty-three markets for corn, coals, hay, &c. Thirteen inns of court and chancery, viz. the Temple; Gray's-Inn; Lincoln's-Inn; Serjeant's-Inn; Symond's-Inn; Clifford's-Inn; Thavy's-Inn; Bernard's-Inn; Staple's-Inn; Furnival's-Inn; Clement's-Inn; New-Inn; and Lyon's-Inn. The four firſt of theſe are always called principal inns. Forty-nine halls for public companies. Three colleges, viz. Sion-College; Greſham-College, (the lectures are now read in a room over the Royal-Exchange;) and Queen's-College, or Weſtminſter-School. Sion-College adjoins to St. Alphage's-Church, London-Wall, and was founded by Dr. Thomas White, vicar of St. Dunſtan's in the weſt: a college for the uſe of the London clergy, with alms-houſes for ten poor men, and the ſame number of women; which ground was accordingly purchaſed

purchaſed, and the college begun in 1627. He likewiſe gave 160l. per ann. for ever, to the colleges and alms houſes 120l. per ann. for the ſupport of the almspeople; and 40l. per ann. for the expences of the foundation.

There are few cities ſo well ſupplied with water, as thoſe of London and Weſtminſter, at a very ſmall expence to the inhabitants, when put in competition with the benefit they receive from it, pipes being laid into their houſes. Theſe pipes are ſupplied from the Thames, the New River, or from ſome ponds at Hampſtead. Another advantage ariſing from this noble ſupply of water, is its utility in caſe of fires, which frequently happen in this vaſt metropolis; but to prevent the ſpreading of the flames as much as poſſible, plugs are every where diſperſed, the keys of which are depoſited with the pariſh officers, and as ſoon as the plugs are opened, there is, without ſome extraordinary accident happens, always a ſupply of water for the fire engines, which, on ſuch occaſions, are ſent by the ſeveral companies who inſure houſes and goods from fire. Theſe companies are an advantage peculiar to England. At a very ſmall premium they inſure the houſes and effects of any individual from fire, and, in caſe of loſs, the recovery of the inſurance is eaſy and certain.

The ſtreets in London are in general paved and lighted in a very convenient, regular and beautiful manner. Foreigners, who are deprived of ſuch advantages in their own countries, ſeem much more ſenſible of theſe improvements than the Engliſh themſelves. The roads alſo round the metropolis, for ſome miles, are alſo lighted and watched during the winter nights, which render them at once exceedingly ſafe and highly commodious to travellers.

There are alſo three other palaces near London, viz. Kenſington, Hampton-Court, and Windſor Caſtle. The laſt named is the only fabric that deſerves the appellation of a royal palace in England, and that chiefly through its beautiful and commanding ſituation. It is ſituated about twenty miles from London, was originally built by William the Conqueror, and our kings reſided in that edifice till the reign of Edward III. who removed the old, and built the preſent ſtately caſtle, to which great additions have ſince been made by ſeveral of his ſucceſſors; and was entirely completed by William III. This caſtle, which ſtands upon a noble eminence, and enjoys an enchanting proſpect of the Thames and the adjacent country, is divided into two wards or courts, with a large round tower between them, called the middle ward; it being formerly ſeparated from the lower ward by a ſtrong wall and draw-bridge. The whole contains above twelve acres of land, and had formerly towers and batteries for its defence, but have been neglected many years. Hampton-Court was the favourite reſidence of king William. It is built in the Dutch taſte, and has ſome good apartments, and, like Windſor, lies near the Thames.

The number of private ſeats in the neighbourhood of London, and all over the kindom, diſplay the amazing opulence of the Engliſh nation. At the ſeat of the earl of Pembroke, more remains of antiquity are to be found, than are in the poſſeſſion of any other ſubject in the world. But thoſe capital houſes of the Engliſh nobility and gentry have an excellency diſtinct from what is to be met with in any other part of the globe, which is, that all of them are complete without and within, all the apartments and members being ſuitable to each other, both in conſtruction and furniture, and all kept in the higheſt preſervation; and though the houſe is generally elegant and coſtly, yet the principal object of the ſeat more frequently conſiſts in its hortulane and rural decorations, Viſtas, open ladſcapes, temples, all of them the reſult of that enchanting art of imitating nature, and uniting beauty with magnificence.

The two hoſpitals of Chelſea and Greenwich, the former for decayed ſoldiers, and the latter for decayed ſeamen, are charities which reflect immortal honour on the nation to which they belong.

Chelſea-Hoſpital, ſometimes called the Royal Hoſpital, and at others Chelſea-College, was built by Sir Chriſtopher Wren, under the auſpices of James II. and William and Mary. The principal edifice conſiſts of a large quadrangle, open to the Thames. The number of penſioners in this hoſpital is between four and five hundred; but the extraordinary, or out-penſioners, are between eight and nine thouſand: the latter are allowed ſeven pounds twelve ſhillings and ſix-pence per annum; they wear red coats lined with blue, and perform duty as in garriſon; and thoſe in the hoſpital are provided with clothes, diet, lodging, waſhing, fire, and one day's pay per week, for pocket money. Formerly, every man admitted into this hoſpital, was obliged to bring proof of his having been diſabled in the ſervice of the crown, or having ſerved twenty years in the king's army. To defray the immenſe charges of this charity, the army pays poundage, and every officer and ſoldier gives one day's pay every year towards the ſupport of it; and when there is a deficiency, it is ſupplied by a grant from parliament. This hoſpital is governed by the preſident of the council, the firſt commiſſioner of the treaſury, the principal ſecretaries of ſtate, the pay-maſter general of the forces, the ſecretary at war, the comptrollers of the army, and by the governor and lieutenant-governor of the houſe.

Greenwich-Hoſpital is ſituated where a royal palace formerly ſtood, but being fallen to decay, Charles II. pulled it down, and began this edifice. It was carried on by his ſucceſſors till the reign of George II. when it was completed, and is, without exception, one of the fineſt buildings in the world. The ſuperb hall was finely painted by Sir James Thornhill. The chapel is one hundred feet long, fifty broad, and fifty high; and the ornaments are all white and gold. The number of diſabled ſeamen in this hoſpital is now increaſed to 2000 men and 100 boys. To every hundred penſioners are allowed five nurſes, who are the widows of ſeamen, and are each allowed ten pounds a year, except thoſe who attend in the infirmary, who have two ſhillings a week more. The penſioners are clothed in blue, with braſs buttons; are found, beſides their livery, in ſtockings, ſhoes, and linen; and, excluſive of their commons, are allowed one ſhilling a week as pocket-money: the common warrant officers have one ſhilling and ſix-pence. This hoſpital is governed by a governor, a lieutenant-governor, and other officers.

The endowments of this houſe are immenſe. William III. gave two thouſand pounds a year towards finiſhing the buildings. In the year 1732, the late earl of Derwentwater's forfeited eſtate, amounting to near ſix thouſand pounds per annum, was given to it by parliament; and, in 1737, a market was opened in the town of Greenwich, under the direction of the governors of this charity, to which the profits that ariſe from it are to be appropriated. Beſides theſe, the ſeveral benefactions to this hoſpital, which appear upon tables, hung up at the entrance of the hall, amount to fifty-eight thouſand two hundred and nine pounds.

Having deſcribed ſeveral of the moſt conſiderable buildings, &c. in the capital and its neighbourhood, ſome attention muſt be paid to the other principal towns of this kingdom, moſt of which are diſtinguiſhed either by manufactures, naval affairs, or a convenient ſituation for the trade carried on with the metropolis, and foreign countries. Among the moſt conſiderable of theſe, are the following:

Briſtol, a city and ſeaport of England, ſituated in the counties of Glouceſter and Somerſet, on the rivers Avon and Frome, which unite here, and form one ſtream under the name of the former, navigable for large and heavy ſhips, till it joins the Severn at

King Road, there known by the name of the Briſtol Channel. The merchants of this city trade with more independence on London than any other town in the kingdom. Their Weſt India ſhips ſail and arrive in fleets. They trade largely with Ireland, Holland, Hamburgh, Norway, Sweden, Ruſſia, and America. They ſend ſhips to Newfoundland and the Mediterranean. The quay is eſteemed one of the fineſt in Europe, and on the banks of the river are ſeveral dock-yards for building and repairing the ſhips. Buſineſs of almoſt all kinds is carried on here, and capital works eſtabliſhed, ſuch as large braſs works, forges for ſmelting copper; iron founderies, where cannon, &c. are caſt and bored; lead works, in which the lead is ſmelted from the ore, caſt into ſheets, milled, &c: manufactures of white and red lead, and lead ſhot; a great number of ſugar-houſes, turpentine, ſulphur, and vitriol works; a manufacture of china, beſides manufactures of woollen-ſtuffs, broad-cloth, ſail-cloth, lace, ſilk, and cotton. Among the public buildings, we may reckon the Exchange, in Corn-ſtreet; other public buildings are the Council-Houſe, Guild-Hall, Cuſtom-Houſe, ſeveral halls of companies, as of merchants, coopers, and merchant tailors, public library, infirmary, &c. Briſtol was erected into a biſhopric by Henry VIII. It contains ſeventeen pariſhes, and, beſides the cathedral, ſeventeen churches and five chapels within the city, and two churches and one chapel in the ſuburbs; in all, twenty-ſix of the eſtabliſhed religion, and fifteen places of worſhip for other perſuaſions. The hoſpitals and charitable foundations are more than twenty. The number of houſes in the city is 13,000, and of the inhabitants 72,000, and if to theſe we add the population of the ſuburbs, the whole muſt exceed 100,000. The government of this city is adminiſtered by a mayor, twelve aldermen, two ſheriffs, twenty-eight common-council, a recorder, town-clerk, &c. Briſtol being a county of itſelf, one of the judges comes every year to Briſtol and holds an aſſize; in the autumn, another aſſize is held by the mayor, recorder, and aldermen. Queen Elizabeth granted a charter, whereby every man that marries a daughter of a citizen of Briſtol, becomes free of the city.

York is ſituated on the river Ouſe, and its chief magiſtrate has the title of Lord Mayor. The cathedral is built in the Gothic taſte. The windows are adorned with glaſs exquiſitely painted with ſcripture hiſtory. The nave of this church is four feet and half wider, and 11 feet higher, than that of St. Paul's. The aſcent from it, through the choir to the altar, is by ſix ſteps. The entrance of the middle nave of the church, at the weſt door, is under the largeſt Gothic arch in Europe, which binds and ſupports the two towers. At the ſouth end of the croſs aiſle is a circular window, called the marigold window, from its glaſs being ſtained of that colour; and a large one at the north end, conſiſting of five lights, reaching almoſt from bottom to top. The painting repreſents embroidery.

The city belongs to neither of the ridings, but enjoys its own liberty, and a juriſdiction over 36 villages and hamlets in the neighbourhood, on the weſt ſide of the Ouſe. This liberty is called the Ainſtey, or county of the city of York.

York is pleaſantly ſituated, and divided into four wards, containing 28 pariſhes, and walled, but not fortified with artillery. The river Ouſe, from the north, paſſes through it, and divides it into two parts, joined together by a ſtone bridge of five arches, of which the middlemoſt is reckoned, for height, breadth, and architecture, to be equal to the Rialto at Venice, though not to that at Blenheim. The great council-chamber, the exchequer, the ſheriff's court, and the two city priſons, are kept upon this bridge. The river brings large veſſels to the quay, though at 60 miles diſtance from the ocean. It has four large well built gates, and five poſterns. The other moſt remarkable ſtructures are the guildhall; the ſtatue of king Edgar, who re-built the city, and St. Anthony's-hall. The market-houſe, in the ſtreet called the Pavement, is a curious piece of architecture, ſupported by 12 pillars of the Tuſcan order; and there is another ſtill larger in a ſquare, called Thurſday market. In this city are 17 churches.

Leeds, a town in the county of York, ſituated on the river Aire, and on the great canal, which is navigable from Liverpool. It is governed by a mayor, recorder, twelve aldermen, twenty-four common councilmen, &c. Leeds has been a long time famous for the woollen manufacture, and is one of the largeſt and moſt flouriſhing towns in the county, yet had but one church till the reign of Charles I. It now contains three, a Preſbyterian meeting-houſe, erected in 1691, called the New Chapel, which is the ſtatelieſt, if not the oldeſt, of that denomination in the north of England; and in the town and its ſuburbs ſeveral others. In 1786 the firſt ſtone of a general infirmary was laid at Leeds, and which is ſince finiſhed. It is noted for ſome medicinal ſprings. Here are two magnificent halls, both built about the year 1714, one uſed for an aſſembly room, the other is the guild, or moot-hall. Its increaſe of building, in the year 1786, was nearly 400 houſes. The antiquity of Leeds is very great, but it was not incorporated till the reign of Charles the Firſt. The manufacture and trade of Leeds are principally in cloth, the market for which is not, perhaps, to be equalled in the world. There are two ſpacious halls for the accommodation of the clothiers, and alſo a third hall, where worſted goods are expoſed to ſale. At about ſix o'clock in the ſummer, and about ſeven in the winter, the market bell rings; upon which, in a few minutes, without hurry, noiſe, or the leaſt diſorder, the whole market is filled, all the benches covered with cloth, as cloſe to one another as the pieces can lie longways, each proprietor ſtanding behind his own piece. As ſoon as the bell has ceaſed ringing, the factors and buyers of all ſorts enter the hall, and walk up and down between the rows, as their occaſions direct. When they have pitched upon their cloth, they lean over to the clothier, and in the feweſt words imaginable, the price is ſtated; one aſks, the other bids, and they agree or diſagree in a moment. In a little more than an hour all the buſineſs is done, ten or twenty thouſand pounds worth of cloth, and ſometimes much more, are bought and ſold in a ſhort time; the laws of the market here being more ſtrictly obſerved than at any place in England. On account of the trade, the rivers Aire and Calder were made navigable, at the expence of ſeveral private merchants, without calling in the aſſiſtance of the nobility and gentry. By this means a communication was opened from Leeds and Wakefield to York and Hull; ſo that all the woollen manufactures exported are carried by water to Hull.

Sheffield, a town in the county of York. This town has been noted ſeveral hundred years for cutlers' and ſmiths' manufactures, which were encouraged and advanced by the neighbouring mines of coal, particularly for files, and knives, or whittles; for the laſt of which, eſpecially, it has been a ſtaple for above 300 years; and it is reputed to excel Birmingham in theſe wares, as that does this town in locks, hinges, nails, and poliſhed ſteel. The firſt mills in England for turning grindſtones were alſo ſet up here. The houſes here look black, from the continual ſmoke of the forges. Here are about 600 maſter-cutlers, incorporated by the ſtile of the cutlers of Hallamſhire, of which this is reckoned the chief town, who employ not leſs than 40,000 perſons in the iron manufactures, and each of the maſters gives a particular ſtamp to his wares. Here is a large market on Tueſday, for many commodities, but eſpecially for corn, which is bought up here for the

whole weſt-riding. By means of the river Dun, which is navigable within two or three miles of the town, it receives iron from Hull, and conveys thither its manufactures for exportation to America and the Weſt-Indies, as well as various parts of Europe. Its neighbourhood, as well as all this part of the country, abounds with coals. There are alſo at Sheffield lead-works, and a ſilk-mill. The Sheffield manufactures extend ſeveral miles over the country; thirty-one miles S. Leeds, and 131 N. London.

Hull, or Kingſton-upon-Hull, a ſeaport town in the county of York, ſituated on the north ſide of the river Humber, at the mouth of the river Hull, from which it takes its name. It has two churches, one called Trinity, or High Church, the other St. Mary's, or Low Church. The former is a ſpacious beautiful building, the pillars of which are remarkably ſmall; and had, before the reformation, 12 chantries, in one of which is now a neat library. Here are ſeveral meeting-houſes, an exchange, a cuſtom-houſe, and an engine for making ſalt water freſh. Here is a free-ſchool, with an hall over it, belonging to the merchants, who have founded an hoſpital, called Trinity-houſe, in which are maintained many diſtreſſed ſeamen and their widows. The town carries on a great trade in ſail-making; is large, cloſe built, and populous. The commerce of Hull has for ſome time been conſtantly increaſing, ſo as to render it probably the fourth port for buſineſs in the kingdom. Its ſituation is extremely advantageous; for, beſides its communication with the Yorkſhire rivers and canals, it has alſo acceſs, by means of the Humber, to the Trent, and all its branches and communications: hence it has the import and export trade of many of the northern and midland counties. The foreign trade is chiefly to the Baltic; but it has alſo regular traffic with the ſouthern parts of Europe, and with America. More ſhips are ſent from hence to Greenland than any other port, that of London excepted. The coaſting trade for coals, corn, wool, manufactured goods, &c. is very extenſive. A new dock has lately been conſtructed, in which eighty ſhips may ride ſafely and conveniently.

Mancheſter, a town of Lancaſhire, ſituated near the conflux of the Irk and the Irwell, about three miles from the Merſey. It was accounted a large and populous town even 50 years ago; but ſince that time it is ſuppoſed to have increaſed in more than a triple proportion, both in reſpect to buildings and inhabitants. The houſes amount to a number not far ſhort of 12,000; and perhaps it may not be an over-rate to reckon ſeven perſons to each. It may be ranked as the moſt populous market-town in Great-Britain. The ſtreets are about 600, many of them ſpacious and airy, great part of the old buildings being removed, and the new ſtreets allowed a convenient breadth. The town is now well lighted every night by 2000 lamps, and guarded by nearly 200 watchmen.

The college here was founded in 1422 by Thomas Weſt, Lord Delaware, and conſiſted of a warden, eight fellows, four clerks, and ſix choriſters. The collegiate body now conſiſts of a warden, four fellows, two chaplains, two clerks (one of whom, by a very late regulation, is to be at leaſt bachelor of arts and in prieſt's orders,) four choriſters, and four ſinging men. This church is a fine ſtructure of what is termed the Gothic ſtile, and is more enriched with ſculpture than ſuch churches uſually are. The tabernacle work over the ſtalls in the choir is very curious, as are the large arches added upon vaulting the choir. The organ, which coſt not leſs than 1000l. is large and powerful.

Beſide the collegiate church, there are alſo the following. St. Ann's, a handſome church, begun in 1709 and finiſhed in 7723: it is in the gift of the Biſhop of Cheſter. St. Mary's, built by the clergy of the collegiate church, and conſecrated upwards of 30 years ago, is a neat and indeed an elegant edifice; as is St. John's, which was built by the late Edward Byrom, Eſq. St. Paul's church is a handſome ſpacious building, chiefly brick; St. James's Church, built by the Rev. C. Bayley, D. D. is a large well lighted building, of brick and ſtone, with a ſmall ſtone ſteeple. St. Michael's is alſo of brick and ſtone, with a ſquare tower. It was built by the late Rev. Humphrey Owen, (one of chaplains of the collegiate church, and rector of St. Mary's.) The new Jeruſalem church, Peter's-ſtreet, St. Clement's, in Stevenſon's-ſquare, and St. Thomas's, Ardwick-green; to theſe may be added, Trinity Church and St. Stephen's, Salford; for though the Irwell intervenes between Mancheſter and Salford, and each is governed by its reſpective conſtables; yet, being connected by three bridges, the two places are generally conſidered under the name of Mancheſter. In Salford, there is likewiſe a Methodiſt chapel. In Mancheſter, a new church is lately finiſhed, and called St. George's. St. Peter's church, at the end of Moſley-ſtreet; when finiſhed, will be a ſtrong and elegant ſtone ſtructure, with a high ſpire; at preſent the body only is completed, and lighted, in a manner not very common, by ſix ſemicircular windows. Beſide the 14 churches above enumerated, there are two Catholic Chapels, three large Methodiſt Chapels, a Chapel for the people called Quakers, and ſeven Chapels for Diſſenters of other denominations.

Cheetham's Hoſpital, commonly called the College, originally the place of reſidence of the warden and fellows, is deſerving of particular notice. Humphrey Cheetham, of Clayton, near Mancheſter, Eſq. having been remarkably ſucceſsful in trade in the middle of the laſt century, bought the college, and liberally endowed it for the maintenance and education of 40 poor boys, admiſſible between the age of 6 and 10 years. By an improvement of the funds of the charity, the number of boys was increaſed to 60; and continued ſuch till the Eaſter meeting of the feoffees in 1780, when another augmentation took place, and the number has ſince been conſtantly 80. The boys of this hoſpital are comfortably provided for till the age of 14, when they are further clothed, and with a premium placed apprentices to uſeful trades. The Library, which occupies an extenſive gallery of the ſame building, owes its foundation and increaſing importance to the ſame benevolent ſource. The annual value of the fund originally bequeathed for the purchaſe of books, and for a librarian's ſalary was 116l.; but, by recent improvements of the eſtate, the income is more than thrice that ſum The books at this time amount to upwards of 10,000 volumes. At ſtated hours, on all days, except Sundays and other holidays, the ſtudious may have free acceſs to read in the library. The Free-ſchool, almoſt joining to the college, is ſupported by the rents of various houſes and lands, and by the rents of three mills; one of which is for grinding malt, another for corn, and the third is employed as a ſnuff-mill. Theſe rents are now increaſed to 241l. per annum, from which ſalaries are paid to three maſters and two aſſiſtants; and eight exhibitioners choſen from ſtudents educated at this ſchool, are each allowed the annual ſum of 25l. for four years, during their reſidence at the Univerſities. Beſide theſe exhibitions, there are others alſo ariſing from lands in Mancheſter, bequeathed by Mr. Hulme. The deſerved reputation of this ſchool is a powerful recommendation of its ſcholars entering at the univerſities.

The Academy is a large and commodious building, raiſed by the ſubſcriptions of ſeveral reſpectable Diſſenters, and placed under the care of able tutors. Here youth above 14 years of age are admitted and inſtructed in the various branches of liberal knowledge, preparatory to trade or the profeſſions. The

Literary

Literary and Philoſophical Society of Mancheſter was inſtituted in the beginning of the year 1781, and is well known by its Memoirs, of which ſeveral volumes have been publiſhed. A ſociety was eſtabliſhed here in November 1789, under the name of the Lancaſhire Humane Society, for the encouragement of all who may attempt the recovery of perſons apparently drowned. The Infirmary, Diſpenſary, Lunatic Aſylum, and public Baths, are all ſituated on one large airy plot of land, in the moſt elevated and agreeable part of the town; a pleaſant graſs-plot and gravel walk extending the whole length of the buildings; a canal intervening between them and the public ſtreet, next to which it is guarded by iron paliſades. The Lying-in-hoſpital is ſituated in Salford, nearly adjoining the New Bayley. A new Work-houſe is completed; and for ſuch a purpoſe a happier ſpot could not be found in any town than that whereon it is erected, being on an equal eminence with the college on the oppoſite ſide of the Irk, and promiſing the greateſt poſſible comforts to ſuch as may be neceſſitated to become its inhabitants. For the poor of Salford a new building has alſo been lately erected. The Exchange was a ſtrong good building; but ſince the late act of parliament obtained for farther improvements of the town, it has been ſold and taken down, and its ſite formed into a convenient area, to the great advantage of the ſurrounding houſes. The Theatre is a neat building, wherein the boxes are placed in a ſemicircle oppoſite to the ſtage. The Gentlemen's Concert-room is an elegant building, capacious enough to accommodate 1200 perſons. The concerts are ſupported by annual ſubſcriptions: but ſtrangers and military gentlemen have free admiſſion to the private concerts, as alſo to the public concerts with a ſubſcriber's ticket. The new Aſſembly-rooms are large and commodious. The Circus is a capacious and handſome building, adapted either for equeſtrian or dramatical exhibitions. Here are two Market-places, the old and the new; which are well ſupplied with every thing in ſeaſon, though at high rates. There are ſeveral charity ſchools belonging to different churches and chapels, where children are furniſhed with clothes and taught to read. The Sunday-ſchools are numerous, and afford inſtruction to upwards of 6000 children.

Over the Irwell are three bridges, uniting the town with Salford; the old bridge is very high at the Mancheſter end, whence it ſlopes into Salford. The middle bridge, four feet wide, raiſed upon timber, and flagged, is only for accommodation of foot paſſengers. The lower bridge is a handſome ſtone building of two arches; this bridge affords a level road for two or three carriages abreaſt. It was undertaken and finiſhed by the private ſubſcription of a few gentlemen; and a ſmall toll is taken for all paſſing, which toll is now annually let by auction. The Irwell having at a great expence been rendered navigable for veſſels of 20 or 30 tons burthen, there is a conſtant communication between Liverpool, Mancheſter, and the intermediate places on the Irwell and Merſey, to the great advantage of the proprietors and the country at large.—This navigation, and more eſpecially the Duke of Bridgewater's canal, opening a paſſage from Mancheſter to the Merſey at 30 miles diſtance, have, together, greatly contributed to the preſent highly flouriſhing ſtate of the town. Advantages ſtill greater may reſult from the intended union of the Humber and the Merſey, by a junction of the Rochdale-canal, with that belonging to his Grace.

We muſt not omit to notice the new penitentiary-houſe, called the New Bayley, for ſeparate confinement of various criminals. Over the entrance is a large ſeſſion-room, with adjoining rooms for the magiſtrates, council, jurors, &c. Beyond this, in the centre of a large area, incloſed by very high walls, ſtands the priſon, an extenſive building, forming a croſs three ſtories high; and the four wards of each ſtory may in an inſtant be ſeen by any perſon in its centre. The priſon is kept ſurpriſingly neat and healthy; and ſuch as can work at any trade, and are not confined for crimes of the greateſt magnitude, are employed in a variety of branches: ſo that one may be ſeen beating and cleanſing cotton, another carding it, another roving, and a fourth ſpinning. In the next place may be obſerved a man or a woman buſy at the loom; and in another, one or more engaged in cutting and raiſing the velvet pile. Hence induſtry is not ſuffered to ſlumber in the ſolitary cell, nor to quit it under the acquired impreſſions of that torpor which formerly accompanied the emancipated priſoner from his dungeon; rendering him, perhaps, totally unfit for the duties of honeſt ſociety, though well qualified, in all probability, to hord with gamblers, and be then, if not before, initiated into their pernicious myſteries. The banks of the rivers and various brooks about the town, afford excellent ſituations for the numerous dye-houſes employed for a multitude of fabrics. Among other things, the manufacture and finiſhing of hats is carried on to an extent of great importance. The general market is here on Saturdays. Tueſday's market is chiefly for tranſacting buſineſs between the traders and manufacturers of the town and circumjacent country. The fairs are on Whitſun Monday, October 1ſt, and November the 17th.

Mancheſter is a manor with courts leet and baron. It ſends no members to parliament, but gives title to a Duke.

Liverpool, a ſeaport town in the county of Lancaſter, ſituated on the eaſt ſide of the Merſey, not far from its mouth, in the Iriſh Sea, and one of the moſt commercial and flouriſhing ports of the kingdom. The inhabitants trade to all parts of the world, except Turkey and the Eaſt-Indies. The harbour is artificial, but capable of receiving veſſels of any burden up to the town; there are ſeveral public docks for the reception of ſhips, where a thouſand may lie in the greateſt ſafety, all bound by quays, a mile and a half in length, with room for 20,000 ton of ſhipping. The entrance of the river is dangerous, though every means is uſed to render it more ſecure. In the middle of the 16th century, Liverpool was a ſmall place, with only one church, which was a chapel of eaſe to Walton. In the year 1699, an act paſſed to make the town a diſtinct pariſh, and erect a new church, ſince which time it has been gradually advancing in population and trade. It was, however, before that time a corporate town, and ſent members to parliament. In the year 1565, there were only 138 houſeholders and cottagers. At this time, the number of houſes is, probably, near 10,000, and of the inhabitants 60,000. The trade of Liverpool is general; but the principal branch is the African and Weſt India trade. The American, Baltic, and Portugal commerce is alſo very great, as well as to Ireland; ſeveral ſhips are ſent annually to Greenland, and many veſſels are employed in the country trade for corn, cheeſe, coals, &c. ſo that near 3000 veſſels are cleared out from this port in one year. Here are ſeveral manufactories for china-ware and pottery, ſome ſalt-works, glaſs-houſes, and upwards of fifty breweries, from ſome of which large quantities of malt-liquor are ſent abroad. By the late inland navigation, Liverpool has communication with the rivers Dee, Ribble, Ouſe, Trent, Derwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Weſtmoreland, Cheſter, Stafford, Warwick, Leiceſter, Oxford, Worceſter, &c. The Merſey, upon which this town is ſituated, abounds with ſalmon, cod, flounders, turbot, plaiſe, and ſmelts; and, at full ſea, it is above two miles over. The Merſey is properly an arm of the ſea, and ſubject to

the variations of the tide. Liverpool contains ten churches, beſides places of worſhip for the religious of other perſuaſions, an exchange, a cuſtom-houſe, a public infirmary, a priſon, built on the plan of the humane Mr. Howard, an obſervatory, a theatre, &c. The markets are on Wedneſday and Saturday, and every other Wedneſday for all ſorts of cattle.

Birmingham, a town in the county of Warwick; has of late years become one of the firſt manufacturing towns in Europe. In the year 1676 it was not even a market town, and is now not a corporation, nor has it any chartered privileges. Indeed this very circumſtance appears to be one of the firſt advantages enjoyed by the town. Formerly, tanning of leather was the principal buſineſs carried on by the people of Birmingham; no appearances of that now remain. Before the revolution, the manufactures of Birmingham were confined to coarſe iron ware; ſhortly after that period, ſome of the inhabitants obtained a contract for furniſhing a ſupply of fire-arms to government; ſoon after the button and buckle trade became extenſive: Birmingham was conveniently ſituated, labour, coals, and neceſſaries of life were cheap; manufactures were erected upon a general and extenſive ſcale. Whatever could be deſired, either uſeful or ornamental, in the various branches diſcovered by ingenuity or ſtudy, the endleſs variety of buttons, buckles, trinkets, and jewellery, ſilver and plated fire-arms, caſt-iron work, mill-work, &c. &c. are all abundantly ſupplied by Birmingham. Some of the moſt extenſive manufactures in the kingdom are eſtabliſhed here. Inland navigations have increaſed the trade, and will ſtill increaſe it much more by freſh communications. Even London will ſoon receive the manufactures of Birmingham by means of inland navigations. It is ſcarcely fifty years ſince there was not a ſingle mercantile houſe, which correſponded directly from hence with any foreign country, but furniſhed their products for the ſupply of thoſe markets through the medium of merchants in London: at this time the principal orders for foreign ſupply come directly to merchants or manufacturers reſident in the town. The air is naturally exceeding pure, and notwithſtanding the diſadvantages which muſt reſult from its cloſe population, the noxious effluvia of various metallic trades, and, above all, the continual ſmoke ariſing from the immenſe quantity of coals conſumed, it is remarked by the moſt accurate obſerver on the probability of human exiſtence (Dr. Price) to be one of the healthieſt towns in England. The foundation being a dry reddiſh ſand, the loweſt apartments are perfectly free from damp, and hence it follows, that agues, and the numerous tribe of diſtempers incidental to moiſt ſituations, are here unknown: the inſtances of longevity are ſtrikingly numerous, and every means for the preſervation of health has been adopted in this great town, particularly bathing; one of the moſt extenſive and complete ſet of baths in the kingdom being erected at Lady Well. Almoſt every artiſt occupying a ſeparate houſe, they are ſpread over a greater extent of ſurface, and conſequently free from the diſadvantages ſo remarkable in other great towns, where the habitations are larger, and every floor occupied by one or more families: the dwellings, however, of the merchants and principal manufacturers are equal to thoſe of the ſame rank in any other part of the kingdom; and Birmingham boaſts of ſome ſtreets which would even do honour to the capital. Birmingham has two pariſh churches, and four chapels of eaſe. Of the former, St. Philip's is juſtly admired for the beauty of its architecture and ſituation, being built in a light elegant ſtile, about ſixty years ago. In each ſteeple is a ſet of muſical chimes, which play every three hours, and a different every day in the week. The chapels are all modern handſome edifices, particularly St. Paul's. There were two Preſbyterian meetings; but they were both deſtroyed in the riots in July 1791: they are now rebuilding, and a third is in contemplation. There are alſo three meetings of Independents, one of Quakers, three of Anabaptiſts, a Romiſh chapel, with ſeveral Methodiſt meeting-houſes, and a Jewiſh ſynagogue. Amongſt the charitable endowments, muſt be ranked the general hoſpital. This is a large and convenient edifice, erected on the edge of the town, at above 7000l. expence, voluntarily ſubſcribed, as is its preſent ſupport, amounting to about 1000l. per annum, in which upwards of ſeventy patients are accommodated weekly upon an average, and a ſtill greater number are relieved externally. There is a weekly market on Thurſdays, which is plentifully ſupplied from the country with every kind of proviſion, and well ſtored with live cattle of all kinds. The following compariſon will place in a very ſtriking light the rapid increaſe of population in Birmingham within a century: in 1688, the ſum diſburſed for the poor was 308l. 17s. 9½d. From Eaſter 1786, to Eaſter 1787, 12,429l. 9s. 11¼d. and nearly the ſame for the preceding ſeven years. The number of inhabitants is ſaid to be ſixty thouſand.

Saliſbury is a large, neat, and well-built city, ſituated in a valley, and watered by the Upper Avon on the weſt and ſouth, and by the Bourne on the eaſt. The ſtreets are generally ſpacious, and built at right angles. The cathedral, which was finiſhed in 1358, at the expence of above 26,000 pounds, is, for a Gothic building, the moſt elegant and regular in the kingdom. It is in the form of a lantern, with a beautiful ſpire of freeſtone in the middle, which is 410 feet high, being the talleſt in England. The length of the church is 478 feet, the breadth is 76 feet, and the height of the vaulting 80 feet. The church has a cloiſter, which is 150 feet ſquare, and of as fine workmanſhip as any in England. The chapter-houſe, which is an octagon, is 150 feet in circumference; and yet the roof bears all upon one ſmall pillar in the centre, ſo much too weak in appearance for the ſupport of ſuch a prodigious weight, that the conſtruction of this building is thought one of the greateſt curioſities in England. It is governed by a mayor, high-ſteward, recorder, deputy-recorder, twenty-four aldermen, &c. Beſides the manufactures of flannels, druggets, and the cloths called Saliſbury whites, for the Turkey trade here, it is noted for the manufacture of bone-lace, and of cutlery. It ſends two members to the Britiſh Parliament, and has two markets weekly, on Tueſday and Saturday.

Nottingham, the capital of the county to which it gives name, ſituated on an eminence, by the ſide of the river Trent. It is large, populous, and handſome, containing three pariſhes, and conſidered as one of the principal ſeats of the ſtocking manufacture. The goods made here are chiefly of the finer kinds, as thoſe of ſilk and cotton; and the trade is extended to the neighbourhood round, and ſome of the more diſtant towns. As the articles of the Nottinghamſhire manufactures are valuable in proportion to their bulk, they are chiefly conveyed to the different ports and places of conſumption by land. A conſiderable ſhare of them is exported to various parts of Europe, America, and the Weſt-Indies. The cotton for this manufacture is ſpun by machinery, worked by water. Nottingham has three churches, a grand town-houſe built on piazzias, a fine ſpacious market-place, with two croſſes in it, and a gaol for the town and county; a manufactory for glaſs and earthen-ware; and the malt buſineſs is likewiſe conſiderable. Nottingham is governed by a mayor, aldermen, recorder, council, &c. and ſends two members to the Britiſh parliament. Here are three markets weekly, on Wedneſday, Friday, and Saturday.

Bath, a city in the county of Somerſet, is ſituated in a deep narrow valley, bounded on the north, ſouth, and

3) 410
136 c 2

ſouth-weſt by lofty hills, forming a very pleaſant natural amphitheatre, and affording the city a double advantage, a barrier againſt the winds, and fountains of the pureſt waters. Theſe hills abound with white free-ſtone, of which the houſes are built. On the north-weſt ſide the valley widens, divided into rich meadows, watered by the river Avon. There are three principal ſprings, or baths, the King's-Bath, the Hot-Bath, and the Croſs-Bath. The Queen's-Bath is merely an expanſion of the waters of the King's Bath. The heat of the King's-Bath is 116 degrees on Fahrenheit's thermometer, of the Hot-Bath 117, and of the Croſs-Bath 111. The diſorders particularly benefited by the Bath waters are obſtructions of the viſcera, palſies, gout, rheumatiſm, hyſteric, colic, the colic of Poitiers, jaundice, white ſwellings, leproſy, hyſteric and hypochondriacal complaints, and ſpaſmodic diſeaſes, as the St. Vitus's dance, &c. The circumſtances which forbid the uſe of the Bath waters, are all caſes with fever, till the fever be removed, pain in the breaſt, with cough, a difficulty of breathing, all caſes in which internal ſuppuration or ſchirrhus has taken place; all caſes of hæmorrhages and plethora. This city, like that of Rome, from a very ſmall and mean beginning, is now become ſo large in bulk, and withal, ſo elegant in its buildings, and ſo reſpectable in its inhabitants and its viſitors, as to be the pride of England and the admiration of foreigners. The old city walls are now built over, and its priſtine ſtate almoſt wholly obliterated by modern improvements. The moſt ſuperb edifices, raiſed by the moſt ſkilful architects riſe in every quarter, and compoſe one of the moſt beautiful cities in the world. In the year 1715, a deſign was ſet on foot for a general hoſpital, but not carried into effect till the year 1738, when freſh contributions were made, a ſpacious and very commodious edifice erected, and an act of parliament procured for incorporating the directors of the charity by the name of the Preſident and Governors of the General Hoſpital or Infirmary at Bath. In 1742, the houſe was opened for the reception of the ſick poor from every part of Great-Britain and Ireland, thoſe of Bath only excepted, in regard they always have a readier and leſs expenſive acceſs to the benefits of the water. There are three pariſh churches in Bath, and ſeveral chapels of the eſtabliſhed form: beſide places of worſhip for Roman Catholics, Preſbyterians, Moravians, Unitarians, Methodiſts, and Quakers.

Exeter, a city and capital of Devonſhire, ſituated on the river Ex, about ten miles from the Engliſh Channel; the ſee of a biſhop, ſuffragan of the archbiſhop of Canterbury, removed to this city from Crediton, by Edward the Confeſſor. The city is ancient, probably built at the time the Romans were in poſſeſſion of Britain; it was ſurrounded with walls, and had ſix gates, moſt of which is a magnificent pile of building, there are eighteen other churches, a few chapels, and five large meeting-houſes. The city is governed by a mayor, recorder, town-clerk, &c. and was incorporated by king John, and erected into a county by Henry VIII. All pleas and civil cauſes are tried by the mayor, alderman, recorder, and common-council; criminal cauſes, and private wrongs, are judged by eight aldermen, who are juſtices of the peace. In the north-weſt corner of the city ſtood the caſtle, called *Rougemont*, from the colour of the hill on which it was built, ſuppoſed to have been founded by the Weſt Saxon kings, and afterwards made the ſeat of the earls of Cornwall. Nothing but the outer walls remain. This caſtle was completely ruined in the civil wars, when the city held out againſt Fairfax, who blockaded it for two months. The principal public buildings are the guildhall, and public hoſpital. The guildhall is a ſpacious and convenient building, built in its preſent form in the year 1593, but repaired in 1720. The public hoſpital were erected by ſubſcription, in the year 1740, for the ſick and lame of the city and county of Devon. The trade of the city of Exeter conſiſts principally in the exportation of coarſe woollen goods, manufactured in the counties of Devon, Cornwall, and Somerſet; theſe goods the merchants of Exeter buy rough from the loom, mill, dye, and finiſh them for uſe, and afterwards export them; they chiefly conſiſt of druggets, duroys, kerſeys, and everlaſtings, which find a ready ſale in Italy, Spain, Germany, Holland, France, and Portugal, to the annual amount of more than half a million ſterling. Beſides this, the Eaſt-India company take off a quantity of long ells, amounting to the value of about 105,000l. of which about a fourth part are ſhipped at Exeter; the remainder at Dartmouth and Plymouth. For making theſe woollens, about 4000 bags of wool are imported at Exeter from Kent. The reſt of the wool made uſe of is the product of Devonſhire and the neighbouring counties. Exeter likewiſe imports dying drugs, wines, and fruit, from Spain and Italy; linens from Germany; and hemp, iron, timber, and tallow, from the Baltic. It ſends ſhips to the Newfoundland and Greenland fiſheries. It ſupplies the country round with coal, both from the northern collieries, and from Wales: and it has an exportation of corn, eſpecially oats, to London. Exeter was twice ravaged by the Danes. In the reign of Henry VII. it was beſieged by Perkin Warbeck, but made ſo brave a defence that he was compelled to raiſe the ſiege, and the king, in acknowledgment of the bravery of the citizens, preſented them with a ſword which he himſelf wore, to be carried before the mayor in all coporate proceſſions. Three markets are held here weekly, Wedneſdays, Fridays, and Saturdays, one of which is for ſerges, of which 80,000l. or 100,000l. worth have been ſold in a day. Exeter ſends two members to parliament.

Cheſter, a city and capital of Cheſhire, ſituated on the river Dee, about twenty miles from the Iriſh Sea. The city is ſquare, and ſurrounded by a wall, nearly two miles in circumference; it contains nine pariſh churches, a Roman Catholic chapel, and ſix places of worſhip for Diſſenters of different perſuaſions. It is ſaid to have been erected into a corporation in the year 1242, and is now governed by a mayor, recorder, aldermen, ſheriffs, common council-men, &c. The ſtreets are hollowed out of a rock to the depth of one ſtory beneath the level of the ground on each ſide; and the houſes have a ſort of covered portico running on from houſe to houſe, and ſtreet to ſtreet, level with the ground behind, but one ſtory above the ſtreet in front. They are called rows, and afford a ſheltered walk for foot paſſengers. Beneath them are ſhops and warehouſes, level with the ſtreet; and apartments above them. The walls are kept in repair by an officer, called a Murenger, and a rate called murage, on all imports by perſons not free of the city. The cuſtody of the gates of Cheſter was committed to very conſiderable noblemen: Eaſt-gate, to the earl of Oxford; Bridge-gate, to the earl of Shrewſbury; Water-gate, to the earl of Derby, and North-gate, to the mayor. The principal manufacture is gloves: and its fairs are reſorted to three times a year by a great concourſe of the Iriſh linen merchants. The caſtle is a noble ſtructure, having a tower aſcribed to Julius Cæſar, and bearing his name, which, as well as its workmanſhip, prove it to have been originally built by the Romans, though the preſent walls are evidently Norman. Cheſter is the ſee of a biſhop, ſuffragan of the archbiſhop of York, and ſends two members to parliament. The number of inhabitants, including the ſuburbs, is eſtimated at 15,000.

Windſor, 21 miles from London, a pleaſant and ancient town on the Thames, and has a fine caſtle, built by William the Conqueror. Edward III. who was born here, enlarged and beautified it; but the royal palace and chapel, together with St. George's

hall and its chapel, and inſtituted here the Order of the Garter. Queen Elizabeth added the noble terrace, faced with free ſtone ramparts, like thoſe of a fortified city, which is ſcarce to be equalled in Europe. King Charles II. laid out great ſums in repairing, new modelling, and furniſhing this palace; and there is a fine equeſtrian ſtatue of him, erected in 1680, over a great well in the inner court. St. George's hall is eſteemed one of the fineſt in Europe. The royal chapel is beautifully adorned with curious paintings. The round tower is built like an amphitheatre, very high, with elegant apartments. On the north ſide is St. George's, or the chapel of the garter, one of the moſt elegant Gothic ſtructures in the univerſe. In the choir are the ſtalls of the knights of the order, and their banners over them, with a throne for their ſovereign.

Here are two parks; the little park about three miles, and the great park 14 miles, in circumference, ſtocked with all kinds of game, and laviſhly embelliſhed by the hand of nature. In the foreſt, which is 30 miles round, are ſeveral ſeats; particularly Cranbourn Lodge, which ſtands on the top of a hill, and has a view not only of Windſor and its parks, but of London and the adjacent country.

Canterbury, a city and capital of the county of Kent, the ſee of an archbiſhop, primate of all England, ſituated in a valley, between gently riſing hills, on the river Stour; founded before the Chriſtian era. It is a county of itſelf, and the magiſtrates have authority to determine all law-ſuits between the citizens, and to try for capital crimes committed within the city. The magiſtracy conſiſts of a mayor, aldermen, recorder, &c. There are two markets weekly, on Wedneſday and Saturday. Canterbury was formerly celebrated for its ſilk manufacture, which has for ſome years been on the decline; the principal manufactures are thoſe of worſted and Canterbury muſlins, many of ſilk and cotton. There were formerly ſeventeen churches within the walls, and three in the ſuburbs, fifteen only of which remain. The Jews have a ſnagogue; Methodiſts, Baptiſts, Preſbyterians, and Quakers, have each a place of public worſhip. The country round about produces a great quantity of hops. It is likewiſe celebrated for its brawn. In the cathedral was once the famous ſhrine of Thomas-a-Becket, who was murdered at the altar in the year 1170, to which pilgrims from all parts of the world continually flocked, having been canonized by pope Alexander, two years after his death, and only put a ſtop to by the reformation under Henry VIII, who took to himſelf the riches of the ſhrine, and ordered his name to be eraſed from among the ſaints.

Northampton ſtands upon the Nen, over which it has two bridges. The buildings were handſome, and the town large (having ſeven pariſh churches within the walls, and two without) when it was reduced to aſhes by a dreadful fire in 1675. Liberal contributions from all parts of the kingdom reſtored it in a meaſure to its original ſize; and for neatneſs, beauty, and ſituation, few towns equal it. It has four churches, of which the great one, viz. Allhallows, is a handſome edifice, with a ſtately portico II. on the baluſtrade. It ſtands near the center of the town, and at the meeting of four ſpacious ſtreets. The ſeſſions and aſſize houſe is a very beautiful building of the Corinthian order. The market-place is one of the fineſt in Europe. The horſe-market is thought to exceed any other of the kind in England. Its moſt conſiderable manufacture is ſhoes, of which great numbers are exported; the next to that, ſtockings. A county hoſpital is built here after the manner of the infirmaries of London, Briſtol, Bath, &c. and the river Nen has lately been made navigable up to the town.

Buckingham, the county town, ſtands in a low ground, encompaſſed on all ſides, but the north, with the river Ouſe. The caſtle, now in ruins, was built in the middle of it, and divides it into two parts. In the north part ſtands the town-hall, a very handſome convenient ſtructure. The town was, for many years, a ſtaple for wool, and ſeveral of its wool halls are yet ſtanding; but that trade is now loſt. It is populous, and has three ſtone bridges over the Ouſe. Its church, which is in the weſt part of the town, is very large. The lace manufacture is the principal buſineſs here, as well as in other parts of the county. There is a road from this town leading to the Marquis of Buckingham's (late Earl Temple's) celebrated ſeat at Stowe. It runs in a ſtraight line, about two miles, up to the Corinthian arch; which, however, ſometimes diſappears, owing to the riſing and falling of the ground. The temple, pavilions, pyramids, obeliſks, monuments, ſtatues, buſts, &c. which adorn the elegant villa at Stowe, are all highly finiſhed; and the many inſcriptions are deſigned for the information and inſtruction of the beholder.

Worceſter, on the Severn, over which it has a fine ſtone bridge, is the capital. The remarkable battle in 1651, when Charles II. was defeated by Cromwell, was fought near the ſouth gate of the city, where bones of the ſlain are frequently dug up. The chief manufactures of the place are broad cloth, gloves, and porcelaine, which is a compoſition of a middle nature, between fine earth and glaſs. The public buildings make a grand appearance, eſpecially the guildhall and the workhouſe. It had formerly a caſtle and walls, with three gates, and five watch towers, all long ſince deſtroyed. The cathedral, which is exactly the model of that of Bruſſels, is a large edifice, but not very elegant, except the choir of the chapel, on the ſouth ſide, which is of curious workmanſhip. A handſome library belongs to the cathedral, ſupported by one ſingle pillar in the middle. Here the monuments of king John, prince Arthur, brother to Henry VIII. the counteſs of Saliſbury; and other illuſtrious perſons. Beſides the cathedral, there are nine pariſh churches. The ſtreets are broad and well paved; the Foregate-ſtreet is regular and beautiful. The hoſpitals deſerve notice, eſpecially that noble one erected by Robert Berkley, of Spetchley, who laid out 2000l. in the building, and 4000l. in endowing it for 12 poor men. Beſides this, there are ſix or ſeven others. The Severn, though generally rapid elſewhere, glides by Worceſter very gently. Here is a good water-houſe and quay.

Warwick, on the Avon, the county town, ſtands on a ſituation remarkably rocky. It is of great antiquity, and may be approached by four ways, anſwering to the points of the compaſs, and cut through rock. Theſe lead to four ſtreets, which meet in the center of the town. The walls and cellars are made in the rock. It is ſupplied with water by pipes from ſprings half a mile off, and has a noble ſtone bridge of 12 arches over the Avon. Here is a caſtle, the principal ornament of the place, ſtrong both by art and nature. The rock on which it ſtands is 40 feet from the river; but on the north ſide it is even with the town. From its terrace, which is above 50 feet perpendicular above the Avon, there is a proſpect of the river, and a beautiful country beyond it. The apartments of the caſtle are well contrived, and many of them adorned with original pictures by Van Dyke. It was built originally by William the Conqueror. Near the town is Guy's Cliff, a high perpendicular rock, where Guy, earl of Warwick, is ſaid to have lived a hermit, after his defeating the Daniſh giant Colbrand. His ſword and other accoutrements are ſtill ſhewn in the caſtle.

Norwich, a city and capital of the county of Norfolk, and the ſee of a biſhop, on the Yare. This city is one of the moſt populous in England, and long took the lead in point of conſequence among the inland towns. For this it was indebted to its great manufacture of crapes, bombazins, and ſtuffs,

of

of various kinds, which is ſtill conſiderable, though ſomewhat declined, on account of the rivalſhip of the cotton branches, and in conſequence of prohibition in foreign countries. The manufacture is confined to the city; but the operations of ſpinning and preparing the wool, employ the poor of moſt of the ſmall towns and villages in the county. The wool uſed is brought from the counties of Lincoln, Leiceſter, and Northampton. The goods are ſent to various parts of the world, particularly Holland, Germany, and the Mediterranean. Many of them are ſhipped at Yarmouth, and many are ſent to London, and other places, by land. Norwich contains many opulent inhabitants, and good buildings, but its ſtreets are narrow, and ill-diſpoſed. It had twenty-five churches, in the Conqueror's time forty-three, afterwards fifty, and now thirty-ſix, in uſe. The caſtle, now the gaol, is of great antiquity; the city invited, in 1563, a number of manufacturers from the Low Counties, who came over to the number of 300, and ſoon after amounted to as many as 1000. They ſet up the making of bayes, ſayes, arras, and mochades, caungeantries, tufted mochades, currelles, and all other works mingled with ſilk, ſaietrie, and linen-yarn; and they firſt made bombazeens in 1575. Theſe have been ſo much improved of late years, in making damaſks, camlets, black and white crapes, &c. that it is computed that ſtuffs to the amount of 700,000l. have ſometimes been manufactured here in a year. The art of printing was introduced here at this time by Anthony Solmpne, one of theſe ſtrangers. The cathedral, built by Herbert de Loſinga, 1096 (whoſe ſtatue is over the north tranſept door, and his tomb below the high altar, modernized in repairing) was damaged by fire, 1171, and repaired and completed 1180, by biſhop John of Oxford. Norwich is governed by a mayor, aldermen, council, recorder, &c. and ſends two members to parliament.

Lincoln, a city and capital of Lincolnſhire, ſituated on the river Witham: it is a very ancient city, and was formerly ſurrounded with walls, and defended with towers, and was one of the chief towns for buying and ſelling wool. We are told, that in Edward the Confeſſor's time, Lincoln contained 1070 houſes, and 900 burgeſſes. William the Conqueror built a caſtle to keep the citizens in awe. Lincoln formerly contained fifty-two pariſh churches, with many religious houſes, but in the ſecond year of Edward VI. the number of churches was reduced to fifteen. The length of the cathedral from eaſt to weſt (including the walls is 530 feet. The length of the great tranſept from north to ſouth is 227. From the pavement to the top of the lantern in the Rood tower is 124 feet. Before the reformation took place, this cathedral was undoubtedly the fineſt and richeſt in the whole kingdom, and the number and ſplendour of its tombs almoſt incredible. In the reign of king Henry the Eighth, in the year 1540, by the king's orders, there were carried from this church into his coffers, no leſs than 2621 ounces of pure gold, and 4285 ounces of ſilver; beſides an amazing quantity of diamonds, pearls, ſapphires, rubies, turquoiſes, carbuncles, and two ſhrines, one of pure gold, called St. Hugh's, the other of ſilver, called Biſhop St. John of D' Alderby. A ſecond plunder was committed on this church, in the year 1548, during the preſidence of biſhop Hobech, who being a zealous reformiſt, gave up all the remaining treaſure, which Henry had thought proper to leave behind. Lincoln, at this day, is a large, long, ſtraggling town, chiefly conſiſting of one ſtreet. There are ſeveral good buildings in it, both below and above the hill. It has a plentiful weekly market on Friday, well ſupplied with proviſions of all kinds, and its corn and wool trade is very great: large quantities of which are exported into Yorkſhire, the veſſels bringing coals back. Upon the plain, on the north ſide of Lincoln, was fought the famous battle between the friends of the empreſs Maud, and king Stephen, in which that prince was defeated and taken priſoner. Upon Lincoln-heath were like-wiſe fought ſeveral bloody battles, between the forces of Cromwell, and the royal army. Lincoln is ſo full of the ruins of monaſteries and religious houſes, that the very barns, ſtables, outhouſes, and even ſome of the hog-ſtyes, are built with arched windows and doors. The ruins of the caſtle, are venerable pieces of antiquity; and from its bold and noble ſituation upon a high hill, it muſt have been a place of prodigious ſtrength. The county-gaol is now ſituated in the caſtle-yard. It ſends two members to parliament.

Colcheſter, a town in the county of Eſſex, on the river Coln, which formerly contained fifteen churches, and now twelve, moſt of which are in good repair, with a caſtle in the centre of the town. The river Coln, which paſſes through the town, encompaſſes it on the north and eaſt; and ſerved, in time of war, for a complete defence on thoſe ſides. There are three bridges over it, and it is navigable, within three miles of the town, for ſhips of large burthen; a little lower it may even receive a royal navy; and up to that part called the Hythe, cloſe to the houſes, it is navigable for hoys and ſmall barks. The Hythe is a long ſtreet, paſſing from weſt to eaſt, on the ſouth ſide of the town, and is ſo populous towards the river, that it may be called the Wapping of Colcheſter. There is one church in that part of the town, a large quay by the river, and a good cuſtom-houſe. This town chiefly ſubſiſts by making baize, though, indeed, all the towns around carry on the ſame trade; as Kilverdon, Witham, Coggeſhall, Braintree, Bocking, &c. and the whole country, large as it may be ſaid to be, employed, and in part maintained, by the ſpinning of wool for the baize trade of Colcheſter and its adjacent villages. The town of Colcheſter has been ſuppoſed to contain about 40,000 people, including the out-villages within its liberty, of which there are many, the liberty of the town being of a large extent. The markets are on Wedneſdays and Saturdays. This place ſends two members to parliament; and is governed by a mayor, recorder, town-clerk, twelve aldermen, eighteen aſſiſtants, eighteen common-council, two coroners, four ſerjeants, and two claviers.

Leiceſter, the capital of the county to which it gives name, ſaid to have been built by king Lear. It is a place of great antiquity, and was a town before the Romans invaded Britain. It is ſituated on the Soar. It is large, well-built, and populous, containing five churches, a Roman Catholic chapel, and other places of worſhip. Before the caſtle was diſmantled, it was a prodigious building, it being the court of the great duke of Lancaſter, who added twenty-ſix acres to it, which he encloſed with a high wall, and called it his Novum Opus, now the Newark, where are ſtill the beſt houſes in all Leiceſter; and they continue extra-parochial, as being under caſtle-guard, by an old grant from the crown. Its hall and kitchen are ſtill entire, the former of which is lofty and ſpacious, and the courts of juſtice, which are held here at the aſſizes, are at ſuch a diſtance as not to diſturb each other. The market, which is on Saturday, abounds with every ſpecies of good living, and is, for an inland town, remarkably well ſupplied with fiſh. The fairs in Leiceſter are upon a large ſcale, particularly in the articles of cheeſe, ſheep, and cattle; Smithfield market, on its greateſt days, bears no ſort of proportion to the beaſts ſhewn in Leiceſter at two or three fairs in the year. In the Domſday-book, this town is ſtiled a city, and had the title of mayor given to its chief magiſtrate in the reign of Henry III. A parliament was held at Leiceſter in the reign of Henry V. wherein the firſt law was made for burning heretics. It is the largeſt, beſt-built, and

moſt

moſt populous town in the ſhire. Its corporation conſiſts of a mayor, recorder, ſteward, bailiff, twenty-four aldermen, forty-eight common-council, a town-clerk, &c. and had its charter from king John, and its freemen are toll-free in all the markets and fairs in England. This town derives great advantages from its manufactures, particularly of ſtockings. A navigable canal is lately made from Leiceſter to Loughborough. Leiceſter ſends two members to parliament.

Southampton, a ſeaport town in the county of Hants, or, as it is ſometimes called, the county of Southampton, ſituated at the union of two rivers, which run into a bay of the Engliſh Channel, called Southampton Water: near this ſpot was formerly a town, called Hanton, which was plundered by the Danes, in the year 980; and, in the reign of Edward III. it was burnt down by the French; after which it was rebuilt in the ſituation it now ſtands, which was ſurrounded with walls, ditches, battlements, and towers, and, for its further defence, a ſtrong caſtle was built by order of Richard II. on a mount, or artificial hill; and a fort was erected in the reign of Henry VIII. The inhabitants carry on a conſiderable trade with Portugal for wine and fruit, as likewiſe with the iſlands of Guernſey and Jerſey, to which iſlands they ſend a certain quantity of wood, allowed by act of parliament: here are manufactures of ſilk and carpets. The town chiefly conſiſts of one broad well-built ſtreet, with ſome ſmaller branches, and contains five pariſh-churches, and an hoſpital. It ſends two members to parliament, and was made a county of itſelf, in the reign of king John. The corporation is compoſed of a mayor, aldermen, recorder, ſheriff, two bailiffs, common-council, &c. There are for the town eleven juſtices of the peace, viz. the biſhop of Wincheſter, the recorder, the mayor, the laſt mayor, five aldermen, and two burgeſſes; all who have paſſed the chair are aldermen. The mayor is admiral of the liberties. The reſort of company here, during the ſummer months, for the purpoſe of ſea bathing, has occaſioned conſiderable improvements in the town, and a regular maſter of ceremonies has been appointed to regulate the amuſements. The town is well ſupplied with good freſh water, from diſtant ſprings, by pipes; and adjacent to the town is a chalybeate ſpring. Packets ſail regularly, in time of peace, from Southampton to Cherburg: packet boats ſail every morning, except Monday, to the Iſle of Wight. In time of war, a cutter is ſtationed here, by government, which ſails every fortnight for Guernſey and Jerſey, which convey paſſengers, or parcels; and veſſels, of from twenty-five to forty tons, continually trade to thoſe iſlands; beſides which, there are about thirty veſſels employed in foreign commerce, and upwards of one hundred in the coaſting-trade: the river is deep enough for the largeſt ſhips. Southampton has three markets weekly, on Tueſday, Thurſday, and Saturday.

Whitehaven, a ſeaport town in the county of Cumberland, ſituated on a bay of the Iriſh Sea. This town in the year 1566, had only ſix houſes. It has a good artificial harbour, with a long pier. The coal-mines here are the moſt extraordinary in the world, being ſunk to the depth of 130 fathoms, and extended under the ſea. Here are copperas-works, which yield conſiderable profit. Its chief trade is furniſhing Ireland, and part of Scotland, with ſalt and coal, as it did the latter alſo, with ſalt and ſugars before the union. Here are ſeveral officers of the cuſtoms, it being the moſt conſiderable port in England, next to Newcaſtle, for the coal-trade, inſomuch, that in time of war, or after croſs winds, it is common to ſee 200 ſail of ſhips go off from hence at once for Dublin, laden with coals, beſides thoſe bound with goods to Cheſter, Briſtol, and other ports. The ſhipping and trade here, is ſo much increaſed lately by acts of parliament for improving its harbour, and repairing the roads to it, that it now contains 16,000 inhabitants, and employs near 300 ſhips. It has a market on Thurſday.

Woolwich, a town in the county of Kent, ſituated on the right bank of the Thames. It was formerly only a ſmall village, inhabited by a few fiſhermen; but, for upwards of two centuries, there has been a royal dock-yard at this place, in which are employed about the ſame number of workmen as at Deptford; and it is, like Deptford, under the immediate direction of the navy-board. This is ſaid to be the moſt ancient naval arſenal in England; or, as the learned Camden ſays, to have a right, by ſeniority, to have the title of Mother Dock to all the king's-yards. On the eaſtern, or lower part of the town, is the Gun Park, in which are great quantities of cannon and mortars, of every ſize and dimenſion; and ſo diſtinguiſhed is this arſenal, that there has been depoſited here, at one time, between 7000 and 8000 pieces of ordnance, beſides mortars and ſhells almoſt innumerable. The ordnance forms a conſiderable part of the buſineſs tranſacted for government at this place. Under the military branch is the Warren, where artillery, of all kinds and dimenſions are caſt, and frequently proved before the principal engineers and officers of the board of ordnance, at which many of the nobility and gentry often attend. The gunpowder, purchaſed by contract, is here proved, as to its ſtrength and goodneſs. Here is alſo a laboratory, where the mattroſſes are employed in the compoſition of fire-works and cartridges, and in charging bombs, carcaſes, grenadoes, &c. for public ſervice. A royal academy is here eſtabliſhed, under the board of ordnance, for the inſtruction and qualifying of young gentlemen, intended as candidates for the office of engineer in the military branch of that office: theſe are called cadets, and are appointed by that board. They are taught in it the principles and art of fortification, and every branch of military ſcience relating thereto, with the French and Latin languages, writing, fencing, and drawing. They are under the immediate direction of a governor, lieutenant-governor, and maſters in each reſpective branch of literature. A part of the pariſh of Woolwich lies on the Eſſex ſhore. The cauſe of this diviſion cannot be aſcertained; but that the river might be diverted out of its ancient channel after a flood, is no improbable ſuppoſition. At high-water, the Thames is about a mile broad at Woolwich, and the water brackiſh. As the channel lies direct eaſt and weſt for about three miles, the tide is ſtrong, and the river being free from ſhoals and ſands, and ſeven or eight fathoms deep, the largeſt ſhips may at all hours ride here with ſafety. Here is a market on Friday.

Berwick upon-Tweed, a town of England, ſituated on the north or Scotch ſide of the Tweed, and a county of itſelf, regularly fortified with walls, baſtions, and ditches: it formerly belonged to Scotland, and was the capital of the county of Berwick, and ſeveral times taken and retaken by the Engliſh, till the year 1482, when it was taken by the duke of Glouceſter, brother to Edward IV. and has ever ſince belonged to the Engliſh. The river is broad, with a bridge over it of ſixteen arches. The town is of much leſs extent then formerly, the old caſtle, now gone to decay, lies at ſome diſtance from the ramparts. The barracks are large, and capable of containing two regiments of foot with convenience. Abundance of wool is exported from this town: eggs in vaſt abundance, collected through all the country almoſt as far as Carliſle, they are packed up in boxes with the thick end downwards, and are ſent to London for the uſe of ſugar refiners. The ſalmon fiſheries here are very conſiderable, and likewiſe bring vaſt ſums: they lie on each ſide the river, and are all private property, except what belongs to the dean and chapter of Durham, which in rent and tythe of fiſh brings in 250l. per annum; for all the other

fiſheries

fiſheries are liable to tythe. The common rents are 50l. a year, for which tenants have as much ſhore as ſerves to launch out and draw their nets on; the limits of each are ſtaked; one man goes off in a ſmall flat bottomed boat, ſquare at one end, and taking as large a circuit as his net admits, brings it on ſhore at the extremity of his boundary, where others aſſiſt in landing it. The beſt fiſhery is on the ſouth ſide, very fine ſalmon trout are often taken here, which come up to ſpawn from the ſea, and return in the ſame manner as the ſalmon do. The chief import is timber from Norway and the Baltic. It is governed by a mayor, recorder, town-clerk, and four bailiffs; and ſends two members to parliament. It has a weekly market on Saturdays.

Deptford, a town ſituated on the Thames, partly in the county of Kent, and partly in Surry. It is now a large and populous town, though it has no market, and is divided into Upper and Lower Deptford. It contains about 2000 houſes, many of which are neat and well-built. The greateſt ſupport and conſequence of Deptford ariſes from its dock. It has a wet dock, of two acres, for ſhips; and another, of one acre and a half, well provided with timber and all ſorts of naval ſtores. Beſides the national docks, there are ſeveral others belonging to ſhipbuilders for merchants' veſſels. At Deptford is the ſociety of the Trinity-Houſe; founded, in the year 1515, by Sir Thoms Spert, knight, commander of the great ſhip Henry Grace de Dieu, and comptroller of the navy to Henry VIII. for the regulation of ſeamen, and the convenience of ſhips and mariners on the coaſt, and incorporated by the above-mentioned prince, who confirmed to them, not only the rights and privileges of the company of mariners of England, but their ſeveral poſſeſſions at Deptford; which, together with the grants of Queen Elizabeth and King Charles II. were alſo confirmed by letters patent of the firſt of James II. in the year 1685, by the name of "The Maſter, Wardens, and Aſſiſtants of the Guild or Fraternity of the moſt glorious and undivided Trinity, and of St. Clement, in the pariſh of Deptford Strond, in the county of Kent." This corporation is governed by a maſter, four wardens, eight aſſiſtants, and eighteen elder brothers; but the inferior members of the fraternity, named younger brethern, are of an unlimited number; for every maſter, or mate, expert in navigation, may be admitted as ſuch; and theſe ſerve as a continual nurſery to ſupply the vacancies among the elder brethren, when removed by death, or otherwiſe. The maſter, wardens, aſſiſtants, and elder brethren, are by charter inveſted with the following powers: and of examining the mathematical children of Chriſt's Hoſpital; the examining of the maſters of his majeſty's ſhips; the appointing pilots to conduct ſhips in and out of the river Thames; and the amercing all ſuch as ſhall preſume to act as maſter of a ſhip of war, or pilot, without their approbation, in a pecuniary mulct of twenty ſhillings; ſettling the ſeveral rates of pilotage, and erecting light-houſes, and other ſea marks, upon the ſeveral coaſts of the kingdom, for the ſecurity of navigation, to which light-houſes all ſhips pay one halfpenny a tun; granting licences to poor ſeamen, not free of the city, to row on the river Thames for their ſupport, in the intervals of ſea ſervice, or when paſt going to ſea; the preventing of aliens from ſerving on board Engliſh ſhips, without their licence, upon the penalty of five pounds for each offence; puniſhing of ſeamen for deſertion, or mutiny, in the merchants' ſervice; and the hearing and determining the complaints of officers and ſeamen in the merchants' ſervice; but ſubject to an appeal to the lords of the Admiralty, or the judge of the court of Admiralty. To this company belongs the ballaſt-office, for clearing and deepening the river Thames, by taking from thence a ſufficient quantity of ballaſt, for the ſupply of all ſhips that ſail out of that river; in which ſervice ſixty barges, with two men each, are conſtantly employed, and all ſhips that take in ballaſt pay them one ſhilling a ton, for which it is brought to the ſhips' ſide. In conſideration of the increaſe of the poor of this fraternity, they are by their charter impowered to purchaſe in mortmain lands, tenements, &c. to the amount of 500l. per annum; and alſo to receive charitable benefactions of well diſpoſed perſons, to the amount of 500l. per annum, clear of reprizes. There are annually relieved by this company about 3000 poor ſeamen, their widows, and orphans, at the expence of 60000l.

Lancaſter, a town and capital of the county to which it gives name, ſituated on the river Loyne, or Lune, which forms a harbour of moderate ſize: the town carries on a conſiderable foreign trade, and many ſhips are conſtructed in the docks. Agricola is ſaid to have formed a ſtation here, which was afterwards improved into a caſtle; and ſurrounded by a ditch as early as the time of Adrian, who placed a garriſon there. After the Norman conqueſt, it was enlarged; and in ſucceeding times became more important. The preſent ſtructure is ſuppoſed to have been erected in the reign of Edward III. and is now made uſe of as a county priſon. Lancaſter was incorporated by king John, and the charter renewed and confirmed, with greater privileges, by Charles II. It is governed by a mayor, aldermen, recorder, bailiffs, &c. and ſends two members to parliament. By means of navigable canals, Lancaſter has a communication with the rivers Merſey, Dee, Ribble, Ouſe, Trent, Severn, Derwent, Thames, Avon, Humber, &c. through the counties of York, Lincoln, Weſtmoreland, Cheſter, Warwick, Nottingham, Stafford, Worceſter, Leiceſter, Oxford, Glouceſter, &c. The merchants trade chiefly to America, the Weſt-Indies, and the Baltic. The principal exports are hardware, woollen goods, cabinet work, candles, &c. Sail cloth is the chief manufacture of the town. The number of houſes is about 1160, which are ſuppoſed to contain 1600 families. There are two markets weekly, on Wedneſday and Saturday.

Portſmouth, a ſeaport town in the county of Hants, ſituated on the Iſland of Portſea. The town was anciently defended by a wall of timber, covered with earth; a baſtion to the north-eaſt, near the gate; and two forts of hewn-ſtone, at the mouth of the harbour, begun by Edward IV. and finiſhed by Henry VI. Queen Elizabeth, at great expence, fortified it with new works. King Charles II. after his reſtoration, directed great alterations, eſtabliſhed new docks and yards, raiſed ſeveral forts, and fortified them after the modern manner; which works were augmented in the reign of James II. Since that time it has received great additions from ſucceeding princes, ſo that it is, at preſent, the moſt regular fortreſs in Britain: and, as it cannot be effectually attacked by ſea, may juſtly be deemed impregnable. Within theſe few years, the government has bought ſtill more ground for additional works; and, no doubt, it may be made impregnable by land, as well as ſea, ſince a ſhallow water may be brought quite round it. All ſorts of military and naval ſtores are diſpoſed in the moſt exact order, ſo that the workmen can find what they want in the dark. The rope-houſe is near a quarter of a mile long. Some of the cables here require 100 men to work them; and their labour is ſo hard, that they can work at them but four hours a day. The leaſt number of men employed continually in the yard is ſaid to be 1000; the docks and yards, in ſhort, reſemble diſtinct towns, there being particular rows of dwellings, built at the public charge, for all the principal officers; and they are under a ſeparate government from the garriſon. Here is a fine quay for laying up the cannon; and the arſenal at Venice is not better diſpoſed. The town being low, and full of water and ditches, it is reckoned

aguiſh; the ſtreets are not very clean, the place being in want of freſh water; yet the continual reſort of ſeamen and ſoldiers to it, the men of war being often paid here, renders it always full of people: here is a deputy-governor and garriſon. The mouth of the harbour, which is not ſo broad as the Thames at Weſtminſter, is ſecured on Goſport ſide by four forts, beſides a platform of above twenty cannon, level with the water; and on the other ſide by South Sea caſtle. The harbour is one of the fineſt in the world, as there is water ſufficient for the largeſt ſhips, and is ſo very capacious, that the whole Engliſh navy may ride here in ſafety: the principal branch runs up to Fareham, about ſix miles to the northward of the harbour's mouth; a ſecond goes up to Portcheſter; and a third to Portſea-bridge; beſides theſe branches, there are ſeveral rithes, or channels, where the ſmall men of war ride at their moorings. It is defended from all winds by ſurrounding lands; and from the fury of the ſea by the Iſle of Wight, which lies before the mouth of the harbour, about ſix miles diſtant. A dreadful conflagration happened in the dock-yard on the 27th day of July 1770: it was firſt diſcovered by the centinels on duty, about five o'clock in the morning, when the drums beat to arms, and, in a few minutes after, the dock-yard was all in a flame. The houſe where the pitch and tar were lodged was ſoon reduced to a heap of rubbiſh, and, in a few minutes, it broke out in four different parts, and burnt with ſuch violence, that it threatened the whole place. The inhabitants were filled with the greateſt conſternation; but, by the wind ſhifting about, and the aſſiſtance of the marines and ſailors, its progreſs was ſtopped before ſeven in the evening. The rope-houſe was again deſtroyed, December 7, 1776, when the damage was eſtimated at 60,000l. For this act an incendiary, called John the Painter, was found guilty, and executed. At the latter end of Auguſt, 1782, a man of war, of 100 guns, called the Royal George, was unfortunately ſunk in this harbour. Portſmouth ſends two members to parliament. The civil government is by a mayor, aldermen, recorder, bailiffs, and common-council. The markets here are Tueſday, Thurſday, and Saturday. Several commodious bating machines are fitted up on South Sea beach.

Newcaſtle is an antient, large, populous, and rich town. It is ſituated at the end of the antient Picts Wall, on the river Tyne, over which it has a fine bridge. Hence it is called Newcaſtle-upon-Tyne. The commerce carried on in coals and ſalmon is amazing, and has rendered it, in a great meaſure, the emporium of the north. It may be ſaid to be ſituated both in Northumberland and the biſhopric of Durham; though that part of it which is in the latter is called Gateſide, and is like Southwark to London, the liberties coming no farther than the great iron gate upon the bridge, which has the arms of the biſhop of Durham carved on the ſouth, and thoſe of Newcaſtle on the north ſide. The ſituation of the town is very uneven and unpleaſant, eſpecially that part which is moſt conſiderable for buſineſs, and which lies upon the river; for it is built on the declivity of a ſteep hill, which makes the ſtreets difficult and uneaſy. It is alſo crowded with houſes, eſpecially in that part of the town beſt ſituated for trade. The caſtle, though old and ruinous, overlooks the whole town. The exchange is a noble and magnificent building, ſituated in the only broad place of that part of the town, contiguous both to the river and the cuſtom-houſe, but too much pent up for want of room. Between the town-wall and the river is a ſpacious place, firmly warfed up with a facing of free-ſtone, and makes a very fine quay. Beſides the commerce above-mentioned, here are ſome glaſs-houſes, iron manufactories, &c. Here is an hoſpital, built by ſubſcription, ſeveral churches and chapels, beſides St. Nicholas's church, which is a curious fabric, an exchange, manſion-houſe, public library, &c.

Shrewſbury has two bridges over the Severn, which ſurrounds it, except on the north ſide, in the form of a horſe-ſhoe, and renders it a peninſula. It has a free grammar-ſchool, founded and endowed by Edward VI. Queen Elizabeth rebuilt it, added a library, and endowed it more largely. Here are five churches, beſides meeting houſes: likewiſe 12 incorporated companies, who repair in their formalities, once a year, to Kingſland, on the oppoſite ſide of the Severn, where they entertain the mayor and corporation, in bowers erected for that purpoſe, and diſtinguiſhed by mottos or devices ſuitable to their reſpective arts and trades. The ſtreets are large, and the houſes well built, with hanging gardens down to the river. Charles II. would have erected this town into a city; but the townſmen choſe to remain a corporation; for which refuſal they were afterwards called the proud Salopians. The town has been famed throughout England for cakes. Its brawn is reckoned to exceed that of Canterbury. Here is plenty of proviſions, eſpecially ſalmon and other good fiſh. Here are many Welch families; and on market days the general language ſpoken is Welch. One great ornament in this town is that called the quarry, now converted into one of the fineſt walls in England, both for beauty and extent. It takes in at leaſt 20 acres of ground on the ſouth and ſouth-weſt ſides of the town, betwixt its walls and the Severn. It is ſhaded with rows of lime trees on each ſide, and adorned in the center with a fine double alcove, and ſeats on both ſides, one of them facing the town, and the other the river. It is reckoned not inferior to the mall in St. James's park. Upon the Welch bridge there is a noble gate, over the arch of which is placed the ſtatue of the great Llewellyn, the idol of the Welch, and the laſt Welch prince.

Oxfordſhire, ſituated on the weſt of Buckinghamſhire, is a pleaſant, healthful, and fertile country.

The city of Oxford ſtands on the conflux of the Charwell and Iſis. It enjoys a ſweet air, in a plentiful country, on a fine plain, and has every way a delightful proſpect. The private buildings are neat, the public ones ſumptuous; and the river navigable for barges. But that which gives it a conſequence above all other places in this kingdom, is the oldeſt and moſt noble univerſity in Europe. It is of ſo great antiquity as to have been an univerſity between eight or nine hundred years. The conſtituion is ſo regular, the endowments ſo plentiful, the manſions ſo convenient for ſtudy, and every thing ſo agreeable to the education of youth, and the accompliſhment of ſtudents, that it is no wonder ſuch numbers of learned men are daily ſent abroad for the ſervice of the church and ſtate. It contains 20 colleges; five halls; a ſtately pile, called the ſchools, wherein exerciſe for the ſeveral degrees are performed; the theatre, the moſt magnificent building of the kind in the world; the Clarendon printing-houſe, which likewiſe ſurpaſſes every thing of a ſimilar nature in the univerſe; the muſeum, containing a chemical elaboratory; a repoſitory of natural and artificial curioſities and antiquities; a library; a phyſic garden, &c. It is governed by a chancellor, vice-chancellor, &c.

Cambridge, ſituated on the river Cam, known in the time of the Romans by the name of Garanta. The town is divided into four wards, containing thirteen pariſhes, and was incorporated in the year 1101, by Henry I. with a mayor, aldermen, recorder, &c. Its principal celebrity is owing to the univerſity, founded, in all probability, by Sigebert, king of the Eaſt Angels, in the year 630. The univerſity is governed by a chancellor, who may be elected every three years, or remain in office by conſent of the ſenate, with a vice-chancellor, commiſſary and high ſteward.

ſteward. The chancellor's courts enjoy the ſole juriſdiction, in excluſion of the king's courts, over all civil actions and ſuits whatſoever, where a ſcholar, or privileged perſon, is one of the parties, except where the right of freehold is concerned. The vice-chancellor is annually choſen on the 4th of November, by the body of the univerſity, out of two perſons nominated by the heads of the colleges. Two proctors are alſo annually choſen, as alſo two taxers, who, with the proctors, have cognizance of the weights and meaſures, as clerks of the market. The univerſity has a cuſtos archivorum, or regiſter, three eſquire beadles, one yeoman beadle, and two library keepers. The proctors viſit the taverns, and other public houſes, and have power to puniſh offending ſcholars, and to fine the public houſes who entertain them. Cambridge univerſity was, at firſt, in all probability, little more than a grammar-ſchool, and lay neglected during the Daniſh invaſions, but began to revive, after the government was ſettled by William I. It now contains ſixteen colleges: in theſe colleges are 406 fellowſhips, and 666 ſcholarſhips. Beſides the colleges, and fourteen pariſh churches, other public buildings are the ſenate-houſe, the ſchools, and public library, Addenbrooke's hoſpital, and the ſhire-hall. Two members are returned by the univerſity to parliament, and two by the town.

Coventry is united with Litchfield in Staffordſhire, as a biſhopric. There are many traditional ſtories relating to this city, particularly that of lady Godina, who, to obtain and perpetuate ſome privileges, rode naked through the ſtreets, and an annual proceſſion is ſtill made through the town in commemoration of it. In the reign of Henry VIII. a ſtately croſs was erected here by Sir William Hoſtes, lord-mayor of London, in the middle of its ſpacious market-place, greatly admired for its workmanſhip. It was 66 feet high, adorned with the ſtatues of moſt of the Engliſh kings as big as the life; but the ſtone it was built with being ſandy and porous, it was ſo much decayed, that it was taken down ſome years ſince. The city is large and populous, but the buildings are old; and ſome of them, which are built with timber, project out ſo much, that in the narrowſt reets the tops of the oppoſite houſes almoſt touch. The chief churches are St. Michael's and Trinity. The Proteſtant Diſſenters are a conſiderable body here. The town-houſe is worth ſeeing, the windows being of painted glaſs, repreſenting ſome of the old kings, &c. who have been benefactors to the city. Its chief manufactures are tammys, and the weaving of ribbons.

Glouceſter is a well-built, clean, healthy city, contains four principal ſtreets, and ſeveral ſmaller ones, ſecured by the river on one ſide, a branch of which brings up veſſels of a conſiderable burthen to its walls. It has a beautiful cathedral, five churches, and a county infirmary. The cathedral is an ancient but magnificent fabric, and has a tower, which is one of the neateſt and moſt curious pieces of architecture in England, and a whiſpering place, as in the cupola of St. Paul's. It has beautiful cloiſters, and 12 chapels in it, with the arms and monuments of great perſons. Here is an elegant ſtone bridge over the river, with a key-wharf and cuſtom-houſe; abundance of croſſes and ſtatues of the kings of England are diſperſed in different parts of the city, and large remains of monaſteries. Its town-hall for the aſſize is called the booth-hall. Under the bridge is a curious machine, which raiſes water to ſerve the town. The principal manufacture is making pins. Beſides the churches for eſtabliſhed religion, there are places of worſhip for diſſenters and quakers, with ſeveral charity ſchools. Two markets are held weekly, on Wedneſday and Saturday. Glouceſter ſends two members to parliament. By the laſt charter, granted by king Charles II. the corporation conſiſts of a mayor, high ſteward, recorder, twelve aldermen, town-clerk, and two ſheriffs, &c.

†

The town of Plymouth is 216 miles from London, at the influx of the rivers Plym and Tamar into the channel, contains near as many inhabitants as Exeter, and is one of the chief magazines in the kingdom, owing to its port, which is one of the largeſt and ſafeſt in England. It conſiſts of two harbours, capable of containing 1000 ſail of ſhips; and is defended by ſeveral forts, particularly a ſtrong citadel, of large extent. It is the general rendezvous of ſhips outward bound; and is very convenient for homeward bound ſhips to provide themſelves with pilots up the channel.

About two miles up the mouth of the river Tamar, is an inlet of the ſea, diſtinguiſhed from Cat-Water by the name of Hamoaze, and commanded by the caſtle on St. Nicholas Iſland, is a royal dock for building and repairing ſhips. Here is a charity-ſchool, four hoſpitals, and a work-houſe. Off the entrance of the bay lies the Edyſtone rock, which is covered at high water, but bare at ebb; where, in 1696, the ingenious Mr. Winſtanley built a light-houſe, which, after ſtanding many violent ſtorms, was blown down by that dreadful one on the 27th of November 1703, when Mr. Winſtanley, and all that were with him in it, periſhed; but another was built in 1706, in its ſtead, by the corporation of Trinity-Houſe, by duties on all veſſels; but this was burnt down in 1755; and rebuilt by Mr. Smeaton, within four years afterwards; this alſo was burnt down in 1770, and rebuilt in 1774. The building, as it is now conſtructed, conſiſts of four rooms, one over the other, and at the top, a gallery and lanthern. The ſtone floors are flat above, but concave beneath, and are kept from preſſing againſt the ſides of the building by a chain let into the walls. Portland ſtone and granite are united together by a ſtrong cement, and let into horizontal ſteps by dove tails on the ſouth-weſt. The ingenious architect diſcovered that Portland ſtone was likely to be deſtroyed by a marine animal, and as the working of granite was very expenſive and laborious, the external part only was conſtructed with this, and the internal part with the other. To form a ſtrong and broad baſe, and a ſtrong bulk of matter to reſiſt the waves, the foundation is one entire ſolid maſs of ſtones to the height of thirty-five feet, engrafted into each other, and united by every means of additional ſtrength. It is about eighty feet in height.

Great Britain is, of all other countries, the moſt proper for trade; as well from its ſituation as an iſland, as from the freedom and excellency of its conſtitution, and from its natural products, and conſiderable manufactures. For exportation, our country produces many of the moſt ſubſtantial and neceſſary commodities. Our horſes are the moſt ſerviceable in the world, and highly valued by all nations for their hardineſs, beauty, and ſtrength. With beef, mutton, pork, poultry, biſcuit, we victual not only our own fleets, but many foreign veſſels that come and go. Our iron we export manufactured in great guns, carcaſes, bombs, &c. Prodigious, and almoſt incredible is the value likewiſe of other goods from hence exported.

There is ſcarcely a manufacture in Europe but what is brought to great perfection in England; and therefore it is perfectly unneceſſary to enumerate them all. The woollen manufacture is the moſt conſiderable, and exceeds in goodneſs and quantity that of any other nation. Hardware is another capital article; locks, edge-tools, guns, ſwords, and other arms, exceed any thing of the kind; houſehold utenſils of braſs, iron, and pewter, alſo are very great articles; and our clocks and watches are in great eſteem. There are but few manufactures in which we are defective.

The trade to the Eaſt-Indies is carried on by individuals, termed the Eaſt-India Company. Their exports to that part of the world conſiſt in broad cloths,

cloths, and other articles of the woollen manufacture, all ſorts of hard-ware, lead, bullion, and quickſilver. Their imports conſiſt of gold, diamonds, raw ſilk, drugs, tea, pepper, arrack, porcelaine or china-ware, ſalt-petre for home conſumption, wrought ſilks, muſlins, callicos, cottons, and all the woven manufactures of India, many of which they export again to other countries, the conſumption of them being prohibited in England. The Eaſt-India-Company is one of the richeſt and moſt flouriſhing in Europe.

Having treated of the trade, commerce, and manufactures of England, it remains that we add ſomething with regard to the Stocks. Though the word ſtock originally ſignified no more than a particular ſum of money contributed to the eſtabliſhing a fund for enabling a company to carry on a certain trade, by means of which the perſon became a partner in that commerce, and received a ſhare of the profits, in proportion to the money advanced; yet the term has been further extended, though improperly, to ſignify any ſum of money which has been lent to the government, on condition of receiving an annual intereſt till the ſum is repaid, and conſequently makes a part of the national debt; becauſe moſt of the money advanced to the government was done by the trading companies.

When the national funds were at firſt eſtabliſhed the money borrowed was transferrable at any time, either in whole or in part, from one perſon to another. This neceſſary clauſe of transferring ſtock, has given riſe to that pernicious practice of ſtock-jobbing, which is one of the ſpecies of gaming ſo deſtructive to this country. The method is this: The perſons concerned in this practice, make contracts to buy or ſell for ſome ſettled price, at a certain diſtant time, a certain quantity of ſome particular ſtock. The contract being made, every art is made uſe of either to riſe or lower ſuch ſtock, by rumours and fictitious ſtories, that people may be induced to ſell out in a hurry, and conſequently cheap, if they are to deliver ſtock; or become unwilling to ſell, and thence raiſe the price, if they are to receive ſtock. For the value of ſtock, as well as that of all other merchandize, will be always proportional to the number of buyers and ſellers: if there are more of the former than the latter, a perſon who is indifferent about ſelling will not part with his property without a conſiderable profit to himſelf: on the countrary, if the ſellers exceed the buyers, the value of ſtock will naturally fall in proportion to the impatience of thoſe who are deſirous of ſelling.

Theſe contracts are generally made by perſons who were never poſſeſſed of any real ſtock; ſo that when the time of delivery arrives, they only pay ſuch a ſum of money as makes the difference between the price mentioned in the contract, and that of the price of ſtock when the contract is fulfilled. The buyer is called the Bull, and the ſeller the Bear, in the polite language of Exchange-Alley. It will not be ſurpriſing that even falſe rumours ſhould produce conſiderable effects in the price of ſtocks, when it is remembered, that every thing which affects the hopes, the fears, and paſſions of the proprietors, ſo far as they regard the ſituation of public concerns, muſt raiſe or lower their current value. Public credit depends in a great meaſure on the ſuppoſed ſtability of the eſtabliſhed government: every incident, therefore, that proves unfavourable to the government, will have more or leſs effect on the public credit, which is the foundation of the ſtocks, and the ſecurity of the proprietors: when any thing of that kind happens, timorous people will endeavour to make ſure of their own private fortunes, by turning their ſtock into ſpecie; and, rather than run the riſk of loſing the whole, they will ſell it at a lower price; for when the demand is ſmall, and the commodity abounds, the market falls of courſe. The very reverſe is the conſequence when any incident happens in favour of the government.

§

The word ſtock is not confined to the national debt, it alſo ſignifies the capital of a company, raiſed for ſome particular purpoſe, and limited by parliament to ſome certain ſum. When this fund is completed, no ſtock can be purchaſed from the company; but the ſhares already purchaſed may be transferred from one perſon to another. Hence we ſee the reaſon why the value of one ſtock is greater than that of another, becauſe the produce per cent. is greater in ſome than in the others. But it muſt be obſerved, that the ſhare in the ſtock of a trading company that produces any ſum, a thouſand pounds for inſtance, per annum, will not ſell for ſo much money as a government annuity producing the ſame ſum, becauſe the ſecurity of the company is not reckoned equal to that of the government; and, at the ſame time, the continuance of their paying ſo much per annum is more precarious, as their dividends are, or ought to be, always proportional to the profits of their trade.

The firſt idea of the Eaſt-India-Company was formed in queen Elizabeth's time, but it has ſince undergone great alterations. Its ſhares, or ſubſcriptions, were originally only 50l. ſterling; and its capital only 369,891l. 5s. but the directors having a conſiderable dividend to make in 1676, it was agreed to join the profits to the capital, by which the ſhares were doubled, ſo that each became of 100l. value, and the capital 739,782l. 10s. to which capital, if 963,619l. 10s. the profits of the company to the year 1685, be added, the whole ſtock will appear to be 1,703,402l. After the Revolution, a new company was erected, under the authority of parliament, and, after violent ſtruggles between that and the old, they were both united, in the year 1702, by an indenture tripartite.

In the year 1708, the yearly fund of eight per cent. for two millions was reduced to five per cent, by a loan of 1,200,000l. to the public, without any additional intereſt; for which conſideration, the company obtained a prolongation of its excluſive privileges; and a new charter was granted to them, under the title of "The United Company of Merchants trading to the Eaſt-Indies." A further ſum was lent by the company in 1730, by which, though the company's privileges were extended for thirty-three years, yet the intereſt of their capital, which then amounted to 3,190,000l. was reduced to three per cent. and called the India three per cent. annuities: the proprietors of which, inſtead of a regular annuity, have a dividend of the profits ariſing from the company's trade: India bonds (erroneouſly denominated ſtock) are to be accepted, they being made payable at ſix months notice, either by the company or the poſſeſſor.

There are twenty-four directors of this company; their meetings are at leaſt once a week; and out of their body are choſen ſeveral committees, who have the peculiar inſpection of certain branches of the company's buſineſs: 2000l. is the qualification for a director. Formerly 500l, but now 1000l. entitles ſuch a proprietor of ſtock, whether man or woman, native or foreigner, to be a manager, and gives a vote in the general council.

The company's amazing territorial acquiſitions, and other cauſes, induced the legiſlature, to lay a reſtriction on their dividends for a certain time. From the report of the committee in 1773, appointed by parliament in India affairs, it appears that the India company, from the year 1708 to 1756, for the ſpace of forty-ſeven years and an half, divided the ſum of 12,000,000l. or above 280,000l. per annum, which, on a capital of 3,190,000l. amounted to above eight and a half per cent. the capital ſtock had alſo been increaſed 180,000l. In 1773, an act paſſed, for "eſtabliſhing certain rules and orders, for the future management of the affairs of the Eaſt-India-Company, as well in India as in Europe," by which conſiderable alterations were made reſpecting qualifications for voting, the courts in India, the governors, judges

judges ſalaries, &c. This was deemed an extraordinary act, adding an immenſe power and influence to the crown, without benefiting the company.

In November 1783, Mr. Fox, then Secretary of State, introduced a bill, the intention of which was, to veſt the whole powers of the India-Company in ſeven Directors, by him named, who were to hold their offices four years, removeable, like the twelve judges, by an addreſs of either Houſe of Parliament, and not by any other power; and for managing the commercial affairs of the Company, nine gentlemen, moved for and adopted in the ſame manner, were to aſſiſt them, ſubject to their control, and removeable by them. The effect of this was, to veſt in theſe ſeven Directors the whole influence of the offices of every kind in India, and at home, belonging to the Company; and many other means of influence. This bill paſſed the Commons; but as the Lords conceived it placed too dangerous a power in the hands of any men, and operated againſt the neceſſary power of the crown, they therefore threw it out by a majority of nineteen.

The parliament and adminiſtration of 1784, ſeemed diſpoſed to be friendly to the company, whoſe intereſts had been greatly injured by their ſervants both at home and abroad. The nabobs, rajahs, and natives of India have been by turns haraſſed and deſpoiled under their management, and many parts of that fine country depopulated. The Company's governors abroad have guards of ſoldiers, and live in all the ſtate of ſovereign princes. Theſe irregularities paved the way for a new bill, which paſſed at the cloſe of the ſeſſions 1784, by which were intended three things: firſt, The eſtabliſhing a power of control in this kingdom, by which the executive government in India is to be connected with that over the reſt of the empire: ſecondly, The regulating the conduct of the Company's ſervants in India, in order to remedy the evils which have prevailed there: and, thirdly, The providing for the puniſhment of thoſe perſons who ſhall, nevertheleſs, continue in the practice of crimes which have brought diſgrace upon the country. This famous bill has a plauſible aſpect, and various opinions have been formed concerning it; ſome contend that the principal and plan thereof are fair, equitable, and honourable; but the following proteſt, ſigned, *Portland*, *Carliſle*, *Devonſhire*, *Cholmondeley*, *Northington*, was entered againſt it in the Houſe Lords: "Becauſe we think the principal of the bill falſe, unjuſt, and unconſtitutional: falſe, inaſmuch as it provides no effectual remedy for the evils it affects to cure; unjuſt, as it indiſcriminately compels all perſons returning from India to furniſh the means of accuſation and perſecution againſt themſelves; and unconſtitutional, becauſe it eſtabliſhes a new criminal court of judicature, in which the admiſſion of incompetent evidence is expreſsly directed, and the ſubject is unneceſſarily deprived of his moſt ineſtimable birthright, a trial by jury." This bill, like former ones, may be depoſited among the archives of the councils of the governments in the Eaſt-Indies, to lie in oblivion, or to be treated with contempt. Rapacity and violence, it is feared, will ſtill predominate; the moſt upright may be overpowered by violence, or be ſent home loaded with irons, to plead their cauſe for pretended crimes charged againſt them by the emiſſaries of powerful delinquents, whoſe peculations and rapacity they endeavoured in vain to repreſs.

Another great advantage to the commerce of England, is the Bank, which was inſtituted in the reign of king William III. under the ſanction of parliament. It is founded on a transferrable fund, and deals by paper circulations on the credit of a large capital. The notes of this company are of the ſame value as the current coin of the kingdom, into which they may be changed whenever the poſſeſſor thinks proper. Here individuals may depoſit their money in ſafety, receiving notes in exchange, which bear no intereſt it is true, but are much more convenient than having large ſums in ſpecie, being more portable, and capable of a much eaſier mode of conveyance. A bank note of very conſiderable value can be ſent to any part by the poſt; and to prevent the ill effects of robberies, they are uſually cut in two, part being ſent at one time, and part at another, which parts, when ſeparated are of no value, but on being joined again are as perfect as before. In order to put a more effectual ſtop to the deſigns of thoſe who rob the mails, or by any other illicit method become poſſeſſed of their notes, the Bank iſſues a number of bills, called Bank-Poſt-Bills, which are made payable to the order of the perſon who takes them out, at a certain number of days after ſight, which gives an opportunity to ſtop bills at the Bank if they ſhould be loſt, and prevents their being ſo eaſily negotiated by ſtrangers as a common Bank-Note. Another great benefit attending Bank-Notes is, that if they are deſtroyed by time, or any other accident, the Bank will, on oath made of ſuch accident, and ſecurity being given, pay the money to the perſon who was in poſſeſſion of them at the time ſuch accident happened.

Bank ſtock may not improperly be called a trading ſtock, ſince with this they deal very largely in foreign gold and ſilver, in diſcounting bills of exchange, &c. Beſides which, they are allowed by the government very conſiderable ſums annually, for the management of the annuities paid at their office. All which advantages render a ſhare in their ſtock very valuable; though it is not equal in value to the Eaſt-India ſtock. The company make dividends of the profits half yearly, of which notice is publicly given; when thoſe who have occaſion for their money, may readily receive it: but private perſons, if they judge convenient, are permitted to continue their funds, and to have their intereſt added to the principal.

In the beginning of the year 1797, a ſcarcity of ſpecie prevailing, and an alarm having been excited by the reports of an invaſion, the run became ſo great on ſeveral banks in the north, that they were unable to make their payments, and obliged to draw largely on the Bank, which having before advanced great ſums to government for foreign loans and public ſervices, found the drain of its ſpecie ſo great, as to be compelled to repreſent the preſſing neceſſity of the caſe to the miniſter. An order of the privy-council was in conſequence iſſued, prohibiting the Bank from paying in ſpecie, either notes or dividends; and a bill was brought into parliament to ſanction this order, and extend the prohibition to the 24th of June following; after which, it was ſtill further extended to one month after the next ſeſſion of parliament; and ſtill continues. To facilitate commercial intercourſe, bank-notes of one and two pounds were iſſued, and Spaniſh dollars, ſtamped by the Bank, were made current at 4s. 9d. But this being above their real value, and the price of ſilver ſoon after falling, ſuch numbers of counterfeit ſtamps appeared, that it was judged adviſable to call them all in; which was done, the Bank advertiſing, the beginning of October, 1797, that they would give caſh for them till the laſt day of that month, but no longer. After the firſt week, as it was apparent that a conſiderable loſs muſt be ſuſtained by the lower and middling claſſes, if all the counterfeit ſtamps were refuſed, the Bank, much to its honour, conſented to receive all that were not baſe ſilver.

On the occaſion of this prohibition of payment, a ſecret committee of the Houſe of Commons was appointed to examine the ſtate of the outſtanding demands on the Bank of England, and its funds for diſcharging the ſame. The ſtatement of theſe demands and funds, to the 25th of February, 1797, was as follows:

Outſtanding demands - - - - - - - - -	*L.*	13,770,390
Funds for diſcharging thoſe demands, not including the permanent debt due from government, of 11,686,000l. which bears an intereſt of three per cent.		17,597,280
Surplus of effects of the Bank, excluſive of the above-mentioned permanent debt of 11,686,800l.		3,826,890

This company is under the direction of a governor, deputy-governor, and twenty-four directors, who are annually elected by the general-court, in the ſame manner as in the Eaſt India company. Thirteen, or more, compoſe a court of directors for managing the affairs of the company.

The officers and ſervants of this company are very numerous.

The SOUTH-SEA-COMPANY had its origin from the following circumſtances:—During the long war with France, in the reign of Queen Ann, the payment of the ſeamen in the royal navy being neglected, and they received tickets inſtead of money, were frequently obliged, by their neceſſities, to ſell theſe tickets to avaricious men at a diſcount of 40l. and 50l. per cent. By theſe and other means, the debts of the nation unprovided for by parliament, amounting to 9,471,321l. fell into the hands of theſe uſurers. Whereupon Mr. Harley, afrerwards earl of Oxford, propoſed a ſcheme to allow the proprietors of theſe debts and deficiencies 6l. per cent. per annum, and to incorporate them, in order to their carrying on a trade to the South-Sea, and they were accordingly incorporated under the title of "The Governor and Company of Merchants of Great-Britain trading to the South-Seas, and other parts of America, and for encouraging the Fiſhery," &c. But the deſign of creating this company was never carried into execution, nor any trade ever undertaken by them, except the Aſſiento, in purſuance of the treaty of Utrecht, for furniſhing the Spaniards with negroes; of which this company was deprived, upon receiving 100,000l. in lieu of all claims upon Spain, by a convention between the courts of Great-Britain and Spain in 1748, ſoon after the treaty of Aix-la-Chapelle. Some other ſums were lent to the government in the reign of queen Anne, at ſix per cent; and in the third of George I. the intereſt of the whole was reduced to five per cent. and they advanced 2,000,000l. more to the government at the ſame intereſt. This company, by the ſtatute ſix George I. were impowered to redeem all or any of the redeemable national debts; in conſideration of which, the company had liberty to augment their capital, according to the ſums they ſhould diſcharge; beſides other powers they were by the ſame ſtatute inveſted with.

At firſt the company ſet out with good ſucceſs; and the value of their ſtock, for the firſt five years, had riſen faſter than that of any other company; and his majeſty, after purchaſing 10,000l. ſtock, had condeſcended to be their governor. Things were thus ſituated, when, taking advantage of the above ſtatute, the South-Sea bubble was projected: the pretended deſign of which was, to raiſe a fund for carrying on a trade to the South-Sea, and purchaſing annuities, &c. paid to the other companies: propoſals were then printed and diſtributed, ſhewing the advantages of the deſign, and inviting perſons into it. The ſum neceſſary for carrying it on, together with the profits that were to ariſe from it, were divided into a certain number of ſhares, or ſubſcriptions, to be purchaſed by perſons diſpoſed to adventure therein; and the better to carry on the deception, the directors engaged to make very large dividends; and actually declared, that every 100l. original ſtock would yield 50l. per annum; which occaſioned ſo great a riſe of their ſtock, that a ſhare of 100l. was ſold for upwards of 800l. This was in the month of July; but before the end of September it fell to 150l. by which multitudes were ruined, and ſuch a ſcene of diſtreſs occaſioned, as is ſcarcely to be conceived. The conſequence of this infamous ſcheme are too well known; moſt of the directors were ſeverely fined, to the loſs of nearly all their property; and though ſome of them had no hand in the deception, nor gained a farthing by it, yet it was inſiſted they ought to have oppoſed, and endeavoured to prevent it, as far as lay in their power.

Several regulations reſpecting the capital ſtock and accompts of this company were made by a ſtatute ſix George II. when their ſtock amounted to 14,651,103l. 8s. 1d. Their annuities, &c. are now reduced to 3l. per cent. In every general court, each member having in his own name and right 500l. in trading ſtock, has one vote; if 2000l. two votes; if 3000l. three votes; and if 5000l. four votes. This company is under the direction of a governor, ſub-governor, deputy-governor, and twenty-one directors; but no perſon is qualified to be governor, his majeſty excepted, unleſs ſuch governor has, in his own name and right, 5000l. in the trading ſtock: the ſub-governor is to have 4000l. the deputy-governor 3000l. and a director 2000l. in the ſame ſtock.

This Company ſtill continue to divide four per cent. on their preſent capital ſtock: which they are enabled to do from the profits they make on the ſums allowed to them for the management of the annuities paid at their office, and from the intereſt of annuities which are not claimed by the owners.

No expedient could have been thought of, which would have ſo far contributed to the extenſion of trade, as the practice of Inſurance, by which means every merchant can ſecure his cargo from the danger of ſeas and enemies. Inſurance is performed in the following manner: when a perſon is diſpoſed to inſure the whole or any part of his cargo, he employs a broker, who, in a printed policy of inſurance, ſpecifies the name of the ſhip in which the cargo is embarked, the voyage upon which ſhe is bound, the value of the merchandize, and the conditions of inſurance. This he preſents to different merchants who are willing to underwrite, and they ſubſcribe their names for different ſums, as they think proper, until the whole value is ſubſcribed, receiving in the mean time the premium, each in proportion to the ſum he has underwritten; after which, if the ſhip is caſt away, or taken by the enemy, ſo that the cargo is loſt, the proprietor has recourſe upon the inſurers, who are obliged to indemnify him, by paying the reſpective ſums they ſubſcribed.

Beſides ſeveral private offices for inſurance, where the above policies of private underwriters are duly entered and regiſtered, there are two corporations eſtabliſhed for this purpoſe by act of parliament, by the titles of the Royal-Exchange-Aſſurance, and the London Aſſurance. They have each an excluſive privilege againſt all other inſuring ſocieties for ſhipping and merchandizes, but this does not interfere with any man's private right of inſuring.

The CONSTITUTION of England may properly be ſaid to partake of monarchy ariſtocracy, and democracy; for the executive power of the laws being lodged in a ſingle perſon, they have all the advantages of ſtrength and diſpatch that are to be found in abſolute monarchy: ſecondly, the king, and the lords ſpiritual and temporal, was to form an ariſtocracy; and thirdly, the Houſe of Commons being freely choſen by the people from among themſelves, make a democracy. Theſe three bodies conſtitute the Britiſh parliament, which has the ſupreme diſpoſal of every thing; and there can be no inconvenience attempted by either of the three branches, but will be withſtood by one of the other two, each branch being armed with a negative power, ſufficient to repel any innovation which it may think inexpedient or dangerous. In no other

manner

manner whatever could theſe three forms of government have been ſo prudently and ſo happily united. Our excellent conſtitution is ſo admirably contrived, that nothing can endanger or hurt it, but the deſtroying the equilibrium of power between one branch of the legiſlature and the reſt.

The principal duty of the king is to govern his people according to law. And it is expreſsly declared, by the 12th and 13th ſtatutes of William III. that "the laws of England are the birth-right of the people thereof; and all the kings and queens who ſhall aſcend the throne of this realm, ought to adminiſter the government of the ſame, according to the ſaid laws; and all their officers and miniſters ought to ſerve them reſpectively according to the ſame: and therefore all the laws and ſtatutes of this realm, for ſecuring the eſtabliſhed religion, and the rights and liberties of the people thereof, and all other laws and ſtatutes of the ſame now in force, are by his majeſty, by and with the advice and conſent of the lords ſpiritual and temporal, and commons, by authority of the ſame, ratified and confirmed accordingly."

The original contract between king and people, is now couched in the coronation oath, and adminiſtered to every king or queen who ſhall ſucceed to the imperial crown of the realm, by one of the archbiſhops or biſhops of the realm, in the preſence of all the people; who, on their parts, alſo reciprocally take the oath of allegiance to the crown. The king engages, by his oath, to govern his people and dominions according to the ſtatutes, laws, or cuſtoms agreed on in parliament.—To cauſe law and juſtice to be executed in all his judgments.—To maintain, to the utmoſt of his power, the laws of God, the true profeſſion of the goſpel, and the Proteſtant reformed religion; and to preſerve to the biſhops, clergy, and churches, all their rights and privileges.

One of the principal bulwarks of civil liberty, or of the Britiſh conſtitution, was the limitation of the king's prerogative, by bounds ſo certain and notorious, that it is impoſſible he ſhould ever exceed them, without the conſent of the people on one hand; or without a violation of that original contract which expreſsly ſubſiſts between the prince and the ſubject on the other

The king, by virtue of his prerogative, may reject bills, make treaties, coin money, create peers, and pardon offences, at his pleaſure; unleſs where the conſtitution hath expreſsly, or by evident conſequence, laid down ſome exception or boundary, declaring that the prerogative ſhall go no further than to ſuch an extent. But though the king may exerciſe theſe prerogatives, yet if the conſequences of that exertion evidently tend to the diſadvantage or diſhonour of the kingdom, the parliament will call his adviſers to a juſt and ſevere account. The king may, for inſtance, make a treaty with a foreign ſtate, which ſhall bind the nation; and yet, when ſuch treaties have been judged pernicious, impeachments have purſued thoſe miniſters by whoſe agency they were concluded. The king may alſo levy armies and fit out fleets, for the defence of his kingdom, the annoyance of his enemies, or the ſuppreſſion of rebellions; grant commiſſions to his officers, both by ſea and land, or revoke them at pleaſure; diſpoſe of all magazines, caſtles, &c. ſummon the parliament to meet, and, when met, adjourn, prorogue, or diſſolve it; and may refuſe his aſſent to any bill, though it has paſſed both houſes. He poſſeſſes alſo the right of chooſing his own council; of nominating all the great officers of ſtate, of the houſehold, and the church; and, in fine, is the fountain of honour, from whom all degrees of nobility and knighthood are derived.

To endeavour at tracing the original inſtitution of parliaments, would be attempting an impoſſibility, as all accounts which have been tranſmitted to us on that head are equally vague and unſatisfactory. It is, however, univerſally agreed, that the foundation of parliament, as it now ſtands, was laid in the great charter granted by king John, in the year 1215, wherein he promiſes to ſummon all archbiſhops, biſhops, abbots, earls, and greater barons, perſonally; and all other tenants in chief under the crown, by the ſheriffs and bailiffs; to meet at a certain place, after forty days notice, to aſſeſs aids and ſcrutages when neceſſary.

According to the preſent form of parliament, the king alone has the power of aſſembling it, which is done by his writ or letter iſſued out of chancery, by advice of the privy-council, at leaſt forty days before it begins to ſit; and this he is obliged to do every year, or oftener, if need be. The ſitting of parliament muſt not be intermitted above three years.

The parliament conſiſts of the king and the three eſtates of the realm, viz. the lords ſpiritual and temporal, who ſit, together with the king, in one houſe; and the commons, who ſit by themſelves, in another.

The lords ſpiritual conſiſt of the two archbiſhops of Canterbury and York, and twenty-four biſhops, who hold, or are ſuppoſed to hold, certain baronies under the king. In the eye of the law, and in moſt acts of parliament, the lords ſpiritual are conſidered as a diſtinct eſtate from the lords temporal; but in practice they are generally blended together, under the one name of the lords: they intermix in their votes, and the majority of ſuch intermixture binds both eſtates. The biſhops, however, are not conſidered as peers of the realm, but merely lords of parliament. The lords temporal conſiſt of all the peers of the realm by whatever title diſtinguiſhed; dukes, marquiſes, earls, viſcounts, or barons. Some of theſe ſit by deſcent, as do all ancient peers; ſome by creation, as do all new-made ones; others by election, which is the caſe of the ſixteen peers, who repreſent the body of the Scots nobility.

The commons conſiſt of ſuch men of conſiderable property in the kingdom, as have not ſeats in the houſe of lords; every one of whom has a voice in parliament, either perſonally, or by his repreſentatives. The counties are repreſented by knights, elected by the proprietors of lands; and the cities and boroughs are repreſented by citizens and burgeſſes, choſen by the mercantile part, or ſuppoſed trading intereſt of the nation. The number of Engliſh repreſentatives is 513, and of Scots 54, in all 558; and every member, though choſen for one particular diſtrict, when elected and returned, ſerves for the whole realm; his buſineſs not being confined to the advantage of his conſtituents only, but to that of the commonwealth; and to adviſe his majeſty: therefore he is not bound to conſult with, or take the advice of his conſtituents upon any particular point, unleſs he thinks it proper or prudent ſo to do.

The king, and theſe three eſtates, when aſſembled, form the great corporation, or body politic of the nation; and when they firſt come together, the king meets them, either in perſon, or by his repreſentative, without which there can be no commencement of parliament. Each of theſe eſtates are equally neceſſary, the conſent of all three being required to make any new law which is to bind the ſubject; therefore whatever is enacted for law by one, or by two of the three, is no ſtatute, and no regard is due to it, unleſs in matters relating to their own privileges. But the parliament, conſidered as one body, has ſovereign and uncontroulable authority in making, confirming, enlarging, reſtraining, abrogating, repealing, reviving, and expounding of laws, concerning matters of all poſſible denominations, eccleſiaſtical or temporal, civil, military, maritime, or criminal. All miſchiefs and grievances, operations and remedies, that tranſcend the ordinary courſe of the laws, are within the reach of this high tribunal. It can regulate or new-model the ſucceſſion to the crown; alter the eſtabliſhed religion of the land; change and create afreſh even the conſtitution of the kingdom, and of parliaments themſelves;

ſelves; and, in ſhort, do every thing which is not naturally impoſſible to be done. But, as terrible conſequences might enſue from placing ſuch unbounded authority in perſons, who may prove incapable or improper to manage it, the law enacts that no one can ſit in either houſe of parliament unleſs he be twenty-one years of age: that no member ſhall vote or ſit in either houſe, till he hath in the preſence of that houſe taken the oaths of allegiance, ſupremacy, and abjuration; and ſubſcribed and repeated the declaration againſt tranſubſtantiation, invocation of ſaints, and the ſacrifice of the maſs: and that no alien born out of the dominions of the crown of Great Britain, even though he be naturalized, ſhall be capable of being a member of either houſe of parliament.

The high court of parliament, like every other court of juſtice, has its own peculiar law, which is founded on the following baſis, viz. "that whatever matter ariſes concerning either houſe of parliament, ought to be examined, diſcuſſed, and adjudged in that houſe to which it relates, and not elſewhere." The privileges of parliament are indefinite; but amongſt the moſt remarkable of them are, privilege of ſpeech, of perſons, of domeſtics, and of lands and goods. Both houſes of parliament have laws and cuſtoms peculiar to each; but thoſe of the upper houſe are by far the moſt extenſive, as are likewiſe its privileges. It is the higheſt court of judicature in the kingdom, and from its ſentence there is no appeal.

The members of parliament have a right, and are conſtantly attended by the judges of the courts of King's-bench, Common-pleas, and ſuch of the barons of the Exchequer as are of the degree of the coif, or have been made ſerjeants at law, as alſo by the maſters of the court of chancery, for their advice in point of law, and for the greater dignity of their proceedings. Formerly the ſecretaries of ſtate, the attorney and ſolicitor-general, and the reſt of the king's counſel, being ſerjeants, uſed to attend the houſe of peers, and to this day their regular writs of ſummons are iſſued out at the beginning of every parliament; but many of them having been of late years members of the houſe of commons, their attendance is diſpenſed with. Every peer may, by licence obtained from the king, make another lord of parliament his proxy, to vote for him in his abſence; and he has alſo a right, by leave of the houſe, when a vote paſſes contrary to his ſentiments, to enter his diſſent on the journals of the houſe, with the reaſons for ſuch diſſent, which is uſually ſtyled his proteſt. All bills likewiſe that may in their conſequences any way affect the rights of the peerage, are by the cuſtom of parliament to have their firſt riſe and beginning in the houſe of peers, and to ſuffer no changes or amendments in the houſe of commons.

The peculiar laws and cuſtoms of the houſe of commons conſiſt principally in the raiſing of taxes, and the election of members to ſerve in parliament. It always has been their indiſputable right and privilege, that all grants of ſubſidies, and parliamentary aids, ſhould begin in the lower houſe, and be firſt beſtowed by them; though their grants are not to all intents and purpoſes effectual, until they have received the aſſent of the other two branches of the legiſlature; and ſo jealous are they of this valuable privilege, that they will not ſuffer the other houſe to exert any other power herein, but that of rejecting; not allowing them to make the leaſt alteration or amendment to the mode of taxing the people by a money bill; which is the appellation given to all bills whereby money is to be raiſed upon the ſubject.

For the more ready diſpatch of buſineſs, each houſe has its ſpeaker: that of the houſe of lords, is the lord-chancellor, or ſome other nobleman appointed by the king's commiſſion; but that of the houſe of commons is choſen by its own members, and muſt be approved of by his majeſty.

With reſpect to a bill, if the relief ſought by it is of a private nature, a petition muſt be preſented before it is brought into the houſe; which petition uſually ſets forth the grievance deſired to be remedied, and is always preſented by a member. Sometimes upon the mere petition, leave is given to bring in the bill; but, if it is founded on facts which may be in their nature diſputed, it is referred to a committee of members, who examine the matter alledged, and, according to their report, it is admitted or rejected: if the former, the perſons directed to bring in the bill, in a competent time preſent it to the houſe, drawn out upon paper, with a number of blanks, where any thing occurs that is dubious, or neceſſary to be ſettled by the parliament itſelf. This is read a firſt time, and at a convenient diſtance a ſecond time; and after each reading the ſpeaker opens to the houſe the ſubſtance of the bill, and puts the queſtion whether it ſhall proceed any further. The introduction of the bill may be originally oppoſed, as the bill itſelf may at either of the readings; and, if the oppoſition ſucceeds, the bill muſt be dropped for that ſeſſion; as it muſt alſo, if oppoſed with ſucceſs, in any of the ſubſequent ſtages.

If the bill obtains a ſecond reading, it is committed, or referred to a committee, which, in matters of ſmall importance, is appointed by the houſe; but, upon a bill of conſequence, the houſe reſolves itſelf into a committee of the whole houſe: the ſpeaker then quits the chair, which is filled by another member, and ſits and debates as a private member. In theſe committees the bill is debated clauſe by clauſe, amendments made, the blanks filled up, and ſometimes the bill entirely new modelled. After it has paſſed the committee, the chairman reports it to the houſe, with ſuch amendments as the committee have made; and then the houſe reconſiders the whole bill again, and the queſtion is repeatedly put upon every clauſe and amendment. When the houſe have agreed or diſagreed to the amendments of the committee, and ſometimes added new amendments of their own, the bill is then ordered to be engroſſed, that is, written in a ſtrong groſs hand, on one or more long rolls of parchment ſewed together. When this is finiſhed, it is read a third time, and amendments are ſometimes then made to it; and if a new clauſe be added, it is done by tacking a ſeparate piece of parchment upon the bill, which is called a rider. The ſpeaker then again opens the contents; and, holding it up in his hands, puts the queſtion, whether the bill ſhall paſs? If this paſſes in the affirmative, the title to it is then ſettled, and one of the members is ordered to preſent it to the lords for their concurrence. Accordingly, being attended by ſeveral more members, he carries it to the bar of the houſe of peers, and there delivers it to their ſpeaker, who comes down from his woolſack to receive it. Here it paſſes through the ſame forms as in the lower houſe, except that of engroſſing; when, if it is rejected, no more notice is taken of it: but, if it is agreed to, the lords ſend a meſſage by two maſters in chancery, or by two of the judges, that they have agreed to the ſame; and the bill remains with the lords. But, if the upper houſe have made amendments in the bill, which ſometimes happens, both amendments and bill are returned to the houſe of commons to receive their concurrence. If the commons diſagree to the amendments, a conference between ſome members, deputed from each houſe, uſually follows, who generally adjuſt the difference; but if both houſes remain inflexible, the bill is dropped. On the other hand, if the commons agree to the amendments, the bill is ſent back to the lords by one of the members, with a meſſage to acquaint them therewith.

When a bill begins in the Houſe of Lords, it is, when of a private nature, referred to two of the judges, to examine and report the ſtate of the facts alledged; to ſee that all neceſſary parties conſent, and to ſettle all points of technical propriety; after which

which the ſame forms are obſerved as in the Houſe of Commons. But when an act of grace or pardon is paſſed, it is firſt ſigned by the king, and then read once only in each of the houſes, without any new engroſſing or amendment.

When both houſes have done with a bill, it is always depoſited in the Houſe of Peers to wait the royal aſſent; except in the caſe of a money-bill, which, after receiving the concurrence of the lords, is ſent back to the Houſe of Commons.

The royal aſſent to a bill may be given two ways: firſt in perſon; when the king comes to the Houſe of Peers, in his crown and royal robes, and ſending for the commons to the bar, the titles of all the bills that have paſſed both houſes are read, and his majeſty's anſwers are declared by the clerk of parliament in Norman French, to the following effect; if he conſents to a public bill, *le roy le veut*, "the king wills it ſo to be;" if to a private bill, *ſoit fait comme il eſt deſiré*, "be it as it is deſired." If he refuſes his conſent, *le roy s'aviſera*, "the king will adviſe upon it." When he aſſents to a money-bill, *le roy remercie ſes royals ſujects, accepte leur benevolence, et auſſi le veut*, "the king thanks his loyal ſubjects, accepts their benevolence, and wills it ſo to be." When an act of grace is paſſed, the clerk of parliament pronounces the gratitude of the ſubjects in Norman French to the following purport. *Les prelats, ſeigneurs, et communs, en ce preſent parlement aſſemblés, au nom de touts vos autres ſubjects, remercient très humblement votre majeſté, et prient à Dieu vous donner en ſanté bonne vie et longue;* "The prelates, lords, and commons, in this preſent parliament aſſembled, in the name of all your other ſubjects, moſt humbly thank your majeſty, and pray to God to grant you in health and wealth long to live." The ſecond method whereby the king may give his aſſent, is by letters patent under his great ſeal, ſigned with his hand, and notified, in his abſence, to both houſes aſſembled together in the Houſe of Lords. When a bill has received the royal aſſent in either of theſe ways, it is then, and not before, a ſtatute, or act of parliament, and it cannot be altered, amended, diſpenſed with, ſuſpended, or repealed, but in the ſame forms, and by the ſame authority of parliament.

Parliaments are ſubject to adjouruments, prorogations, and diſſolutions. An adjournment is only the continuance of the ſeſſion from one day to another, and is done by the authority of each houſe, ſeparately, every day, and ſometimes for a fortnight or a month together: but the adjournment of one houſe is no adjournment to the other.

A prorogation is the continuance of parliament from one ſeſſion to another; and is done by the royal authority, expreſſed either by the lord-chancellor in his majeſty's preſence, or by commiſſion from the crown or frequently by proclamation.

A diſſolution is the civil death of the parliament, and may be effected three ways; firſt, by the king's will, expreſſed either in perſon, or by repreſentation; ſecondly, by the demiſe of the crown; and thirdly, by length of time. Under different monarchs this period has been extended and contracted; but as our conſtitution now ſtands, the parliament muſt expire at the end of every ſeventh year, if not ſooner diſſolved by the royal prerogative.

The laws of England have aſſigned the king a diverſity of councils, in order to aſſiſt him in the diſcharge of his duties, and the exertion of his prerogative. Among theſe the firſt is the high court of parliament, already conſidered. The ſecond are the peers of the realm, who are by their dignity hereditary counſellors, and may be called together to impart their advice, in all matters of importance to the realm, either in time of parliament, or, when there is no parliament in being. And beſides this general meeting, each individual peer of the realm has a right to demand an audience of the king, and to lay before him, with decency and reſpect, ſuch matters as he judges of importance to the public weal. A third council belonging to the king, are his judges of the courts of law, with regard to all matters concerning the laws of England.

The principal council belonging to the king is his privy-council, generally called, by way of eminence, "The Council." The king's will is the ſole conſtituent of a privy-counſellor, and this alſo regulates their number, which was formerly twelve. Afterwards it increaſed to ſo large a number, that it was found inconvenient for ſecrecy and diſpatch; and accordingly king Charles II. in the year 1679, limited the number to thirty; fifteen whereof were to be principal officers of ſtate, and the other fifteen compoſed of ten lords and five commoners, choſen by the king. At the ſame time the ancient office of lord preſident of the council was revived in the perſon of Anthony, earl of Shafteſbury. That office is ſtill continued; but the number of counſellors has ſince been greatly augmented, and now continues indefinite. Privy-counſellors are made by the king's nomination, without patent or grant, and ſubject to removal at his diſcretion. Every privy-counſellor, before he takes his ſeat at the council-board, muſt take the oath of office, in which are contained all the duties of his function, conſiſting of the ſeven following articles: 1. To adviſe the king according to the beſt of his cunning and diſcretion. 2. To adviſe for the king's honour and the good of the public, without partiality through affection, love, meed, doubt, or dread. 3. To keep the king's counſel ſecret. 4. To avoid corruption. 5. To help and ſtrengthen the execution of what ſhall be there reſolved. 6. To withſtand all perſons who would attempt the contrary. And 7. To obſerve, keep, and do all that a good and true counſellor ought to do for his ſovereign lord. The power of the privy-council conſiſts in inquiring into all offences againſt the government, and in committing offenders to ſafe cuſtody, in order to take their trial in ſome of the courts of law. But their juriſdiction does not extend to puniſhment, and the perſons committed by them are entituled to their Habeas Corpus, equally with thoſe committed by an ordinary juſtice of the peace. In this counſel the civil government is regulated, and every new meaſure of the adminiſtration propoſed and planned. Here alſo all the appeals from Ireland and the plantations are determined. The privy-counſellors ſit at the board bare-headed when the king preſides in perſon. In all debates the loweſt delivers his opinion firſt; and the ſovereign, at laſt, by declaring his ſentiments, determines the queſtion. A privy-counſellor, though a gentleman only, takes precedence of all knights and younger ſons of barons, and his perſon is held ſacred.

Upon any unforeſeen emergency, which the laws do not take cognizance of, the privy council can ſupply the deficiency. And it has more than once, in times of the moſt urgent neceſſity, ſuch as famine and the like, ventured to ſuperſede the operations of the law, when no parliament was ſitting. But in theſe caſes, it is always neceſſary, at the firſt meeting of the parliament, to procure an act for the pardon and indemnification of all concerned in ſuch illegal proceedings. It muſt alſo be remembered, that every privy-counſellor is reſponſible for his advice and conduct.

Beſides the privy-council, there is another, called the Cabinet-council, conſiſting of a ſelect number of noblemen and miniſters ſelected by the king; and in this council the capital affairs of government are determined. This council is unknown to the Engliſh conſtitution, notwithſtanding its decrees are powerful and extenſive.

The two ſecretaries of ſtate are more official than any others of the privy-counſellors. They are entruſted with the moſt important ſecrets of government,

ſome of which are improper to be communicated even to the privy-council. The number of ſecretaries of ſtate has not been always the ſame; ſometimes there have been three, and ſometimes only one; as, for inſtance, during the American war, there was a third appointed to manage the affairs of that department. The office of ſecretary of ſtate is ſeparated into two diviſions, called the northern and ſouthern departments, one of the ſecretaries executing the buſineſs of the former, and the other that of the latter. The northern department comprehends the ſtates of Germany, Pruſſia, Poland, Ruſſia, Sweden, Denmark, Holland, Flanders, and the towns comprehended in the Hanſeatic league. The ſouthern contains France, Spain, Portugal, Italy, the Swiſs cantons, Conſtantinople, and all other ſtates in the ſouthern parts.

For the more regular and ſpeedy conducting the multiplicity of affairs of government, one of the members of the cabinet-council is generally conſidered as firſt miniſter, though that name is unknown to the conſtitution of England, and conſequently there is no office of that kind. A reſponſibility for all the tranſactions of government is however always annexed to the title, which renders it a poſt of great danger and difficulty.

The great officers of the crown take place next to the princes of the blood, and the two primates: they are nine in number, viz. the lord high ſteward, the lord chancellor, the lord treaſurer, the lord preſident of the council, the lord privy-ſeal, the lord chamberlain, the lord high conſtable, the earl marſhal, and the lord high admiral.

The lord high ſteward is the firſt officer of the crown. This is an office very ancient, and formerly was hereditary, or at leaſt for life; but now, and for centuries paſt, it is exerciſed only occaſionally; that is, at a coronation, or to ſit as judge on a peer or peereſs, when tried for a capital crime. In coronations, it is held for that day only, by ſome high nobleman. In caſes of trials, it is exerciſed generally by the lord chancellor, or lord keeper, whoſe commiſſion as high ſteward ends with the trial, by breaking his white rod, the badge of his office.

The lord high chancellor preſides in the court of chancery, to moderate the ſeverities of the law, in all caſes where the property of the ſubject is concerned; and he is to determine according to the dictates of equity and reaſon. He is an officer of the greateſt weight and power of any now ſubſiſting in the kingdom, and is ſuperior in precedency to every temporal lord. He is a privy-counſellor by his office; and, according to ſome, prolocutor of the houſe of lords by preſcription. To him belongs the appointment of all juſtices of the peace; he is viſitor, in right of the king, of all hoſpitals and colleges of the king's foundation, and patron of all the king's livings under the value of 20l. per annum in the king's books. He is the general guardian of all infants, idiots, and lunatics, and hath the ſuperintendance of all charitable uſes in the kingdom, over and above the extenſive juriſdiction which he exerciſes in his judicial capacity in the court of chancery.

The lord high treaſurer is inveſted with his office by receiving a white ſtaff from the king; but, ſince the acceſſion of the preſent royal family, the office has been put into commiſſion, and the buſineſs of the revenue managed by five commiſſioners, called lords of the treaſury; but the preſiding commiſſioner is ſuppoſed to poſſeſs the whole authority of the lord high treaſurer. The power of this officer is very great; for he has, in fact, the public finances in his hands, together with the letting leaſes of all the crown lands, and the gift of an amazing number of lucrative places.

The lord preſident of the council is created by letters patent under the great ſeal. He propoſes all the buſineſs tranſacted at the council-board, and, when the king is abſent, reports to him all the debates and proceedings. This is a place of great dignity, as well as difficulty.

The lord privy-ſeal is an officer of great truſt; all charters, pardons, and grants, ſigned by the king, paſs through his hands before they receive the confirmation of the great ſeal. He alſo ſeals warrants for penſions, and the payment of money in other affairs, which do not require the confirmation of the great ſeal. He is reſponſible if he gives the ſanction of the privy-ſeal to any thing contrary to the laws of the land.

The office of lord chamberlain of England is hereditary in the duke of Ancaſter's family. This officer has great power, and enjoys a conſiderable number of perquiſites. He takes care to provide every neceſſary in the houſe of lords during the time of parliament; and the government of the whole palace, at Weſtminſter, belongs to him. He iſſues warrants for preparing and furniſhing Weſtminſter-Hall for coronations and trials of peers; and the gentleman-uſher of the black rod, with his deputies, are under his command. Upon ſolemn occaſions, the keys of Weſtminſter-hall, the court of wards, and court of requeſts, are delivered to him. He is entitled to livery and lodgings in the king's court, to certain fees from the biſhops when they do homage or fealty to the king, and alſo from all peers at their creation. At the ceremony of a coronation he receives forty ells of crimſon velvet for his own robes. His majeſty's night apparel alſo, together with the bed and furniture of the king's chamber, are his fees. At that ceremony he walks with a white ſtaff in his hand.

The lord high conſtable was formerly an officer of the higheſt truſt; he was commander of all the king's poſts and garriſons, and took place of all other military officers in the field. This poſt has not been uſed ſince the attainder and execution of Stafford, duke of Buckingham, in the year 1521, except at coronations, when a lord high conſtable is created to aſſiſt at that ſplendid ceremony.

The poſt of earl marſhal of England has long been hereditary in the duke of Norfolk's family. This office was formerly of great importance. The earl marſhal, in time of war, was judge of all martial cauſes, which he decided according to the principles of the civil law. If the cauſe could not be decided by that method, it was left to a perſonal combat, which was attended with a vaſt variety of ceremonies, the regulation of which fell within the marſhal's province. He ſtill regulates all points of precedency according to the archives kept in the herald's office. He marſhals the ceremony at the proclamation and coronation of kings, their marriages, interviews, feſtivals, and funerals.

The office of lord high admiral of England is now put into commiſſion; the laſt who filled that poſt being George prince of Denmark, and huſband to queen Anne. The admiralty of England is a board of direction, as well as execution, and independent even of the crown itſelf in its proceedings. The board of admiralty regulates the whole naval force of the realm, and either names all its officers, or confirms them when named; ſo that its power is very extenſive. All proceedings in the court of admiralty are determined according to the maxims of the civil law; except trials for piracy, murder, and other capital offences, when the criminals are tried according to the laws of England, by witneſſes and a jury; by a ſpecial commiſſion of the king to the lord high admiral, ſome of the judges being always commiſſioners.

Courts of law and equity come next under conſideration. The principal of theſe, and next in dignity to the parliament, is the court of chancery, inſtituted as a court of equity to mitigate, in many caſes, the ſeverity of the common law, and to relieve the ſubject from frauds, breaches of truſt, and various other oppreſſions. The ſole judge of this court is the lord high chancellor, or, in his abſence, the maſter of

of the rolls. The proceedings of this court are carried on by bills, anſwers, and decrees, regulated on the principles of conſcience and equity. The lord chancellor is provided with twelve aſſiſtants, called maſters in chancery; the principal of which is ſtyled maſter of the rolls, becauſe all the records of this court are committed to his care. The clerk of the crown likewiſe belongs to this court, he or his deputy being obliged always to attend on the lord chancellor as often as he ſits for the diſpatch of buſineſs.

The court of chancery is always open; and the lord chancellor has the power of granting an Habeas Corpus for a perſon ſent to priſon, provided ſufficient reaſons are alledged. This court alſo iſſues writs of ſummons for parliaments, charters, protections, ſafe-conducts, and patents for ſheriffs; and in this court are ſealed and enrolled all letters patent, treaties with foreign princes; all deeds touching the purchaſe of lands or eſtates, extents upon ſtatutes, recognizances for payment of money, and ſecuring contracts, commiſſions of appeal, and of oyer and terminer.

The higheſt court of common law in England, is the King's Bench, and is ſo called, becauſe formerly the kings of England preſided here in perſon. But this has for many years been laid aſide, and the royal power veſted in the lord chief juſtice of the king's bench, ſtyled, by way of eminence, the lord chief juſtice of England. He is created by a writ from the ſovereign, and aſſiſted by three inferior judges, conſtituted by letters patent; theſe are ſtyled juſtices, or judges of the king's bench. This court takes cognizance of every thing that concerns the loſs of life or member of any ſubject, of treaſons, felonies, breaches of the peace, oppreſſion, miſ-government, and, in a word, all matters determinable by common law, between the king and his ſubjects. It is alſo a kind of check upon all the inferior courts, their judges, and juſtices of the peace; has a power to rectify errors and miſtakes in the ſentences of inferior courts, except thoſe of the exchequer, its juriſdiction extending all over the kingdom; for the law preſumes that the ſovereign is always perſonally preſent. It has alſo a power to grant prohibitions in any cauſe depending either in the ſpiritual or temporal courts; and the houſe of peers often directs to the lord chief juſtice to iſſue out his warrant for apprehending perſons under ſuſpicion of high crimes.

The court of Common Pleas is held by another lord chief juſtice, ſtyled lord chief juſtice of the common pleas, aſſiſted by three other juſtices of this court, created by letters patent. All civil cauſes, real, perſonal, and mixed, litigated between ſubject and ſubject, are determined here. None but ſerjeants at law are ſuffered to plead in this court, which has alſo the power of iſſuing prohibitions, like that of the king's bench.

The Exchequer is an ancient court of record, in which all cauſes touching the revenue and the rights of the crown, are heard and determined. The judges of this court are the lord chief baron, and three other barons; ſo called, becauſe formerly none but barons of the realm were allowed to be judges in this court. Beſides theſe, there is alſo a curſitor baron, who adminiſters the oath to all high ſheriffs, bailiffs, auditors, receivers, collectors, comptrollers, ſurveyors, and ſearchers of all the cuſtom-houſes in England. The exchequer includes two courts, one of law, another of equity. All judicial proceedings at law are litigated before the barons; but the court of equity is held in the exchequer chamber, before the treaſurer, chancellor, and barons. Beſides the officers already mentioned, there belong to the exchequer, the king's remembrancer, who takes and ſtates all accounts of the revenue, cuſtoms, exciſe, parliamentary aids, ſubſidies, &c. and the lord treaſurer's remembrancer, whoſe buſineſs it is to make out proceſſes againſt ſheriffs, receivers of the revenue, and other officers.

The duchy chamber of Lancaſter conſiſts of the chancellor of the duchy as chief judge, aſſiſted by the attorney of the duchy, and other officers. This court takes cognizance of all cauſes relative to the revenue of that duchy.

All theſe courts are held in Weſtminſter-hall, and opened at the four terms of Eaſter, Trinity, Michaelmas, and Hilary.

But though the principal courts are held in the capital, yet the country is not left without the means of obtaining juſtice without the expence of journies, &c. to Weſtminſter-hall. In order to this, England is divided into ſix circuits, and two judges allotted for each. Wales alſo is divided into two circuits, and the ſame number of judges aſſigned them. Theſe judges ſit at the principal or ſome other convenient town in every county twice a year, to hear and determine cauſes, both civil and criminal.

There are alſo courts of conſcience ſettled in many parts of England, for the relief of the poor, in the recovery or payment of ſmall debts, not exceeding 40s.

In a well regulated ſtate, it is not enough that proper judges and courts of law are eſtabliſhed in the capital, and the counties viſited twice a year by the judges; magiſtrates muſt alſo be appointed to reſide in every diſtrict, in order to keep the peace and preſerve good order and harmony in all parts of the kingdom. The principal of theſe officers are ſheriffs, coroners, juſtices of the peace, conſtables, ſurveyors of the highways, and overſeers of the poor.

The ſheriff, or high-ſheriff, is an officer of very great antiquity in this kingdom, as we may find obſerved in ſome accounts of the diviſions of England. His power and duties are very extenſive; both with regard to a judge, a keeper of the king's peace, a miniſterial officer of the ſuperior courts of juſtice, and the king's bailiff. In his judicial capacity he is to hear and determine all cauſes of forty ſhillings value and under, in his county court. He is to decide the elections of knights of the ſhire (ſubject to the controul of the houſe of commons) of coroners, and of verdurers; to judge of the qualifications of voters, and to return, ſuch as he ſhall determine to be duly elected. As keeper of the king's peace, he is the firſt man in the county, during his office; and in order to this he may command all the people of his county to attend him, which is called the *poſſe comitatus*, or power of the county. In his miniſterial capacity he is bound to execute all proceſſes iſſuing out of the king's courts of juſtice; and carry all ſentences into execution. As the king's bailiff, he muſt preſerve the rights of the king within his bailiwick. He muſt ſeize to the king's uſe all lands devolved to the crown, by attainder or eſcheat; and levy all fines and forfeitures.

In each county, there are two coroners. This officer, in his miniſterial character, is the ſheriff's ſubſtitute. He is to enquire, by a jury of neighbours, how or by whom any perſon came by a violent death, and to enter it on record as a plea of the crown. Another branch of his office is, to enquire concerning ſhipwrecks, and certify whether wreck or not, and who is in poſſeſſion of the goods. The coroner is choſen for life; but may be removed on promotion, or for neglect, miſbehaviour, &c.

The next ſpecies of magiſtrates, ſubordinate to the ſheriffs, are juſtices of the peace; the principal of whom is the *cuſtos rotulorum*, or keeper of the records of the county. As peace is the very end and foundation of civil ſociety, the common law hath ever had a ſpecial care and regard for the conſervation of it. Accordingly, a ſufficient number of proper perſons, in every county, are appointed by the king's ſpecial commiſſion to keep the peace. Their power is very extenſive; but the buſineſs of the office is ſo great and of ſuch variety, that very few gentlemen of independent fortune care to engage in this troubleſome ſervice.

The power, office, and duty of a juſtice of peace, depend on his commiſſion, and on the ſeveral ſtatutes which

which have created objects of his jurisdiction. His commission, first, empowers him singly to conserve the peace in suppressing riots and affrays, in taking securities for the peace, and in apprehending and committing felons and other inferior criminals. It also empowers any two or more of them to hear and determine all felonies and other offences, which are the grounds of their jurisdiction at the sessions; these are held every quarter at the county town, where a jury of twelve men, called the grand inquest of the county, are summoned to appear. The duty of this inquest is to inquire into the cases of all delinquents, and to pronounce them guilty or not guilty of their indictments; the justices then commit the former to prison, in order to take their trial at the next assizes, if the crime be great, if otherwise, they order the allotted punishment; and discharge the latter. This short sketch of the duty will sufficiently indicate the great difficulty of performing the office; so that society is greatly obliged to such worthy gentlemen, who, without any sinister views of their own, will engage in this troublesome service. And therefore if any well-meaning justice makes any undesigned slip in his practice, great lenity and indulgence are always shewn him in the courts of law; and there are many statutes made to protect him in the upright discharge of his office: which, among other privileges, prohibit such justices from being sued for any oversights, without notice before-hand; and stop all suits begun, on tender being made of sufficient amends. On the other hand, any malicious or tyrannical abuse of their office is sure of being severely punished; and all persons who recover verdict against a justice, for any wilful or malicious injury, are entitled to double costs.

Constables are the next officers appointed for keeping the peace. They are of two kinds, high-constables, and petty-constables. Of the former, there is one at least in every hundred: the latter are inferior officers in every town and parish, subordinate to the high-constable of the hundred: they generally execute two offices, that of headborough, and that of assisting the high-constable. The principal duty both of high and petty constables is that of keeping the king's peace, and for this they are furnished with ample powers from the government. They can imprison offenders till they are brought before a justice of peace; and it is their duty to execute, in their respective districts, every warrant directed to them from any magistrate or a bench of justices.

The constitution of England greatly excels all others for the solid basis on which the rights of the people are founded, and which cannot be annihilated but by the destruction of the constitution itself. These rights may be reduced to three principal articles, the right of personal security, the right of personal liberty, and the right of private property; because if these are kept inviolate, our civil rights, taken in their most extensive sense, must be preserved.

1. The right of personal security consists in a person's legal and uninterrupted enjoyment of his life, his limbs, his body, his health, and his reputation; because if either of these are destroyed, or injured, personal security is invaded.

2. The right of personal liberty consists in the power of changing our situation or removing to any place we please, without any restraint or imprisonment whatever, unless by due course of law. This, like the former, is a right strictly natural; a right which the laws of England have never abridged without sufficient cause; and which can never be abridged by the mere discretion of the magistrate, without the permission of the laws. The great charter declares that no freemen shall be taken or imprisoned but by the lawful judgment of his peers, or by the law of the land. And lest any person should be detained by the sentence of an illegal court, or by command of the king's majesty in person, or by warrant of the council-board, or by any of the privy-council, the Habeas Corpus act was passed. So that while this statute remains unimpeached, no subject of England can be long detained in prison, except in those cases where the law requires, and justifies such detainer; and, to prevent this act being evaded by demanding unreasonable bail, it is declared by a subsequent act of parliament, that unreasonable bail shall not be required.

3. The third absolute right inherent in every Englishman, is that of property; which consists in the free use, enjoyment, and disposal, of all his acquisitions, without any control or diminution, except only by the laws of the land. The great charter declares, that no freeman shall be disseized, or divested by his freehold, or his liberties, or free customs, but by the judgment of his peers, or by the law of the land. And by a variety of statutes it is enacted, that no man's lands or goods shall be seized into the king's hands, against the great charter and the laws of England. Nor can any subject of England be constrained to pay any aids or taxes, even for the defence of the realm or the support of government, but such as are imposed by his own consent, or that of his representatives in parliament.

The law is so very careful in this particular, that a man charged with a capital offence, is not suffered to undergo even the ignominy of a public trial, till the evidences of his guilt are laid before the grand jury of the town or county in which the fact is alleged to have been committed, and not without twelve of them agreed to a bill of indictment against him. If this be done, he is to stand a second trial before twelve other men, whose opinion is definitive. In some cases, the prisoner (who is always supposed to be innocent till there appears sufficient proof of his guilt) is allowed a copy of his indictment, in order to assist him in making his defence. He is also furnished with a pannel, or list of the jury, who are to be his true and proper judges, that he may learn their characters, and discover whether they want abilities, or whether they, or any of them, are prejudiced against him. In case he has the least suspicion of either he may object peremptorily in open court to twenty of their number; and to as many more as he can give sufficient reasons why they ought not to be admitted as his judges.

When twelve unexceptionable men, the neighbours of the person accused, or living near the place where the supposed fact was committed, are approved of, they all take the following oath: "You shall well and truly try, and true deliverance make, between the king and the prisoner at the bar, according to the evidence." These are now the only judges, from whose sentence the prisoner is to expect life or death; and upon their integrity and understanding, the lives of all that are brought in danger ultimately depend, and from whose judgment there lies no appeal. They are to be all of one mind, and, after they have fully heard the evidence, are to be confined without meat, drink, or candle, till they are unanimous in acquitting or condemning the prisoner; and should one of them happen to die before they have delivered their verdict, the prisoner is acquitted. Every juryman is invested with a solemn and awful trust: if he, without being convinced by the evidence, submits his opinion to that of any other juryman, or yields in compliance to the opinion of the judge; if he neglects to examine with the greatest care; if he questions the veracity of the witnesses, who may be of an infamous character; or, after the most impartial hearing, has the least doubt upon his mind, and yet joins in condemning the person accused; he will wound his own conscience, and bring upon himself the complicated guilt of perjury and murder.

When the jury have agreed in their verdict, and delivered it to the judge, he pronounces such sentence upon the offender as the law has prescribed.

Every sensible and patriotic person must be convinced,

vinced, that trial by jury is a capital privilege, and at the ſame time ſo great a ſecurity to the liberty of the ſubject, that it is much to be regretted that perſons of education, honour, and property, are often too ready to evade ſerving the office. By this means, juries frequently conſiſt of ignorant and illiterate perſons, who neither have knowledge enough to underſtand their right and the privileges of Engliſhmen, nor ſpirit enough to maintain them. No man ſhould evade ſerving ſo important an office, when regularly called upon: and thoſe who, from indolence or pride, decline diſcharging this duty to their country, ſeem hardly to deſerve that ſecurity and liberty which the inhabitants of Britain derive from this invaluable inſtitution.

Juries have always been conſidered as giving the moſt effectual check to tyranny; for in a nation like England, where a king can do nothing againſt law, they are a ſecurity that he ſhall never make the laws, by a bad adminiſtration, the inſtruments of cruelty and oppreſſion. Were it not for juries, a corrupt nobleman might, whenever he pleaſed, act the tyrant, while the judge would have that power which is now denied to our kings.

By our happy conſtitution, which breathes nothing but liberty and equity, all imaginary indulgence is allowed to the meaneſt, as well as the greateſt: the priſoner, when brought to trial, is freed from all bonds; not only the judges are ſuppoſed to be his counſel, but other counſel are allowed him; he may alſo try the validity and legality of the indictment, and ſet it aſide if contrary to law. The racks and tortures that are cruelly and prepoſterouſly made uſe of in ſome part of Europe, to make a man accuſe himſelf, are here unknown, and none puniſhed without conviction, but he who refuſes to plead in his own defence. Nothing, in ſhort, is wanting, in this country, to clear up the cauſe of innocence, and to prevent the ſufferer from ſinking under the power of corrupt judges, and the oppreſſion of the great.

In England, the ſovereign has it not in his power to take away the liberty of the leaſt individual, unleſs, by ſome illegal act, of which he is accuſed or ſuſpected upon oath, he has forfeited his right to liberty: or except when the ſtate is in danger, and the repreſentatives of the people think the public ſafety makes it neceſſary that he ſhould have the power of confining perſons on ſuch a ſuſpicion of guilt; ſuch as the caſe of a rebellion within the kingdom, when the legiſlature has thought proper to paſs a temporary ſuſpenſion of the Hebeas Corpus act: but this ſeldom has been done but with great difficulty and caution, and when the national ſafety has abſolutely required it. The rights of individuals are ſo attentively conſidered, that the ſubject may, without the leaſt danger, ſue his ſovereign, or thoſe who act in his name, and under his authority: he may do this in open court, when the king may be caſt, and be obliged to pay damages to his ſubject.

The laws of England are more merciful to criminals than thoſe of any other country. The proceedings formerly, indeed, with regard to offenders who refuſed to plead to their indictments, were very cruel; but theſe are now abrogated by a late act of parliament, whereby all perſons indicted for any crime, who ſhall refuſe to plead, that is, to ſubmit themſelves to a lawful trial, are declared guilty of the offence of which they are accuſed, and ſentence is accordingly to be pronounced againſt them.

All capital offences are, by the laws of England, included under high-treaſon, petty-treaſon, and felony. High-treaſon conſiſts in plotting, conſpiring, or taking up arms, againſt the ſovereign, or in counterfeiting the current coin. Whoever is found guilty of this crime is ſtyled a traitor, and puniſhed by being drawn on a ſledge to the place of execution, where, after the body has hung upon the gallows for ſome minutes, it is cut down alive, the heart taken out and expoſed to public view, and the entrails burnt: the head is then cut off, and the body quartered, after which the head is generally expoſed on ſome public edifice: the criminal's lands and goods are forfeited, his wife loſes her dowry, and his children both their eſtates and nobility. The ſentence is the ſame to all traitors; but with regard to perſons of quality it is generally changed into beheading, which is executed on a ſcaffold erected for that purpoſe.

Though the law has declared the counterfeiting the current coin to be high treaſon, yet the criminal is only drawn upon a ſledge to the place of execution, and there hanged in the ſame manner as all other offenders guilty of felony.

If a child kills his father, a wife her huſband, a clergyman his biſhop, or a ſervant his maſter or miſtreſs, the crime is petty treaſon, and the criminal is drawn upon a ſledge to the gallows, and there hanged till dead. Women guilty of either petty or high treaſon, were ſentenced to be burnt alive; but the rigour of the law is mitigated, by ſtrangling them only.

Felony includes murders, robberies, forgery, houſebreaking, &c. Theſe are all puniſhed by hanging only, except murderers, who are hanged in twenty-four hours after ſentence is paſt, and their bodies delivered to the ſurgeons in order to be diſſected publicly. It is, however, common, in order to allow the criminal as much reſpite as poſſible, to bring on the trial on a Saturday, by which means he is not executed till Monday, Sunday not being conſidered as a day for public buſineſs.

The other puniſhments known in England are burning in the hand, tranſportation, impriſonment, whipping, fines, and ſtanding on the pillory; and are inflicted for the crimes of manſlaughter, chance-medley, ſhop-lifting, perjury, petty larceny, and libelling.

If a perſon ſtrikes another in the king's court, ſo as to draw blood, the law condemns him to loſe his right hand. If the blow be given in Weſtminſter-Hall while the courts are ſitting, the puniſhment is impriſonment for life, and forfeiture of all the offender's eſtate.

Drunkards, vagabonds, and looſe, idle, diſorderly perſons, are puniſhed by being ſet in the ſtocks, paying a fine, or commitment to the houſe of correction.

With reſpect to marriages, the holineſs of the matrimonial ſtate is left entirely to the eccleſiaſtical law; the puniſhing or annulling inceſtuous or other unſcriptural marriages, is conſequently the province of ſpiritual courts. The firſt legal diſability is a prior marriage, or having another huſband or wife living; in which caſe, beſides the penalties conſequent upon it as a felony, the ſecond marriage is to all intents and purpoſes void, polygamy being condemned both by the law of the New Teſtament, and the policy of all prudent ſtates, eſpecially in theſe northern climates. The ſecond diſability is want of age, which circumſtance annuls the contract, on account of the imbecility of judgment in the parties: the marriage of a boy under fourteen, or a girl under twelve years of age, is deemed imperfect: but the common law pronounces the marriage good, if the parties are *habiles ad matrimonium*. Another incapacity ariſes from want of conſent of guardians. It has been lately thought proper to enact, that all marriages celebrated by licence (for banns ſuppoſe notice) where either of the parties is under twenty-one, not being a widow or widower, who are ſuppoſed free, without the conſent of the father, or, if he be not living, of the mother or guardians, ſhall be abſolutely void. Much has been, and may be ſaid, both for and againſt this innovation upon our ancient laws and conſtitution. On the one hand, it prevents the clandeſtine marriages of minors, which are often a terrible inconvenience to thoſe private families where they happen; and,

on the other, reſtraints upon marriages, eſpecially among the lower claſs, are evidently detrimental to the public, as well as prejudicial to religion and morality. The fourth legal diſability is want of reaſon; without a competent ſhare of which, neither the matrimonial nor any other contract can be valid. Upon the whole, we may collect, that, as the law now ſtands, no marriage is void by the temporal law, which is celebrated by a perſon in orders; in a pariſh church or public chapel (or elſewhere, by diſpenſation;) in purſuance of banns, or a licence; between ſingle perſons; conſenting; of ſound mind; and of the age of twenty-one years; or of the age of fourteen in males, and twelve in females, with conſent of parents or guardians, or without it, in caſe of widowhood.

Divorces are either total or partial. The total muſt be on account of conſanguinity, affinity, or corporeal imbecility; the iſſue of ſuch marriages are baſtards. The other kind of divorce is, when the marriage is juſt and lawful, but for ſome ſupervenient cauſe it becomes improper or impoſſible for the parties to live together; and in the caſe of intolerable ill temper, or adultery, in either party. In this caſe, the law allows alimony to the wife (except when for adultery, the parliament grants a total divorce, as has frequently happened of late years) which is an allowance made to the woman for her ſupport, out of her huſband's eſtate, and ſettled at the diſcretion of the eccleſiaſtical judge.

A woman in England, as ſoon as married, is, with all her moveables, at the will and diſpoſal of her huſband; nor can ſhe alienate any thing without his conſent; her neceſſary apparel is not her own property; nay, at the death of her huſband, all the perſonal chattles ſhe poſſeſſed at marriage, deſcend to his executor or adminiſtrator. She can make no contract without her huſband's conſent, no reply without him, in matters of law. On the other hand, he muſt pay the debts which ſhe has contracted; and if ſhe ſhould injure any perſon by her tongue or treſpaſs, he will be obliged to make ſatisfaction. Though our law in general conſiders man and wife as one perſon, yet there are ſome inſtances in which ſhe is ſeparately conſidered as inferior to him, and acting by his compulſion, ſuch as in felonies, and other inferior crimes, committed by her, but not as to treaſon or murder. In the civil law, the huſband and wife are conſidered as two diſtinct perſons, and may have ſeparate eſtates, contracts, debts, and injuries; and therefore a woman may ſue, and be ſued, without her huſband, in the eccleſiaſtical courts.

The authority of fathers is ſo abolute in England, that they may give away their unentailed eſtates from their own children, or bequeath their fortunes to any one child, in preferenee to all the reſt. A youth of fourteen may chooſe his guardian, and conſent to marriage; at twenty-one he is at age to make any contract, deed, or will, and to ſit in parliament. The eldeſt ſon commonly inherits the landed eſtate, and the younger children are portioned from the goods and chattels; but in Kent, and ſome other places, the lands are, by the cuſtom of gravel-kind, equally divided among all the ſons.

The revenues of the Britiſh government, or, as they are commonly called, the royal revenues, are either ordinary or extraordinary. The king's ordinary revenue is ſuch, as has either ſubſiſted from remote time in the crown, or has been granted by parliament, in exchange for ſuch of the king's inherent hereditary revenues, as were found inconvenient to the ſubject.

The king's eccleſiaſtical revenues conſiſt in, 1. The cuſtody of the temporalities of vacant biſhoprics; from which he receives little or no advantage. 2. A corody or penſion out of every biſhopric; that is, to ſend one of his chaplains to be maintained by the biſhop, or to have a penſion allowed him, till the prelate promotes him to a benefice. This is now fallen into diſuſe. 3. Extraparochial tythes. 4. The firſt-fruits and tenths of all ſpiritual livings in the kingdom. Little or no profit ariſes to the revenue from theſe four branches, through the bounty of the crown to the church.

The ordinary temporal revenue of the king conſiſts in, 1. The rents and profits of the demeſne lands of the crown, which at preſent are reduced to little or nothing. 2. The hereditary exciſe, which formerly aroſe from the profits of the king's military tenures, and from the profitable prerogative of purveyance and pre-emption. 3. An annual ſum of 7000l. iſſuing out of the ſtamp-duties impoſed on wine licences. 4. His foreſts, now wholly laid aſide. 5. The profits ariſing from the king's ordinary courts of juſtice, &c.

Theſe extraordinary grants are called by the ſynonimous names of aids, ſubſides, and ſupplies, and are granted by the commons of Great-Britain aſſembled in parliament, who, when they have voted a ſupply to his majeſty, and ſettled the quantum of that ſupply, uſually reſolve themſelves into what is called a committee of ways and means, to conſider of the methods neceſſary to be taken for raiſing the ſupply ſo voted. The reſolutions of this committee, when approved of by a vote of the houſe, are generally conſidered as final and concluſive; for though the ſupply cannot be actually raiſed upon the ſubject till directed by an act of the whole legiſlature, yet no monied man will ſcruple to advance to the government any quantity of ready caſh, on the credit of a vote of the Houſe of commons, though no law be yet paſſed to eſtabliſh it.

There are two kinds of Taxes levied upon the ſubject, annual and perpetual. The uſual annual taxes are, 1. The land-tax, or the ancient ſubſidy raiſed upon a new aſſeſſment. 2. The malt-tax, being an annual exciſe on malt, mum, cyder, and perry. The perpetual taxes are, 1. The cuſtoms or duties payable upon all merchandize exported and imported. 2. The exciſe-duty, or inland impoſition on ſundry commodities. 3. The duty on ſalt. 4. The poſt-office, or duty for the carriage of letters; the annual amount of this revenue, from 1644 to 1744, gradually increaſed from 5000l. to 198,226l. and it is now, by increaſing the duty in 1784, and abridging the franking, conſiderably augmented. 5. The ſtamp duties, almoſt innumerable. 6. The duties on houſes and windows. 7. The duty on offices and penſions, with a variety of new taxes in 1784, ſuch as, an additional tax on windows, the bill-tax, &c. &c. After all charges of collecting and management are paid, the clear nett produce of the ſeveral branches of the revenue, old and new, is eſtimated to amount to about eleven millions ſterling, with two millions and a quarter raiſed at an average by the land and malt-tax. How theſe prodigious ſums are applied, is next to be conſidered.

The national debt owes its origin to the revolution, when our new connections with the continental powers of Europe introduced a new ſyſtem of foreign politics; for large ſums being neceſſary to ſettle the new eſtabliſhment, and to maintain an expenſive war on the continent, in order to reduce the exorbitant power of the French monarchy, which then threatened the liberties of Europe, it was not thought prudent to raiſe the ſums neceſſary to defray the expences of one year, by taxes levied on the people, during that ſhort period, leſt the unuſual weight of theſe taxes ſhould create murmurings and diſquiets in the nation. It therefore became neceſſary to anticipate the revenues of their poſterity, by borrowing immenſe ſums for the current ſervice of the ſtate, and to lay no more taxes on the ſubject than was neceſſary to pay the intereſt of the ſums ſo borrowed, converting the principal debt into a new ſpecies of property, transferable at any time, either in whole or in part, from one man to another. This ſyſtem, which was borrowed from the

the ſtate of Florence, laid the foundation of what is called the national debt; for a few long annuities created in the reign of Charles II. hardly deſerve the name. This ſyſtem has been ſo cloſely purſued, to the preſent time, that the capital of the funded debt at Midſummer 1775 was 129,860,018l. and the annual charge of it amounted to 4,219,254l. 7s. The American war was commencing at this time, and the execrable policy continuing of alienating the ſinking fund, and the manner of borrowing the money for ſupplies, have conſiderably increaſed it; for in the courſe of the ſaid war, from 1776 to 1782, 46,550,000l. was added to the three per cents, and 26,750,000l. to the four per cents. making together a capital of 73,400,000l. for which the money advanced was only forty-eight millions.

The ſurpluſſes of the three great national funds, the aggregate, general, and South-ſea funds, over and above the intereſt and annuities charged upon them, are directed by ſtatute 3 Geo. I. c. 7. to be carried together, and to attend the diſpoſition of parliament; and are uſually denominated the *ſinking fund*, becauſe originally deſtined to be held ſacred, and to be applied inviolably to the redemption of the national debt. To this have been ſince added many other entire duties, granted in ſubſequent years; and the annual intereſt of the ſums borrowed on their reſpective credits, is charged on, and payable out of the produce of the ſinking fund. However, the nett ſurpluſſes and ſavings, after all deductions paid, amount annually to a very conſiderable ſum. For, as the intereſt on the national debt has been at ſeveral times reduced (by the conſent of the proprietors, who had their option either to lower their intereſt, or be paid their principal), the ſavings from the appropriated revenues muſt needs be extremely large. This ſinking fund is the laſt reſort of the nation; its only domeſtic reſource, on which muſt chiefly depend all the hopes we can entertain of ever diſcharging or moderating our incumbrances. And therefore the prudent application of the large ſums, now ariſing from this fund, is a point of the utmoſt importance, and well worthy the ſerious attention of parliament.

Different ſchemes have been formed for paying the public debts: but no method can be ſo expeditious and effectual as an unalienable ſinking fund, as this money is improved at *compound intereſt*, and therefore increaſes in the moſt perfect manner.

In treating of the military and marine ſtrength of Great Britain, it may be proper to obſerve, that in abſolute monarchies it is neceſſary to form a diſtinct order for the profeſſion of arms, but extremely dangerous in a land of liberty. No man, in a free ſtate, ſhould take up arms but with a view to defend his country and its laws: he puts off the citizen when he enters the camp; but it is becauſe he is a citizen, and would wiſh to continue ſo, that he makes himſelf for a while a ſoldier. Accordingly, the laws and conſtitution of this country know no ſuch ſtate as that of a perpetual ſtanding ſoldier, bred up to no other profeſſion than that of war, nor had the kings of England ſo much as a guard about their perſons till the reign of Henry VII.

The military force of this kingdom, in the time of our Saxon anceſtors, was in the hands of dukes and heretocks. Alfred the Great firſt ſettled a regular militia; and, by his prudent management, made all the ſubjects of this kingdom ſoldiers.

Upon the Norman conqueſt, the feudal law was introduced here in all its rigour, the whole of which is built upon a military plan. All the lands in England were divided into what were called knights-fees, amounting to about 60,000; and, for every knight's fee, a knight or ſoldier was obliged to attend the king in his wars, forty days in a year: in which ſpace of time, before war was reduced to a ſcience, the campaign was generally finiſhed, and a kingdom either conquered or rendered victorious. By this means the king, without the leaſt expence, had an army of 60,000 men always ready at his command. This perſonal ſervice, however, in length of time, degenerated into pecuniary commutations, or aids, till at laſt the whole feudal ſyſtem was aboliſhed at the reſtoration.

This abolition of the military tenures gave occaſion to aſcertain the power of the militia, to recognize the power of the crown to govern and command them, and to put the whole into a more regular method of military ſubordination. The preſent militia laws are founded upon theſe ſtatutes, with the addition of ſome new regulations; the general ſcheme of which is to diſcipline a certain number of the inhabitants of every county, choſen by lot for three years, and officered by the lord-lieutenant, the deputy-lieutenants, and other principal landholders, under a commiſſion from the crown. They are not obliged to march out of their reſpective counties, unleſs in caſe of invaſion or actual rebellion, nor in any caſe compellable to march out of the kingdom. They are to be exerciſed at ſtated times, and their diſcipline is in general very eaſy; but when called out to actual ſervice they are ſubject to the rigours of martial law, as neceſſary to keep them in order and proper ſubordination. This is the conſtitutional ſecurity which our laws have provided for the public peace, and for protecting the realm againſt foreign and domeſtic violence. The legiſlature has indeed always been jealous of ſtanding armies; for king Charles II. having kept up about 5000 regular troops by his own authority, for guards and garriſons, which king James II. by degrees increaſed to no leſs than 30,000, all paid from his own civil liſt, the parliament was ſo offended, that it was made one of the articles in the Bill of Rights, That the raiſing up and keeping a ſtanding army in time of peace, unleſs it be with conſent of parliament, is illegal.

For many years paſt it has been annually judged neceſſary by the legiſlature, for the ſafety of this kingdom, the defence of the poſſeſſions of the crown of Great-Britain, and the preſervation of the balance of power in Europe, to maintain annually, even in time of peace, a ſtanding body of troops, under the command of the crown; but theſe are, *ipſo facto*, diſbanded every year, unleſs continued by parliament. Accordingly, an annual act of parliament paſſes, "To puniſh mutiny and deſertion, and for the better payment of the army and their quarters." This regulates the manner in which they are to be diſperſed among the ſeveral innkeepers and victuallers throughout the kingdom, and eſtabliſhes a martial law for their government.

The land forces of Great-Britain maintained in time of peace do not uſually exceed 40,000 in number, computing 18,000 in England and Scoland, 12,000 on the Iriſh eſtabliſhment, and the remainder in garriſons abroad, at Minorca, Gibraltar, Nova-Scotia, Jamaica, and Antigua. In the war of 1756, however, the nation maintained above 100,000 ſoldiers, excluſive of marines, and an army of 50,000 Germans on the Continent; and ſince the American war, there have been in the pay of Great-Britain, natives and foreigners, 135,000 men, beſides 42,000 militia.

The Britiſh infantry have always been diſtinguiſhed by a ſpecies of courage and intrepidity peculiar to themſelves; and the cavalry is beyond all doubt the beſt in Europe, whether we reſpect the beauty, ſize, ſpirit, and docility of the horſes, or the ſtrength, appearance, and gallantry of the dragoons. The troops, both horſe and foot, are compoſed of tall, ſtrong, muſcular, handſome men, in red uniforms, with facings of various colours, well cloathed, armed, and accoutred; inferior to none in exerciſe and diſcipline, and ſuperior to all others in martial and military appearance.

The maritime ſtate is nearly related to the former, though much more agreeable to the principles of our free

free conſtitution. The royal navy of England has ever been its greateſt defence and ornament; it is its ancient and natural ſtrength; the floating bulwark of the iſland; an army, from which, however ſtrong and powerful, no danger can ever be apprehended to liberty; and accordingly it has been aſſiduouſly cultivated, even from the earlieſt ages. To ſo much perfection was our naval reputation arrived in the 12th century, that the code of maritime laws, which are called the laws of Oleron, and are received by all nations in Europe as the ground and ſubſtruction of all their marine conſtitutions, was confeſſed compiled by king Richard I. at the iſle of Oleron, on the coaſt of France, then part of the poſſeſſions of the crown of England. And yet, ſo vaſtly inferior were our anceſtors in this point to the preſent age, that, even in the maritime reign of queen Elizabeth, ſir Edward Coke thinks it matter of boaſt that the royal navy of England then conſiſted of 33 ſhips. The preſent condition of our marine is in a great meaſure owing to the ſalutary proviſions of the ſtatute called the navigation act; whereby the conſtant increaſe of Engliſh ſhipping and ſeamen was not only encouraged, but rendered unavoidably neceſſary.

The complement of ſeamen, in time of peace, uſually hath amounted to 12 or 15,000. In time of war, they formerly amounted to about 80,000 men; and after the commencement of the American war, to above 100,000, including marines. The vote of parliament for the ſervice of the year 1797, was for 120,000 ſeamen, including marines.

This navy is commonly divided into three ſquadrons, namely, the red, white, and blue, which are ſo termed from the differences of their colours.—Each ſquadron has its admiral: but the admiral of the red ſquadron has the principal command of the whole, and is ſtyled vice-admiral of Great Britain. Subject to each admiral is alſo a vice and rear-admiral. But the ſupreme command of our naval force is, next to the king, in the lords commiſſioners of the admiralty.

We may venture to affirm, that the Britiſh navy, during the war of 1756, was able to cope with all the other fleets of Europe. In the courſe of a few years it entirely vanquiſhed the whole naval power of France, diſabled Spain, and kept the Dutch and other powers in awe. For the protection of the Britiſh empire, and the annoyance of our enemies, it was then divided into ſeveral powerful ſquadrons, ſo judiciouſly ſtationed, as at once to appear in every quarter of the globe; and while ſome fleets were humbling the pride of Spain in Aſia and America, others were employed in fruſtrating the deſigns of France, and eſcorting home the riches of the eaſtern and weſtern worlds.

The Britiſh navy is diſtributed into ſix rates, orders, or claſſes, excluſive of the inferior veſſels; as ſloops of war, armed ſhips, bomb ketches, fire-ſhips, and cutters or ſchooners commanded by lieutenants.

The navy of England is at all times ſuperior to any other maritime power, in number of ſhips, weight of metal, and expert mariners. But the efforts of Great Britain by ſea on extraordinary occaſions, are inconceivable.

The gold coin of England conſiſts of guineas, half-guineas, and ſeven ſhillings pieces; and though the people reckon by pounds, it is at preſent an imaginary denomination. The pound is equal to twenty ſhillings, and the guinea amounts to twenty-one: beſides the Engliſh pieces, the gold coin of Portugal, called Joannes and Moidores, were till lately taken by all the dealers in England. Crowns, half-crowns, ſhillings, and ſixpences, compoſe the ſilver coin that circulates through Great Britain and Ireland, and for the convenience of retail, there is an immenſe quantity of copper coin, conſiſting of two-penny and penny pieces, half-pence, and farthings; the value of a crown is five ſhillings; a ſhilling twelve-pence; and four farthings conſtitute one penny. No perſon, however, is obliged to receive copper money in payment of any ſum above one ſhilling. Beſides the coins we have already mentioned, there are ſome five and two guinea pieces of gold, as well as fourpenny, three-penny, two-penny and penny pieces in ſilver; but theſe are rather preſerved as medals than uſed in circulation.

The title of the king of England is, By the Grace of God, of Great Britain, France, and Ireland, King, Defender of the Faith. The deſignation of the kings of England was formerly his or her Grace, or Highneſs, till Henry VIII. to put himſelf on a footing with the emperor Charles V. aſſumed that of Majeſty; but the old deſignation was not aboliſhed till towards the end of queen Elizabeth's reign. The title of Defender of the Faith, above mentioned, was given to Henry VIII. by the pope, on account of a book written by the king againſt Luther and the Reformation. Beſides the titles already given, the king of Great Britain has others from his German dominions, as Elector of Hanover, Duke of Brunſwick Lunenburgh, &c.

Since the acceſſion of the preſent royal family of Great Britain, anno 1714, the royal achievement is marſhalled as follows: quarterly, in the firſt grand quarter, Mars, three lions, paſſant guardant, in pale Sol, the imperial enſigns of England, impaled with the royal arms of Scotland, which are, Sol, a lion rampant, within a double treſſure flowered, and counter-flowered, with fleurs-de-lis, Mars. The ſecond quarter is the royal arms of France, viz. Jupiter, three fleurs-de-lis, Sol. The third, the enſigns of Ireland, which is, Jupiter, an harp, Sol, ſtringed Luna. And the fourth grand quarter is his preſent majeſty's own coat, viz. Mars, two lions paſſant guardant, Sol, for Brunſwick, impaled with Lunenburg, which is, Sol ſemee of hearts, proper, a lion rampant, Jupiter; having ancient Saxony, viz. Mars, an horſe currant, Luna, ente (or grafted) in baſe: and in a ſhield ſur tout, Mars, the diadem, or crown of Charlemagne; the whole, within a garter, as ſovereign of that moſt noble order of knighthood.

The motto of *Dieu et mon Droit*, that is, *God and my Right*, is as old as the reign of Richard I. who aſſumed it to ſhew his independency upon all earthly powers. It was afterwards revived by Edward III. when he laid claim to the crown of France. Almoſt every king of England had a particular badge or cognizance: ſometimes a white hart, ſometimes a fetlock with a falcon, by which it is ſaid Edward IV. alluded to the infidelity of one of his miſtreſſes; and ſometimes a portcullis, which was that of the houſe of Lancaſter, many of the princes of which were born in the caſtle of Beaufort. The white roſe was the bearing of the houſe of York; and that of Lancaſter, by way of contradiſtinction, adopted the red. The thiſtle, which is now part of the royal armorial bearings, belonged to Scotland, and was very ſignificant when joined to its motto, *Nemo me impune laceſſet*, "None ſhall provoke me unpuniſhed."

The titles of the king's eldeſt ſon are, prince of Wales, duke of Cornwall and Rothſay, earl of Cheſter, electoral prince of Brunſwick and Lunenburg, earl of Carrick, baron of Renfrew, lord of the iſles, great ſteward of Scotland, and captain general of the artillery company.

He bears the king's arms, with the addition of a label of three points, charged with nine torteux; his device being a coronet beautified with three oſtrich feathers, inſcribed *Ich dien*, ſignifying in the German language, "I ſerve."

All degrees of nobility are derived from the king, as their fountain; and he may inſtitute what new titles he pleaſes. The right of peerage ſeems to have been originally territorial; that is, annexed to lands, honours, caſtles, manors, and the like, the proprietors and poſſeſſors of which were, in right of thoſe eſtates, allowed to be peers of the realm, and were ſummoned to

to parliament to do ſuit and ſervice to their ſovereign: and when the land was alienated, the dignity paſſed with it as appendant. Thus the biſhops ſtill ſit in the houſe of lords in right of ſucceſſion to certain ancient baronies annexed, or ſuppoſed to be annexed, to their epiſcopal lands.

Peers are now created either by writ or by patent: for thoſe who claim by preſcription, muſt ſuppoſe ether a writ or patent made to their anceſtors, though by length of time it is loſt. The creation by writ, or the king's letter, which is the more ancient method, is a ſummons to attend the houſe of Peers, by the ſtyle and title of that of barony which the king is pleaſed to confer: that by patent is a royal grant to a ſubject of any dignity and degree of peerage.

The preſent nobility of England are at once numerous and wealthy; enjoy many honourable privileges, but poſſeſs no power incompatible with the rights and liberties of their fellow-ſubjects. The majority of them live with great magnificence, eſpecially at their country-ſeats, which are indeed elegant palaces, adorned with beautiful gardens, ponds, parks, and plantations. No country in Europe can produce ſuch a number of noblemen living in all the pomp of affluence and all the delights of independence, ſecured by the law from the arm of arbitrary power, and, in their turn, diſabled by the law from excerciſing the rod of oppreſſion. They are diſtinguiſhed by the different titles of duke, marquis, earl, viſcount, and baron; and, according to theſe degrees, take precedence of one another. But they are all equally peers of England, and all ſit in the Houſe of Lords, which is the ſupreme court of judicature in England.

The perſon of a peer is ſacred from arreſt, except in caſe of treaſon, felony, breach of the peace, condemnation in parliament, or contempt of the king. In theſe caſes he cannot be tried but by jury of peers, he cannot be impanelled on any jury of inqueſt: he cannot be bound to his good behaviour, nor obliged to ſwear in any court of juſtice, but only to declare upon his honour. In caſe of lawful abſence, he can conſtitute a proxy to vote for him in parliament; a privilege which no commoner enjoys. He is exempted from all attendance at ſheriffs turns and leets, where other ſubjects are obliged to take the oath of allegiance, as alſo from joining the *poſſe cometatus*, when it is raiſed by the ſheriff to ſuppreſs routs and riots. He cannot be outlawed in any civil action, nor preſſed to death as a commoner, when mute upon his trial; and when condemned to die, he is indulged with the honour of decapitation.

The ſons of nobility have certain titles by courtſey, according to the rank of their fathers; but the law ranks them among the commons of England. Thus, the eldeſt ſon of a duke is denominated marquis, or earl; and the youngeſt ſons are ſaluted by the appellation of My Lord. The firſt ſon of a marquis or earl is denominated lord of ſome barony belonging to his father, and his brothers are likewiſe addreſſed by the title of Lord John or Lord William. The ſiſters enjoy the honourable title of Lady, in the ſame manner; but this courteſey is not extended to the younger children of viſcounts and barons.

The baronets of England were ſo called as being deemed an inferior kind of barons, in Latin *baronuli baronculi* and *baronetti*, conſtituted in the room of the old vavaſours, to hold a middle place between the parliamentary barons and the different orders of knights. They were created by James the Firſt, who beſtowed this hereditary honour as an encouragement to thoſe of his ſubjects who aſſiſted in the reduction of the province of Ulſter in Ireland. No perſon could be admitted into this order unleſs he was a gentleman by blood, of unblemiſhed morals, and poſſeſſed a yearly revenue of one thouſand pounds in land; and the expreſs condition of his admiſſion was, that he ſhould maintain thirty ſoldiers for three years on the military eſtabliſhment of Ireland. As an armorial badge of diſtinction, he wears in a canton of his eſcutcheon a bloody hand, as the arms of Ulſter. The number of baronets was, at firſt, reſtricted to 200, but now it is enlarged without limitation. The title of baronet is conferred by patent under the great ſeal, and deſcends to heirs male: like other knights, he is diſtinguiſhed by the appelative *Sir* prefixed to his chriſtian name in ſpeaking and writing. He takes precedence of all other knights, except thoſe of the garter, and baronets created in the field of battle. He is entituled to an honourable place in the kings army, near the royal ſtandard; and his eldeſt ſon, by virtue of a peculiar privilege when of age, has a right to the honour of knighthood, whenever it ſhall be demanded. The wives of baronets are ladies, and take place before the wives of all knights whatſoever.

There are two grand orders of knighthood in England, namely thoſe of the GARTER and the BATH The order of St. George, or the garter, is one of the moſt ancient and honourable inſtitutions of lay knights now extant. It was founded by Edward the Third. The order of the garter is a college or corporation, conſiſting of the ſovereign and twenty-five companions, called knights of the garter, of a dean, canons, petit canons, vergers, and other inferior officers; and of twenty-ſix poor knights, who receive their maintenance from the college, as a reward for military ſervice. There are other officers belonging to the order of the garter, which is dedicated to St. George, the tutelar ſaint and patron of England; ſuch as that of prelate of the garter, annexed to the biſhopric of Wincheſter; the chancellorſhip, veſted in the biſhop of Saliſbury; and the regiſtery, belonging to the dean of Windſor. There is a principal king at arms, called Garter, whoſe province it is to marſhal the ſolemnities of feaſts and inſtallations: finally the uſher of the black rod is likewiſe uſher of the garter. The ſeat of the order is the caſtle of Windſor, conſiſting of the chapter-houſe, the hall, and chapel of St. George. A knight of this order is diſtinguiſhed by a blue garter, with a gold buckle worn on the left leg, and inſcribed, *Honi ſoit qui mal y penſe*, ſignifying, *Shame to him who thinks evil of, or puts a bad conſtruction on, this order*; by a ſilver ſtar on the left breaſt, enamelled with gold and ſet with diamonds, hanging at the end of a broad blue ribband that croſſes the body from the left ſhoulder. The greateſt monarchs of Europe have been members of this inſtitution.

The order of the BATH was firſt inſtituted by Henry IV. and took their denomination from bathing on the eve of their admiſſion. The order, which had grown obſolete, was revived by king George the Firſt, in the year 1725, when eighteen noblemen, and as many commoners were inſtalled knights of the bath with great ceremony at Weſtminſter. Their number is limited to forty-ſix; and they are diſtinguiſhed by a ſtar on the breaſt, and a broad red ribband worn like a belt over the ſhoulder.

A knight is a term uſed almoſt in every nation in Europe, and in general ſignifies a ſoldier ſerving on horſeback; a rank of no mean eſtimation in ancient armies, and entitling the parties themſelves to the appellation of *Sir*. Other knighthoods formerly took place in England; ſuch as thoſe of *bannerets*, batchelors, knights of the carpet, and the like; but they are now diſuſed. Indeed, in the year 1773, at a view of the royal navy at Portſmouth, the king conferred the honour of Knights Bannerets on two admirals and three captains. They have no particular badge on their garments, but their arms are painted on a banner placed in the frames of the ſupporters.

The gentlemen of England are comprehended under the general denomination of eſquires, or *armigeri*, the title formerly given to thoſe among the gentry who acted as armour-bearers in war to the prince and

prime nobility. Though the right of this title is limited to perſons of a certain rank, ſuch as the ſons of barons, and gentlemen whoſe anceſtors have been always free, and borne a coat of arms, mayors of towns, counſellors at law, batchelors of divinity, law or phyſic; yet it is indiſcriminately given to all thoſe who maintain the appearance of gentlemen. The higheſt order of plebeians are the freeholders, called yeomen, from the Saxon word *gemani*, which ſignifies *common*. Theſe are the huſbandmen and farmers, who hold lands and tenements inheritable by a perpetual right to them and their heirs for ever. The next claſs of people are the merchants and traders, greatly and deſervedly reſpected in England, on account of their riches as well as their profeſſion, which contributes ſo eſſentially to the wealth and power of the nation.

HISTORY OF ENGLAND.

It is generally agreed that the firſt inhabitants came from the neighbouring continent of the Celtæ, or Gauls, that ſettled on the oppoſite ſhore, long before their country was known to the Romans. The ancient Britons were a rude warlike people, living in hovels erected within the covert of thick and almoſt impenetrable woods. They painted their bodies with woad, and gave them a blueiſh or greeniſh caſt, and had no other covering than the ſkins of beaſts, caſually thrown over them, without being ſhaped into any kind of garment; and they are ſaid to have had the figures of animals and heavenly bodies on their ſkins. In their marriages, they were not very delicate, for they formed themſelves into a kind of matrimonial clubs; twelve or fourteen men married as many wives, and each wife was common to them all; but her children belonged to the original huſband. They ſowed corn, though it is likely they lived chiefly on animal food and milk. They were amazingly dextrous in the management of their chariots; and, fought with lances, darts, and ſwords. Women ſometimes led their armies to the field, and were recognized as ſovereigns of their particular diſtricts. They favoured a primogeniture or ſeniority, in their ſucceſſion to royalty, but ſet it aſide on the ſmalleſt inconveniency attending it.

Such were the ancient Britons, when Julius Cæſar, about fifty-two years before the Chriſtian æra, invaded their country; and after a long and bloody war England was reduced to a province of the Roman empire. But the Romans were obliged to maintain their conqueſt by a military force, which was divided into different parties, and placed at convenient ſtations all over the province: the Roman governor, for the time being, was ſupreme ruler of the country.

The Britons lived during the long reign of Auguſtus Cæſar, rather as the allies than the tributaries of the Romans; but the communications between Rome and Great-Britain being then extended, the emperor Claudius Cæſar, about forty-two years after the birth of Chriſt, undertook an expedition in perſon, in which he ſeems to have been ſucceſsful againſt Britain. His conqueſts, however, were imperfect; Caractacus, and Boadicia though a woman, made noble ſtands againſt the Romans. The former was taken priſoner after a deſperate battle, and carried to Rome, where his undaunted behaviour before Claudius gained him the admiration of the victors, and is celebrated in the hiſtories of the times. Boadicia being oppreſſed in a manner that diſgraces the Roman name, and defeated, diſdained to ſurvive the liberties of her country; and Agricola, general to Domitian, after ſubduing South-Britain, carried his arms northwards, where his ſucceſſors had no reaſon to boaſt of their progreſs, every inch of ground being bravely defended.

While the Romans remained in this iſland, they erected thoſe walls, ſo often mentioned, to protect the Britons from the invaſions of the Caledonians, Scots, and Picts. But in the year 426, the barbarous nations of the North, breaking into the Roman empire, rendered it neceſſary to recall the legions ſtationed in Britain; when the emperor Honorius renounced his ſovereignty of the country, and releaſed the inhabitants from their allegiance. On the departure of the Roman legions, the iſland was left in a feeble and defenceleſs ſtate.

The Scots, who inhabited the country to the northward of the Roman provinces, no ſooner perceived the weakneſs of their ſouthern neighbours, than they invaded their country, and committed the moſt dreadful outrages; the tracts of their irruptions were marked with blood and deveſtation; the northern parts of the once flouriſhing provinces of the Romans were totally waſted with fire and ſword, and the wretched inhabitants, deſtitute at once of forces and generals capable of repelling the cruel ravages of their barbarous enemies, became an eaſy prey. Reduced to this dreadful ſtate, the Britons had recourſe to the Saxons, a warlike people of Scandinavia, for protection; offering to give, as a reward for their ſervice, the Iſle of Thanet, a ſmall tract of land ſeparated by a narrow channel from the county of Kent. The offer was accepted, and the Saxons, together with a great number of Angles, a people of Jutland, landed in England. The Britons, headed by theſe auxiliaries, were ſoon too ſtrong for the Scots, who were defeated in ſeveral engagements, and driven back to their own country. Theſe victories, however, were far from reſtoring peace to the haraſſed Britons: Hengiſt and Horſa, the two Saxon generals, looked with contempt on the ſmall ſpot of land aſſigned them and their followers, as a reward for their ſervices, and meditated the conqueſt of the whole iſland: which was eaſily accompliſhed by Hengiſt, who perſuaded Vortigern, the Britiſh king, that, as his ſubjects underſtood very little of agriculture, it would be of infinite advantage to ſo fertile a country, if he would ſuffer a number of Saxons to be ſent for to cultivate the ſoil. Accordingly as many of thoſe people embarked as ſixteen ſhips would contain; but they had not long been in this iſland before they threw off the maſk, and convinced the wretched Britons that they had inadvertently conſented to their own deſtruction. The Saxons pretended that Hengiſt's troops had not been rewarded according to agreement, and that they had an undoubted right to ſatisfy themſelves. On which account a long and terrible war enſued; a great number of battles were fought, in which the Saxons were generally victorious, and the Britons forced at laſt to retire into Wales. Having thus no enemy in the field to contend with, the victors divided England into ſeven kingdoms, termed the Saxon heptarchy; namely, Kent; South-Sex, or the South-Saxons; Weſt-Sex, or the Weſt-Saxons; Eaſt-Sex, or the Eaſt-Saxons; Northumberland; the Eaſt-Angles, and Mercia.

Chriſtianity ſoon after this was introduced into England by pope Gregory the Great. And, about the year 596, he ſent over to England the famous Auſtin, the monk, who probably found no great difficulty in converting the king and his people; and alſo Sebert, king of the Eaſt-Saxons, who was baptized, and founded the cathedral of St. Paul's in London. Auſtin then attempted to bring the churches in Wales to a conformity with that of Rome, particularly at the celebration of Eaſter; but finding a ſtout reſiſtance on the part of the biſhops and clergy, he perſuaded his Chriſtian converts to maſſacre them, which they did to the number of 1200 prieſts and monks, and reduced the Britons, who were found in the heptarchy, to a ſtate of ſlavery, which ſome think gave riſe to the ancient villenage in England. Auſtin is accouuted the firſt archbiſhop of Canter-

bury,

bury, and died in 605, as his convert Ethelbert did ſoon after.

The pope, in Auſtin's time, ſupplied England with about 400 monks, and the Popiſh clergy took care to keep their kings and laity under the moſt deplorable ignorance, but always magnified the power and ſanctity of his holineſs. Hence it was that the Anglo-Saxons, during their heptarchy, were governed by prieſts and monks; and, as they ſaw convenient, perſuaded their kings either to ſhut themſelves up in cloiſters, or to undertake pilgrimages to Rome, where they finiſhed their days; and ſuch was the tyranny in theſe early times, that no leſs than thirty Anglo-Saxon kings, during the heptarchy, reſigned their crowns in that manner, and among them was Ina, king of the Weſt-Saxons, though in other reſpects he was a wiſe and brave prince. The contributions of thoſe Anglo-Saxon kings to the ſee of Rome was unlimited; and Ethelwald, king of Mercia, impoſed an annual tax of a penny upon every houſe, which was afterwards known by the name of Peter's pence, becauſe paid on the holiday of St. Peter ad vincula, Auguſt 1. This tax was impoſed at firſt for the ſupport of a college at Rome for the education of Engliſh youth, founded by Ina, king of Weſſex, under the name of Rome-ſcot, but in proceſs of time the popes claimed it as a tribute due to St. Peter and his ſucceſſors.

During the Saxon heptarchy, a black cloud of barbarous ignorance covered the whole country. Continual wars among themſelves, blended with the moſt ſhocking crimes, furniſh the hiſtorical tranſactions that have reached our time. Theſe continual tumults and diſorders haſtened the deſtruction of the heptarchy, which was aboliſhed by Egbert, who annexed the other ſix kingdoms to his own, about the year 819. He was the eldeſt branch of Cerdic, one of the Saxon chiefs who firſt arrived in England, and related to Birthric, king of the Weſt-Saxons, he was in his early youth obliged to leave his country to avoid the effects of that prince's jealouſy. Fortunately for Egbert, Charlemagne, the moſt accompliſhed prince of his age, then ſwayed the ſceptre of France. The prince found there a generous protector, and under him he learned the arts of war and government. About the year 800, Birthric paid the debt of nature, and the Weſt-Saxons earneſtly ſolicited Egbert to return to his native land, and take poſſeſſion of the crown of his anceſtors. He immediately complied with their requeſt, and no ſooner found himſelf ſettled on the throne, than he took ſuch meaſures as in a ſhort time rendered him the ſole monarch of the ſeven provinces of the heptarchy. Peace being thus reſtored, he was ſolemnly crowned king at Wincheſter. Soon after he changed the name of his kingdom into that of Engle-lond or England.

About the year 832, the Danes, who were a powerful people, had long infeſted the Britiſh ſeas, and made deſcents upon the coaſts of Kent and Dorſetſhire. Egbert marched againſt them, but from the ſovereign contempt he entertained of theſe pirates, marched at the head of a ſmall number of forces, and was defeated. The Danes, however, did not long enjoy the fruits of their victory: for about two years after he attacked them with ſuch impetuoſity, that they were obliged to abandon the kingdom; nor did they ever venture to return till after his death, which happened in 838.

Ethelwolf, ſon of Egbert, proved a weak and indolent prince, without the leaſt tincture of his father's virtues; he was ſcarcely ſeated on the throne, before the Danes appeared again upon the coaſts, and the Engliſh being unable to oppoſe their ravages, they fixed themſelves in the iſland, which ſoon became one continued ſcene of bloodſhed and devaſtation. They however received a ſevere check from Athelſtan, ſon to Ethelwolf, and his partner in the regal authority; but this was not ſufficient to prevent their forming a ſettlement in the Iſle of Thanet, where they employed themſelves in collecting arms and force ſufficient to extend their ſettlements in England.

At the death of Ethelwolf, which happened in 857, his dominions were divided between his two eldeſt ſons (Athelſtan being then dead), Ethelbald and Ethelbert, whoſe joint reign affords no tranſaction worthy to be recorded. Ethelbald died firſt; and Ethelbert, at his deceaſe, named his brother Ethelred for his ſucceſſor, purſuant to the will of his father, though two ſons of his own were then living. During the reign of Ethelred, the Danes, notwithſtanding the valiant efforts of the king and his brother Alfred, made themſelves maſters of many of the counties in England, and were almoſt entirely maſters of the ſea-coaſt, when, by the death of Ethelred, which happened in 827, Alfred aſcended the throne.

Alfred came to the crown at a time when his kingdom was falling a prey to barbarous invadors, and his ſubjects worn out with frequent wars. Such was his courage and conduct, that, though during the ſtruggle he had once entirely loſt his dominions, and was reduced for a time to the ſervile ſtate of a cow-herd; yet before his death, which happened in the year 900, he had not only recovered the crown, but added new luſtre to it by his conqueſts over the Danes, whom he obliged to ſwear obedience to his government. Even the inhabitants of Wales, who had lived in a perpetual ſtate of enmity with the Saxons, courted his protection. The virtues of this monarch juſtly acquired him the epithet of Great, and his excellent laws, that of "The Father of the Engliſh Conſtitution." One of the principal glories of his reign was that of giving birth to a maritime power in England. Convinced that the ſuperiority of numbers in his enemies would always be againſt him, unleſs he could acquire the dominion of the ſea, he carefully obſerved the manner in which the Danes conſtructed their veſſels, and having made improvements upon their art, ordered a number of gallies to be built, ſome of which carried ſixty rowers, and were, though more lofty and of greater bulk, ſwifter ſailers than the Daniſh ſhips. He revived the uſe of juries, which had lain dormant for ſome time. He gave great encouragement to navigation and commerce, which, even in that early period, he brought to ſome degree of perfection. He introduced buildings of brick and ſtone, materials till then uſed only in erecting churches. His treatment of corrupt judges was truly exemplary; he cauſed ſeveral of them to be hung up by the ſides of high roads, as an example to deter others from the like deſtructive practices. A ſcholar himſelf, he admired and rewarded thoſe who were fond of the ſciences, and invited ſeveral learned men into his dominions.

Edward the Elder, ſucceeded his father Alfred. This prince reigned twenty-ſeven years, during which he was engaged in ſeveral wars againſt the Danes, and was generally victorious. The king of Scotland alſo, who had entered into an alliance with theſe invaders, was glad to purchaſe a peace by conſenting to hold his dominions in vaſſalage to the crown of England. Nor were the Danes and Scots the only enemies Edward had to contend with. In the year 920, an inſurrection happened in Wales, headed by Leofred, a Dane, and Griffith ap Madoc, brother-in-law to the prince of Weſt-Wales. Theſe two, at the head of a formidable army, had advanced as far as Cheſter, before Edward was in a condition to oppoſe their progreſs; but coming up with them at Sherwood, a battle enſued, wherein Griffith was killed, Leofred taken priſoner, and their whole army put to flight. Edward having thus ſubdued all his enemies, turned his thoughts to the improvement of his conqueſts, and the well governing of his ſubjects.

He enacted the moſt ſalutary laws, and took care to put them ſtrictly in execution.

Edward dying in 927, was ſucceed by his eldeſt ſon, Athelſtan, at the beginning of whoſe reign the Danes once more renewed their barbarous ravages; and his whole reign was one continued ſcene of war with theſe reſtleſs invaders, the Scots, the Engliſh, and other neighbouring powers. Theſe commotions, however, did not divert his attention from the welfare of his people. The encouragement of commerce ſeems to have been his chief delight. He alſo encouraged coinage; and we find by his laws, that archbiſhops, biſhops, and even abbots, had then the privilege of minting money. He enacted many excellent laws, and one in particular whereby every merchant, who had, on his own account, made three voyages to the Mediterranean, was put upon the ſame footing with a thane, or nobleman of the firſt rank. He died in 941.

Edmund I. brother to Athelſton, whoſe reign, and thoſe of his ſucceſſors, Edred and Edwy, were weak and inglorious, being either engaged in wars with the Danes, or diſgraced by the influence of prieſts, Edgar mounted the throne about the year 959, but, like his predeceſſors, he was the dupe of prieſts, particularly Dunſtan. During his reign, which upon the whole was not inglorious, he ceded to the Scots all the territory north of Severus's wall, and revived the naval glory of England. He died in 975, and was ſucceeded by his eldeſt ſon Edward; but by the intrigues of his ſtep-mother, Elfrida, was ſoon deprived of both his crown and life; and in 978, was ſucceeded by Ethelred, ſon to Elfrida. In his reign, the Engliſh nation was over-run with barbarians, and the Danes had by degrees poſſeſſed themſelves of the fineſt parts of England, and left Ethelred in no condition to diſlodge them. To get rid of them, he agreed to pay them 30,000l. which was levied by way of tax, and called Danegelt, being the firſt land-tax in England. In 1002, they had made ſuch ſettlements in the country, that Ethelred was obliged to give way to a general maſſacre for their extirpation. But whether this cruel deſign was executed entirely, or only in part, is uncertain; it was however ſeverely revenged by Swein, the Daniſh king, who in 1013 laid the country waſte with fire and ſword, and even obliged Ethelred, with his queen and two ſons, to fly into Normandy, where they remained till Swein paid the debt of nature. Immediately after his death, notwithſtanding Canute had been proclaimed king of England by the Danes, Ethelred returned; and having forced Canute to retire into Denmark, was once more reinſtated in his kingdom. Canute, however, ſoon collected a numerous fleet, and in 1016 once more invaded England. Juſt at that period Ethelred died, and his ſon, Edmund II. ſurnamed Ironſide, (from his great bodily ſtrength) after fighting ſeveral battles with the Danes, in order to prevent a further effuſion of human blood, conſented to divide the kingdom with Canute. This diviſion was ſoon terminated by the death of Edmund, who was aſſaſſinated by one of his courtiers; hoping, by that cruel act, to ingratiate himſelf with Canute: but that monarch no ſooner found himſelf firmly fixed on the throne of England, than he cauſed the traitor's head to be ſtruck off, as a juſt reward for his horrid ſervice.

Canute's reign was very favourable to the Engliſh, whom he incorporated with the Danes, and treated with the utmoſt tenderneſs. He was engaged in ſeveral wars, which he always finiſhed with honour, and at the time of his death, which happened in 1039, the nation enjoyed a profound peace. He left three ſons, Swein, Harold, and Hardicanute, who all ſucceeded to the crown of England; but their behaviour was ſo baſe and deteſtable, that the very government of the Danes became odious to the Engliſh; they therefore on the demiſe of Hardicanute, which happened in 1042, reſtored the family of Ethelred to the throne, in the perſon of Edward, commonly called the Confeſſor.

Edward, for ſome time, ſuffered himſelf to be entirely governed by earl Goodwin, whoſe daughter he had married, and by whoſe arts he was placed on the throne, in preference to Edward, ſon of Edmund II. but the inſolence of this nobleman and his ſons aroſe to ſuch a pitch, that they were baniſhed by the king, who, however, afterwards thought proper to recall and reinſtate them in their power. Edward repulſed the Danes, who had made a deſcent at Sandwich. Siward, one of his generals, routed the Scots, and killed their king Mackbeth. Alfgar, an Engliſh nobleman, and Griffin, king of Wales, made an inroad into England, and took and plundered Hereford, but were at length totally routed by Harold, ſon to earl Goodwin; ſo that Edward, either in perſon, or by his generals, obtained the victory over every power againſt whom he directed his arms. This monarch collected the laws of the Danes, Saxons, and Mercians, which he digeſted into one body, and called it "The common law of England." Being like moſt of his predeceſſors, a great friend to the monks; he founded many religious houſes, and rebuilt the Abbey at Weſtminſter, where he was buried in the year 1065.

Edward dying without iſſue, Herold, ſon to earl Goodwin, was raiſed to the throne in preference to Edgar Atheling, grandſon to Edmund Ironſide, and the only ſurviving prince of the ancient kings of England. Some authors aſſert that Edward had appointed William, duke of Normandy, his ſucceſſor, while others maintain it was only a pretence made uſe of by William for invading England. However that be, he actually landed on the coaſt of Suſſex, in the year 1066, without oppoſition; Harold being then employed in repulſing the Danes, who had made freſh inroads into England. William was at the head of forty thouſand men, all veteran troops, and commanded by the braveſt officers in Europe. He was met by Harold, at Haſtings, and a moſt dreadful engagament enſued, wherein Harold was ſlain, and the conqueror, with very little difficulty, aſcended the Engliſh throne.

William, in the beginning of his reign, gave the Engliſh a flattering proſpect of a juſt and mild adminiſtration; but they ſoon found themſelves deceived, for, having given them cauſe of complaint in the partiality ſhewn upon every occaſion to the Normans, they broke out into open rebellion, and endeavoured to place Edgar Atheling upon the throne. The attempt proved abortive; and William, in revenge for their conſpiracies, deprived them of all their poſſeſſions, which he divided among the Normans, and ſuch of the Engliſh as had remained faithful to him. He aboliſhed the Anglo-Saxon laws, and introduced thoſe of Normandy: built great numbers of forts all over the country, and diſarmed the old inhabitants: inſtituted the curfew bell, which was rung every evening at eight o'clock, and at the ſound of which the Anglo-Saxons were obliged to extinguiſh their candles and fires. He alſo ſeized the treaſures belonging to their monaſteries, under pretence that the rebels had concealed their moſt valuable effects in theſe religious ſtructures: impoſed the tenure of knight's ſervice upon all lands held of the crown: cauſed a general ſurvey of all the lands in England to be made, and an account to be taken of the villains, ſlaves, and live ſtock, upon each eſtate; all which was recorded in Doomſday-Book. He would not ſuffer the Engliſh to hunt or fell timber in his foreſts, without leave firſt obtained from him. He obliged them to uſe the Norman language upon all occaſions, and ordered it to be taught in ſchools. During his reign, England was treated in every reſpect as a conquered country. He died in the year 1087, and was ſucceeded by his ſecond ſon,

William

William II. ſurnamed Rufus, who, purſuant to the will of his father, had diſinherited Robert, his eldeſt ſon, for being concerned in a conſpiracy againſt him. This engaged the two brothers in perpetual wars with each other: but the cruſades to the Holy Land being ſet on foot about this time, Robert engaged in an expedition to Aſia, and, having occaſion for a ſum of money to defray the neceſſary expences of this undertaking, he mortgaged his duchy of Normandy to the king of England for ten thouſand marks of ſilver. William was continually engaged in ſubduing his rebellious ſubjects, and repelling the incurſions of the Welſh and Scots; the latter of whom aſſerted the right of Edgar Atheling to the crown of England. Theſe ſucceſſive commotions obliged him to raiſe large ſums of money, which he uſually levied on the clergy, as moſt able to bear the burden: but theſe being the only hiſtorians of that age, they have loaded his memory with the crimes of rapaciouſneſs and oppreſſion. William's death happened in the year 1100, and the 44th year of his age, when, being on a hunting party, he was accidentally ſhot by one of his attendants.

William II. having no iſſue, as ſucceeded by his younger brother Henry, ſurnamed Beauclerk, on account of his learning, who, taking advantage of Robert's abſence, ſeized upon the crown, to which he had no juſt pretenſions during the life of his elder brother. Robert, on his return from the Holy Land, endeavoured to obtain his right, by invading England; but loſt his duchy of Normandy, together with his liberty, in the attempt, and, after a long impriſonment, died in Cardiff-Caſtle. Henry was next engaged in a long but ſucceſsful war againſt France; and afterwards ſubdued the Welſh, who had taken up arms againſt him. By a charter granted to his ſubjects, he confirmed ſeveral privileges they had enjoyed under the Saxon kings, and reformed the abuſes which had crept into the court. In his reign, the clergy formed themſelves into a kind of ſeparate body, dependent on the pope only, which afterwards created great confuſion in the nation.

Henry having previouſly ſettled the ſucceſſion on his daughter, the empreſs Matilda, or Maud, and her ſon Henry, but they being abroad at the time of Henry's death, the crown was claimed and ſeized by Stephen, earl of Blois, ſon of Adela, fourth daughter to William the Conqueror. A dreadful civil war enſued, and the kingdom was torn to pieces by inteſtine diviſions. The empreſs Matilda thought this a proper opportunity to aſſert her right, together with that of her ſon. Accordingly ſhe landed in England in the year 1139, attended by no more than 140 men; but, being continually reinforced by her friends as ſhe advanced, ſhe was ſoon in a condition of facing Stephen's forces, and ſeveral ſkirmiſhes happened between the two armies: at laſt, on the ſecond of February 1141, a general engagement enſued, wherein the king's army was defeated, and himſelf taken priſoner. Matilda, however, having, by her folly and unbounded ambition, rendered herſelf odious to the greater part of the nation, particularly to the clergy, who, by this time, had arrived at the moſt intolerable height of inſolence, ſhe was driven out of the kingdom, and Stephen re-inſtated on his throne. He did not long, however, enjoy the peace he thus acquired; Henry, ſon to the empreſs Matilda, conſidering Stephen, as an uſurper, applied to the king of Scotland, his great uncle, for aſſiſtance; and, being aſſured of the countenance of the clergy, he entered England, and the nation became once more a ſcene of anarchy and confuſion. At length a peace was concluded between the two contending princes, whereby it was agreed that Stephen ſhould enjoy the crown during his life, and Henry ſucceeded to it after his his deceaſe. Though this accommodation was only precarious and imperfect, yet it was received with great joy by the Engliſh.

Stephen dying in 1154, Henry II. peaceably aſcended the throne, and began his reign by ſending all the foreigners, particularly the Flemings whom Stephen had called over to his aſſiſtance, out of the kingdom. The dreadful ſcenes of murder and confuſion that had attended the civil wars, having convinced Henry that many forts and caſtles belonging to private perſons were deſtructive of the public tranquility, he demoliſhed them all, except ſuch as he thought neceſſary for the ſafety of his kingdom. He was a great encourager of trade and manufactures; incorporated ſeveral towns, and granted ſuch power to the boroughs in England, that, if a bondman or ſervant remained in any of them a year and a day, he became a freeman by ſuch reſidence. This law gave a ſevere blow to the feudal power of the barons. He revoked all the donations his predeceſſor had made, and reſumed the crown lands which Stephen had alienated. He endeavoured to curb the inſolence of the clergy, particularly that of Becket, archbiſhop of Canterbury, and, by that means embroiled himſelf with the ſee of Rome. The haughty prelate, finding himſelf ſupported by the pope, treated the king with the utmoſt inſolence and contempt, which raiſed the reſentment of Henry to ſuch a pitch, that he one day exclaimed—"Is there no one who will revenge his monarch's cauſe upon this audacious prieſt!" His exclamation was not made in vain, it was overheard by four knights, and without informing Henry, who was then in Normandy, of their intention, they came over to England, and ſlew Becket at the altar of his own church in Canterbury. Henry, in order to appeaſe the public reſentment, which the ſuppoſition of his being privy to the murder had raiſed againſt him, he ſuffered himſelf to be ſcourged at the tomb of the pretended martyr.

Henry was the firſt who levied a tax on the moveables and perſonal eſtates of his ſubjects. He introduced the uſe of glaſs windows into England, and ſtone arches in building: but, among all the excellent laws made by this monarch, none redounds more to his honour than that relative to ſhipwrecks, whereby the barbarous and abſurd practice of forfeiting ſhips, which had been loſt on the coaſt, was aboliſhed, and, if either man or animal was found on board alive, the veſſel and goods were reſtored to the owners.

This prince was engaged in perpetual wars with Scotland, France, Wales, and Ireland; the laſt he entirely conquered, and governed by an officer, to whom he gave the title of grand juſticiary. He took William, king of Scotland priſoner, and obliged him to pay 100,000l. for his ranſom; and, juſt before his death, concluded an honourable peace with France. But, notwithſtanding Henry's great ſucceſſes, his life was a continual ſeries of miſery, occaſioned by the ſucceſſive rebellions of his ſons, who did not ſcruple to act in concert with his avowed enemies. They were encouraged in theſe deteſtable practices by their mother, queen Eleanor, in revenge for the attachment ſhewn by Henry to other women, particularly the fair Roſamond. Theſe repeated misfortunes at length broke the ſpirit of that great prince, and he died of grief in the year 1189.

Richard I. ſurnamed Cœur de Lion, on the demiſe of his father, aſcended the throne, and diſtinguiſhed the beginning of his reign by raiſing an army of 35,000 men, with whom, by the perſuaſion of the clergy, and for their own ends, he made a moſt magnificent but ruinous cruſade to the Holy Land, where he took Acon and Aſcalon, and performed many other acts of valour. But, on his return to England, he was treacherouſly taken priſoner by Leopold, duke of Auſtria, who had ſerved under him at the ſiege of Acon, where, being diſguſted at an inſult offered to his ſtandard by this haughty monarch, he cauſed him to be ſeized as he was paſſing through his dominions, and thrown into priſon. The

emperor Henry VI. who alſo conſidered Richard as an enemy, on account of an alliance contracted by him with Tancred, king of Sicily, offered the duke a large ſum of money if he would deliver the royal captive into his hands. Leopold readily conſented; and, while England was diſtracted with inteſtine commotions, her king was confined in a dungeon by the faithleſs and avaricious Germans. He continued in this diſmal ſituation till the ſum of 300,000l. of our preſent money was paid for his ranſom.

At his return to his dominions, he was received with univerſal joy by his ſubjects, but found every thing in the utmoſt confuſion; by the treachery of his brother John, in whoſe favour France had invaded this kingdom. However, he ſeems to have held John in too much contempt to exert that revenge which he doubtleſs had in his power: his mind was fixed on more important objects; he liſtened to the overtures of the emperor Henry VI. who, aſhamed of the treatment he had inflicted on Richard, now ſolicited his friendſhip and aſſiſtance againſt the king of France. War was accordingly declared againſt that monarch, but ſoon after terminated by a truce of five years; and the renewal of hoſtilities was prevented by the death of Richard, who was ſlain before the walls of the caſtle of Chalus. The viſcount Limoges, owner of that fort, being a vaſſal of Richard, refuſed to deliver up a treaſure he had diſcovered, and which Richard claimed as ſuperior lord of the ſoil. This event happened in 1199, the 42d of his age, and 10th of his reign.

John ſeized the crown, and determined to defend it to the laſt extremity, and ſoon after baſely murdered Arthur, the eldeſt ſon of his brother Geoffrey, who had the hereditary right. Philip, king of France, eſpouſed the cauſe of that unfortunate prince, and cited the king of England to repair to France, and ſtand trial for that atrocious crime. John refuſed to obey the ſummons, and was declared guilty of felony and parricide; adjudged to forfeit to his ſuperior lord all his ſeignories and fiefs in France. That inhuman act had rendered him deteſtable to the generality of his ſubjects, and, ſoon after, his puſillanimous conduct embroiled him with the barons, who deteſted his actions. Apprehenſive of an invaſion from France, and dreading the reſentment of his nobility, inſtead of making the neceſſary preparations for ſecuring his kingdom, he applied to the pope for protection. He even offered to become his tributary, as a proof of which he meanly laid his crown at the feet of Pandulph, the pope's legate. The church of Rome, ſenſible of John's weakneſs, now reſolved to acquire unlimited power in England. In this deſign the pope was aſſiſted by the clergy, who wiſhed to render themſelves entirely independent of the civil power, and therefore exerted their utmoſt efforts. England was now once more reduced to a deplorable ſtate of anarchy and confuſion. At length the barons prevailed, and John was obliged to ſign that foundation of all our liberties, ſo well known by the title of Magna Charta. But this being merely an act of compulſion, John complained to the pope of the violence impoſed upon him, and his holineſs immediately declared the charter to be null and void, as having been obtained by force.

In the mean time, John privately levied a body of foreign forces, by whoſe aſſiſtance he, in his turn, triumphed over the barons, who, reduced to the moſt deſperate extremity, offered to acknowledge Lewis, eldeſt ſon to the king of France, as their ſovereign, provided he would aſſiſt them againſt their enraged monarch. The terms were accepted, and Lewis landed in England. John immediately aſſembled a conſiderable army, but paſſing from Norfolk into Lincolnſhire, his road lay along the ſea-ſhore, then overflowed at high water; and fixing on an improper time for his journey, he loſt, in the inundation, all his treaſure, carriages, baggage, and regalia. This misfortune ſo deeply affected him, that he retired to the caſtle of Newark, where he died in 1216, in the 18th year of his reign, and 49th of his age.

Henry III. then a child of ten years old, he appointed to ſucceed him; and, during his minority, the earl of Pembroke was choſen protector of the kingdom. Though hiſtorians have charged John with being of an arbitrary, inconſtant, and cruel diſpoſition, yet it is evident, from the ſame relation, that he had great provocations from the clergy and the barons, who, in their turns, attempted to annihilate the royal prerogative. It muſt be acknowledged, at the ſame time, that, under John, the commons of England laid the foundation of all the wealth and privileges they now enjoy; and the commerce of England received a moſt ſurpriſing increaſe. He may be called the father of the privileges of free boroughs, which he eſtabliſhed and endowed all over his kingdom; and that it was under him that the ſtone-bridge was finiſhed acroſs the Thames at London, as it ſtood ſome years ago. The city of London owes ſome of her privileges to him. The office of mayor, before his reign, was for life; but he gave them a charter to chooſe them a mayor out of their own body, and alſo to elect their ſheriffs and common council annually.

Henry was obliged to ſwear fealty to the pope, and renew that homage to which his father had ſubjected the kingdom; and his holineſs, in return, acknowledged Henry's right to the crown of England. Lewis was now obliged to quit the kingdom, and renounce all pretenſions to the crown. But the protector well knew that it was not ſufficient for Henry to have no competitor for the throne, it was alſo neceſſary for him to gain the affections of his ſubjects; accordingly, a new charter of liberties, chiefly copied from that extorted by the barons from his father, was granted. It had been happy for Henry had the protector lived, by whoſe wiſe adminiſtration affairs once more flowed in their proper channels, and the independency of this country was once more reſtored; but Pembroke dying in 1219, he was ſucceeded in the government by the biſhop of Wincheſter and Hubert de Burgh, high juſticiary. Their conduct was the reverſe of that of their predeceſſor, and the barons again broke out into open rebellion. They, however, aſſured the king, when ſummoned to anſwer for their conduct, that they had no deſign againſt his ſacred perſon, and that their ſole motive for appearing in arms was to remove Hubert de Burgh from his office. Henry, at that time, refuſed to comply with their requeſt; but, a few years after, Hubert was diſmiſſed.

The government of the kingdom devolved entirely on the biſhop of Wincheſter, who was a native of Poictou; he perſuaded Henry to admit a number of his countrymen, and other foreigners to ſettle in England. In a ſhort time all places of importance were beſtowed upon them, and Henry was prevailed on to violate the great charter. This once more rouſed the barons, and the king was threatened with excommunication by Edmund, archbiſhop of Canterbury, and other prelates of England, if he did not diſmiſs the biſhop of Wincheſter from his poſts, and all foreigners from the kingdom. Henry thought proper to comply with both theſe injunctions, and the primate, who was in every reſpect equal to the taſk, was placed at the head of the government.

Henry's attachment to foreigners, however, ſtill continued. He had married Eleanor, daughter to the count of Provence, and her relations and followers were promoted to the chief poſts in the kingdom. The barons, finding all remonſtrances ineffectual, entered into a confederacy, at the head of which was one Simon de Montfort, earl of Leiceſter. This ſtruggle between the king and his diſcontented barons laſted a conſiderable time; but at length the latter conquered, and, in one deciſive battle, the king and prince Edward, his eldeſt ſon, were taken priſoners at the

†

the battle of Lewes. Leiceſter and the barons now governed the nation; but prince Edward, having found means to eſcape, ſoon aſſembled an army at Eveſham, and coming to an engagement with the barons, killed Leiceſter, entirely defeated their forces, and replaced his father on that throne his rebellious ſubjects had ſo unjuſtly uſurped.

Edward afterwards undertook an expedition to the Holy Land; but, during his abſence, England again became a ſcene of confuſion; and Henry, worn out with age and grief, died in 1272, expiring in the arms of his favourite ſon, in the 64th year of his age, and 56th of his reign, which was uncomfortable and inglorious; and yet to the ſtruggles of this reign, the people in great meaſure owe the liberties of the preſent day. During the reign of Henry, the feudal tenures in England received a ſevere blow by the knights and burgeſſes being allowed to form part of the legiſlature in a ſeparate houſe, which is the preſent Houſe of Commons.

Edward was proclaimed king of England immediately on the demiſe of his father. He invited all who held of his crown *in capite* to his coronation dinner, which conſiſted of 278 bacon hogs, 450 hogs, 440 oxen, 430 ſheep, 22,600 hens and capons, and 13 fat goats. Alexander III. king of Scotland, was at the ſolemnity, and let looſe 500 horſes, for any that could catch them, to keep them. As ſoon as the ceremony of his coronation was performed, Edward employed himſelf in correcting thoſe abuſes, which, during the preceding reigns, had introduced themſelves into the kingdom. The nation was over-run with robbers, murderers, incendiaries, raviſhers, and plunderers, who lived in open defiance of the laws; and, to proceed againſt ſuch, the king appointed ſpecial commiſſioners, who were to travel through all the counties in England, inquire ſtrictly into diſorders of every kind, and puniſh them with the utmoſt ſeverity. The commiſſioners executed their orders with ſuch vigour, that numerous gangs of diſorderly people were ſoon diſperſed, and the evil totally eradicated. Edward likewiſe regulated the coin, which at that time was greatly adulterated. He ſettled the privileges of the cinque ports; and paſſed the famous mortmain act, whereby all perſons were reſtrained from giving, by will or otherwiſe, their eſtates to religious, and other ſocieties that never die, without a ſpecial licence from the crown.

In the year 1276, he undertook an expedition againſt Lewellyn, prince of Wales, who, during the life of Henry, had aſſiſted the barons; and, on the acceſſion of Edward, refuſed to perform the homage of a vaſſal. Lewellyn made the neceſſary preparations for defending his principality; but finding that the advantageous ſituation of Edward's army had cut off all ſupplies from his own, he was obliged to ſurrender at diſcretion, without having been able to bring the king to an engagement: a treaty was agreed to, and hoſtages delivered by Lewellyn for ſecurity of his future ſubmiſſion. The Welſh, however, could not long ſuffer the inſolent treatment they received from the Engliſh, and once more had recourſe to arms: but this laſt effort for the preſervation of their liberties proved abortive. Lewellyn was ſlain, and his brother David, who ſucceeded to the title, never being able to collect an army ſufficient to face Edward, flew from place to place, and was at laſt betrayed into the king's hands, who cruelly put him to a ſhameful death. The ancient race of their princes being thus extirpated, all the nobility in Wales ſubmitted to the conqueror, and the laws of England, with the ſheriffs, and other miniſters of juſtice, were eſtabliſhed in that principality. Edward created his ſon prince of Wales, and the eldeſt ſons of the monarchs of England have ever ſince borne that title.

Edward was choſen arbiter between Robert Bruce and John Baliol, each of whom, on the death of Margaret, queen of Scots, in 1291, claimed the throne of that kingdom. Edward declared in favour of Baliol, who accordingly aſcended the throne, and, purſuant to a promiſe he had previouſly made the king of England, did homage to Edward for his crown; but, repenting of ſo ſhameful a ſubmiſſion, he ſeized the opportunity offered him, by a war breaking out between England and France, to exert his right of independence. With this view he entered into an alliance with France, but unfortunately for him, a truce being ſoon after concluded between England and that nation, Edward had leiſure to employ the whole force of his arms againſt Scotland, which he reduced to a province of England, and took Baliol priſoner. Impatient of ſubmitting to the Engliſh yoke, the Scots reſolved, if poſſible, to ſhake it off; and Edward, rendered furious by their frequent attempts, at laſt reſolved to ruin their country ſo effectually, as to prevent every attempt of that nature for the future. He aſſembled a numerous army, which he conducted to Carliſle; but, while the neceſſary preparations were making to execute his intentions, he was ſeized with a diſorder which put a period to his life in the year 1307, the 69th year of his age, and 35th of his reign. He ordered his heart to be ſent to the Holy Land, with 32,000l. for the maintenance of what was called the Holy Sepulchre.

In his wars with France, Edward loſt Guienne; for, though he had formed alliances againſt that nation with moſt of the princes of Germany and other powers, he had the mortification to reap no advantage from their aſſiſtance; and that every attempt to leſſen, tended only to heighten the glory of Philip.

This monarch gave great encouragement to foreigners, who traded with England; but he made the aggregate body of every particular nation, reſiding here, anſwerable for the crimes of each individual of their number. He regulated the forms of parliament, and their manner of granting aids towards the nation's defence, which differed very little from the preſent method: and, at the beginning of his reign, he proceeded with great rigour againſt the Jews, whom he expelled the kingdom, and ſeized upon their eſtates.

Edward II. ſucceeded his father, but fell far ſhort of him in the government of his dominions. He was no ſooner, as he ſuppoſed, maſter of himſelf and actions, than he recalled his favourite Gaveſton, ſon to a Gaſcon knight of ſome diſtinction. This young man had been eſtabliſhed in the Prince of Wales's houſehold by Edward I. in return for the ſervices of his father; but finding he had inſinuated himſelf into the affections of his ſon, in whom he was deſirous of cruſhing his deſire for favourites, which already ſeemed the ruling paſſion of his ſoul, he baniſhed young Gaveſton, and, on his death-bed, exacted a promiſe from the prince never to recall him. Happy had it been for Edward had he obeyed this injunction of his father; for the barons finding that, beſides endowing his minion with the earldom of Cornwall, he was daily loading him with riches and honours, which rendered him inſupportably inſolent, they formed a party againſt him, at the head of which was Thomas, earl of Lancaſter, couſin-german to the king.

The barons now repaired to the parliament-houſe armed, where they inſiſted upon the baniſhment of Gaveſton, and that he ſhould take a ſolemn oath never to return into England. The king finding he muſt in ſome meaſure comply with this requeſt, appointed his favourite lord lieutenant of Ireland; but, unable to bear his abſence, he ſoon recalled him. The barons, however, obliged him once more to quit the kingdom; and, upon his returning again in 1312, the whole nation roſe up in arms; upon which Edward placed Gaveſton in the caſtle of Scarborough, then deemed impregnable. Gaveſton, however, had neither courage nor conduct ſufficient to defend it: he ſoon capitulated, and ſurrendered himſelf a priſoner

ſoner to the barons. By the terms of capitulation it was agreed, that his life ſhould be ſafe for two months; but the enraged barons no ſooner found themſelves maſters of his fate, than they ordered his head to be ſtruck off by the hands of the common executioner. The king was at firſt inconſolable, and denounced vengeance on the barons and nobility who had been acceſſary to the murder of his favourite; but upon their condeſcending to aſk his pardon, publicly on their knees, he forgave them every thing that was paſt.

While England was diſtracted with inteſtine broils, Robert Bruce recovered the greater part of Scotland, and, at the time of Gaveſton's death, was beſieging Stirling, the only fortreſs which remained in the hands of the Engliſh. Edward led a numerous army to its relief, but coming to an engagement with Bruce near Bannock-Bourn, he was entirely defeated, and the greater part of his forces ſlain. After which, Robert conquered the Engliſh as often as he engaged them; laid all their provinces contiguous to his dominions under contribution, ſecured his crown, and gave a general peace to his kingdom.

After the death of Gaveſton, the king attached himſelf to Hugh Spencer, and was entirely governed by his counſels and thoſe of his father. This once more gave the barons a pretence for rebellion, and both father and ſon were baniſhed. But Edward having, by the aſſiſtance of the common people, obtained ſome advantages over the barons, he, at the inſtigation of his queen Iſabella, a furious ambitious woman, recalled the Spencers; and numbers of the nobility fell victims to her cruelty. At length the Spencers themſelves having given her cauſe of diſguſt, ſhe formed a party, and publicly levied a body of troops in order to deſtroy thoſe very favourites, to whom ſhe was indebted for her power. All theſe ſchemes were concerted at the court of Philip the Fair, king of France, who was brother to Iſabella, and whither ſhe had retired, under pretence of taking her ſon to pay homage for Guienne and Ponthieu. There ſhe was joined by numerous malcontents from England, and, among the reſt, by Roger Mortimer, a Welſh baron, who had been condemned for high treaſon; but his ſentence of death being changed into that of perpetual impriſonment, he found means to eſcape from the Tower, and took ſhelter in France. Here he was introduced to the queen of England, who firſt employed him as her counſellor, but ſoon becoming enamoured of his perſon, they publicly lived together in the moſt criminal intimacy.

When affairs were ripe for execution, Iſabella ſailed for England, where, on her landing, ſhe was joined by the nation in general, who ſuppoſed her only intent was to put an end to the power of the Spencers. Thus abandoned, Edward attempted to fly into Ireland, but being driven by contrary winds on the coaſt of South Wales, he endeavoured to conceal himſelf in the mountains: he was however, ſoon diſcovered, and conducted to Kenelworth Caſtle, and the Spencers being alſo taken priſoners were both put to death. The infamous queen now ſummoned a parliament, in which ſentence was paſſed upon the unfortunate but innocent Edward, whereby he was obliged to reſign his crown in favour of his ſon. This point obtained, there wanted nothing to render the character of Iſabella truly diabolical, but the murder of her depoſed huſband; and this by her contrivance, jointly with that of Mortimer, was perpetrated on the 21ſt of September 1327.

Edward III. at his acceſſion to the throne, was only 14 years of age; ſo that the queen and Mortimer flattered themſelves that the adminiſtration of affairs would, for ſome years at leaſt, be under their direction, and, in order to ſecure their power, they planned and executed many popular meaſures. But Edward eaſily penetrated into their deſigns, and reſolved to counteract them, when a proper opportunity ſhould offer. He was ſurrounded by the emiſſaries of Mortimer, and was therefore obliged to act with the utmoſt caution; but having privately engaged the aſſiſtance of ſeveral perſons of diſtinction, Mortimer was ſeized in his bed, and, after a ſhort trial, condemned by parliament to be hanged; which ſentence was executed on a gibbet at the Elms, in the neighbourhood of London. The vile queen was confined for life to her own houſe at Riſings, and her revenue reduced to 4000l. per annum.

Edward now proceeded with the utmoſt induſtry and judgment to redreſs all thoſe grievances which had either proceeded from want of authority in the crown, or from the late abuſes of it. Thieves, murderers, and criminals of all kinds, were protected by the barons, for whom they had acted during the civil commotions. Edward ſaw the danger of this attempt, and, in order to render it ſucceſsful, firſt exacted a promiſe from the peers, that they would break off all connections with ſuch diabolical wretches. This point being gained, he iſſued writs to the judges, enjoining them to adminiſter juſtice without paying any regard to arbitrary orders from his miniſters; and they proceeded with ſuch rigour, that the public diſturbers of the peace of the kingdom were ſoon either extirpated or diſperſed, their gangs broken, and a period put to their pernicious practices.

When affairs were ſettled at home, the king employed his forces againſt John Bruce, king of Scotland, who, on the death of Edward II. had committed dreadful ravages on the frontiers of England: but the queen dowager and Mortimer thought it at that time moſt conducive to their ſafety to make peace with John; and, to render it more laſting, Iſabella gave her daughter Joan in marriage to David, eldeſt ſon of Bruce. This conſanguinity, however, did not affect Edward, who reſolved to place Edward Baliol, ſon of that prince, who had been taken priſoner by Edward I. on the throne of Scotland, in oppoſition to his brother-in-law. He ſent for him from Normandy, and promiſed him every aſſiſtance in the recovery of the Scottiſh crown, to which he had an undoubted right, provided he would, in return, become his vaſſal. Baliol conſented, and, after ſeveral conflicts, drove David out of Scotland, where he was ſoon after crowned.

The king of France dying without iſſue in 1337, Philip of Valois declared himſelf next male heir to that crown, but was oppoſed by Edward, who, notwithſtanding he was well acquainted with the Salique law, which excludes all females or their deſcendents from aſcending the throne of that kingdom, aſſerted his claim in right of his mother; and, when he found that Philip was acknowledged king of France, reſolved to invade his kingdom. This war, on the part of Edward, was a continual ſcene of ſucceſs, and he carried his victorious arms even to the gates of Paris. In 1340, he took the title of king of France, uſing it in all public acts, and quartered the arms of France with his own, adding this motto, "Dieu et mon Droit, God and my right." On the 19th of September 1356, was fought the famous battle of Poictiers, wherein the army of John, the French king, was defeated, and himſelf, with his ſon Philip, taken priſoners, by the Engliſh, under the command of Edward prince of Wales, commonly called the Black Prince, at that time only 16 years of age. This prince was the darling of his father, the admiration of all Europe, and the hope of England: but his early death prevented the enjoyment of that happineſs with the proſpect of which the nation fondly flattered themſelves when he ſhould aſcend the throne. He died in 1372, while he was making a glorious campaign in Spain, where he reinſtated Peter the Cruel on that throne. In 1360, Edward having reduced Calais, conſented to a peace, whereby he was left in poſſeſſion of ſeveral capital provinces in France,

and

and John was to pay three millions of crowns in gold for his ranſom.

During the above war with France, the Scots taking advantage of the abſence of Edward, recalled their king, David, who, returning with a body of choſen troops, marched into Northumberland, penetrated as far as Durham, which he took, and put all its inhabitants to the ſword. He did not long enjoy the fruits of his invaſion; Edward's queen, Philippa, marching againſt him at the head of a numerous army, obtained a complete victory, and took David priſoner. He was conducted to London, and did not recover his liberty till the end of the war.

The order of the garter was inſtituted by Edward III. and he built the noble caſtle of Windſor. In his reign John Wickliffe, a ſecular prieſt, educated at Oxford, preached the doctrines of the Reformation, and made many diſciples among all ranks of people, who were diſtinguiſhed by the appellation of Wickliffites, or Lollards. He was a man of parts, language, and piety; and has the honour of being the firſt perſon in Europe who publicly called in queſtion thoſe doctrines which had generally paſſed for certain and undiſputed during ſo many ages. The doctrines of Wickliffe being derived from his ſearch into the Scriptures, and into eccleſiaſtical antiquity, were nearly the ſame with thoſe propagated by the reformers in the 16th century. He had many friends in the univerſity of Oxford and at court, and was powerfully protected againſt his enemies, by John of Gaunt, duke of Lancaſter, one of the king's ſons, and other great men. Edward died in the year 1377.

Richard II. ſon to the Black Prince, ſucceeded his grandfather Edward, at the early age of 11 years. During his minority, the kingdom was governed by the duke of Lancaſter, the duke of York, and the duke of Glouceſter, his three uncles. In the beginning of his reign, the Scots defeated the Engliſh army, and this was followed by a three years truce. The French inſulted the coaſts of England, which induced Richard to carry his arms into France, but without ſucceſs, and the war was at length terminated by a twenty-five years truce. Richard was ſoon after affianced to Iſabel, daughter of Charles VI.

The king's unbounded attachment to favourites, which offended his ambitious uncles; the heavy taxes, particularly the poll-tax, impoſed upon the people; and the doctrines of Wickliffe; rendered the nation a continued ſcene of confuſion, during the whole reign of this weak prince. A rebellion broke out, headed by Ball, a prieſt, Wat Tyler, and Jack Straw, who, aſſembling 100,000 rabble, marched from Blackheath to London, where they committed great outrages, and became ſo formidable, that the king was obliged to enter into a conference with the arch-rebel in Smithfield: but the demands of theſe headſtrong people were ſo inſolent, and the menaces of their chief, in caſe of refuſal, ſo daring, that Walworth, lord-mayor of London, who then attended the king, enraged at his audacity, ſtruck him a violent blow on the head, which inſtantly deprived him of life, and, by the excellent conduct of the young king, the rebels ſoon after laid down their arms without any further ill conſequences. Happy had it been for Richard, if the ſame moderation which he poſſeſſed in the inſurrection of Wat Tyler, had influenced every other action of his life. But Sir Michael de la Pole, lord chancellor, judge Treſilian, and Robert de Vere, earl of Oxford, created duke of Ireland, deſtroyed the pleaſing proſpect of happineſs. Theſe three worthleſs men poſſeſſed his entire confidence, which rendered them exceedingly obnoxious to parliament; and, notwithſtanding the king's utmoſt efforts in their favour, they were attainted, and condemned to ſuffer as traitors.

By theſe factions, the kingdom was brought to the brink of deſtruction, and the king ſacrificed ſeveral noblemen to his ſafety, particularly the duke of Glouceſter, who was inſidiouſly impriſoned, and afterwards murdered at Calais. A quarrel ſoon after happened between the duke of Hereford, ſon to the duke of Lancaſter, and the duke of Norfolk, which was to be determined by ſingle combat between the parties; but, when the two champions appeared in the field, the king interpoſed, and, in order to prevent at once the preſent effuſion of noble blood, and the future conſequences of the quarrel, he ordered both the dukes to quit the kingdom, and retire to different nations.

About this time, Richard embarked for Ireland, in order to revenge the death of his couſin, Roger, earl of Marche, the preſumptive heir of the crown, who had lately been ſlain in a ſkirmiſh with the natives; and the nobility, thinking themſelves materially affected by the injury done to Henry, duke of Lancaſter, offered that nobleman the crown of England, if he would return and head the malcontents, who were by this time very numerous. This opportunity of gratifying his revenge and gaining the crown, was eagerly embraced by the duke, who ſoon found himſelf at the head of 60,000 men, and ſoon after reinforced by 40,000 more, under the duke of York, who had been left regent to the kingdom. Richard, having intelligence of this invaſion and inſurrection, immediately left Ireland, and landed at Milford-Haven with a body of 20,000 men; though he ſoon found them reduced to about 6,000, the reſt having joined the duke. Thus abandoned, the king fled to the iſle of Angleſey, from whence he propoſed to eſcape either into France or Ireland; but, being prevailed on to continue in the kingdom by the feigned conceſſions of Lancaſter, he was ſoon after betrayed by Percy, duke of Northumberland, into the hands of his rebellious ſubjects, who conveyed him priſoner to London. A parliament was now aſſembled, and Richard, accuſed of oppreſſion, tyranny, and miſconduct, was depoſed by the ſuffrages of both lords and commons, and ordered to be impriſoned in Pomfret-Caſtle, in Yorkſhire, where he died in 1399, in the 34th year of his age, and 23d of his reign.

Henry IV. was ſon of John of Gaunt, duke of Lancaſter, fourth ſon of Edward III. and placed on the throne of England in prejudice to Edmund, earl of Marche, ſon of that Roger who was ſlain in Ireland, and who had been declared preſumptive heir of his crown by Richard. The nobility flattered themſelves that this glaring defect in his title would render him dependent upon them, but they ſoon found themſelves diſappointed. Though this occaſioned ſome conſpiracies againſt him, his prudence ſoon rendered them abortive, and he reſolved to leave nothing unattempted to reduce the enormous power of the nobility.

Foreign powers conſidered the acceſſion of Henry in no other light than that of an uſurpation; ſome, however, from indolence, and others from intereſt, acknowledged his title to the crown of England. The king of France, highly incenſed at the injury offered to Richard, reſolved to revenge it, and even impriſoned the herald ſent by Henry's ambaſſadors to demand a ſafe conduct for them to the French court: but being haraſſed by inteſtine diviſions, political motives obliged him to accommodate affairs as ſoon as poſſible. Having recovered his daughter, widow to Richard, he laid aſide his preparation for war, and renewed the truce between the two crowns.

Theſe commotions induced the Scots to make incurſions into England, and, though Henry had taken poſſeſſion of Edinburgh, he could not prevail on Robert III. to do him homage for his crown, nor force him to a battle. Finding therefore that his ſtay in Scotland was of no conſequence, he returned to London and diſbanded his army. But the next year, Archibald, earl of Douglas, having made an

irruption into the northern counties of England, and committed great devaſtations, was overtaken on his return by the Percies, and a dreadful battle enſued, wherein the Scots were totally routed, and Douglas himſelf taken priſoner, together with a great number of the principal Scots nobility. The news of this victory being tranſmitted to Henry, he returned the earl of Northumberland, with the reſt of his family, thanks for this important ſervice; but, at the ſame time, required the noble priſoners to be delivered up to him. This gave diſguſt to the conquerors, who, in a ſhort time after, broke out into open rebellion, and a battle was fought between the king, who commanded his own forces, and Henry Percy, ſurnamed Hotſpur, at the head of the rebels. After a long and bloody conteſt, wherein Hotſpur was ſlain, Henry proved victorious, and the earl of Northumberland having made the neceſſary conceſſions, the king thought proper to grant him a pardon: but the loſs of his favourite ſon ſat heavy on his mind. He ſoon after entered into a conſpiracy with the earl of Nottingham and the archbiſhop of York; the whole, however, proved abortive: Nottingham and the prelate were taken priſoners, Percy fled into Scotland, and afterwards made ſome fruitleſs endeavours to excite an inſurrection in the north of England, where he was ſlain in battle by Sir Thomas Rokeſby, ſheriff of Yorkſhire. About the ſame time Glendour, who had headed the Welſh in their rebellions, died; and Henry having by accident taken James, heir to the crown of Scotland, a child of nine years old, peace was entirely reſtored to the nation.

The marine of England was conſiderably increaſed in the reign of this monarch: the different orders of parliament, eſpecially the commons, acquired their proper authority. Learning was at this time at a much lower paſs in England, and all over Europe, than it had been 200 years before. Biſhops, when teſtifying ſynodal acts, were often forced to do it by proxy in the following terms, viz. "As I cannot read myſelf, N. N. hath ſubſcribed for me;" or, "As my lord biſhop cannot write himſelf, at his requeſt I have ſubſcribed." By the influence of the court, and the intrigues of the clergy, an act was obtained in the ſeſſion of parliament 1401, for the burning of heretics, occaſioned by the great increaſe of the Wickliffites or Lollards; and William Sawtree, the firſt martyr for this doctrine, was burnt alive. Henry IV. died in 1413, in the forty-ſixth year of his age, and the thirteenth of his reign.

Henry. V. who now aſcended the throne, had ſignalized himſelf greatly during the wars carried on by his father; but on the reſtoration of peace, he aſſociated himſelf with ſome infamous perſons, who led him into every ſpecies of vice and outrage. During the laſt illneſs of his father, however, there ſeems to have been a thorough reformation in his conduct, and the annals of England do not contain a greater hero.

The beginning of his reign was diſtinguiſhed by a conſpiracy formed among the Wickliffites, who were every day increaſing, and headed by Sir John Oldcaſtle, lord Cobham, who it was pretended had agreed to put himſelf at their head, with a deſign to overturn the government; but this appears to be a groundleſs accuſation, ſuggeſted by the bloody zeal of the clergy: however, Henry endeavoured at firſt, by gentle converſations, to reconcile that nobleman to the Catholic faith; but finding he could not prevail, delivered him over to the eccleſiaſtical power, and he was condemned to the flames for his erroneous opinions. He, however, before the day appointed for his execution, found means to eſcape from the Tower, but was taken about four years after, hanged as a traitor, and his body burnt on the gibbet, purſuant to the ſentence pronounced againſt him as a heretic. This rigour checked for a time the rapid progreſs which the Lollards had made ſince their firſt inſtitution.

Henry having received an injuction from his father never to ſuffer the Engliſh to remain long in peace, reſolved to follow the advice of Chichely, archbiſhop of Canterbury, and aſſert the right which Edward III. had formed to the crown of France. He firſt demanded that the provinces of Normandy, Anjou, Maine, and Poitou, ſhould be reſigned to him, which being refuſed by Charles VI. a war enſued. In 1415 Henry landed, with his army, at Havre de Grace, in Normandy, took Harfleur, and then defeated the French in the battle of Agincourt, where a great number of the principal nobility of France were left dead on the field, and many taken priſoners. After this engagement the conqueror ſubdued moſt part of France with the greateſt rapidity.

The French king having been declared a lunatic, the adminiſtration of affairs was diſputed between his bother, Lewis, duke of Orleans, and his couſin german, John, duke of Burgundy. This conteſt threw the whole nation into a ferment, which was artfully increaſed by Henry; who, taking advantage of theſe commotions, obliged the queen of France to give him her daughter Catharine in marriage; to declare him regent of France during her huſband's life, and his iſſue ſucceſſors to the French monarchy, in prejudice of the dauphin, her ſon. Accordingly, Henry made a triumphant entry into Paris, where he received the fealty of the French nobility, and the dauphin was formally proſcribed. That prince, however, aſſiſted by the Scots, left nothing uneſſayed for the recovery of his kingdom; but, in all probability, the attempt would have proved his deſtruction, had not death put a period to Henry's glory. Finding his laſt moments approach, he ſent for his brother, John, duke of Bedford, the earl of Warwick, and a few more noblemen, whom he had honoured with his confidence, and conjured them to protect his infant ſon. He adviſed them never to give liberty to the French princes taken at Agincourt, till his ſon was of age; and never to make peace with that nation, unleſs, by the ceſſion of Normandy, and its annexation to the crown of England, compenſation was made for all the hazards and expence he had experienced in endeavouring to obtain the crown of France. He then left the regency of that kingdom to the duke of Bedford; that of England to his younger brother the duke of Glouceſter; and the particular care of the infant king to the earl of Warwick. Having thus ſettled his worldly affairs, he diſmiſſed all but his confeſſor, and ſoon after expired, in the thirty-fourth year of his age, and the tenth of his reign. This event happened in the year 1422.

Henry VI. an infant of nine months, was proclaimed king of France, as well as of England, and writs were iſſued in his name for calling a parliament. At this meeting very little regard was paid to the verbal appointments of the deceaſed king. The duke of Bedford was nominated protector, or guardian of England, but the parliament would not ſuffer him to aſſume the appellation of regent, which ſeemed to them a title of two great authority. As the ſtate of affairs required that nobleman's preſence in France, they inveſted his brother, the duke of Glouceſter, with the ſame dignity during his abſence; and, in order to limit the power which theſe princes might aſſume, they named a council, without whoſe advice and approbation no meaſure of importance could be determined. The young king, inſtead of being in the hands of Warwick, was committed to the care of Henry Beaufort, biſhop of Wincheſter, his great uncle, who had the ſole care of his education. Mean time, the duke of Bedford reſolving to complete the conqueſt of France, made every neceſſary preparation for that purpoſe, both by the exertion of arms, and by entering into new treaties with the principal nobility in that kingdom.

On

On the death of Charles VI. which happened ſoon after that of Henry V. many of the French ſecretly wiſhed that the dauphin might aſcend the throne. The army of that prince was re-inforced by conſiderable numbers of Scots; and Bedford being obliged to viſit England, where buſineſs detained him near eight months, on his return to France had the mortification to find the Engliſh had ſuffered ſome defeats, and that numbers of the chief men in France had deſerted to the intereſt of Charles, among whom was the duke of Brittany. The regent therefore immediately attacked his province, and reduced him to ſuch extremities, that he once more renounced the French alliance, and promiſed to do homage for his duchy to Henry.

The duke now reſolved on the ſiege of Orleans, a place rendered by its ſituation of ſuch importance, that on the poſſeſſion of it the entire conqueſt of France in a manner depended. Senſible of this, Charles placed a ſtrong garriſon in that important city, which was for ſome time vigorouſly defended, but was at laſt on the point of ſurrendering for want of proviſions, when a phenomenon, ſcarcely to be paralleled in hiſtory, brought it unexpected relief. In the village of Domremi there lived a girl of about twenty-ſeven years of age, named Joan d'Arc, a ſervant at an inn, where ſhe performed the common offices of an oſtler. By frequently hearing the misfortunes of Charles, ſhe began to pity him, and miſtaking her deſire of affording him aſſiſtance for a divine miſſion, ſhe reſolved, if poſſible, to procure admiſſion to his preſence, which after ſome difficulty was effected. On approaching the prince, ſhe aſſured him that ſhe was ſent expreſsly from heaven to raiſe the ſiege of Orleans, and afterwards to conduct him to Rheims, and cauſe him to be crowned in that city. Charles having conſulted his friends, they either believed the girl inſpired, or thought her enthuſiaſm might be a means of raiſing the drooping ſpirits of the French. A ſtrong body of forces was immediately put under her command; and ſuch was the panic with which the Engliſh were ſeized on her approach, that, inſtead of engaging, they ſuffered her to enter Orleans peaceably, with the convoy deſtined to relieve the garriſon. Elated with her ſucceſs, ſhe reſolved to attack the beſiegers, who, dreading her ſupernatural influence, loſt all their wonted courage and confidence. The forts, built by the Engliſh generals round the city, were taken, with great ſlaughter, and at length the ſiege was raiſed, to the utter diſgrace of the Britiſh army. The maid of Orleans, an appellation uſually beſtowed on this extraordinary woman, did not give her enemies time to recover from their deluſion; ſhe diſpoſſeſſed them of ſeveral towns, and, having again defeated their army, took Talbot, their general, priſoner. She then conducted Charles to Rheims, ſeizing upon all the cities which oppoſed her paſſage, and rendered the French as formidable to the Engliſh, as, a ſhort time before, the Engliſh had been to the French. At laſt this extraordinary perſon fell into the hands of the Engliſh, who, contrary to every ſenſe of juſtice, humanity, or reaſon, condemned her to be burnt as a witch.

Bedford flattered himſelf that the death of this heroine would have re-eſtabliſhed Henry's intereſt in France, whither he cauſed the young king to be brought, and crowned at Paris. But it was beyond the power of man to retrieve the affairs of the Engliſh. The French returned with joy to the allegiance they owed Charles as their rightful ſovereign; and the duke of Burgundy, who had been a firm friend to the Engliſh ever ſince the beginning of this war, followed the current, and was reconciled to Charles. This defection was of the utmoſt importance at ſo critical a juncture, and was followed by a ſtill greater blow to the Engliſh; the duke of Bedford paid the debt of nature at Rouen, a few days after he received the news of the duke of Burgundy's reconciliation with Charles VII. in the year 1435.

§

England was at this time in the utmoſt confuſion; the king had married Margaret, daughter to the duke of Anjou, and titular king of Sicily, a woman of a high ſpirit and implacable diſpoſition. Glouceſter had loſt all his authority in the government. Wincheſter, who preſided at the head of the treaſury, had by his avarice ruined the intereſt of the nation both at home and abroad; and Richard, duke of York, lord-lieutenant of Ireland, whoſe claim to the crown of England was prior to that of Henry, being deſcended by the mother's ſide from Lionel, an elder ſon of Edward III. ſecretly formed a party to aſſert that right, and ſoon after broke out into open rebellion.

The duke of Glouceſter having been aſſaſſinated, by order of the queen, who, taking advantage of Henry's weakneſs, had ſeized the entire management of affairs, appointed William de la Pole, duke of Suffolk, prime miniſter: but he being ſoon after baniſhed and murdered, was ſucceeded by Edmund Beaufort, duke of Somerſet.

The king having been viſited with a fit of illneſs in 1454, it was neceſſary to appoint a protector; and the queen, being unable to reſiſt the York party, was obliged to acquieſce, when the duke was named to fill that important office by the parliament. This ſet the nation in a flame, and Henry recovering, both parties prepared for action. Soon after, a battle was fought at St. Alban's, in which the Yorkiſts gained the victory, and took Henry priſoner. This misfortune ſo diſconcerted the king, that he committed the whole authority of the crown into the hands of Richard. Margaret, however, found means to ſet her huſband at liberty. Five years after, a ſecond battle was fought at Northampton, wherein the Lancaſtrians were again defeated, and Henry made priſoner a ſecond time.

In a parliament ſummoned immediately after the battle of Northampton, the duke of York publicly aſſerted his claim to the crown, and ſubmitted his rights to the debates of the peers. After many deliberations, it was enacted, that the king ſhould poſſeſs the throne during his life, and the duke of York ſucceed him, in excluſion of all Henry's iſſue. When Margaret, who, with her infant ſon, had fled to Durham, heard of this deciſion, ſhe employed her utmoſt abilities to gain the northern barons over to her intereſt, and, to the aſtoniſhment of her enemies, ſoon collected an army of 20,000 men. At the head of this powerful body ſhe proceeded as far as Wakefield, and gave battle to the duke of York, who had marched thither to meet her; but Margaret proved victorious, the duke of York was ſlain in the engagement, and his forces cut to pieces.

Edward, now duke of York, exerted himſelf to revenge the death of his father, and obtained ſeveral advantages over the Lancaſtrians; notwithſtanding which, the queen advanced towards London, and having defeated the earl of Warwick at St. Alban's, ſet Henry once more at liberty. Not daring to enter London, where Edward was received with every demonſtration of joy, ſhe retreated northwards, taking her huſband with her. Edward now reſolved to aſſume the title and dignity of king, without waiting for the meeting of parliament. He ordered his army to aſſemble in St. John's Fields, where numbers of people attended, and the right of Edward being explained in an harangue, pronounced to this mixed multitude, they were aſked if they would have Henry of Lancaſter for their king? To which they replied in the negative. It was then demanded, whether they would accept of Edward, eldeſt ſon of the late duke of York? When they expreſſed their conſent by loud acclamations of joy. This popular election being finiſhed, it was ratified by a great number of biſhops, lords, magiſtrates, &c. and the new king was on the 5th of March 1461 proclaimed in London,

London, under the name of Edward IV. In the mean time the king and queen retreated into the north, where Margaret levied more forces; but Edward reſolving to give her as little time as poſſible, marched with the utmoſt expedition againſt her. The two armies met at Towton, where a moſt obſtinate battle enſued. After a moſt bloody conteſt, in which a great number of the nobility were ſlain, victory at length declared in favour of Edward, who purſuing the enemy with unrelenting fury, 40,000 men were left dead on the field.

Margaret and her huſband were obliged to fly into Scotland, where ſhe made ſuch conceſſions to the Scots, as induced them to aſſiſt her with a body of forces. At the head of this little army ſhe again entered England; and being reinforced by conſiderable numbers in the northern counties, ſhe again ventured to face the victorious Edward, but met with numberleſs defeats. Henry was taken priſoner, and ſhe, after enduring incredible fatigues, eſcaped into France.

This civil war was carried on with greater animoſity than any perhaps ever known. Margaret was as blood-thirſty as her opponents; and when priſoners of either ſide were made, their deaths were deferred only far a few hours, eſpecially if they were perſons of rank.

Edward IV. (the late duke of York) being crowned on the 29th of June, had ſome time before ſent the earl of Warwick to demand Bona of Savoy, the king of France's ſiſter, in marriage, in which embaſſy he was ſucceſsful, and nothing remained but the bringing over the princeſs into England; but in the mean time the king fell in love with, and privately married Elizabeth, the widow of Sir John Grey. When the ſecret of Edward's marriage broke out, the earl, deeming himſelf affronted, returned to England inflamed with rage and reſentment, and, from being Edward's ſincere friend, became his moſt implacable enemy: he, therefore, with the marquis of Montacute, the archbiſhop of York, and the duke of Clarence, concerted meaſures to dethrone the king, whom they attacked, in his camp at Nottingham, and made priſoner, but eſcaping from his confinement, and retiring to Holland, the earl of Warwick, and the French king, Lewis XI. declared for the reſtoration of Henry, who was replaced on the throne.

Edward, returning from Holland, advanced to London, under pretence of claiming his dukedom of York; but being received by the citizens into the capital, he re-aſcended the throne, defeated and killed Warwick in the battle of Barnet, and made Henry once more his priſoner. A few days after, he routed a freſh army of Lancaſtrians, and made queen Margaret priſoner, together with her ſon prince Edward, whom the duke of Glouceſter, Edward's brother, murdered in cold blood.

Edward, being thus ſettled on the throne, purſued the Lancaſtrians with unremitting fury, and numbers of all ranks were put to death. In 1474 the kingdom of England was in a deplorable ſituation. The king abandoned himſelf to the moſt luxurious indolence, in which he was imitated by his great men, who, to ſupport their extravagance, became penſioners to the French king. The parliament ſeemed only to act as the executioners of Edward's bloody mandates. The beſt blood in England was ſhed on ſcaffolds, and even the duke of Clarence fell a victim to his brother's jealouſy. Edward, partly to amuſe the public, and partly to ſupply the vaſt expences of his court, pretended ſometimes to quarrel, and ſometimes to treat with France; but his irregularities put an end to his life in 1483, in the twenty-third year of his reign, and the forty-ſecond of his age. Before his death he nominated his brother, the duke of Glouceſter, regent, during the minority of his eldeſt ſon.

During the reigns of Henry IV. and Edward IV. notwithſtanding the turbulence of the times, there was an increaſe of the trade and manufactures of England, particularly the woollen. So early as 1440 a navigation act was thought of by the Engliſh, as the only means to preſerve to themſelves the benefit of being ſole carriers of their own merchandize; but foreign influence prevented Henry's paſſing the bill for that purpoſe. The invention of printing, which is generally ſuppoſed to have been imported into England by William Caxton, and which received ſome countenance from Edward, is the chief glory of his reign; but learning in general was then in a poor ſtate in England; its chief ornaments were the famous Littleton, judge of the Common-Pleas, and Forteſcue, chancellor of England, both of whom flouriſhed at this period.

The late king Edward IV. left two ſons by his queen, who had raiſed many of her obſcure relations to the higheſt employments, and thereby given great offence to the chief nobility. Her eldeſt ſon, Edward V. was about thirteen; and his uncle and guardian, the duke of Glouceſter, taking advantage of the queen's unpopularity among the great men, reſolved to fix that crown on his own head, which was deſigned to adorn the brow of his nephew. Accordingly, he found means to baſtardize the queen's iſſue, by act of parliament, under the ſcandalous pretext of a pre-contract between their father and another lady. The duke was then declared guardian of the kingdom, and at laſt accepted of the crown, which was offered him by the Londoners, having firſt put to death all the nobility and great men, whom he thought to be well affected to the late king's family.

Richard III. had, however, ſo ſtrongly prejudiced the minds of the Engliſh againſt him, as being the murderer of his nephews, that the earl of Richmond, who ſtill remained in France, carried on a ſecret correſpondence with the remaining friends of Edward IV. and, by offering to marry his eldeſt daughter, he was encouraged to invade England at the head of about 2000 foreign troops, which were ſoon joined by 7000 Engliſh and Welſh. A battle between him and Richard, who was at the head of 15,000 men, enſued at Boſworth-Field, in which Richard, after diſplaying moſt aſtoniſhing acts of perſonal valour, was ſlain in the year 1485, having been firſt abandoned by a main diviſion of his army, under lord Stanley and his brother.

The crimes of Richard have no doubt been much exaggerated by ſome hiſtorians, who have been ſilent reſpecting his good qualities. He is repreſented by other writers, as exemplary in his diſtributive juſtice. He kept a watchful eye over the great barons, whoſe oppreſſions he aboliſhed, and was a father to the common people. He founded the ſociety of heralds —an inſtitution, which, in his time, was found neceſſary to prevent diſputes among great families. During his ſhort reign, we have repeated inſtances of his relieving cities and corporations that had gone into decay. He was remarkable for the encouragement of the hardware manufactures of all kinds, and for preventing their being imported into England, no fewer than ſeventy-two different kinds being prohibited by one act. He was the firſt Engliſh king who appointed a conſul for the ſuperintendency of Engliſh commerce abroad.

Henry VII. was now univerſally acknowledged king of England, and, according to agreement between him and the queen dowager, married the princeſs Elizabeth, eldeſt daughter to Edward IV. This marriage united the two houſes of York and Lancaſter, and put a final period to thoſe dreadful contentions which had ſo often deluged England with the blood of its inhabitants. Henry, however, could not forget that the deſtruction of his family had been owing to partiſans of the houſe of York, and, in conſequence of this averſion, he committed the earl of Warwick, ſon to the duke of Clarence, and ne-

phew to Edward IV. close prisoner to the Tower, without pretending to charge him with any other crime, than his propinquity to the house of York. The same motives prompted him to declare that he did not hold the crown in consequence of his alliance with Elizabeth, but by his own undoubted right. These unconquerable prepossessions in Henry gave great disgust to the nation, and several conspiracies were formed against him, particularly those of Lambert Simnel, and Perkin Warbeck. Simnel was taken prisoner, and, after being employed in the king's kitchen, was made one of his falconers. Perkin was never proved to satisfaction to have been an impostor, either by Henry, or by James IV. king of Scotland, who had for some time kindly entertained him: at length, however, after various unfortunate adventures, he fell into Henry's hands, and was shut up in the Tower of London, from whence he endeavoured to escape with the innocent earl of Warwick, for which Perkin was hanged, and the earl beheaded.

The ruling passion of Henry was avarice: to this he sacrificed every other consideration. In 1499, Arthur, his eldest son, married the princess Catharine of Arragon, daughter to the king of Spain. Though the prince did not long survive his nuptials, Henry was so averse to the refunding of her dowry, that he obliged his second son, Henry, to marry his brother's widow; and notwithstanding the opposition of Warham, archbishop of Canterbury, the pope was prevailed on to grant a dispensation for that purpose. To the same vice in Henry may be attributed the little encouragement he gave to Columbus, who made him the first offer of discovering the West-Indies. This neglect was, however, somewhat extenuated, by the encouragement he gave to Cabot, who discovered North America. He was also desirous of improving the commerce of England, and often lent considerable sums of money, without interest, to such merchants whom he knew had not funds sufficient to accomplish the schemes they had formed. Henry died in 1509, in the fifty-second year of his age, and the twenty-fourth of his reign. At the time of his demise he was possessed of 1,800,000l. sterling, equal to five millions at present.

This monarch married his eldest daughter Margaret to James IV. king of Scotland—an union which in the next age produced remarkable events. He instituted a company, called Yeomen of the Guard, who were to attend continually near his person; and these, with little variation, have been ever since continued by his successors. An act was passed, by which the barons and gentlemen of landed interest were at liberty to sell and mortgage their lands without fines and licences for the alienation. This obstacle being removed, the estates of the barons soon became the property of the commons, but stripped of their dangerous privileges. The baronial power was thus imperceptibly undermined, and soon after fell to the ground. Several other acts of parliament were passed, relative to trade and navigation, which proved infinitely beneficial to the nation. The fine arts were far advanced in England during this reign.

Henry VIII. succeeding his father at the age of eighteen, ascended the throne amidst the universal acclamations of his people. The young monarch possessed a liberality of temper bordering on profusion, and which, though sometimes misapplied, generally tended to the benefit of his subjects. He was brave without ostentation, and of a frank and candid disposition. Fond of study, and a friend to learning, he had made considerable progress both in philosophy and divinity, and was thoroughly acquainted with music. To all these qualifications nature had given him a most engaging person; and people were so much prepossessed in his favour, that the vices of vehemence, ardour, and impatience, to which he was remarkably addicted, were considered as the faults of youth, which time would correct; but which, in the latter part of his life, degenerated into tyranny and cruelty. His pride was unbounded, and his flatterers took care to turn it to their own advantage. They engaged him deeply in the affairs of the continent, and he once made the necessary preparations for the conquest of France. But in all his wars he was the dupe of foreign powers, particularly of Ferdinand, king of Spain, and the emperor Maximilian.

Thomas Wolsey, the son of a butcher at Ipswich, but afterwards a student at Magdalen-College, in Oxford, was this monarch's chief favourite. He was first introduced to court by Fox, bishop of Winchester, where his great talents and insinuating address soon recommended him to the particular notice of the king. His promotions were as great as they were rapid. From almoner of the household, he was made dean of Lincoln, then a member of the privy-council, soon after appointed prime-minister, then bishop of Lincoln, and afterwards archbishop of York. Francis I. king of France, raised him to the purple; Henry created him lord chancellor, and likewise obtained a commission from the pope, nominating him legate *à latere*. It is natural to imagine that such noble preferments were sufficient to satisfy the most unbounded ambition. That of Wolsey, however, did not stop here; he aspired to the pontifical chair, to which Charles V. had promised to raise him. Finding that emperor never intended to perform his promise, he persuaded Henry to abandon his alliance with Charles, and engage in a treaty with France, hoping by that means to reach the summit of his ambition.

Martin Luther, professor of divinity in the university of Wirtemburg, in 1521 began to preach against the abuses which had crept into the church of Rome, and even called the authority of the pope in question. This doctrine, which in some particulars was the same with that of the Lollards, was readily embraced by the remains of that sect in England. Henry, in order to stop the rapid progress it was making among all ranks of people, wrote a Latin treatise "Of the seven Sacraments," against the principles of Luther; and the pope, as a reward for this service, conferred on him the title of "Defender of the Faith." A disappointment soon after entirely changed Henry's sentiments. From a friend, he became an enemy; he had for some time entertained many scruples with regard to the propriety of his marriage with Catharine, his brother's widow; and in order to remove them, had consulted the principal divines of the kingdom, all of whom declared that the contract was contrary to every law, either human or divine. This unanimous opinion determined the king to solicit a divorce from the court of Rome. He was indeed excited to this measure by a much stronger motive than that of conscience; he had fallen in love with Anne Boleyn, a young lady belonging to the queen's court. Wolsey used his interest to obtain the divorce, hoping he should, by that means, revenge himself on Charles V. nephew to Catharine. That emperor interposed so effectually with Clement VII. who then filled St. Peter's chair, that he absolutely refused to annul the marriage of Henry with Catharine. This was the first cause of disgust the king conceived against Wolsey, who had represented the divorce as a thing easily obtained. Wolsey's enemies laid hold of this opportunity to ruin him. Their attempt succeeded: Henry soon after seized all his furniture, papers, and treasure, and even impeached him of high treason. This blow was too severe for the spirit of Wolsey to support; he died of grief on the twenty-ninth of November 1530, at Leicester-Abbey.

A perplexing, though nice conjuncture of affars, induced Henry at last to throw off all relation to, or dependence upon the church of Rome, and to bring about a reformation. Henry never could have ef-

fected this arduous meaſure but for his deſpotic diſpoſition, which broke out on every occaſion. Upon a ſlight ſuſpicion of the queen's inconſtancy, and after a ſham trial, he cut off her head in the Tower, and put to death ſome of her neareſt relations, and in many reſpects he acted in the moſt arbitrary manner; his wiſhes, however unreaſonable, being too readily complied with, in conſequence of the ſhameful ſervility of his parliaments. The diſſolution of the religious houſes, and the immenſe wealth that came to Henry, enabled him to give full ſcope to his ſanguinary diſpoſition; ſo that the beſt and moſt innocent blood in England was ſhed by his orders, and ſeldom any long time paſſed without being marked with ſome illuſtrious victim of his tyranny. Among others, was the aged counteſs of Saliſbury, deſcended immediately from Edward IV. and mother to cardinal Pole; the marquis of Exeter, the lord Montague, and others of the blood royal, for holding a correſpondence with that cardinal. Sir Thomas More, lord high chancellor, John Fiſher, biſhop of Rocheſter, and Thomas Cromwell, a man who, from the loweſt rank, had been raiſed by Henry to the higheſt poſts, were alſo among the number of victims whom, either from religious or political motives, he ſacrificed to his cruelty.

Henry's third wife was Jane Seymour, daughter to a gentleman of fortune and family: but ſhe died in bringing Edward VI. into the world. His fourth wife was Anne, ſiſter to the duke of Cleves; he diſliked her ſo much, that he ſcarcely bedded with her, and, obtaining a divorce, he ſuffered her to reſide in England on a penſion of 3000l. a year. His fifth wife was Catharine Howard, niece to the duke of Norfolk, whoſe head he cut off for ante-nuptial incontinency. His laſt wife was Catharine Parr, in whoſe poſſeſſion he died, after ſhe had narrowly eſcaped being brought to the ſtake for her religious opinions, which favoured the Reformation. Henry's cruely increaſed with his years; nor did he, while thus perſecuting the followers of Luther, ſpare the Catholics, many of whom ſuffered for denying his ſupremacy; and it was juſtly obſerved by a foreigner, at that time in England, that thoſe who were againſt the pope were burnt, and thoſe who were for him hanged. He alſo put the brave earl of Surrey to death without a crime being proved againſt him; and his father, the duke of Norfolk, muſt have ſuffered the next day, had he not been ſaved by Henry's own death, in the year 1547, in the fifty-ſixth year of his age, and the thirty-eighth of his reign. He left at his deceaſe three children, viz. Mary, by his firſt wife, Catharine of Arragon; Elizabeth, by his ſecond wife, Anne Boleyn; and Edward, by his third wife, Jane Seymour.

Henry's attention to the naval ſecurity of England is highly commendable; and it is certain that he employed the unjuſt and arbitrary power he frequently aſſumed, in many reſpects, for the glory and intereſt of his ſubjects. Whatever were his religious motives, it muſt be candidly confeſſed, that had the Reformation gone through all the forms preſcribed by the laws and the courts of juſtice, it probably never could have taken place, or at leaſt not for many years; and without enquiring into his perſonal crimes, or failings, the partition he made of the church's property among his courtiers and favourites, and thereby reſuming it from dead hands, undoubtedly promoted the preſent greatneſs of England. Henry was a great encourager of learning and the arts; he gave a penſion to Eraſmus, who was himſelf a prodigy of learning; he brought to England, encouraged, and protected Hans Holbein, that excellent painter and architect; and in his reign noblemen's houſes began to reſemble thoſe of Italy for magnificence and regularity. He was a conſtant and generous friend to Cranmer; and though he was, upon the whole, rather whimſical than ſettled in his own principles of religion, he advanced and encouraged many who afterwards became the inſtruments of a more pure reformation. In his reign, the Bible was ordered to be printed in Engliſh; Wales was united and incorporated with England; and Henry took the title of king, inſtead of lord, of that principality.

Edward VI. aſcended the throne at the age of nine years; but, agreeable to Henry's will, the regency devolved on ſixteen executors, and twelve counſellors, who, after ſome diſputes were ſettled, appointed the earl of Hertford, the king's uncle, protector. This nobleman was always a friend to the Reformation, and now promoted it with all his power. He was aſſiſted in this deſign by the young king, and archbiſhop Cranmer, but vehemently oppoſed by Gardiner, biſhop of Wincheſter, and Bonner, biſhop of London. He however ſucceeded, and in a ſhort time private maſſes were aboliſhed, the cup was reſtored to the laity, all images were removed out of churches, the common prayer was corrected, and the Reformation confirmed by act of parliament. All theſe alterations, however, were not effected without great diſturbances; the inhabitants of different counties took up arms, but, after ſeveral defeats, accepted of a general pardon.

Henry having earneſtly recommended his executors to exert their utmoſt endeavours for uniting England and Scotland by the marriage of Edward with the young queen of Scots, the protector entered that kingdom at the head of a powerful army. This war, which was carried on with very little ſucceſs, did not obtain the end propoſed; the young queen was ſent into France, and betrothed to the dauphin. During the protector's abſence, great diviſions and cabals were formed in the Engliſh councils; and ſoon after his return, he had the mortification to ſee lord Seymour, his brother, who, on the death of Henry, had married the queen dowager, endeavour to ſupplant him. This breach was widened by the earl of Warwick, who was reſolved to raiſe his own fortune on the deſtruction of both. He perſuaded the protector to deprive his brother of the poſt of admiral, and commit him to the Tower as a ſeditious perſon. Soon after, on refuſing the terms of reconciliation offered him, he was accuſed of high treaſon, tried, and beheaded.

England, in 1549, was one continued ſcene of confuſion. The war ſtill continued with Scotland; inſurrections, occaſioned by the encloſure of lands, had broke out in almoſt every county, and France, taking advantage of theſe domeſtic diſtractions, attempted to recover Boulogne, which Henry VIII. had conquered. The council, which alone could reſtore tranquillity, was divided in itſelf, and the protector became obnoxious to every other member. At length they proceeded to extremities againſt him; and Warwick became his open enemy. He was accuſed of ſeveral miſdemeanors, and committed to the Tower, together with his principal friends and adherents. An entire change immediately took place in the council: Warwick enjoyed the chief authority, who thinking that this revolution in affairs had ſufficiently humbled the ſpirit of Somerſet, he readmitted him into the council, and even formed an alliance between their families, by the marriage of his ſon, lord Dudley, with the lady Jane Seymour, Somerſet's daughter.

Warwick was now created duke of Northumberland; but finding that Somerſet often expreſſed his reſentment for the diſgrace he had ſuffered, he determined to deſtroy him. He was accuſed of a deſign to raiſe an inſurrection in the north, and of having formed a conſpiracy to murder the duke of Northumberland. His peers acquitted him of the firſt charge, but found him guilty of the ſecond, and he was beheaded, purſuant to his ſentence, upon Tower-hill. The duke, having now the ſole management of the king, perſuaded him by many plauſible arguments, to change

change the order of ſucceſſion eſtabliſhed by Henry VIII. in favour of lady Jane Gray, daughter to the duke of Suffolk, and wife to Northumberland's fourth ſon. In 1553, the king granted his letters patent for this purpoſe, and in a few days after expired at Greenwich, at the early age of eighteen.

Northumberland immediately publiſhed Edward's will, and cauſed lady Jane to be proclaimed queen at London, where her title was recognized by the citizens; though on the approach of Mary with a powerful army, lady Jane was entirely abandoned, and Mary's right to the crown acknowledged with univerſal acclamations. The duke, finding his ſchemes fruſtrated, was among the foremoſt to own the title of that princeſs. This mean artifice was not ſufficient to ſave his life: he was beheaded, together with the duke of Suffolk, lord Guildford Dudley, and lady Jane Gray. The execution of the two latter was haſtened by the inſurrection of Sir Thomas Wyat, who having aſſembled about ſix thouſand men, entered London, firmly perſuaded that the inhabitants would riſe in favour of lady Jane. The very contrary happening, he was totally diſappointed: his forces were defeated, and he himſelf taken priſoner, and beheaded.

Mary (ſtyled, by ſome, Mary the Bloody) was a bigotted Papiſt, and proceeded, like an infernal fury, to reſtore Popery to its former ſtate in England; though, on her acceſſion, ſhe had firmly promiſed religion ſhould remain on the ſame footing as in the time of her predeceſſor. Her firſt ſtep was to recall cardinal Pole, who had been baniſhed by her father; and he, together with Bonner, biſhop of London, and Gardiner, biſhop of Wincheſter, were the chief agents who executed her bloody mandates. The torch of perſecution blazed in every corner of the kingdom, and no leſs than five biſhops, viz. Cranmer, Ridley, Latimer, Hooper, and Ferrar, twenty-one divines, eight gentlemen, eighty-four tradeſmen, one hundred huſbandmen, twenty-ſix wives, twenty widows, nine virgins, two boys, and two infants, periſhed in the flames. Even the princeſs Elizabeth eſcaped with difficulty, as her attachment to the Proteſtant religion was well known. In the beginning of her reign, Mary married Philip, ſon to the king of Spain, and they jointly laboured to exterminate all thoſe who refuſed to embrace the religion of Rome.

In 1557, the queen ſignified her intention of taking part with Spain in the war that kingdom then carried on againſt France. This ſtep was ſtrongly oppoſed by the miniſtry; but the remonſtrances and threatenings of Philip prevailed, and war was declared on the moſt trifling pretences. It was with great difficulty, however, that Mary found means to raiſe an army, nor was the war attended with the leaſt advantage to England. On the contrary, the important town of Calais, which had been in poſſeſſion of the Engliſh above two hundred years, was taken by the French. This loſs occaſioned alarming reflections on the queen's imprudence, who had thus ſacrificed the welfare of her people, and expoſed the nation to diſgrace, merely to ſatisfy the capricious humour of her huſband. Theſe cenſures, together with the grief ſhe felt for the loſs of Calais, and her huſband's reſolution of ſettling for ever in Spain, preyed ſo greatly on her ſpirits, that ſhe was ſeized with a lingering fever, which put a period to her turbulent and ſanguinary life in the year 1558, in the 42d year of her age, and 5th of her reign.

Elizabeth, daughter to Henry VIII. by Anne Boleyn, aſcended the throne on the demiſe of her ſiſter Mary; and the nation, with an univerſal joy, acknowledged her for their queen. She immediately notified her acceſſion to foreign courts, and among the reſt to Philip of Spain. That prince flattered himſelf, that by forming an alliance with Elizabeth he ſhould be able to acquire that unbounded power in England, which he had vainly endeavoured to eſtabliſh in the reign of her ſiſter. He ordered his miniſter to pay her his compliments of congratulation, and at the ſame time to propoſe a marriage between them. Elizabeth received this propoſal with a determined reſolution to reject it, but gave ſo evaſive an anſwer, that Philip flattered himſelf with the hopes of ſucceſs, and actually ſent an agent to Rome to ſolicit the neceſſary diſpenſation.

Elizabeth having reſolved to make a thorough change in religion, ordered the Lord's prayer, the creed, the ten commandments, the litany, and the goſpels to be read in Engliſh. At the ſame time ſome able divines were employed to review the liturgy of Edward VI. and to prepare the nation for its being uſed in the public ſervice of the church. In a word, the queen exerted her utmoſt endeavours to extirpate Popery, by the gentleſt methods, and was ſo happy as to enjoy the fruits of thoſe endeavours during the whole courſe of a long reign.

Mary, queen of Scots, by her ill conduct having obliged her ſubjects to inſiſt on her abdicating the throne in favour of her ſon James, then an infant, fled into England for protection, which had often been promiſed her by Elizabeth: but that politic princeſs, fearing ſhe might create diſturbances in the kingdom, to which ſhe had ſet up a claim, kept her confined eighteen years, and at laſt brought her to a trial for being acceſſary to the murder of her ſecond huſband, lord Darnley, and of forming conſpiracies againſt the government of England. No poſitive proof of guilt, however, could be produced againſt this unhappy princeſs; notwithſtanding which ſhe was condemned to loſe her head, and the horrid ſentence was executed in 1587.

Elizabeth's reign was for the moſt part employed in ſchemes againſt Philip, who no ſooner found that his offers of alliance were rejected, than he became her avowed enemy. The moſt formidable attempt of Spain was in the year 1558, when, in order to invade England, Philip equipped a powerful fleet, ſtyled the Invincible Armada. It conſiſted of 130 veſſels, of which near an hundred were galleons, and much larger than any ever before uſed in Europe. It carried 19,295 ſoldiers; 8456 mariners; 2088 galley-ſlaves; and 2630 large pieces of braſs ordnance. It was victualled for ſix months, and attended by twenty ſmaller ſhips, called caravals, and ten ſalves with ſix oars each. The duke de Medina Sidonia was appointed admiral of this Invincible Armada, and the duke of Parma, who commanded in the Spaniſh Netherlands, was to join him with an army of 30,000 foot, and 1800 horſe; but the latter part of the ſcheme was fruſtrated, the Engliſh and Dutch fleets blocking up the ports of Flanders. The Spaniſh armament arrived in the channel on the 19th of July, and were met by the Engliſh ſquadron under the command of lord Effingham, Sir Francis Drake, and ſeveral other perſons of diſtinction; by whoſe valour and good conduct the enemy were ſoon put into the utmoſt diſorder, and rendered incapable of performing any one part of the orders received from Philip. The amazing ſize of their ſhips, from which they promiſed themſelves certain conqueſt, proved the means of their deſtruction; for, unacquainted with the narrow ſeas, they were at a loſs how to manage them, and, while their bulk expoſed them to the fire of the Engliſh, their cannon was placed too high to do any material execution. Some were ſunk, ſome burnt, and others taken. The Spaniſh admiral, finding that the intention for which he was ſent was now entirely fruſtrated, determined to return to Spain by ſailing round the north of Scotland. After his fleet had paſſed the Orkneys, it was overtaken by a violent ſtorm, which drove many of the Spaniſh ſhips on the weſtern iſles of Scotland, and others on the coaſt of Ireland, where they periſhed. Not one half of this formidable armament ever reached Spain, to the confuſion and diſhonour of Philip. Thus ended an expedition which had been three

three years in preparing, and by which the Spaniards are ſaid to have loſt 13,500 men, and 81 ſhips of war, large and ſmall.

Elizabeth entered into ſeveral treaties with the Dutch, and for a ſeries of time ſupported that people in their revolt from Philip. She ſent them her favourite, the earl of Leiceſter, who acted as her general and viceroy in the Low Countries. Though this nobleman behaved ill, yet her meaſures were ſo wiſely taken and executed, that the Dutch eſtabliſhed their independency upon Spain; and then ſhe ſent forth her fleets under Drake, Raleigh, the earl of Cumberland, and other gallant and naval officers, into the Eaſt and Weſt Indies, who enriched their country by the prodigious treaſures they took from the Spaniards in thoſe parts of the globe.

On the death of the earl of Leiceſter, Elizabeth made choice of the young earl of Eſſex, as her chief favourite, who was appointed to command the land forces, in a joint expedition with the lord admiral Howard, againſt Cadiz, which they took, deſtroyed the ſhips in the harbour, and did other damage to the Spaniards, to the amount of 20,000,000 of ducats.

The latter part of Elizabeth's reign was employed in concerting means with Henry, king of France, for the reduction of the houſe of Auſtria; and in ſuppreſſing the rebellion in Scotland, which was chiefly fomented and ſupported by the Spaniards. After humbling the latter, ſhe made the Iriſh feel the weight of her reſentment, and ſubmit to her mercy. But even theſe fortunate events adminiſtered but little ſatisfaction to Elizabeth, who in her old age grew diſtruſtful, peeviſh, and jealous. Though ſhe had an attachment to the earl of Eſſex, ſhe teazed him, by her capriciouſneſs, into the madneſs of taking arms, and then beheaded him. She afterwards became a prey to the ſevereſt grief, which in a few days had ſuch an effect on her health, that her death was every inſtant expected. In this diſtreſsful ſituation, it was thought neceſſary, in order to prevent a diſturbance, that ſhe ſhould name her ſucceſſor; and, being aſked the queſtion, anſwered, James, king of Scotland. This was her laſt act; and ſhe ſoon after expired without a groan, in the year 1603, in the 70th year of her age, and 45th of her reign.

The ſucceſſes of Elizabeth's reign have diſguiſed her internal government; for ſhe was far from being a friend to perſonal liberty, and was guilty of many ſtretches of power againſt the moſt ſacred rights of Engliſhmen. The ſevere ſtatutes againſt the Puritans, debarring them of liberty of conſcience, and by which many ſufferred death, muſt be condemned. Through the practices of the Spaniards with the Iriſh Roman Catholics, ſhe found great difficulty to keep that iſland in ſubjection, and at the time of her death her government there had gone into great diſorder. We can ſcarcely retain a ſtronger proof that the Engliſh began to be tired of Elizabeth, than the joy teſtified by all ranks at the acceſſion of her ſucceſſor, notwithſtanding the long inveterate animoſities which had ſubſiſted between the two kingdoms.

James I. was ſon to the unfortunate queen of Scots, by her ſecond huſband, lord Darnley, and great grandſon of Margaret, eldeſt daughter of Henry VII. Soon after his acceſſion, a conſpiracy was diſcovered for ſubverting the government, and to fix on the throne of England Arabella Stuart, a near relation of the king, and deſcended equally from Henry VII. Among the conſpirators were ſeveral perſons of diſtinction; particularly the famous Sir Walter Raleigh. They were all impeached and found guilty, but few executed: Sir Walter was ordered into cloſe confinement in the Tower, where he remained for ſeveral years.

In 1605, a ſecond plot was diſcovered of a much more dangerous nature. The Papiſts had flattered themſelves, that when James came to the throne their religion would be reſtored in this kingdom: but finding all their hopes abortive, and that every law againſt them was executed with the utmoſt ſeverity, a few individuals determined to revenge the cauſe of all the reſt. Cateſby, Piercy, and Fawkes, were at the head of this conſpiracy, which was near a year and a half in concerting. They thought the ſureſt method to extirpate their enemies at once, would be that of blowing up the Parliament-Houſe with gunpowder, at the very time when the king and all the members were aſſembled. Nothing was omitted which could render this infernal contrivance ſecure; and the fatal cataſtrophe muſt have been inevitable, had it not been for a letter ſent to lord Monteagle, a Catholic peer, adviſing him to abſent himſelf from parliament on the firſt day of the ſeſſion; for that a terrible blow was intended for every individual of it. This letter was ſhewn to his majeſty, who immediately concluded, that the blow hinted at was to be given by gunpowder, and orders were iſſued for examining carefully all the vaults below the houſes of parliament. The lord chancellor purpoſely delayed the ſearch, till the day before the meeting of parliament, when on going into a valut underneath the Houſe of Lords, he diſcovered great quantities of wood and faggots, which ordering to be removed, thirty-ſix barrels of powder were diſcovered concealed under them. Fawkes was found in the vault, and ſecured; matches and every thing proper for ſetting fire to the train being found in his pocket. He at firſt refuſed to diſcover his accomplices; but being ſent to the Tower, and threatened with the rack, his courage failed him, and he made a full diſcovery of all the conſpirators, who were apprehended, and moſt of them executed.

James's attachment to favourities has juſtly been cenſured by the writers of that and every ſucceeding age. His firſt was Robert Carr, a youth of twenty years of age, and of a good family in Scotland. James firſt knighted, and then created him viſcount Rocheſter, honoured him with the order of the garter, gave him a ſeat in the privy-council, and, without aſſigning him any particular office, beſtowed on him the ſupreme direction of all his buſineſs and political concerns. For a long time, by following the advice of Sir Thomas Overbury, he enjoyed, what is very rare, the favour of the prince, without being hated by the people; but having connected himſelf with the counteſs of Eſſex, a woman of an abandoned character, whom he intended to marry as ſoon as ſhe could be divorced from her huſband, the earl of Eſſex, Overbury remonſtrated with him on the folly and danger of ſuch a proceeding. Rocheſter was weak enough to reveal this converſation to the Counteſs, who, enraged at the interpoſition of Overbury, ſo much to her diſadvantage, reſolved on his deſtruction, and prevailed on Rocheſter to aſſiſt in her diabolical ſchemes. James committed him priſoner to the Tower, where the Counteſs cauſed him ſoon afterwards to be poiſoned, which atrocious crime James pardoned, contrary to his ſolemn oath.

Some time before the murder of Overbury was diſcovered, Somerſet's power at court began to give place to George Villiers, a youth of good family, who by his perſonal accompliſhments had rendered himſelf agreeable to James, and was created his cupbearer. Upon Somerſet's diſgrace, he acquired a ſtill more unlimited power over James than his former favourite had ever enjoyed, ſo that riches and honours were laviſhed on him to exceſs.

In 1613, James married his eldeſt daughter, Elizabeth, to the elector palatine, whom he furniſhed with large ſums of money, and raiſed a regiment of upwards of 2,000 men, to aſſiſt him in retrieving his affairs. Some time after, he entered into a treaty with the court of Spain, for giving the infanta in marriage to his ſecond ſon, Charles, who, by the death of his elder brother, Henry, became heir apparent to the crown of England. Buckingham, who was almoſt

moſt as great a favourite with the prince as with the king, fell in with the prince's romantic humour, and, againſt the king's will, they travelled in diſguiſe to Spain, where a moſt ſolemn farce of courtſhip was acted; but the prince returned without his bride, and had it not been for the royal partiality in his favour, the earl of Briſtol, who was then ambaſſador in Spain, would probably have brought Buckingham to the block, for breaking off the treaty, after the Spaniſh court had conſented to the match.

A treaty of marriage was now ſet on foot between Charles and Henrietta Maria, daughter to Henry IV. of France. In the midſt of this negotiation, and the praparations making for reſtoring the Palatine to his electorate, James was ſeized with a tertain ague, which put a period to his life, in the year 1625, and in the 59th year of his age, having reigned over England twenty-two years.

Commerce and colonization owed great advantages to this prince, and he laid the foundation of great national benefits; but it is certain that he had no juſt ideas of the Engliſh conſtitution and liberties, which led him into many abſurd diſputes and jars with his parliament; and he with his miniſters were continually inventing new ways to raiſe money, as by monopolies, benevolences, loans, and other illegal methods: among other expedients, he ſold the titles of baron, viſcount, and earl, at a certain price; made a number of knights of Nova-Scotia, each to pay ſuch a ſum; and inſtituted a new order of knights baronets, which was to be hereditary, for which each perſon paid 1095l. His pacific reign was a ſeries of theological conteſts with eccleſiaſtical caſuiſts, in which he proved himſelf more of a theologian than a prince, and his pedantry was extremely ridiculous. In 1617 he attempted to eſtabliſh epiſcopacy in Scotland, but the zeal of the people baffled his deſign. His puſillanimous conduct reſpecting his ſon-in-law, the elector palatine, rendered him contemptible to his people, and has ſubjected his memory to the cenſure of every ſucceeding age. He formed a ſyſtem of policy for attaching himſelf intimately to the court of Spain, that it might aſſiſt him in recovering the Palatine; and to this ſyſtem he ſacrificed the brave Sir Walter Raleigh, on a chance of having committed hoſtilities againſt the Spaniſh ſettlements in the Weſt-Indies. He was ſentenced to die in 1603, and beheaded on Tower-Hill in 1618.

He reſtored to the Dutch their cautionary towns, upon diſcharging part of the mortgage that was upon them; and procured from Spain at the ſame time an acknowledgment of their independency. We have already deſcribed the progreſs of the arts and learning under his reign. He encouraged and employed that excellent painter, Sir Peter Paul Rubens, as well as Inigo Jones, who reſtored the pure taſte of architecture in England; and in his reign, poetical genius, though not much encouraged at court, arrived at its vertical point. Mr. Middleton alſo at this time projected conveying water into the city from Hertfordſhire, by means of pipes, which is now called the New River.

Charles I. aſcended the throne on the death of his father, and immediately completed his marriage with the princeſs Henrietta, a woman of a haughty, turbulent ſpirt. By her inſtigations, joined to thoſe of his favourites, he entered into ſeveral meaſures which at firſt cauſed murmurings among his ſubjects, and afterwards gave them a pretence for breaking out into open rebellion. At the very beginning of his reign, Charles gave ſufficient indications of his deſpotic temper; and the commons, reſolving to reduce the prerogative of the crown, refuſed to furniſh thoſe aids he demanded for carrying on the war againſt Spain, without his making conceſſions in favour of the liberty of the people. The king's great attachment to Buckingham was another cauſe of diſguſt. At the earneſt ſolicitations of that nobleman, Charles ſent a fleet to the relif of the Hugonots, or French Proteſtants, who were beſieged in Rochelle. Buckingham's delay at Portſmouth proved fatal to him, by giving an opportunity to one Felton, formerly a lieutenant of foot, to aſſaſſinate him juſt as he was going to embark, in 1628. However, the fleet ſailed for Rochelle, under the command of the earl of Lindſey, but was obliged to return to England, without being able to afford the Hugonots any relief.

The contentions between the king and parliament were now become very ſerious. The commons denied him the power of levying tonnage and poundage, a cuſtom which had been granted to his predeceſſors; and at the ſame time refuſed to raiſe, by any other means, the neceſſary ſupplies. Charles was ſoon reduced to the utmoſt diſtreſs, the commons not having voted him money even for the expences of his houſehold. This neglect obliged him to have recourſe to methods unknown to the conſtitution of England: he levied money upon ſalt, ſoap, and other neceſſaries of life, alledging the example of his predeceſſors as an excuſe for his arbitrary conduct. Theſe proceedings rendered his government more and more deteſted. The ſevere puniſhments inflicted on Burton a divine, Prynne a lawyer, and Baſtwick a phyſician, who, under pretence of aſſerting the liberties of the people, had blown the trumpet of ſedition, increaſed the king's unpopularity: and he was afterwards as much embroiled with his Scotch as with his Engliſh ſubjects. Unfortunately for him, he had choſen archbiſhop Laud for his ſpiritual guide, and, at the inſtigation of that prelate, endeavoured to introduce the religion of the church of England into Scotland, where the inhabitants profeſſed a ſtrict preſbytery. They immediately formed ſecret connections with the malcontents in England, invaded the kingdom, and obliged the king, who was very ill ſerved by his army in general, to conſent to an inglorious peace.

The firſt ſtep of the commons, in the new parliament, was, to refuſe Gardiner, recorder of London, for their ſpeaker, becauſe he was choſen by the king, and to advance Lenthal, a lawyer, to that high office. They then impeached the earl of Strafford, who was conſidered as chief miniſter, of having endeavoured to change the form of government, and ſubvert the ancient laws and liberties of the kingdom. Laud was next impeached of high treaſon, and ſent to the Tower. Strafford was beheaded on the 22d of May 1641; and on the 10th of January 1645, archbiſhop Laud was alſo brought to the block.

Charles now endeavoured to conciliate the affections of his ſubjects, by popular acts. He paſſed the famous Petition of Rights, and agreed to other demands made by the commons: but theſe conceſſions came too late. A rebellion broke out in Ireland, wherein many thouſand Proteſtants of that nation were maſſacred, without diſtinction of age, ſex, or condition, by the Papiſts, and no pains were omitted to inſinuate into the minds of the public, that the king had ſecretly favoured this conſpiracy, from hatred to his Engliſh ſubjects. The biſhops were now expelled the Houſe of Peers, and committed to cloſe cuſtody, becauſe they drew up a proteſt againſt the proceedings of parliament, which the king two haſtily ſigned. Charles, finding that lenient meaſures had no effect, ſuffered himſelf to be guided by thoſe who adviſed more violent methods. He accuſed lord Kimbolton and five commoners, viz. Mr. Denzil Hollis, Sir Arthur Hazlerig, Mr. Hambden, Mr. Pym, and Mr. Strode, of high treaſon; and the houſe having refuſed to deliver them to his meſſenger, he went in perſon to demand them; but they had made their eſcape, and taken ſhelter in London, where the citizens remained all night under arms, in order to protect them. This raſh ſtep was conſidered as an act of high treaſon againſt his people, and the commons would not liſten to any terms of reconciliation. The city militia was raiſed, and the mobs

grew ſo inſolent that the king was obliged to retire to Hampton-Court, and from thence thought proper to retire to York, where he had the ſatisfaction of finding himſelf joined by the chief nobility and gentry. Thus ſupported, he refuſed his concurrence to a militia bill, which the commons had drawn up. Preparations for a civil war were now made on both ſides. The two houſes firſt levied a guard for themſelves, and the county of York raiſed one of ſix hundred men for the king. Both houſes then aſſembled an army; and the queen having diſpoſed of the crown jewels in Holland, purchaſed a large quantity of arms and ammunition, part of which, after eſcaping many dangers, were ſafely received by the king. Before things came to the laſt extremity, the parliament ſent conditions to their monarch on which they were willing to come to agreement; but took care they ſhould be ſuch as he could not, conſiſtent with his honour or dignity, comply with. He then collected ſome forces, and advancing ſouthwards, erected the royal ſtandard at Nottingham. The earl of Lindſey was appointed his general, and next to him in command were the princes Rupert and Maurice, ſons to the elector Palatine. The parliament, whoſe cauſe was favoured by London, and moſt of the trading towns and corporations, appointed the earl of Eſſex general of their forces. The firſt battle was fought on the twenty-third of October 1642, at Keinton, or Edge-Hill, in Warwickſhire, Five thouſand men were left dead on the field, and neither ſide had reaſon to boaſt an advantage, though, as is uſual in ſuch caſes, both claimed the victory. After this battle, a treaty was ſet on foot between the king and parliament; but the demands of the latter, ſtriking immediately at the root of all monarchical power, were rejected. For ſome time the king's affairs wore a favourable aſpect, and the parliament was reduced to ſuch diſtreſs, that they invited the Scots to come to their aſſiſtance, who immediately ſent an army of 20,000 men.

During the winter of 1644, the king ſummoned all the members of both houſes, in his intereſt, to meet at Oxford. The Houſe of Peers was tolerably full. The Houſe of Commons did not conſiſt of half the number of that at Weſtminſter; and the members of the latter proſecuted their animoſities againſt the royaliſts with redoubled fury. About this time a ſet of men began to make ſome noiſe at Weſtminſter, who ſtyled themſelves Independents, and were in fact equally enemies to the Preſbyterians and the royaliſts. By the arts of Oliver Cromwell, their leader, the earls of Eſſex and Mancheſter were removed from the command of the parliament's forces, to which Fairfax and ſome Independent officers were appointed. This was a fatal blow to the power of the Preſbyterians. In the interim, the war raged with unremitting fury, and the king obtained ſeveral advantages.

Prince Rupert, contrary to the advice of the marquis of Newcaſtle, engaged the parliament's forces at Marſton-Moor, and was totally defeated. From this time the king's affairs were, by miſmanagement, rendered irretrievable. By degrees he loſt all his towns and forts; and, on the 14th of June 1645, was himſelf defeated at Naſeby, by Fairfax, and Cromwell. He retired into Wales, where he remained for ſome time, and then marched to the relief of Cheſter, from whence he went to Oxford, the only place where he thought he could be ſafe. The Scots were beſieging Newark at the time when Charles arrived in their camp, and was received by them with all the exterior marks of duty and reſpect; but ſoon found that he had, in fact, only ſurrendered himſelf priſoner into their hands. They informed the Engliſh parliament of the king's arrival among them, but refuſed to deliver him up, unleſs their arrears, which they ſaid amounted to two millions, were firſt paid. After numberleſs debates on this point, it was at laſt agreed that they ſhould accept of 400,000l. and reſign their unhappy monarch into the hands of his implacable enemies. Having taken the king's perſon out of the hands of the commiſſioners, they inveſted Cromwell with the ſupreme command, and ſet the parliamentary power at defiance. The Preſbyterian members now found how neceſſary it was to come to an accommodation with the king, and ſeveral treaties were ſet on foot for this purpoſe, which, by the artifices of Cromwell, were all rendered abortive. After ſome conſultation, Charles was reſolved to truſt to the generoſity of Hammond, governor of the Iſle of Wight; who was no ſooner maſter of the king's perſon, than he confined him in Cariſbroke-Caſtle, and informed Cromwell of the whole tranſaction. A treaty for accommodating matters was ſet on foot by the Independents, which would in all probability have ſucceeded, had not Cromwell, who dreaded the general diſpoſition of the people for peace, carried him firſt to Hurſt-Caſtle, and afterwards to London, where, after an extraordinary trial before a court of juſtice of their own erecting, his head was ſtruck off before his own palace at Whitehall, January 30, 1648-9, in the 49th year of his age, and 24th of his reign.

Some writers have concluded, that had Charles been reſtored to his throne, he would have become an excellent prince; he is, however, allowed to have had many virtues, and, notwithſtanding the tyrannical nature of his government, his death was exceedingly lamented by great numbers.

Cromwell, who hated ſubordination to a republic, had the addreſs to get himſelf declared commander in chief of the Engliſh army. Admiral Blake, and the other Engliſh admirals, carried the terror of the Engliſh name by ſea to all quarters of the globe; and Cromwell, having now but little employment, began to be afraid that his ſervices would be forgotten, for which reaſon he went April 20, 1653, without any ceremony, with about 300 muſqueteers, and diſſolved the parliament, opprobriouſly driving all the members, about an hundred, out of their houſe. He next annihilated the council of ſtate, with whom the executive power was lodged, and transferred the adminiſtration of government to about 140 perſons, whom he ſummoned to Whitehall, on the 4th of July. This aſſembly, however, after ſitting about five months, diſſolved itſelf, and Oliver Cromwell was choſen protector. He was inſtalled into this high office with great ceremony and magnificence, by the title of, His Highneſs the Lord Protector of the Commonwealth of England, Scotland, and Ireland; a title under which he exerciſed all the power that had been formerly annexed to the royal dignity.

The Protector next proceeded to new-model the government, and various were the ſchemes that were propoſed, eſtabliſhed, and proved abortive; and it was by his management of the army that he did every thing. He was openly or ſecretly thwarted by people of property all over England; and, however hiſtorians have been dazzled with his amazing fortune and power, it appears, from the beſt evidences, that, during the continuance of his protectorate, he was perpetually diſtreſſed for money to keep the wheels of government going. The war with Holland, in which the Engliſh were again victorious, ſtill continued. Seven bloody engagements at ſea were fought in little more than the ſpace of one year; and in the laſt, which was deciſive in favour of England, the Dutch loſt their brave admiral Van Tromp.

At laſt his wants led him into the error of taking part with France againſt Spain, in hopes that the rich Spaniſh prizes would ſupply him with ready money, and his expectations herein were not wholly diſappointed. He lent the French court 6000 men, and Dunkirk being taken by their aſſiſtance from the Spaniards, he took poſſeſſion of it. Finding that his

uſurpation gave as much diſcontent to his own party, as terror to the royaliſts, he had thoughts of renewing the model of the conſtitution, and actually erected a houſe of lords out of his own creatures. After a moſt uncomfortable uſurpation of four years, eight months, and thirteen days, he died on the 3d of September 1658, in the 60th year of his age.

No king ever acted, either in England or Scotland, more deſpotically in ſome reſpects than he did; yet no tyrant ever had fewer real friends, and even theſe few threatened to oppoſe him, if he ſhould take upon him the title of king, which he was very deſirous of aſſuming.

The famous and beneficial navigation act, that palladium of the Engliſh trade, was now planned and eſtabliſhed; and afterwards confirmed under Charles II. Notwithſtanding all Cromwell's faults, it muſt be allowed that he maintained the honour of the nation much, and in many inſtances interpoſed in favour of the Proteſtants abroad: and he alſo paid ſome regard to men of learning, and the education of youth.

Richard Cromwell, who ſucceeded his father as Protector, differed greatly from Oliver both as to ſpirit and parts in the affairs of government. Being placed in his dignity by thoſe who wanted to make him the tool of their own government, he was ſoon after driven, without the leaſt ſtruggle or oppoſition, into obſcurity. Though the Preſbyterians were very zealous in promoting the reſtoration of Charles, that event was in fact brought about by the general concurrence of the people, who ſeemed to think that neither peace nor protection were to be obtained, but by reſtoring the ancient conſtitution of monarchy. Monk, commander of the forces in Scotland, made this a pretence for putting into execution a ſcheme he had long planned, of reſtoring Charles. He was a man of military abilities, but of no principles, except ſuch as ſerved his ambition or intereſt: he proteſted againſt the violence offered to parliament, drew together the ſeverel ſcattered regiments, marched into England, took poſſeſſion of the capital, cauſed a new parliament to be aſſembled, and recalled Charles from Spain. For theſe ſervices, he was loaded with honours and riches, created duke of Albemarle, and confirmed in the command of the army.

In 1660, Charles II. mounted the throne, and ſoon after married the princeſs Catharine of Portugal, with whom he received a portion of 300,000l. together with the two fortreſſes of Tangier in Africa, and Bombay in the Eaſt Indies. He endeavoured, in the firſt year of his reign, to unite every party in an affection for him and his country, ſeemed deſirous to promote the happineſs of his people, and Preſbyterians and loyaliſts were equally admitted into his councils. But it was not long before affairs put on a more unpleaſing aſpect: the king became at length entirely abſorbed in pleaſure and diſſipation, to which he ſet no bounds: this led him into the moſt extravagant expences, and, together with his indolence, had the ſame pernicious conſequences as deſpotiſm itſelf. He has been ſeverely cenſured for ſelling Dunkirk for about 250,000l. to the French for ſupplying his neceſſities, after he had ſquandered the immenſe ſums granted him by parliament: he was alſo ſo ill adviſed as to ſeize upon the money of the bankers, which had been lent him at eight per cent. and to ſhut up the Exchequer, which indefenſible ſtep he intended to juſtify by the neceſſity of his affairs. But even in this, his conduct was more defenſible than in his ſecret connections with France, which were of the moſt ſcandalous nature, utterly repugnant to the welfare of the kingdom, and ſuch as muſt ever reflect infamy on his memory; among other inſtances of his reprehenſible conduct, may be mentioned his giving way to the popular clamour againſt the lord Clarendon, as the chief adviſer of the ſale of Dunkirk, and whom he ſacrificed to the ſycophants of his pleaſurable hours, though he was a man of extenſive knowledge and great abilities, and more honeſt in his intentions than moſt of his other miniſters: this great man was, in 1667, impeached of high treaſon, and, to avoid the ſtorm, retired into France, where he ſurvived his diſgrace only ſix years.

The firſt Dutch war began in 1665, which was carried on with great reſolution and ſpirit under the duke of York; but, through Charles's miſapplication of the public money granted to carry on the war, the Dutch, taking advantage of his negligence, ſent a large fleet of ſhips to ravage the coaſt of England, which accordingly ſailed up the Medway as far as Chatham, where (and alſo at Upnor-caſtle) they burnt ſeveral capital ſhips of war. Soon after, a treaty was concluded at Breda between England, Sweden, and the States-General, in 1667, called the Triple Alliance, for the preſervation of the Spaniſh Netherlands againſt the arms of France.

War was again declared againſt Holland in 1672, which had almoſt proved fatal to that republic, as the Engliſh fleet and army acted in conjunction with thoſe of France. The duke of York commanded the Engliſh fleet; as did the duke of Monmouth, a natural ſon of Charles, 6000 Engliſh forces acting in conjunction with the Engliſh in the Netherlands; and all Holland muſt have fallen into the hands of the French, had it not been for the vanity of their monarch Louis XIV. who was in a hurry to enjoy his triumph in his capital, and ſome utterly unforeſeen circumſtances. All confidence was now loſt between Charles and his parliament, notwithſtanding the glory which the Engliſh fleet obtained by ſea againſt the Dutch, with whom the popular clamour at length obliged him to make peace, in conſideration of 200,000l.; and in order to remove the nation's fears, as much as poſſible, reſpecting the duke of York, he negotiated a marriage between Mary, eldeſt daughter to the duke, and heir apparent to the crown of England, and the prince of Orange; which was concluded, October 23, 1677.

Charles complaining of the freedom taken with his prerogative in coffee-houſes, he ordered them to be ſhut up, but in a few days afterwards they were opened again: he exerciſed great rigour and ſeverity againſt the Preſbyterians, and all other nonconformiſts to epiſcopacy, which was eſtabliſhed with a high hand in Scotland as well as England. His parliament addreſſed him, but in vain, to make war with France in the year 1677; for he was entirely devoted to that crown, whoſe money he regularly received as a penſioner, and hoped through its influence and power to be abſolute: ſeveral of his great men had alſo ſalaries from the ſame court, and alledged the king's example in juſtification of this infamous practice.

The hatred of the commons to the French and Papiſts grew every day more violent; and many of the members of parliament were bent upon ſuch a revolution as afterwards took place, and were ſecretly determined that the duke of York ſhould never reign. In 1678, the famous Titus Oates, taking advantage of this diſpoſition, alarmed the whole nation with the account of a plot which he pretended was formed by the Jeſuits to murder the king, and introduce Popery into England. Nothing could exceed the improbability of this conſpiracy, but the readineſs with which the intelligence of it was received by the parliament; who, blinded by their prejudice, gave credit to the moſt glaring abſurdities. Lord Stafford, at this time a very old man; Coleman, ſecretary to the duke of York; numbers of Jeſuits, and ſeveral other Catholics, were publicly executed on the moſt perjured evidences. It was with difficulty that the queen herſelf eſcaped. The duke of York, againſt whom the heavieſt of the ſtorm was directed, thought it moſt prudent to retire from England; and the king, though convinced that the whole was an infamous impoſition, in order to prejudice the minds of the nation

againſt his ſucceſſor, was compelled by neceſſity to yield to the popular clamour. The conduct of ſome members in the houſe of commons, plainly demonſtrated, that the chief end of this plot was, to exclude the duke of York from the throne. A bill for that purpoſe was, ſome time after, actually brought into and paſſed by that houſe; but was rejected by the peers.

England was again in a flame; but the king, by a well-timed adjournment of the parliament to Oxford, ſeemed to recover the affections of his people to a very great degree. The duke of York and his party, however, made a ſcandalous uſe of their victory; for on their part, they trumped up a plot of the Proteſtants for killing or ſeizing the king, and altering the government. This plot was as falſe as that charged upon the Papiſts; notwithſtanding which, lord Ruſſel, Algernon Sidney, and ſeveral other diſtinguiſhed Proteſtants, ſuffered death on this occaſion; Eſſex died in priſon, Hampden was fined 40,000l. and the king ſet his foot upon all oppoſition. Even the city of London was intimidated into the meaſures of the court, as were almoſt all the corporations in the kingdom. The duke of Monmouth, and the earl of Shafteſbury, was obliged to fly, and the duke of York returned in triumph to Whitehall. Charles, it was thought, afterwards repented of ſome of his arbitrary ſteps, and intended to have recalled the duke of Monmouth, and execute ſome meaſures for the future quiet of his realm, but amidſt all theſe excellent reſolutions, he was ſeized with a ſudden fit, reſembling an apoplexy; and though he was recovered from it by bleeding, he languiſhed only for a few days, and expired February 6, 1685, in the 55th year of his age, and 25th of his reign.

Though the principles and conduct of Charles were in general unconſtitutional to England, yet ſome of his actions muſt be owned beneficial to the nation. He confirmed the abolition of all the feudal tenures, in lieu of which he received from the parliament a gift of the exciſe for life; and in this act coffee and tea are firſt mentioned. By his long reſidence, and that of his friends, abroad, he imported into England the culture of many elegant vegetables, ſuch as the cauliflowers, aſparagus, artichokes, and ſeveral kinds of beans, peas, and ſalads. Under him, Jamaica, which had been conquered by the Engliſh under the auſpices of Cromwell, was greatly improved, and made a ſugar colony. The Royal Society was inſtituted, and many popular acts reſpecting trade and colonization were paſſed. The trade of England was alſo incredibly increaſed during his reign, and he entered into many vigorous meaſures for its protection and ſupport. He carried the art of ſhip-building to great perfection; and the royal navy of England, at this day, owes its fineſt improvements to his and his brother's knowledge of naval affairs and architecture. Charles loved, patronized, and underſtood the arts, more than he encouraged or rewarded them, eſpecially thoſe of Engliſh growth; but his neglect proceeded not from narrow-mindedneſs, but indolence, and want of reflection. In his time, our language was harmonized, refined, and rendered natural; and the days of Charles may be called the Auguſtan age of mathematics and natural philoſophy. As to his religion, James, ſoon after Charles's death, publiſhed to the world, that his brother, notwithſtanding his repeated profeſſions of regard to the Proteſtant faith, was a Papiſt, and died ſuch, of which there are now inconteſtable proofs. The reign of this monarch has indeed been celebrated for wit and gallantry, but both were coarſe and indelicate: the court was a nurſery of vice, and the ſtage exhibited ſcenes of impurity.

England was viſited with two dreadful calamities in the late reign. In May 1665, a terrible plague broke out in London, and raged for eleven months, in which time it ſwept away, in the city only, upwards of 100,000 ſouls: and on the 2d of September 1666, a fire broke out in the city, which in three days conſumed eighty churches, ſeveral city gates, and 400 ſtreets, containing 13,200 dwelling-houſes.

James II. now aſcended the throne, though great oppoſition was at firſt made to his acceſſion: but the declaration which he made to the privy-council, immediately on the demiſe of his brother, of his reſolution to maintain the eſtabliſhed government, both in church and ſtate, quieted the minds of the whole nation; and the popular affection towards him was increaſed by the early declaration he made in favour of the church of England, which, during the reign of Charles, had formerly pronounced all reſiſtance to the king to be unlawful. It was not long, however, before his arbitrary notions of government began to appear. The army and people ſupported him in cruſhing an ill-concerted rebellion of the duke of Monmouth, who pretended to be the lawful ſon of Charles II. and, as ſuch, had aſſumed the title of king. That duke being beheaded July 15, 1685, and ſome hundreds of his followers hanged, drawn, and quartered, in the weſt of England, exhibiting a ſcene of barbarity ſcarcely ever known in this country, in which Jefferies and Colonel Kirke were the principal inſtruments. James deſperately reſolved to try how far the practice of the church of England would agree with her doctrine of non-reſiſtance: the experiment failed, and in the end proved fatal to him. He made the moſt provoking ſteps to render Popery the eſtabliſhed religion of his dominions. He arrogated to himſelf a power of diſpenſing with the known laws; inſtituted an illegal eccleſiaſtical court, openly received and admitted into his privy-council the pope's emiſſaries, giving them more reſpect than was due to the miniſters of a ſovereign prince. He ſent an embaſſy to Rome, and received at his court the pope's nuncio. The encroachments he made upon both the civil and religious liberties of his people, are almoſt beyond deſcription, and were diſapproved of by the pope himſelf, and all ſober Roman Catholics. His ſending to priſon, and proſecuting for a libel, ſeven biſhops, for preſenting a petition againſt reading his claration againſt liberty of conſcience, alarmed his beſt Proteſtant friends. The joyful news of their acquittal was however ſoon conveyed from Weſtminſter-Hall to thoſe without, from them to the city and army, and in a ſhort time ſpread throughout the kingdom.

Matters being brought to this extremity, many great men in England and Scotland applied for relief to William, prince of Orange, in Holland; a prince of great abilities, and the inveterate enemy of Louis XIV. who then threatened to enſlave Europe, inviting him to aſſiſt them by his arms in the recovery of their laws and liberties. This prince was the nephew and ſon-in-law of James, having married the princeſs Mary, that king's eldeſt daughter; and he at laſt embarked with a fleet of 500 ſail for England, avowing it to be his deſign to reſtore to the church and ſtate their due rights, and prevent the eſtabliſhment of a deſpotic power. Upon his arrival in England, he was joined not only by the Whigs, but by many whom James had conſidered as his beſt friends; and and even his daughter the princeſs Anne, and her huſband, George prince of Denmark, left him and joined the prince of Orange. James might ſtill have reigned; but he was ſurrounded with French emiſſaries, and ignorant Jeſuits, who wiſhed him not to reign, rather than not reſtore Popery. They ſecretly perſuaded him to ſend his queen and ſon, real or pretended, then but ſix months old, to France, and to follow them in perſon, which he did; and thus ended the reign of James in England, which event in Engliſh hiſtory is termed the Revolution, and took place in the year 1688.

The chief object of William was to humble the power of France, and his reign was ſpent in an almoſt uninterrupted courſe of hoſtilities with that power, which

which were ſupported by England at an expence ſhe had never known before. The nation had grown cautious, through the experience of the two laſt reigns, and he gave his conſent to the bill of rights, by which the liberties of the people were confirmed and ſecured. England had never before this time been at ſo high a pitch of wealth and proſperity: her tonnage of ſhips was nearly doubled, both in the merchants ſervice and royal navy, to what it had been a few years before: the increaſe of the cuſtoms, and the annual rental of England, was in the ſame proportion.

The war with France, which, on the king's part, was far from being ſucceſsful, required an enormous expence, and the Iriſh continued, in general, faithful to James: but many Engliſh, who wiſhed well to the Stuart family, dreaded their being reſtored by conqueſt; and the parliament enabled the king to reduce Ireland, and to gain the battle of the Boyne. The marine of France proved ſuperior to that of England, in the beginning of the war; but in the year 1692, that of France received an irrecoverable blow in the defeat at La Hogue. The continental war forced the parliament to open new reſources for money. A land-tax was impoſed, and every ſubject's lands were taxed, according to their valuations given in by the ſeveral counties. On December 28, 1694, William loſt his excellent queen, who died of the ſmall-pox, in her 34th year: and, not being well ſupported in his war with France, he was forced, in 1697, to conclude the peace of Ryſwick with the French king, who acknowledged his title to the crown of England.

In 1698, William was guilty of a very impolitic action, in agreeing to a treaty of partition with France, with regard to the Spaniſh ſucceſſion, in caſe Charles II. king of Spain, whoſe death was daily expected, ſhould leave no iſſue. By this treaty the Spaniſh monarchy was to be divided between the houſes of Bourbon and Auſtria; but Charles, who died in 1700, bequeathed his dominions to the duke of Anjou, ſecond ſon to the Dauphin of France. The ſplendor of a crown was too great a temptation to be reſiſted by Louis; who, in open defiance of the treaty he had concluded with William, and the ſtates-general, ſeized on the Spaniſh monarchy. This breach of faith was further aggravated by the inſincerity of the French court, on the death of James II. which happened in September 1701. Soon after which, Louis gave orders, that the ſon of the deceaſed monarch ſhould be proclaimed king of England, Scotland, and Ireland, by the name of James III.

William was no ſooner informed of theſe proceedings, than he recalled his ambaſſador from Paris, and ordered the French reſident here to leave the kingdom immediately. The parliament, which had been highly chagrined at the treaty of partition, and even impeached ſome of the miniſtry for adviſing it, approved of the juſt reſentment of their monarch; and William received addreſſes from every part of the kingdom, promiſing to ſupport his government againſt the pretender and all his enemies. Aſſured of the aſſiſtance of his people, the king now concluded alliances with ſeveral foreign princes againſt France, particularly with the emperor and Holland, uſually ſtyled the grand alliance. Land and ſea forces were raiſed with the utmoſt expedition, and every thing was in the greateſt forwardneſs for the declaration of war, when the king, whoſe health had been viſibly declining for ſome time, received a fall from his horſe, whereby his collar bone was broken. The bone was ſet, and the phyſicians began to flatter themſelves that his majeſty would recover; but a defluxion having fallen upon his knee, attended by ſeveral dangerous ſymptoms, he languiſhed a few days, and expired. This event happened on the firſt of March 1702, in the 52d year of his age, and the 14th of his reign.

The chief glories of this prince's reign were, the reſcue and preſervation of religion and public liberty; for under him, England ſuffered ſeverely both by ſea and land. With reſpect to his diſpoſition, he did not appear formed by nature for popularity; his manners were cold and forbidding; he ſeemed alſo ſometimes to loſe ſight of thoſe principles of liberty, for the ſupport of which he had been raiſed to the throne; and, though he owed his royalty to the Whigs, yet he often favoured the Tories.

Anne, princeſs of Denmark, was immediately proclaimed queen of England; and, as it was ſuſpected that ſhe would deviate from the meaſures purſued by William, ſhe took the earlieſt opportunity of aſſuring her ſubjects and allies, that ſhe meant faithfully to adhere to the engagements formed by that monarch. The two parties of Whig and Tory now ran very high in England, and when it came to be debated in council, whether England ſhould enter into the war as principals, or only as auxiliaries, the Tories, headed by the earl of Rocheſter, the queen's maternal uncle, adviſed the latter: but the Whigs, the chief of whom were the dukes of Devonſhire and Somerſet, inſiſted upon the expediency of our acting as principals; as the honour of the nation was immediately concerned in fulfilling the engagements made by the late king, which could not be done otherwiſe than by entering into the quarrel as principals. The earl of Marlborough, who was competitor with Rocheſter for the queen's favour, and, by the influence which his counteſs had over that princeſs, in a manner directed her reſolutions, declared himſelf of the ſame opinion. This point being determined, war was declared againſt France and Spain on the 4th of May 1702. The prince of Denmark, huſband to the queen was created high admiral of England, and the duke of Marlborough appointed general of the combined army.

A ſcene of almoſt uninterrupted ſucceſs attended the confederates, particularly the Engliſh, during the whole courſe of this war; and gained the earl, who, for his eminent ſervices, was created duke of Marlborough, much honour. Several battles were fought, the principal of which were thoſe of Blenheim, Ramillies, and Oudenarde. The battle of Blenheim happened in conſequence of the queen's generous reſolution to ſave the empire of Germany, which was in danger of being totally ruined by the joint forces of France and Bavaria. The States-General having embraced the ſame reſolution, Marlborough marched with ſurpriſing rapidity into Germany, at the head of the confederates, and drove the French and Bavarians from the intrenchments they had raiſed at Schellenberg, in order to prevent his croſſing the Danube. Having paſſed that river, and being joined by a conſiderable body of forces under prince Eugene, he attacked the French and Bavarians at Blenheim, where they gained a very ſignal and complete victory; marſhal Tallard, the French general, was taken priſoner, together with 13,000 men, and a proportional number of cannon, artillery, and trophies of war. The French were ſoon after driven out of Germany, and all Bavaria conquered. About this time, Sir George Rook reduced Gibraltar, which ſtill remains in our poſſeſſion. At ſea, other advantages were alſo obtained.

On the 12th of May 1706, the battle of Ramillies was fought, with equal ſucceſs. The loſs of the French amounted to near 40,000 men. After this victory, the archduke of Auſtria, who diſputed the crown of Spain with the duke of Anjou, and had taken upon himſelf the title of Charles III. was ſolemnly recognized by the ſtates of Flanders for their ſovereign; and the allies purſued the conqueſts with the utmoſt rapidity.

On the 12th of July 1708, an engagement happened at Oudenarde, when the French were once more totally defeated. In this action the electoral

prince of Hanover, afterwards king George II. gave early proofs of his martial diſpoſition; for, having charged at the head of the Hanoverian dragoons with great intrepidity, his horſe was ſhot under him, and one of his aids-de-camp killed by his ſide. In this battle, between three and four thouſand of the enemy were left dead on the field, and ſeven thouſand were taken priſoners.

France was reduced to ſuch diſtreſſes in 1709, that the pride of her aſpiring monarch Louis being thereby humbled, he determined to ſacrifice all the calls of ambition, as well as the intereſt of his grandſon, to obtain a peace, and accordingly, about the middle of May, conferences were opened for this purpoſe at the Hague. Prince Eugene, Marlborough, and the Dutch penſionary Heinſius, were for continuing the war, and their propoſals to Louis were ſuch as no monarch could, conſiſtent with his honour, acccept: the conferences therefore were broken off, and the allies reſolved to begin the campaign with the ſiege of Tournay. The trenches were opened on the 27th of July, and the town ſoon after ſurrendered; but it was the ſecond of September before the garriſon capitulated. Mons was the next great object of the allies; but, before that ſiege could be effected, it was found neceſſary to drive the French army from their poſts behind the woods of la Merte and Trainiere, in the neighbourhood of Malplaquet. This was attempted with ſucceſs; but it proved the deareſt victory the confederates ever purchaſed, having coſt them above 18,000 men killed and wounded, and among the former were ſeveral officers of diſtinction. The end propoſed by this engagement, however, was obtained, for about the middle of November, Mons ſurrendered.

In Spain, the affars of the confederates were far from being equally ſucceſsful. The queen had ſent a fine army under the command of lord Galway, to aſſiſt Charles III. That general was joined by the Portugueſe forces, and, at firſt, their attempts were attended with ſome ſucceſs; but, in 1707, the Engliſh ſuſtained a ſevere defeat in the plains of Almanza, chiefly through the cowardice of their allies.

The Tories, who were Marlborough's inveterate enemies, had long endeavoured to convince the queen that this war would, in the end, prove ruinous to the church and ſtate; and accuſed the Whigs of not being very well affected to the former. Robert Harley, afterwards earl of Oxford, was at the head of this party, formed to ruin the duke. The people were taught to believe that the church was in danger, and, by that means, rendered clamorous. This was increaſed by a ſermon preached at that time by Dr. Sacheverel, wherein he ſtrenuouſly aſſerted the high notions of hereditary indefeaſible right, paſſive obedience, and non-reſiſtance. He was impeached by the commons, and found guilty by the lords, who paſſed a very mild ſentence upon him. The honour and intereſt of the nation were now ſacrificed to private court intrigues, managed by Mrs. Marſham, a relation of the ducheſs of Marlborough, her benefactreſs, whom ſhe had ſupplanted, and by Mr. Harley, afterwards earl of Oxford. To complete the triumph of the Tories, Marlborough was diſmiſſed from all his employments, and the command of the army given to the duke of Ormond.

The new miniſtry having reſolved to negotiate a peace with France, a congreſs was opened at Utrecht, on the 29th of January 1712, for that purpoſe. The preliminaries were ſoon ſettled between England and France, and, not long after, acceded to by all the princes who formed the grand alliance, the emperor excepted. That monarch determined to carry on the war againſt France, but was ſoon convinced he had undertaken what he was unable to ſupport, and accordingly made a ſeparate peace.

The queen, after the peace of Utrecht, was perpetually diſturbed by the jarring of parties. When the change of the miniſtry had taken place in favour of the Tories, Oxford, at that time Mr. Harley, was created lord high treaſurer, Sir Simon Harcourt appointed lord keeper, and Mr. Henry St. John, afterwards lord Bolingbroke, nominated ſecretary of ſtate. Theſe three perſons, though they had united in oppoſing the adminiſtration of the Whigs, were far from being united in their political ſentiments; their views and purſuits were very different: it is therefore no wonder that they ſoon experienced an oppoſition more formidable than that they had ſo lately ſubdued. Each found his hopes diſappointed, and an open rupture between them was the conſequence. Nor did they ſet any bounds to their reſentment; forgetting the reſpect due to their royal miſtreſs, who had diſtinguiſhed them with the higheſt marks of her favour, they made uſe of the moſt bitter invectives againſt each other in her preſence. This deeply affected her, and ſhe removed the earl of Oxford from his office of lord high treaſurer. The general confuſion occaſioned by this event, and the fatigue of attending a long cabinet council, had ſuch an effect upon the queen's ſpirits, before greatly weakened by her bad ſtate of health, that, on the 29th of July 1714, ſhe was ſeized with a lethargic diſorder, languiſhed till the firſt of Auguſt, and then expired, in the 50th year of her age, and 13th of her reign. With her ended the line of the Stuarts, which, from the acceſſion of James I. anno 1603, had ſwayed the ſceptre of England 111 years, and that of Scotland 343 years, from the acceſſion of Robert II. anno 1371. As queen Anne left no iſſue, ſhe was ſucceeded by George, elector of Hanover, in purſuance of a ſtatute paſſed in the 12th year of William III. for limiting the ſucceſſion of the crown.

George I. mounted the throne with ſtrong prepoſſeſſions againſt the Tories, whom he conſidered as enemies to the houſe of Hanover. A total change therefore immediately took place in the miniſtry. This avowed partiality greatly inflamed the minds of thoſe who were already but too much diſcontented at the late changes, and the rejoicings on account of the coronation were interrupted in ſeveral places by diſorderly rabbles, who committed numberleſs outrages. The Pretender, taking advantage of theſe commotions, cauſed a manifeſto to be diſperſed in England, ſetting forth his right to the crown. A rebellion ſoon after broke out in Scotland, under the earl of Mar, which might have been attended with very ſerious conſequences, had not the death of Louis XIV. who had promiſed to ſupport the young adventurer, happened at this criſis. In the mean time, ſeveral of the Scottiſh peers armed their clans in favour of George I. and the duke of Argyle having been appointed commander in chief of the forces in Scotland, engaged the rebels, under the earl of Mar, at Sheriff-Muir, and totally defeated their whole army. This defeat did not however intimidate the inſurgents. In the beginning of the year 1716, the pretender arrived in Scotland, and made his public entry into Perth. The duke of Argyle immediately marched to attack the rebels; but they did not wait his approach. They retreated with the utmoſt expedition to Montroſe, where the chevalier, with ſome of his principal adherents, went on board a ſmall veſſel, and paſſed over into France. The rebel army now found that their chiefs had abandoned them, upon which they immediatly diſperſed. During the rebellion in Scotland, an inſurrection happened in the Weſt of England, where the pretender's friends were very numberous, but was ſuppreſſed almoſt as ſoon as formed, and ſeveral of the leaders puniſhed with death.

In 1715, a new parliament, conſiſting chiefly of Whigs, met at Weſtminſter, when Henry, earl of Bolingbroke, Robert, earl of Oxford, and James, duke of Ormond, were impeached of high treaſon; and the earl of Strafford of high crimes and miſdemeanors.

meanors. Lord Bolingbroke and the duke of Ormond retired into France; and lord Oxford was impriſoned for three years, when he regained his liberty.

Peace being reſtored to the kingdom, his majeſty went over to the continent, in order to ſecure his German dominions from the attempts of Charles XII. king of Sweden, who had been incenſed againſt George, as elector of Hanover, for purchaſing Bremen and Verden of the Danes, which had been a part of the Swediſh dominions. In 1718, a rupture happened between England and Spain, on account of the quadruple alliance; and the Engliſh admiral, Sir George Byng, by the king's orders, defeated the Spaniſh fleet near Syracuſe. France having joined the Engliſh in this war, it was ſoon ended, by the Spaniards delivering up Sardinia and Sicily, the former to the duke of Savoy, and the latter to the emperor. Charles had embraced the intereſt of the pretender, and even engaged to aſſiſt the malcontents in England with a powerful army. This confederacy being diſcovered, his Britannic majeſty concluded a treaty with France and the States-General, known by the name of the Triple Alliance, in order to diſappoint any attempts that might be made againſt his dominions. On his return to England he immediately ordered count Gyllembergh, the Swediſh reſident, into cuſtody, and purſued ſuch prudent meaſures, that the deſigns of Sweden were for that time rendered abortive. Charles, however, did not abandon his deſign; and he would, in all probability, have invaded England at the head of a powerful army, in conjunction with Peter, czar of Muſcovy, had not death put an end to his life before the ſcheme was ripe for execution.

The year 1720 was rendered remarkable by the ſudden riſe of the South-Sea ſtock. That company had been lately erected, and owed its riſe to a ſcheme for carrying on an excluſive trade, and making a ſettlement in the South Seas. Accordingly, a plan was laid before the houſe of commons, to increaſe their capital ſtock by redeeming the public debts, in conſideration of certain advantages which were to be granted them. This plan occaſioned many warm debates, but at length the company's offers were accepted.

In 1722, a conſpiracy was ſaid to be formed againſt the king, and, after ſome conteſt, the Habeas Corpus act was ſuſpended. The earl of Orrery, Dr. Atterbury, biſhop of Rocheſter, and the lord North and Grey, were charged with high treaſon, and committed to the Tower; and ſoon after, the duke of Norfolk. Several other perſons were ſeized and impriſoned; and Dr. Atterbury was baniſhed for life. Mr. George Kelly, an Iriſh clergyman, and Mr. John Plunket, were impriſoned during his majeſty's pleaſure; and Mr. Chriſtopher Layer, a young counſellor at law, put to death.

The courts of Spain and Vienna having entered into a treaty contrary to the intereſt of Great-Britain, the king, in order to counteract their deſigns, projected a defenſive treaty between England, France, and Pruſſia, which was ſigned at Hanover on the 3d of September 1725. The real intent of this alliance was to ſecure his Britannic majeſty's German dominions, though it was repreſented by the court party as having been contracted merely for the glory and advantage of this nation, the intereſt and honour of which was evidently ſacrificed to that electorate. Catharine, empreſs of Ruſſia, having conſulted with the courts of Madrid and Vienna the moſt probable meaſures for placing the pretender on the throne of Great-Britain, they ſent a fleet into the Baltic under the command of Sir Charles Wager, with orders to remonſtrate with the empreſs on her conduct: that artful woman, however, diſowned having the leaſt knowledge of thoſe proceedings, and the admiral, after continuing in the Baltic till the ſeaſon was too far advanced for the Ruſſian fleet to make any ſucceſsful attempt in favour of the pretender, returned to England. Sir John Jennings, with ſeveral ſhips of war, ſailed at the ſame time as Sir Charles Wager, in order to inſult the coaſt of Spain, and he ſo effectually executed his orders, that the panic extended even to Madrid. A third ſquadron, which ſailed at this juncture for the Weſt Indies, under the command of rear-admiral Hoſier, was not ſo fortunate. His orders were to watch the Spaniſh plate fleets; but the Spaniards having received intelligence of this deſign, before he could reach the Baſtimentos, had unladen the galleons, and carried the treaſure, amounting to ſix millions and a half ſterling, back to Panama. Hoſier, however, continued cruiſing before Porto Bello from the beginning of June till Chriſtmas. But, during this interval, the admiral himſelf, and moſt of his crew, periſhed by epidemical diſeaſes. The management of the Spaniards was little better: they reſolved to attempt the retaking of Gibraltar, and actually laid ſiege to that important fortreſs; but ſuch care had been taken to put the place into a proper poſture of defence, that, having loſt 10,000 men, the enemy was obliged to abandon the enterpriſe.

While the chief powers in Europe were thus preparing for war, they were actually very deſirous of peace. Louis XV. undertook the friendly office of a mediator, and a congreſs was opened at Soiſſons for adjuſting all differences between the contending nations. The king reſolved to ſeize this favourable opportunity of viſiting his German dominions; and accordingly, having appointed a regency, he embarked at Greenwich on the 3d of June, 1727, and landed in Holland on the 7th. But on the road to Hanover, he was ſuddenly ſeized with a paralytic diſorder, which terminating in a lethargy, he was carried in a ſtate of inſenſibility to Oſnaburgh, where he expired on the 11th of the ſame month, being the 68th year of his age, and 13th of his reign, and was interred among his anceſtors at Hanover.

As ſoon as this event was known in England, Sir Robert Walpole, at that time conſidered as firſt miniſter, immediately waited on the prince and princeſs of Wales with the melancholy intelligence, and, on the 15th of June, the prince was proclaimed king of England, by the title of George II. Conſiderable changes were at firſt expected in the miniſtry, but all the great officers of ſtate continued in their places; Sir Robert Walpole kept poſſeſſion of the treaſury, notwithſtanding a coolneſs had ſubſiſted between him and George II. while prince of Wales. The principal members who oppoſed the meaſures purſued by Sir Robert, were Mr. Daniel Pultney, Mr. William Pultney, Mr. Shippen, and Sir William Wyndham. He filled all places of power, truſt, and profit, and almoſt the houſe of commons itſelf, with his own creatures; and was blamed for his unbounded love of peace, whereby he ſubjected the nation to the inſults of foreign powers; but an attempt which, in 1733, he made in the houſe of commons to introduce a general exciſe, was what gave the firſt ſhock to his power. There is no doubt but, had he been determined to have exerted his influence, the bill would have paſſed; but, finding that the nation in general was averſe to it, he ſuffered the oppoſition to prevail, and the people teſtified their approbation by tokens of public rejoicing.

The meaſures of Sir Robert Walpole had for ſome time rendered him the object of popular reſentment, which was now greatly increaſed by his giving offence to Frederick, prince of Wales. A motion had been made in the houſe of commons for augmenting the prince's revenue. Sir Robert oppoſed it, and it was carried in the negative. The prince was now conſidered as the leader of the oppoſition, and Sir Robert began to fear the conſequences, when Frederick, by an unhappy accident, incurred the diſpleaſure of the king, who gave the prince to underſtand, that until he ſhould withdraw his confidence from thoſe by

whoſe

whoſe inſtigation and advice he was encouraged in his diſobedient behaviour, and return to his duty, he ſhould not reſide in the palace; at the ſame time ſignifying his pleaſure, that he ſhould leave St. James's with all his family, as ſoon as it could be done without prejudice or inconvenience to the princeſs, who now lay-in there. The prince, in conſequence of this meſſage, retired to Kew; but found his father's anger was not eaſily appeaſed: even his requeſt to obtain admittance to the queen, his mother, to implore forgiveneſs, and receive her bleſſing in her laſt moments, was denied. That princeſs paid the debt of nature on the 29th of November, 1737, and was regretted as a pattern of conjugal virtue, and a friend to all the learned of Europe.

In the mean time, the debates in parliament relating to the Spaniſh depredations in America, were carried on with uncommon ardour. Sir Robert adhered to his pacific ſyſtem, and concluded a ſhameful compromiſe, under the title of a convention, which even his beſt friends could not defend; but at length, vigorous meaſures becoming neceſſary, war was declared againſt Spain on the 23d of October, 1736. Vernon, a ſworn enemy to the miniſter, having aſſerted in the houſe of commons, that Porto Bello might be taken with ſix men of war, was ſent with a fleet to the Weſt Indies. The admiral performed his promiſe: he took Porto Bello, ſituated on the Iſthmus of Darien, with ſix ſhips only, and demoliſhed all the fortifications by which it was defended. He, however, miſcarried in another attempt he made againſt Carthagena; but the misfortune was chiefly owing to the general of the land forces.

The ſucceeding winter was one of the ſevereſt ever known in England. The river Thames was frozen over, and ſeveral trades exerciſed on the ice. The fruits of the earth were deſtroyed, trade was at a ſtand, and the price of proviſions aroſe to an amazing height; even water was ſold in the ſtreets of London. In this ſeaſon of diſtreſs many wretched families muſt have periſhed by cold and hunger, had not thoſe of opulent fortunes been inſpired with a remarkable ſpirit of humanity and compaſſion. Nothing can more redound to the honour of the Engliſh nation, than the inſtances of benevolence and well-conducted charity which were then exhibited.

The general election now coming on, the miniſter determined to try his ſtrength in the houſe of commons by a conteſted election; and had the mortification to find a majority of ſixteen voices againſt him. On this deciſion he declared he would never more ſit in that houſe. Accordingly, the parliament was adjourned by the king for ſixteen days, and, during that interval, Walpole was created earl of Orford, and reſigned his employments. After which, the new adminiſtration being ſettled, by dividing, after various removals, the power of the premierſhip between Mr. Pelham and his brother the duke of Newcaſtle, the prince of Wales, attended by a numerous retinue of his adherents, waited on his majeſty, who received him very graciouſly, and ordered his guards to be reſtored.

The affairs of Europe, about this time, wore a threatening aſpect. In the Weſt-Indies the war, in 1741, proved unfortunate for England, through the fatal diviſions between admiral Vernon and general Wentworth, who commanded the land troops; and it was thought that above 20,000 Britiſh ſeamen periſhed in the impracticable attempt on Carthagena, and the inclemency of the air and climate during other fruitleſs expeditions. The year 1742 had been ſpent in negotiations with the courts of Peterſburgh and Berlin, which, though expenſive, proved of little or no ſervice to Great Britain; ſo that the victory of Dettingen left the French troops in much the ſame ſituation as before. A difference between the admirals Matthews and Leſtock had occaſioned the Spaniſh and French fleets to eſcape out of Toulon with inconſiderable loſs; and ſoon after the French and Engliſh declared war againſt each other. The Dutch, England's natural allies, carried on a moſt lucrative trade during the war; nor could they be brought to act againſt the French till the people entered into aſſociations and inſurrections againſt the government. Their marine was in a miſerable condition; and when they at laſt ſent a body of troops to join the Britiſh and Auſtrian armies, which had been wretchedly commanded for one or two campaigns, they did it with ſo bad a grace, that it was plain they did not heartily embark in the war.

When the duke of Cumberland took upon himſelf the command of the army, the French, to the great reproach of the allies, were almoſt maſters of the barriers in the Netherlands, and were beſieging Tournay. The duke attempted to raiſe the ſiege, but, by the coldneſs of the Auſtrians, the cowardice of the Dutch, whoſe government all along held a ſecret correſpondence with France, and miſconduct ſomewhere elſe, he loſt the battle of Fontenoy, and 7000 of his beſt men; though it is generally believed that his diſpoſitions were excellent, and both he and his troops behaved with amazing intrepidity. To counterbalance ſuch a train of misfortunes, admiral Anſon returned this year to England with an immenſe treaſure (about a million ſterling) which he had taken from the Spaniards in his voyage round the world; and commodore Warren, with colonel Popperel, took the important town and fortreſs of Louiſbourg, in the iſland of Cape Breton, from the French.

Such was the ſtate of affairs in Europe, when the pretender's eldeſt ſon, in 1745, landed in Scotland. His friends, on his firſt appearance, conſidered the attempt as deſperate, as a ſcheme which nothing but the madneſs of enthuſiaſtic zeal could have projected, and the fury of wild ambition undertaken to execute; but he was deaf to all their arguments, and determined to proceed, whatever conſequences might enſue. For ſome time fortune attended his ſtandard; Sir John Cope was defeated at Preſton-Pans, the pretender entered England, took the city of Carliſle, and penetrated as far as Derby. The capital was now thrown into the utmoſt confuſion, and the Jacobite party laid a deep ſcheme to diſtreſs the bank of England. The merchants immediately aſſembled, and agreed to take bank notes in payment; this preſerved the public credit. The duke of Cumberland was appointed to command the army aſſembled in the neighbourhood of Litchfield. But the chevalier, finding himſelf fatally diſappointed in his hopes of being joined by the Engliſh, retreated back into Scotland, where he defeated general Hawley, and burnt Fort Auguſtus.

The duke of Cumberland purſued the rebels, and, on the 16th of Auguſt, both armies met at Culloden. A fierce encounter enſued; but, in leſs than thirty minutes, the pretender's army was totally defeated, the field of battle covered with their dead bodies, and the young adventurer himſelf obliged to have recourſe to flight for his ſafety.

This extinction of the rebellion did not however reſtore the peace of Europe. The war was carried on with great vigour in Flanders, and the iſland of Zealand threatened with a deſcent. This again rouſed the populace of Holland; and the States, in order to prevent the dreadful conſequences of a tumult, declared the prince of Orange ſtadtholder, and proclaimed war againſt France. Notwithſtanding theſe appearances, the Dutch never could be prevailed upon to act with vigour. The allies were defeated at Laffeldt; and Bergen-op-Zoom was taken in a manner that has never been accounted for. In the mean time, the French marine and foreign trade were almoſt annihilated by the Engliſh, under the command of Anſon, Warren, Hawke, and others.

A general peace now ſeemed neceſſary to all parties; and accordingly a definitive treaty was ſigned at

at Aix-la-Chapelle, on the 17th of September 1748. Soon after the concluſion of the peace, the boldeſt ſtroke of financing ever perhaps attempted in any government, was undertaken and executed with ſucceſs. The laſt war had greatly increaſed the public debt, ſo that very large ſums were obliged to be raiſed annually to diſcharge the intereſt, which was then at four per cent. Mr. Pelham, who preſided at the treaſury board, was deſirous, if poſſible, of leſſening this annual ſum. It was ſufficiently evident, that great numbers of private perſons in England had acquired immenſe fortunes during the war; and, conſequently, that there was no want of money in the nation. He therefore took the reſolution of reducing the intereſt of the national debt, from four to three and a half per cent. for ſeven years, and, after that time, to ſtand at three per cent.

This meaſure, however bold it might at firſt appear, was well founded. Very few choſe to take their money out of the funds; and even ſome of them afterwards made intereſt with the miniſter to have it replaced on the conditions he had offered. Many improvements were alſo made by Mr. Pelham during this ſtate of tranquility, with regard to commerce, manufactures, and the fiſheries. On the 20th of March 1750, Frederick, prince of Wales, paid the debt of nature. He was a munificent patron of the arts, a friend to merit, and warmly attached to the true intereſts of his country. In the next ſeſſion of parliament an act was paſſed for regulating the commencement of the year, and correcting the calendar, according to the Gregorian computation, which had been long adopted by moſt other nations in Europe. This was done by ſinking eleven days in September 1752, and, from that time, beginning the year on the 1ſt of January. In 1753 was paſſed the famous act for preventing clandeſtine marriages. In the year 1754, died univerſally lamented, Mr. Pelham, who had for ſome time ſo worthily and wiſely conducted the affairs of England.

When the treaty of Aix-la-Chapelle was ſigned, it was conſidered by every intelligent perſon as nothing better than an armed ceſſation of hoſtilities. The French were aſſiduous in repairing and augmenting their marine; they had laid an artful ſcheme for poſſeſſing themſelves of the Engliſh back-ſettlements in North-America, and for cutting off all communication between the Britiſh ſubjects and the Indians. Alarmed at theſe proceedings, the Britiſh miniſtry ordered a ſquadron of men of war, under the command of admiral Boſcawen, to ſail to the coaſt of Newfoundland, and obſerve the motions of the French fleet, then fitting out at Breſt. Boſcawen ſailed about the latter end of April 1775, with eleven ſhips of the line, and one frigate, having a conſiderable number of land forces on board. He was ſoon after joined by admiral Holborne, with ſix ſhips of the line and one frigate. A few days after the Britiſh fleet had reached the banks of Newfoundland, the French ſquadron appeared, but the fog prevented any purſuit, ſo that only two of them, the Alcide and the Lys, both of 64 guns, fell into the hands of the Engliſh; the reſt of the fleet eſcaping up the river St. Laurence.

For ſome time the ſpirit of the Engliſh nation had been rouſed by the encroachments of the French in America. It was no ſooner known that hoſtilities were begun, than the public poured their money into the funds of the government, and orders were iſſued for making repriſals both in Europe and America; and that all the French ſhips, whether outward or homeward bound, ſhould be ſtopped and brought into the harbours of England. Theſe orders were ſo effectually obeyed, that, before the end of the year 1755, above 300 of the richeſt French merchant ſhips, and above 8000 of their beſt ſailors were ſent into the Britiſh ports. This well-timed meaſure had ſuch an effect, that the French had neither hands to navigate their merchantmen, nor to man their ſhips of war; for, about two years after, there were above 30,000 French ſeamen priſoners in England: ſo that the French name, inſtead of being the terror, now became the contempt of Europe.

While the enemy's trade was thus ruined in Europe, colonel Monckton, at the head of a body of troops raiſed by the province of Maſſachuſet's-Bay, drove the French from the forts they had erected in different parts of Nova-Scotia, and ſecured the tranquility of that province. But general Braddock, who had been ſent from England at the head of a body of troops, in order to drive the French from the forts they had erected on the Ohio, had, for want of taking the neceſſary precautions in paſſing through the woods, fallen into an ambuſcade, where his army was cut to pieces, and himſelf ſlain in the conteſt. General Johnſon was more fortunate; he totally defeated the French army near Crown Point, commanded by baron Dieſkau, a German officer, whom he took priſoner.

The French miniſtry, baffled in every attempt both in Europe and America, were determined to ſtrike an important blow, and accordingly fitted out a formidable fleet at Breſt, where they aſſembled a great number of tranſports. This armament at firſt filled the Engliſh with conſternation, as it ſeemed to threaten a deſcent upon their coaſt. Six thouſand men, furniſhed by the landgrave of Heſſe Caſſel, and twelve battalions of Hanoverian troops, arrived in England, and every neceſſary precaution was taken to render the attempt abortive. But it ſoon appeared that the preparations at Breſt were only intended to cover the real deſign formed by the enemy. While the Engliſh were every day expecting an invaſion, the French embarked a large body of troops at Toulon, and landed them in Minorca, where they beſieged and took the caſtle of St. Philip, though bravely defended by general Blakeney, and took poſſeſſion of the whole iſland. The loſs of this place was more ſhameful than prejudicial to the kingdom; but the public outcry was ſuch, that the king gave up Byng to public juſtice, and he was ſhot to death at Portſmouth for not doing all that was in his power againſt the enemy.

This ſacrifice being found very inſufficient to ſilence the complaints of the people, Mr. Pitt, long known as a bold and eloquent ſpeaker, was placed at the head of affairs. He ſoon proved himſelf equal to the important poſt he filled, and, by his ſpirited meaſures, raiſed the depreſſed minds of his countrymen. About the ſame time, advices arrived from the Eaſt-Indies, which more than counterbalanced the loſs of Minorca. The ſucceſſes of colonel Clive in that part of the world were truly amazing. He defeated Suraja Dowla, nabob of Bengal, Bahar, and Orixa, and placed Jaffier Ally Cawn in the ancient ſeat of the nabobs of theſe provinces. Suraja Dowla, who had embraced the French intereſt, and, at their inſtigation, had attacked the Engliſh ſettlements, was, a few days after his defeat by colonel Clive, taken priſoner by the ſon of the new nabob, Jaffier Ally Cawn, and put to death. This event laid the foundation of the amazing extent of territory now poſſeſſed by the Engliſh in the Eaſt Indies.

Mr. Pitt introduced a new ſyſtem of operations againſt France; a plan calculated at once to alarm and diſtreſs the enemy, and reſtore the ſpirits of the Engliſh. Deſpiſing the threats of an invaſion from the enemy, he planned an expedition for carrying the arms of England into France, and convincing the world, that the Britiſh forces are ſo far from fearing an attack, that they were deſirous of ſeeking them in their own territories. The firſt expedition was deſigned againſt Rochfort, and the command of the land forces given to Sir John Mordaunt. The fleet, commanded by admiral Hawke, ſailed from Spithead on the 8th of September, 1757; but, for reaſons beſt known to the officers of the army, no attempts were

made to land on the coaſt of France; and, on the 6th of October, the admiral returned to St. Helen's. This diſappointment, however, occaſioned no murmurings againſt the miniſter: the people had too great an opinion of his virtue and intrepidity, to impute any part of the failure to him.

The French having ſent a numerous army into the electorate of Hanover, large ſupplies were voted by the Britiſh parliament for the defence of his majeſty's hereditary dominions, and the neceſſary methods taken for rendering the deſigns of the enemy abortive. The duke of Cumberland, who commanded an army of obſervation in that country, did every thing in his power to ſtop the progreſs of the French; but, being preſſed by a force far ſuperior to his own, he was obliged to abandon the enterpriſe, and ſigned a convention with the enemy at Cloſterſeven: then the duke de Richlieu, who commanded the French, took poſſeſſion of that electorate and its capital.

So many difficulties concurring in 1758, a treaty of mutual defence and alliance was concluded between his Britannic majeſty and the king of Pruſſia, in conſequence of which the parliament voted 670,000 pounds to the latter; together with near two millions per annum, for the payment of 50,000 of the troops of Hanover, Heſſe-Caſſel, Saxe-Gotha, Wolfenbuttel, and Buckburg.

The French under Richlieu having violated the convention, an army was formed at Stade, under the direction of prince Ferdinand of Brunſwick, a celebrated Pruſſian officer, was appointed general of the combined army, who determined to begin the operations of the campaign immediately, and, if poſſible, drive the French out of the electorate of Hanover. It was the latter end of November before the army began their march; but, notwithſtanding the advanced ſeaſon of the year, they ſoon drove the enemy out of Lunenburg, Zell, and part of the Brunſwick dominions. Enraged at this reverſe of fortune, Richlieu committed the moſt barbarous ravages on the innocent inhabitants, burning and deſtroying all the villages and farm-houſes that lay in his way. He reduced the ſuburbs of Zell to aſhes, and even ſet fire to the orphan-houſe, by which infernal action a great number of poor innocent children periſhed.

The Engliſh repeatedly inſulted the coaſts of France; deſtroyed the ſtores and ſhipping at St. Maloes and Cherburg, and filled the whole French nation with the moſt dreadful alarms. After theſe expeditions, the duke of Marlborough, who commanded the Britiſh forces, joined prince Ferdinand at the head of 12,000 veteran troops; and this number was afterwards increaſed to 25,000. Succeſs almoſt conſtantly attended the ſtandard of prince Ferdinand; but, being oppoſed by an army always nearly double to his own, his victories were not attended with the advantages they would otherwiſe have produced. The moſt glorious battle ever fought in this, or, perhaps, any other age, was that of Minden; where about 7000 Engliſh defeated above 80,000 regular troops of the enemy.

In every other part of the globe the Britiſh armaments had equal ſucceſs. The French ſettlement at Senegal, on the coaſt of Africa, was taken by captain Marſh, and the iſland of Goree by commodore Keppel. The important fortreſs of Louiſburg, in the iſland of Cape Breton, which had been reſtored to the French by the treaty of Aix-la-Chapelle, was again reduced by admiral Boſcawen and general Amherſt, and ſix French ſhips of the line taken. The war in the Eaſt Indies was alſo carried on with equal advantage. Admiral Pococke defeated the French fleet in two engagements, and forced them to abandon the coaſt of Coromandel. General Lally, commander of the French forces in India, undertook the ſiege of Madras. The place was accordingly inveſted, and a briſk cannonade continued for two days; but not being able to make any impreſſion on the works, and the Engliſh receiving a reinforcement of 600 men, Lally thought proper to raiſe the ſiege, and retire to Pondicherry. This was immediately performed, but with ſuch precipitation, that they left behind them 40 pieces of cannon.

Three capital expeditions were planned in America, and carried into execution in the year 1759. The firſt was againſt the French iſlands in the Weſt-Indies. The command of this expedition was given to commodore Hughes and general Hobſon. The firſt attack was made upon the iſland of Martinique; but, failing in the attempt, they ſteered for Guadaloupe, which ſubmitted to the Engliſh. The ſecond expedition was againſt Quebec, the capital of Canada, ſituated on the river St. Laurence, and remarkably ſtrong both by art and nature. The miniſter gave the command of the fleet to admiral Saunders, and that of the land forces to general Wolfe, a young officer, but one of the greateſt military geniuſes the world ever ſaw. Wolfe was oppoſed with far ſuperior force by Montcalm, the beſt and moſt ſucceſsful general the French had. Though the ſituation of the country which the Britiſh general was to attack, and the works the French threw up to prevent a deſcent of the Engliſh, were deemed impregnable, yet Montcalm never relaxed in his vigilance. Wolfe's courage and perſeverance, however, ſurmounted incredible difficulties; he gained the heights of Abraham, where he fought and defeated the French army, but was himſelf killed, as was Montcalm; general Monckton, who was next in command, being wounded, brigadier-general (now marquis) Townſhend, completed the French defeat, and reduced Quebec.

General Amherſt conducted the third expedition. His orders were to reduce all Canada, and join general Wolfe on the banks of the river St. Laurence. The miniſter took care that Amherſt ſhould be well ſupplied with every neceſſary for rendering his expedition ſucceſsful; in conſequence of which, all the operations were carried on with ſuch amazing facility, that Canda was conquered, and became a part of the Britiſh empire in North America.

The affairs of France now became deſperate, and ſhe determined to venture all upon a ſingle ſtake, by invading England in three different parts of the kingdom: but on the 8th of Auguſt, 1759, admiral Boſcawen attacked the Toulon ſquadron, commanded by M. de la Clue, near the ſtraits of Gibraltar, took Le Centaure, of 74, Le Temeraire, of 74, and Le Modeſte, of 74 guns; and burnt L'Ocean, of 80, and Le Redoubtable, of 74 guns. The reſt of the fleet, conſiſting of ſeven ſhips of the line and three frigates, made their eſcape in the night; and on November 20, Sir Edward Hawke defeated the Breſt fleet, commanded by admiral Conflans, off the iſland of Dumet, in the bay of Biſcay. The Formidable, a French man of war of 80 guns, was taken; the Theſee, of 74, and the Superbe, of 70 guns, were ſunk; and the Soleil Royal, of 80, and the Heros, of 74 guns, were burnt; and afterwards the Juſte, of 74, periſhed in the mouth of the Loire. Seven or eight French men of war of the line got up the river Vilaine, by throwing their guns overboard; and the reſt of the fleet, conſiſting of five ſhips of the line and three frigates, eſcaped in the night. The Engliſh loſt, on this occaſion, the Eſſex, of 64, and the Reſolution, of 74 guns, which ran aſhore in the chaſe. After this engagement, the French gave over all thoughts of their invaſion of Great Britain.

Captain Thurot having eſcaped from Dunkirk, and ſailing to the northward round the iſles of Scotland, made a deſcent at Carrickfergus in Ireland; but on his return from thence he was met by captain Elliot, with a force inferior to his own. An engagement enſued, when fortune declared for the Engliſh; the whole ſquadron of the enemy were taken, and Thurot himſelf killed in the action.

The

The war in Germany ſtill continued as undeciſive as it was expenſive, and all the belligerent powers ſeemed inclined to peace. A negotiation was accordingly ſet on foot, but proved abortive, as did many other projects of the ſame kind. While the thoughts of the public were engaged on this deſirable event, George II. died ſuddenly at his palace at Kenſington, in the ſeventy-ſeventh year of his age, and the thirty-fourth of his reign. He died at the very point of time when the terror of his arms, the power of his dominions, and the wiſdom of his government, were raiſed almoſt to the ſummit of human acquiſition; they were indeed at that height of proſperity and glory as never had been exceeded in the reign of the moſt fortunate of his predeceſſors. Though his parts were neither lively nor brilliant, yet the whole of his conduct demonſtrated that his judgment was at once both ſolid and comprehenſive. He underſtood the intereſts of the other ſovereigns of Europe, and was particularly acquainted with all the receſſes of that political labyrinth, the ſyſtem of Germany; and was, during his whole life, a zealous aſſertor of the liberties of that country, but could never ſeparate an idea that there was any difference between his electoral and royal dominions. His temper was ſudden and violent, but placable; nor did theſe ſtarts of paſſion, though they influenced his behaviour for a time, make any impreſſion on his conduct, which was always ſufficiently deliberate and attentive both to his own intereſts and thoſe of his people. He was plain and direct in his intentions; true to his word; ſteady in his favour and protection to his ſervants, and never changed them willingly. He hardly ever removed thoſe who ſerved more immediately about his perſon; they grew old with him, or died in their places. He was merciful in his diſpoſition, but not to ſuch a degree as to encourage offences againſt his government; nor did his affections, either public or private, ever interfere with the ordinary courſe of juſtice. He lived beloved, and died lamented.

George III. grandſon of George II. aſcended the throne when England was in the zenith of its glory. Being a native of England, the people were prejudiced in his favour: he was in the bloom of youth, in his perſon tall and comely, and at the time of his acceſſion the moſt ſalutary unanimity and harmony prevailed among the people. The firſt acts of this young monarch's reign ſeemed to convince the public, that the death of his predeceſſor ſhould not relax the operations of the war, which hitherto had been remarkably proſperous. Accordingly, in 1761, the iſland of Belleiſle, on the coaſt of France, ſurrendered to his majeſty's ſhips and forces under commodore Keppel and general Hodgſon, as did the important fortreſs of Pondicherry in the Eaſt-Indies to colonel Coote and admiral Stevens. The operations againſt the French Weſt-Indies ſtill continued under general Monckton, lord Rollo, and Sir James Douglas; and in 1762, the iſland of Martinico hitherto deemed impregnable, as likewiſe thoſe of Grenada, St. Lucia, Grenadillas, St. Vincent, and others of leſs note, were ſubdued by the Britiſh arms.

The war againſt France having been conducted with ſuch wiſdom and effect by Mr. Pitt, and he receiving authentic information of the hoſtile intentions and private intrigues of the court of Spain, propoſed in council an immediate declaration of war againſt that kingdom. He aſſerted, that this was the time for humbling the whole houſe of Bourbon, and that if this opportunity was let ſlip, it might never be recovered; but he was over-ruled in the council, all the members of which, except his brother-in-law earl Temple, declared themſelves of a contrary opinion. This great man now perceived his influence decline, and it was ſuppoſed he was ſupplanted by the earl of Bute, who had a conſiderable ſhare in directing the education of the king, and had of courſe acquired an aſcendancy in the royal favour. Mr. Pitt, however, convinced that nothing could be hoped for in a divided miniſtry; and being determined not to be reſponſible for meaſures he was no longer allowed to guide, reſigned the ſeals, and lord Temple alſo gave up the poſt which he held in the adminiſtration. His majeſty, ſenſible of the diſtinguiſhed merit of this miniſter, made him an offer of any rewards in the power of the crown to beſtow, and was pleaſed to ſettle a penſion of 3000l. a year upon Mr. Pitt for three lives, and a title was beſtowed upon his dady and her iſſue.

The earl of Egremont was made ſecretary of ſtate on the reſignation of Mr. Pitt, and the duke of Newcaſtle placed at the head of the treaſury. The war, however, ſtill continued to be carried on with vigour, and the plans were purſued that he had previouſly concerted. Accordingly, war was declared againſt Spain on the 4th of January 1762. The vitals of the Spaniſh monarchy were ſtruck at by the reduction of the Havannah, the ſtrongeſt and moſt important fort which his catholic majeſty held in the Weſt-Indies, after a ſiege of two months and eight days. About the ſame time the Hermoine, a large Spaniſh regiſter ſhip, valued at a million ſterling, was taken by three Engliſh frigates, and carried into Gibraltar. This was followed by the reduction of Manilla and the Philippic iſlands in the Eaſt-Indies, under general Draper and admiral Corniſh, with the capture of the Trinidad.

The new alliance by theſe dreadful ſhocks between France and Spain, were now convinced, that unleſs ſome methods could be taken to balance theſe advantages, a peace on any terms muſt be concluded. They accordingly opened their laſt reſource, which was an invaſion of Portugal, on the moſt frivolous pretences. As this kingdom had for a long time been under the peculiar protection of the Britiſh arms, there was a neceſſity for our defending it. This greatly embarraſſed the Britiſh miniſtry; but the forces ſent to that kingdom found no difficulty in repelling the troops ſent againſt it by the enemy. The only acquiſition France made during this year was that of Newfoundland, which was ſoon recovered by general Amherſt's forces, who made the French governor and the garriſon priſoners.

The negotiations for peace about this time were reſumed; and the enemy at laſt offered ſuch terms as the Britiſh miniſtry thought admiſſible. The defection of the Ruſſians from the confederacy againſt the king of Pruſſia, and his conſequent ſucceſſes, produced a ceſſation of arms in Germany, and in all other quarters; and on the 10th of February 1763, the definitive treaty of peace between his Britannic majeſty, the king of France, and the king of Spain, was concluded at Paris, and acceded to by the king of Portugal, the ratifications were exchanged on the 10th of March at Paris; and the treaty having on the 18th been laid before the parliament, and received the approbation of a majority of both houſes, the peace was ſolemnly proclaimed on the twenty-ſecond of the ſame month at Weſtminſter and London.

The extenſive province of Canada, with the valuable iſlands of Newfoundland, Cape Breton, and St. John, were, by this treaty, confirmed to Great-Britain, alſo the two Floridas, containing the whole continent of North-America, on the north ſide of the Miſſiſſippi, except the town of New Orleans, and a ſmall diſtrict round it. The iſlands of Grenada and and the Grenadillas were alſo ceded to the Engliſh; and the French and Spaniards quitted their pretenſions to the neutral iſlands of St. Vincent, Dominica, and Tobago. The ſettlement of Senegal on the coaſt of Africa was alſo ceded by the French. On the other hand, the Havanah was reſtored to Spain. The iſlands of Deſirade, Martinique, Guadaloupe, and Mariegalante, were reſtored to France. The Engliſh gave up their claim to the neutral iſland of St. Lucia,

Lucia, granted the French the ſmall iſlands of St. Pierre and Miquelon, on the coaſt of Newfoundland, and returned the iſland of Goree, on the coaſt of Africa. The article relating to the Eaſt-Indies was dictated by the directors of the Eaſt-India company, and by it the French were put into poſſeſſion of all the places they enjoyed before the war, on condition that they erected no forts, nor kept any forces in the province of Bengal. The city of Manilla was alſo reſtored to the Spaniards; and they conſented that the Engliſh ſhould enjoy the liberty of cutting log-wood in the bay of Honduras, in America. The French reſtored the iſland of Minorca, and the Engliſh that of Belleiſle. At the ſame time it was mutually agreed, that a reciprocal reſtitution and oblivion ſhould take place with regard to Germany, and the various places that had been taken during the war, ſhould revert to their proper ſovereigns, or thoſe who poſſeſſed them before the troubles began. The ſame conduct was obſerved between the courts of Portugal, Spain, and France, every thing being placed upon the ſame footing as before the war.

Though the peace received the ſanction of a majority of both houſes of parliament, it was far from giving univerſal ſatisfaction to the people. And from this period various cauſes contributed to occaſion a ſpirit of diſcontent throughout the nation.

On April 30, 1763, the perſon and papers of John Wilkes, eſq. were ſeized by the king's meſſengers, on account of his being the author of the North-Briton, a periodical paper, which ſeverely arraigned the conduct of adminiſtration, and repreſented the earl of Bute as the king's favourite, and the perſon from whom meaſures of government of a very pernicious tendency originated. The forty-fifth number contained ſtrictures on the king's ſpeech. He was forcibly carried before the ſecretaries of ſtate, by whom he was examined, and afterwards commited cloſe priſoner to the Tower, though he had objected to the warrant, as illegal, his name not being mentioned in it. He was proſecuted in the court of King's-Bench, for being the author of Number Forty-Five, which was alſo voted by parliament to be a falſe, ſcandalous, and ſeditious libel, and ordered to be burnt by the common hangman, the execution of which order met with great oppoſition from the populace, who wounded Mr. Harley, one of the ſheriffs, and obliged him to take ſhelter in the Manſion-Houſe. Mr. Wilkes was alſo proſecuted for cauſing to be printed an obſcene and profane poem, called "An Eſſay on Woman," though only twelve copies of this piece had been printed, and it did not appear intended for publication. He was ſoon after expelled the houſe; and was outlawed towards the end of the year 1764.

In the mean time earl Bute reſigned his office, and was ſucceeded by Mr. George Grenville, who framed and cauſed to be paſſed the Stamp-Act, which was productive of the moſt pernicious conſequences to Great-Britain, by laying the foundation of a fatal and ruinous war. The alarm in England, on hearing of the commotions in America, which this offenſive act occaſioned, was ſo great, that the king thought proper to diſmiſs his miniſters; and the marquis of Rockingham and his friends were appointed to the adminiſtration. In March 1766 the American ſtamp-act was repealed, but at the ſame time another act was paſſed for ſecuring the dependence of the American colonies on Great-Britain. On July 30, 1766, the miniſtry was again changed, the duke of Grafton being appointed lord-treaſurer in the room of the marquis of Rockingham; and Mr. Pitt, ſince created earl of Chatham, was made lord privy-ſeal.

In the year 1768, Mr. Wilkes, who had for a conſiderable time reſided in France, in order to eſcape the fury of his perſecutors, came over to England. The parliament having been lately diſſolved, he offered himſelf a candidate for London, but loſt his election; he afterwards offered himſelf for the county of Middleſex, and was elected by a great majority on March 28. In May following he ſurrendered himſelf up, and was committed to the priſon of the King's-Bench: on which account great diſorders enſued; and one William Allen, a youth, being ſingled out, was purſued by the ſoldiers, and ſhot near his father's houſe in a manner which the occaſion could in no reſpect juſtify. This affair made a great noiſe; and the odium of the tranſaction was rather increaſed than leſſened by the pains the miniſtry took to ſupport and vindicate the military. On the eighth of June Mr. Wilkes's outlawry was reverſed; and on the eighteenth of the ſame month he was ſentenced to pay a fine of 500l. and be impriſoned ten months, for re-publiſhing the North-Briton, Number Forty-Five, and alſo to pay a fine of 500l. and be impriſoned twelve months, to be computed from the expiration of the term of his former impriſonment, for publiſhing the Eſſay on Woman. He complained to the houſe, by petition, of the injuſtice and illegality of the proceedings againſt him; but his complaints were voted frivolous and groundleſs.

Mr. Wilkes's popularity increaſed ſtill more by the rigour of his proſecutions, and the ſpirit and firmneſs he diſplayed throughout. He had been choſen alderman of London before his expulſion; and on February 16, 1769, he was without oppoſition re-elected member for Middleſex. The houſe declared his election void, by reaſon of his expulſion; he was, however, immediately re-elected by the freeholders, and the election again declared void by parliament. A new election being ordered, colonel Luttrell, in order to recommend himſelf to the court, vacated his ſeat, and became a candidate for Middleſex, in oppoſition to Mr. Wilkes. The latter, however, notwithſtanding the whole weight of court-intereſt was againſt him, obtained a majority of near four to one, Wilkes having 1143, and Luttrell only 296 votes. The Houſe of Commons, however, two days afterwards, reſolved that Mr. Luttrell ought to have been choſen, and ordered the return to be amended, by eraſing the name of Mr. Wilkes, and inſerting that of Mr. Luttrell in its place. Theſe proceedings excited a general diſcontent, and loud complaints were every where made againſt them, as the rights of election were thought to be thereby groſsly violated; petitions were, therefore, in very ſtong terms, preſented to the throne, from different parts of the kingdom.

In 1771 the term of Mr. Wilkes's impriſonment was expired; he was then choſen one of the ſheriffs for London and Middleſex; and was afterwards again choſen member for the county of Middleſex, in the ſubſequent parliament, and permitted quietly to take his ſeat there; in the year 1775 he executed the office of lord-mayor of the city of London, and hath ſince been elected to the lucrative office of chamberlain of that city. In the year 1783, after the change of lord North's adminiſtration, on Mr. Wilkes's motions, all the declarations, orders, and reſolutions of the Houſe of Commons, reſpecting his election for the county of Middleſex, were ordered to be expunged from the journals of that houſe, "as being ſubverſive of the rights of the whole body of electors of this kingdom." It may be proper to mention here, that in conſequence of Mr. Wilkes's manly and ſpirited conteſts with the government, general warrants were declared to be illegal, and an end was put to ſuch warrants, and to the unlawful ſeizure, of an Engliſhman's papers, by ſtate-meſſengers.

The unhappy diviſions which had for ſeveral years ſubſiſted between Great-Britain and the American colonies commenced on account of an act of the Britiſh legiſlature paſſed in 1765, "for laying a ſtamp-duty on the Britiſh colonies in America." The firſt commotions were in the province of Maſſachuſet's-bay, and more particularly at Boſton, where the commiſſioners for enforcing the revenue acts, and collecting the monies ariſing therefrom, were ill received, and

and narrowly eſcaped with their lives. All perſons, directly or indirectly, belonging to government, were looked upon with a ſuſpicious eye; the cool and diſpaſſionate were ſilent, and the commonalty declared they would not be taxed by the Britiſh parliament without their own conſent, that is, without actual repreſentation. Some of the commiſſioners were compelled, upon oath, to renounce all concern with theſe taxes. The tax-gatherers were tarred and feathered; the ſhips, which carried over the ſtamps, were threatened with conflagration, unleſs they delivered up the exceptionable parts of their cargoes to be committed to the flames; and, in fine, anarchy ſucceeded amity, and mutual enmity uſurped the place of reciprocal concord. The inhabitants of Boſton, and ſome other parts of New-England, at length came to a determination, not to make uſe of any articles of Britiſh manufacture; and about the beginning of February 1768, the houſe of repreſentatives gave their ſanction to this reſolution.

The moſt acrimonious diſputes now took place between many of the inhabitants of New-England in general; moſt of the people of Boſton in particular on the one part, and governor Barnard, with the loyaliſts on the other. Aggravating things were ſaid, ill-natured actions done, and libels were publiſhed by both parties. Thus a war of ſentiments commenced before real hoſtilities; and the obſolete terms of Whig and Tory were revived.

In the middle of June 1768, the captain of a ſhallop wanting to run ſome wine, and ill-uſing the tide-waiter, the veſſel was ſeized, and for better ſecurity put along-ſide of the Romney man of war. This occaſioned a riot, when the comptroller and collector of the cuſtoms took refuge on board the ſaid man of war. Government, however, in order to conciliate matters as much as poſſible, repealed the ſtamp-act; but ſtill the Americans were diſſatisfied, for they inſiſted, that though the act itſelf was repealed, yet the ſpirit of it remained, while a revenue was demanded from the colonies; beſides which, other laws had been paſſed in England, one relative to quartering troops in the colonies, and another for ſuſpending the legiſlative powers of New-York, which gave the Americans great umbrage. Unlawful meetings were continued; riots were frequent, and intereſted perſons fomented diſputes. About the ſame time the governor directed the houſe of repreſentatives at Boſton to reſcind a reſolution concerning a circular letter to ſome of the other governments; but they refuſing on the third of Auguſt following, he diſſolved the aſſembly.

It was at length determined to coerce the Americans, and a body of troops arrived there for that purpoſe, from Halifax, September 30, 1768, eſcorted by ſome ſhips of war. But the riotous proceedings of the Boſtonians increaſing, more troops were ordered to Boſton, and a variety of altercations took place.

In the beginning of the year 1769 many perſons in the colony of New-York thought proper to adopt the ſentiments of the Boſtonians, and to engage in the political ſquabbles which were daily heightening in New-England. Other colonies ſoon after acceded to the combination, and in particular to the reſolutions for the non-importation of the Britiſh manufactures, and Eaſt-India goods; and thus the fire of diſſenſion increaſed with great rapidity.

The inhabitants of Boſton now ſummed up a variety of grievances, which were either denied, or palliated by the other party, by the plea of the military being compelled to act as they did, and to defend themſelves; and at the ſame time accuſations, equally atrocious, were brought againſt the people of New-England. Some perſons were tried for murders, but none executed. Sir Francis Barnard having returned to England, the animoſities and diſputes ſtill continued between the people and lieutenant-governor Hutchinſon, who remained in his room.

Affairs thus remained, when about the middle of December 1773, ſome ſhips laden with tea, being at Boſton (as a duty was to be paid) the people would not ſuffer it to be landed. The ſhips being refuſed a clearance by the governor, unleſs the cargoes were landed, and properly diſpoſed of, a mob, dreſſed like Mohawk Indians, entered the three ſhips, which contained the tea, and were commanded by the captains Hall, Bruce, and Coffin, and emptied their cargoes, conſiſting of 342 cheſts of tea, into the water. This and other outrages occaſioned the Boſton-Port Bill, paſſed April 4, 1774, by which the town of Boſton was proſcribed and blocked up.

The people of New-England now began to form themſelves into companies, practiſe the military arts, enter into ſolemn leagues and covenants, &c. Several other colonies followed the example, provincial aſſemblies were held, and a general congreſs eſtabliſhed, to which deputies from the ſeveral provinces were invited.

After many bickerings and animoſities between the royaliſts and provincials, and the martial parade of the latter, the next material tranſaction was the ſeizure of Fort William and Mary, near Portſmouth, in New-Hampſhire, by the provincial militia, in which they found 106 barrels of gunpowder, ſeveral cannons, ſhot, ſmall arms, &c.

General Gage being informed that a great quantity of military ſtores were in the poſſeſſion of the provincial troops, at the town of Concord, ſent a detachment of troops, under the command of lieutenant colonel Smith, and major Pitcairn, ſupported by another body, commanded by lord Percy, in order to ſeize or deſtroy them. This ſervice was effectually performed, after ſome ſkirmiſhes; but on April 19, 1775, the troops were attacked at Lexington, on their return towards Boſton, the provincials firing from behind ſtone-walls, hedges, buſhes, &c. The loſs of the king's troops on this occaſion amounted to ſixty-five killed, 170 wounded, and about twenty priſoners. The Americans were computed not to have loſt more than ſixty, including killed and wounded.

The provincials now inveſted the town of Boſton; and the people of New-York, hearing of the action at Lexington, and the affair of Concord, roſe in a tumultuous manner, entered the town-houſe, ſeized a great many ſtands of arms, appropriated to their own uſe the cargoes of two ſhips laden with military ſtores for general Gage, and then marched to the aſſiſtance of the Boſtonians. They alſo not only continued to block up the town of Boſton, but began to raiſe batteries on the heights of the peninſula of Charles-Town, in order to cannonade his majeſty's troops. This brought on the action of Bunker's-Hill; for on the 17th of June, 1775, a conſiderable body of troops, under the command of major general Howe and brigadier general Pigot, were ſent to diſlodge the provincials. This body of forces, with a proportionable quantity of artillery, made good their landing near Bunker's-Hill, under the protection of the ſhips of war, armed veſſels, floating batteries, &c. and being ſoon after reinforced by another detachment, a deſperate action commenced, in which the Britiſh troops were victorious, the provincial lines being forced, and themſelves compelled to retreat, leaving behind ſeveral pieces of cannon and other military ſtores. The loſs of the provincials in killed and wounded was very great; of the Britiſh troops, according to the return of general Gage, 226 were killed, and 828 were wounded, ſome of the latter dying ſoon after; and more than a proportional number of officers being included in both liſts.

The cannon at New-York were ſeized upon in the night of the 23d of Auguſt, 1775, by order of Congreſs, though the Aſia man of war, which lay in the harbour, tried to prevent it, by cannonading the town. At the ſame time general Carleton was inde-

fatigable, in putting the province of Canada into a proper ſtate of defence; and the earl of Dunmore, governor of Virginia, having thought proper to take refuge on board a ſhip of war, haraſſed the coaſt, and made frequent deſcents upon the laſt-mentioned province, laying waſte the country, carrying off or ſpiking up a great number of cannons, deſtroying vaſt quantities of military ſtores belonging to the provincials, &c. &c. But on the other ſide, Fort St. John ſurrendered to the provincial forces, on the 3d of November, and the garriſon became priſoners.

The regulars and provincials had a hot engagement on the 18th of November, near Savannah in Georgia, in which the latter were defeated; and on the 31ſt of December, in the ſame year, the provincial general Montgomery, who had for ſome time laid ſiege to the city of Quebec, attempted to take it by ſtorm. In this attempt, however, he was defeated and ſlain, with ſeveral of his officers, and about ſixty private men, and 300 were taken priſoners. On January the 4th, 1776, ſome ſhips of war deſtroyed the town of Norfolk in Virginia. While this dreadful havock was going forward in America, ſeveral attempts were made in the Britiſh parliament by the duke of Richmond, Mr. Burke, Mr. Hartley, Mr. Wilkes, and others, to adopt ſome meaſures for bringing about a reconciliation; but no ſchemes for that purpoſe obtained the countenance of the government; and it was ſtill hoped by the court and miniſtry, that the Americans might be ſubjugated by force. With this view, large bodies of Heſſian troops were taken into the pay of Great-Britain, and the war continued to be carried on againſt the Americans with great ardour.

General Gage having been recalled, general Howe, who ſucceeded in the command, thought proper to evacuate the town of Boſton, which he effected on the 17th of March, 1776, and made good his landing, and capture of New York. In June, a battle was fought in Canada, between the regulars, under general Carleton, and the provincials, at a place called Three Rivers, when the latter were defeated, many of them being killed and wounded, and about 200 taken priſoners. Alſo, an attempt was made on Charles-Town, South-Carolina, by Sir Peter Parker, at the head of a fleet of ſhips of war, and general Clinton, with a body of land forces, but it failed of ſucceſs; and on the 4th of July following, the Congreſs declared the colonies "Free and Independent States."

After the king's troops were in poſſeſſion of New York, many ſkirmiſhes happened between them and the provincials, but nothing deciſive, till Oct. 1776, when the latter were defeated, in an action, which, from the place where it was fought, was termed the battle of the White Plains.

In the diſpatches from general Howe, dated Nov. 30, 1776, beſides an account of a variety of ſkirmiſhes, we are informed of the taking of Fort-Waſhington, and Fort-Lee, by the Britiſh forces, together with a great variety of military ſtores, and many priſoners. In December 1776, Rhode-Iſland was taken by general Clinton; about the ſame time lord Cornwallis took poſſeſſion of Eaſt-Jerſey, and general Lee was taken priſoner by a patrole, conſiſting of thirty Britiſh dragoons, commanded by lieutenant-colonel (ſince lord) Harcourt. Volunteer reinforcements of gentlemen, merchants, farmers, tradeſmen, and labourers, joined general Waſhington, who, in the night of the 25th of December, amidſt ſnow, ſtorms, and ice, with a ſmall detachment, croſſed the Delaware, and ſurpriſed a brigade of the Heſſian troops at Trenton; he took upwards of 900 of them priſoners, with whom he repaſſed the river, having alſo taken three ſtandards, ſix pieces of braſs cannon, and near 1000 ſtand of arms.

In the beginning of the year 1777, ſeveral ſkirmiſhes happened in the Jerſeys, with various ſucceſs. On the 23d and 24th of March, a great quantity of proviſions, ſtores, &c. with barracks, ſtore-houſes, &c. belonging to the provincials, were deſtroyed by the king's troops at Peck's-Hill, upon the North River. The cruizers belonging to lord Howe, and commodore Hotham's fleet, continued to take many prizes. In Connecticut, on the 27th of April, 1777, the king's troops deſtroyed a great quantity of ſtores at Danbury.

General Burgoyne, with the northern army, proceeded to Ticonderago, and Fort Independence, which he took poſſeſſion of the 6th of July, and found in them great quantities of ſtores and proviſions, beſides what he deſtroyed of both at Skeneſborough; ſoon after, he took poſſeſſion of Fort-Edward, which the provincials abandoned, and then proceeded to Saratoga, where they were ſtrongly poſted.

On the 11th of September, the troops, under the command of general Howe, had an engagement with the provincials on the heights of Brandy-wine, in which many were killed and wounded on both ſides; 400 provincials were taken priſoners; but though the latter were defeated, and the action at firſt ſeemed of an indeciſive nature, yet it occaſioned Philadelphia to fall into the hands of the Britiſh troops. While general Howe was thus employed, an unſucceſsful attack was made by the provincials on Staten-Iſland, for they were repulſed; and much about the ſame time general Clinton ſtormed and took Fort-Clinton and Fort-Montgomery.

On the 16th of October, the provincials, under the command of general Gates, having ſurrounded general Burgoyne's army at Saratoga, the latter thought proper to enter into articles of capitulation, by which himſelf and his troops, after laying down their arms, were to have a free paſſage to Great Britain; but the Congreſs, under various ſpecious pretences, did not ratify the ſtipulation, but detained the men at Boſton: and general Burgoyne came to England on his parole of honour.

In the latter end of the year 1777, ſeveral forts were taken by the troops and ſhipping, and many ſkirmiſhes happened on the banks of the Delaware, in order to keep up the communication with the army at Philadelphia. The provincials likewiſe evacuated their entrenchments at Red Bank. The French court ſeems to have thought this a favourable opportunity for leſſening the power of Great Britain; the Americans, during ſome part of the war, received conſiderable ſupplies of arms and ammunition from France. Some French officers entered into the American ſervice; and on the 6th of February, 1778, a treaty of alliance was concluded at Paris between the French king and the Thirteen United Colonies. The conduct of France towards Great Britain occaſioned hoſtilities to be commenced between the two nations, in which Spain afterwards took an active part againſt the Engliſh.

On the 17th of June, 1778, the Licorne and La Belle Poule, two French frigates, were taken by admiral Keppel; and on the 27th of July, a battle was fought off Breſt between the Engliſh and French fleets; the former conſiſting of thirty capital ſhips, and the latter of thirty-two; of the Engliſh, 133 were killed in the action, and 373 wounded; the loſs of the French is ſuppoſed to have been very great.

By a letter from general Howe, dated Philadelphia, May 11, 1778, that commander ſignified his intention to return to England, and to delegate the command of the Britiſh troops to general Clinton; he likewiſe informed the miniſtry of the ravages made by the Britiſh troops in the neighbourhood of Philadelphia, and of their having ſeized or deſtroyed great quantities of military ſtores, proviſions, veſſels, &c.

On the 18th of June, general Clinton (Sir William Howe having previouſly departed for England) purſuant

ſuant to the inſtructions received from government, evacuated Philadelphia. He was attacked on his march by the provincials, whoſe principal object appeared to be the gaining poſſeſſion of the Britiſh baggage; but in this they were diſappointed, and every where repulſed, by means of the judicious manner in which general Clinton had diſpoſed his troops. This failure occaſioned a diſpute between the provincial generals, Waſhington and Lee.

The earl of Carliſle, Mr. Eden, and governor Johnſtone, having been ſent as commiſſioners from Great Britain, to treat of a pacification with America, did not meet with that ſucceſs which every true lover of both countries wiſhed for. The terms, which at an earlier period would have been accepted with gratitude, were now rejected with diſdain; nor would the Congreſs enter into any treaty, unleſs the independency of the United States of America was previouſly acknowledged, and the Britiſh forces withdrawn. Perhaps the ſpeedy termination of this deſtructive war was in ſome meaſure impeded by the arrival of a French fleet in America, under the command of the count d'Eſtaing. This fleet, in concert with an army of provincials, attempted, in September 1779, the reduction of Rhode Iſland; but the Britiſh troops behaved ſo well on the land ſide, that the provincials were repulſed, and compelled to retreat; at the ſame time the French fleet meeting with a warmer reception than they expected, and finding that lord Howe, with his fleet, was approaching them, quitted their deſign upon Rhode Iſland, and attempted to eſcape. Lord Howe, however, compelled them to engage; but the two fleets being ſeparated by a ſtorm, the French ſquadron, with great difficulty, got into Boſton in a very ſhattered condition.

On the 4th of May, 1780, Sir Henry Clinton made himſelf maſter of Charles-Town, South Carolina; and on the 6th of Auguſt, earl Cornwallis obtained a very ſignal victory over general Gates in that province: but on the 10th of July, the French landed 6000 men, commanded by the count de Rochambeau, at Rhode Iſland. Soon after this, major general Arnold deſerted the ſervice of the Congreſs, and was made a brigadier general in the royal ſervice at New York. This officer had concerted a ſcheme, with general Clinton, for delivering up to him his troops, and the poſt he commanded; which if it had taken place, the deſtruction of the whole American diſciplined force, moſt of their beſt officers, with a loſs of artillery, magazines and ſtores, muſt have been the immediate conſequence. But the whole of this affair was detected by the capture of major Andre, in the American lines, on his return to New York, for which he ſuffered death, though the Americans would have exchanged him for general Arnold.

This year (1780) teemed with diſturbances at home of a very ſingular nature, which originated from an averſion to ſome indulgences lately granted by parliament to the Papiſts, by a relaxation of the penal laws. Hereupon an aſſociation was formed, at the head of which was lord George Gordon; and a petition was prepared, ſaid to be ſubſcribed by more than 100,000 perſons, to be preſented to the houſe, complaining of the repeal of thoſe laws. Lord George undertook to carry the petition; and accordingly gave the members of the Aſſociation public notice to meet him on Friday, June 2, in St. George's Fields, where near 40,000 people met his lordſhip, whom they accompanied, in martial parade, with blue cockades in their hats, to the houſe. The petition being poſtponed by the houſe of commons till another day, irritated the profligate and abandoned part of the multitude to ſuch a degree, that, dividing themſelves into parties, in the courſe of the day ſeveral members of parliament were groſsly inſulted and ill-treated by the rabble; and in the evening, the Romiſh chapel in Lincoln's-Inn-Fields, and another in Warwick-ſtreet, Golden-ſquare, were entirely demoliſhed. On Sunday they deſtroyed a Popiſh chapel in Ropemaker's-alley, Moorfields. On Monday they demoliſhed a ſchool and three dwelling-houſes in the ſame place, belonging to the Romiſh prieſts, with a valuable library of books, and a Maſs-houſe in Virginia-ſtreet, Ratcliffe-highway; they alſo deſtroyed all the houſehold furniture of Sir George Saville. On Tueſday evening they made a moſt daring and violent attempt to force open the gates of Newgate, in order to releaſe the five rioters who had been confined there; and the keeper refuſing to deliver up the keys, they ſet fire to his houſe, after burning his furniture in the ſtreet: ſoon after this, the priſon was in flames, and great part of it conſumed, by which means upwards of 300 priſoners eſcaped, many of whom joined the mob. The ſame night another party ſet fire to the houſe of lord Mansfield in Bloomſbury-ſquare, which was entirely conſumed, together with a collection of pictures of great value, and many of the ſcarceſt manuſcripts in the poſſeſſion of any private perſon in the world; beſides all his lordſhip's notes on great law caſes and the conſtitution of England, which was an irreparable loſs to the public: the houſe of Sir John Fielding, that of Juſtice Cox, and ſeveral other private houſes, were alſo deſtroyed about this time, beſides two other priſons. On Wedneſday they deſtroyed by fire the King's-bench and Fleet priſons. Two houſes, one at the bottom of Holborn, and the other near the Bars, belonging to Mr. Langdale, an eminent diſtiller, were ſet fire to and conſumed, as were the dwellings of many other perſons profeſſing the Roman Catholic faith; and, in ſhort, every part of the metropolis exhibited violence and diſorder, tumults and conflagrations. The rioters even made two attacks upon the Bank, and one upon the Pay-office, but were repulſed by the ſoldiery, who were now through extreme neceſſity introduced into the city, and by whom many perſons were on this occaſion killed and wounded.

Upwards of 130 of theſe people were tried for theſe outrages in London and Southwark, many found guilty, but only twenty-ſeven of the principal actors were executed. Lord George Gordon, having been taken into cuſtody, and committed to the Tower, as the inſtigator of theſe diſturbances, was on the 5th of February, 1781, tried in the court of King's-bench, at Weſtminſter, for high treaſon, and acquitted.

While the internal peace of the kingdom was diſturbed by theſe commotions, there appeared reaſon to apprehend an increaſe of its foreign enemies, by a rupture with Holland; loud remonſtrances were made by the Britiſh miniſter to the States-general, complaining that a clandeſtine commerce was carried on between their ſubjects and the Americans; that this was particularly the caſe at St. Euſtatius; and that the enemies of Great Britain were ſupplied with naval and military ſtores by the Dutch.

The war with Holland was commenced with great vigour: and that republic ſoon ſuffered a very ſevere blow in the loſs of the iſland of St. Euſtatius, which was taken by the Engliſh on the 2d of February, 1781.

On the 5th of Auguſt the ſame year, a very bloody engagement was fought between an Engliſh ſquadron of ſhips of war, under the command of admiral Hyde Parker, and a Dutch ſquadron under the command of admiral Zoutman, off the Dogger-bank. Both the contending ſquadrons fought with great gallantry, and by both the victory was claimed.

While the war was carrying on at home with various ſucceſs, the French made themſelves maſters of the iſland of Tobago; and the Spaniards of Penſacola, and the whole province of Weſt Florida. On March 15, 1781, earl Cornwallis obtained a victory over general Green's army at Guildford in North-Carolina; but it was a hard fought battle, and the loſs on both ſides conſiderable. Some ravages were alſo committed in Virginia by the generals Philips and Arnold,

Arnold, who deſtroyed much ſhipping, and about 8000 hogſheads of tobacco.

The army of lord Cornwallis now amounted to above 7000, all excellent troops; but ſuch was their plundering and devaſtations on their route, and the order of the Americans, that his ſituation became at length very critical. Sir Henry Clinton was prevented from ſending thoſe ſuccours to him which he otherwiſe would have done by his fears for New York, againſt which he apprehended Waſhington meditated a formidable attack. This American general, by cauſing ſome letters to be intercepted, confirmed Sir Henry Clinton, in his opinion, who, by being continually amuſed and deceived, was prevented from giving any aſſiſtance to lord Cornwallis, and alſo from forming any ſuſpicion of the real deſigns of the enemy. At length, the Engliſh general receiving information that the count de Graſſe was expected every moment in the Cheſapeak, with a large fleet to co-operate with Waſhington, now ſeriouſly attempted to reinforce lord Cornwallis, but without ſucceſs. Preſently the moſt effectual meaſures were adopted by general Waſhington for ſurrounding lord Cornwallis's army; and on the 30th of September it was cloſely inveſted in York-town, and at Glouceſter on the oppoſite ſide of the river, with a conſiderable body of troops on one ſide, and a large naval force on the other. The intrenchments were opened in two attacks above and below York River, in the night between the 6th and 7th of October, with a conſiderable train of artillery. The works which had been raiſed by the Engliſh ſunk under the weight of the enemies batteries; the troops were much diminiſhed by the ſword and ſickneſs, and greatly enfeebled by conſtant watching and fatigue; when all hope of relief failing, lord Cornwallis, on the 19th of October, ſurrendered himſelf and his whole army, by capitulation, to general Waſhington, priſoners of war.

The capture of this army was too heavy a blow to be ſoon or eaſily recovered; it threw a cloud over the whole court and cabinet at home, and put a total period to the hopes of thoſe who had flattered themſelves with the ſubjugation of the colonies by arms. The ſurrender of the ſecond Britiſh army may be conſidered as the cloſing ſcene of the continual war in America. The immenſe expence of carrying it on ſo diſtant from the ſeat of preparations and power; the great accumulation of public debt it had brought upon the nation; the plentiful effuſion of human blood it had occaſioned; the diminution of trade, and the vaſt increaſe of taxes, were evils of ſuch magnitude, ariſing from this conteſt, as could ſcarcely be overlooked. On which account the parliament, on the 1ſt of March 1782, requeſted the king, in an addreſs, to put a ſtop to any further proſecution of ſo offenſive a war againſt the American colonies. This application to the throne, with other concurrent cauſes, occaſioned a complete revolution in the cabinet, which was effected March 27, 1782, under the auſpices of the marquis of Rockingham, who was appointed firſt lord of the treaſury.

Meaſures were immediately taken by the new miniſtry for effectuating a general peace; and Mr. Grenville was accordingly inveſted with full powers to treat at Paris with all the powers at war, and directed to propoſe the independency of the Thirteen United Provinces in America in the firſt inſtance. A ſeries of loſſes ſtill continued to agitate the minds of the people, ſo that peace became every day more deſirable to the nation. January 18, 1782, the French took Nevis; on the 5th of February, the iſland of Minorca ſurrendered to the Spaniards: and on the 13th of the ſame month, the iſland of St. Chriſtopher's was given up to the French. On the 12th of April a moſt obſtinate engagement happened between the Engliſh fleet under admiral Rodney, and that of the French under the Count de Graſſe, in their way to join the Spaniſh fleet at St. Domingo. The battle laſted with unremitting fury from ſeven o'clock in the morning till half paſt ſix in the evening, when victory declared in favour of the Britiſh flag. The Ville de Paris of 110 guns (a preſent from the city of Paris to the French king) commanded by Count de Graſſe, with four others of the line, were captured, and another of the line ſunk in the action. The Cæſar, one of thoſe taken, was blown up, and the whole crew, among whom were fifty Engliſh ſeamen, periſhed. A few days after, two more of the ſame fleet, of ſixty-four guns each, were taken by Sir Samuel Hood's ſquadron. By this victory, the enemy's deſign againſt Jamaica was fruſtrated, and admiral Rodney's reputation and intereſt were greatly promoted: he received the public thanks of the Britiſh ſenate, and was further honoured by being created a peer of the realm. Unhappily the Ville de Paris, and moſt of the other ſhips taken by admiral Rodney, beſides two of our own ſhips of the line, where loſt at ſea before they could reach England.

The military operations after this, were few and of little conſequence. Negapatnam, a ſettlement in the Eaſt-Indies, and Trincomale, in the iſlands of Ceylon, were taken from the Dutch by the Britiſh forces; but the French ſoon after receiving conſiderable ſuccours from Europe, took Cuddalore, retook Trincomale, forced the Britiſh fleet in ſeveral actions, but none deciſive, and enabled Hyder Alley to withſtand with various ſucceſs all the efforts of Sir Eyre Coote and his troops. On the 8th of May, the Bahama Iſlands ſurrendered to the Spaniards. But the credit of the Britiſh arms was well ſuſtained at Gibraltar, under general Elliot, the governor, and captain Curtis, who defeated the combined efforts of France and Spain. On the 13th of September at ten in the morning, the ten battering ſhips, or gun-boats, commanded by admiral Moſeno, were ſtationed as near the fortreſs as poſſible, covered by the combined fleet. All things being ready, a general attack began, and the heavy pieces from the gun-boats were diſcharged with great rapidity. But the deſign of this grand project (on which their hopes of ſucceſs principally depended) was ſoon rendered abortive. The brave general Elliot had cauſed furnaces to be made, in which having heated the balls till they were red hot, they were in that ſtate fired againſt the enemy. This produced the total deſtruction of the floating batteries, and moſt of the aſſailants in them; for the balls entering their ſides, ſet them on fire, and the whole blew up one after another, except three, which were burnt to the water's edge. Thus was this grand ſcheme totally fruſtrated by the diſtinguiſhed courage and military proweſs of the Britiſh commanders. The battering ſhips burnt before Gibraltar, carried 212 braſs cannon, &c. the proportion of men on board them was thirty-ſix for each of the guns in uſe, excluſive of officers, and marines for working the ſhips. The garriſon was in the month of October relieved by lord Howe, who offered battle to the combined force of France and Spain, though inferior twelve ſail of the line.

On the death of the marquis of Rockingham, which happened on the firſt of July 1782, lord Shelburne was, without the knowledge of his colleagues, appointed firſt lord of the treaſury. This gave great offence to Mr Fox, lord Cavendiſh, and others, who reſigned their places. However, the duke of Richmond, general Conway, and others, continued to act with lord Shelburne, till under his auſpices preliminaries for a general peace were ſettled.

By the preliminary articles of peace agreed on between the contending powers on the 20th of January 1783, Great-Britain ceded to France, of her poſſeſſions before the war, the iſland of Tobago in the Weſt-Indies, and the river of Senegal in Africa, with its dependencies and the forts on the river; and gave up a few diſtricts in the Eaſt-Indies, as dependencies on Pondicherry and Karical; it agreed alſo to reſtore

the iſlands of St. Lucia, St. Pierre, and Miquelon, and the iſland of Goree, with Pondicherry, Karical, Mahe, Chandernagore, and the Comptoire of Surat, in the Eaſt-Indies, which had been conquered from the French during the war. To prevent diſputes about boundaries in the Newfoundland fiſhery, it was agreed, that the French line for fiſhing ſhould begin from Cape St. John on the eaſtern ſide, and, going round by the north, ſhould have for its boundary Cape Ray on the weſtern ſide; and Great-Britain renounced every claim, by former treaties, with reſpect to the demolition of Dunkirk.—France, on the other hand, was to reſtore to Great-Britain the iſlands of Grenada, and the Grenadines, St. Chriſtopher's, St. Vincent, Dominica, Nevis, and Montſerrat; and guarantied Fort James, and the river Gambia, agreeing that the rum trade ſhould remain in the ſame condition as before the war, 1755. The allies of each ſtate in the Eaſt-Indies were to be invited to accede to the pacification; but if they were averſe to peace, no aſſiſtance on either ſide was to be given them.

The articles of peace with Spain, ſpecified, that Great-Britain gave up Eaſt-Florida to that power, and alſo ceded Weſt-Florida and Minorca which Spain had taken during the war. To prevent all cauſes of complaint and miſunderſtanding for the future, it was agreed that Britiſh ſubjects ſhould have the right of cutting and carrying away logwood in the diſtrict lying between the rivers Wallis or Ballize, and Rio Hondo, taking the courſe of the ſaid rivers for unalterable boundaries. Spain agreed alſo to reſtore the iſlands of Providence, and the Bahamas, to Great-Britain, in the ſame condition in which they were when conquered by the arms of Spain.

In the treaty with the United-States of America, the king of Great-Britain acknowledged New Hampſhire, Maſſachuſet's-Bay, Rhode-Iſland, and Providence Plantations, Connecticut, New-York, New-Jerſey, Pennſylvania, Delaware, Maryland, Virginia, North-Carolina, South-Carolina, and Georgia, to be free, ſovereign, and independent ſtates, and for himſelf, his heirs and ſucceſſors, relinquiſhed all claims to the government, propriety, and territorial rights of the ſame, and every part thereof. To prevent all diſputes in future on the ſubject of boundaries between theſe ſtates and the remaining provinces to Great-Britain, lines were very minutely drawn, which were properly noticed, as well as delineated on the map of the United-States of America: and ſome favourable clauſes were obtained for the loyaliſts. The navigation of the Miſſiſippi to remain open and free to both parties, as alſo the Newfoundland fiſheries.

In the treaty with the Dutch, great difficulties aroſe, but at length it was ſtipulated that Great-Britain ſhould reſtore Trincomale in the iſland of Ceylon, but the French had already taken it, and that the Dutch ſhould yield to us the town of Negapatnam, with its dependencies in the Eaſt-Indies, with liberty to treat for its reſtitution on the point of an equivalent.

Thus a period was put to a moſt calamitous war, in which Great-Britain loſt the beſt part of her American colonies, and many thouſand valuable lives, and expended or ſquandered nearly 150 millions of money. The addreſs of thanks for the peace was carried in the Houſe of Lords, by a majority of ſeventy-two to fifty-nine; but loſt in the Houſe of Commons, by a majority of 224 to 208. The terms of the peace were to many a ſubject of great regret, and reprobated as highly injurious to the dignity and intereſt of the nation; but had the war continued, it would have been neceſſary to have borrowed annually ſeventeen millions and a half, by which a million per annum would have been added to the taxes, and twenty-five millions at leaſt to the capital of the public debt, according to the uſual modes of funding. Conſidering, therefore, the true ſtate of the nation, and the unavoidable ruinous conſequences of protracting the war, the terms of the peace were advantageous and honourable.

A convention between his Britannic majeſty and the king of Spain was ſigned at London on July 14, 1786. It conſiſts of ſixteen articles, and grants full liberty to the Engliſh to cut and carry away logwood, mahogany, &c. from the Moſquito-Shore, belonging to Spain. And, a treaty of navigation and commerce was agreed to, and ſigned at Verſailles, on Sept. 26, 1786, between his Britannic majeſty and the moſt Chriſtian king. This treaty conſiſted of forty-ſeven articles, and the ſame was acceded to by the Britiſh parliament in 1787. And, on the 13th of Auguſt 1788, a definitive treaty of defenſive alliance was ſigned at Berlin between the king of Pruſſia and the king of Great-Britain. This treaty conſiſts of ſix articles.

In the year 1791, a diſagreeable affair occurred between Great-Britain and Spain, which had like to have been attended with very ſerious conſequences. A ſmall aſſociation of Britiſh merchants, reſident in the Eaſt-Indies, had, early in the year 1786, formed the project of opening a trade to the north-weſtern coaſt of America, for the purpoſe of ſupplying the Chineſe market with furs. The principal point towards which theſe expeditions were directed was Port Nootka, or King George's Sound; and the adventurers, being in ſome degree ſatisfied with their traffic, took meaſures, in the year 1788, to ſecure to themſelves a permanent ſettlement; at the ſame time that the ſhipping employed in this expedition was generally of two, and never exceeded the amount of four ſmall veſſels.

The Spaniards conceived ſome jealouſy of the intruſion of the Engliſh into a part of the world which they had long been deſirous of conſidering as their excluſive property; and, accordingly, a Spaniſh frigate of 26 guns was diſpatched from the province of Mexico, in order to put an end to this commerce. The Spaniſh frigate arrived in May 1789, and captured two veſſels in the following July, at the ſame time taking poſſeſſion of the little ſettlement which had been formed upon the coaſt. This tranſaction was firſt notified to the Engliſh government by the Spaniſh ambaſſador reſident at the court of London, who, at the ſame time, demanded that meaſures ſhould be taken by the Engliſh government to prevent Britiſh ſubjects from frequenting theſe coaſts, which were alledged to have been previouſly occupied by the ſubjects of Spain.

After much altercation reſpecting this buſineſs, and the preparation of an expenſive armament on the part of Great-Britain, the court of Spain agreed to the ſatisfaction and indemnification demanded by Mr. Fitzherbert, the Engliſh ambaſſador to the Spaniſh court. Accordingly diſpatches were ſent, from him to the Britiſh court, containing an account, that a convention for terminating the differences which had ariſen with that court, had been agreed upon by his excellency on the part of his Britannic majeſty, and by the count de Florida Blanca on the part of the Catholic king.

The royal proclamation on the 21ſt of May, 1792, againſt ſeditious writings, which was followed by orders for the embodying the militia of the kingdom, engaged a conſiderable ſhare of the public attention. It had the intended effect, and excited numerous addreſſes, teſtifying the loyalty of the people.

In the beginning of the year 1793, numerous aſſociations were formed throughout the kingdom againſt republican principles and theories. The controverſies occaſioned by the pamphlets of Meſſrs. Burke and Calonne, and particularly the writings of Mr. Paine, contributed to render the example of the French revolution in ſome degree contagious. But the diſaffected party was neither numerous nor reſpectable. The church, the ariſtocracy, and all the moſt opulent of the community, were averſe to any change or inno-

vation whatever. It was among the lower part of the middle claſs of ſociety, that democratical opinions were chiefly entertained. The violent proceedings of the French, however, had terrified the well-diſpoſed part of the people, and almoſt diſguſted them with the very name of reform. From the period of the fatal 10th of Auguſt, the converts from the French ſyſtem were numerous: the proſcription and perſecution of the emigrants rapidly increaſed the number; and the premeditated ill treatment and unjuſt death of the king almoſt entirely annihilated the ſpirit of republicaniſm in this country. The public wanted only to be excited to give the moſt forcible proofs of its attachment to a conſtitution which had ſo wiſely provided againſt the intolerable perſecutions of tyranny, and the leſs deplorable miſchiefs of faction.

The firſt diſpoſition manifeſted by Great-Britain to break with France, regarded the navigation of the Scheldt, which the French had determined to open for the benefit of Antwerp and the Netherlands.

The next exception which was taken by the Engliſh miniſtry was to the decree of fraternity, which was offered by the French convention to the revolting ſubjects of any monarchical (or, as they ſaid, tyrannical) government, and which was conſtructed into a direct affront to this country, and a plot againſt her peace.

The alien bill, which the French complained was an infraction of the commercial treaty, was the next cauſe of diſpute; and this offence was augmented by the prohibition to export corn to France, while it was freely allowed to the powers at war with that country.

At length, towards the end of January, M. Chauvelin was officially informed by the Engliſh court, that his character and functions, ſo long ſuſpended, had entirely terminated by the *fatal* death of the king of France; that he had no more any public character here, where his further reſidence was forbidden.

Mr. ſecretary Dundas, on the 28th of January, preſented to the Houſe of Commons a meſſage from the king, in which his majeſty expreſſed the neceſſity of making a further augmentation of his forces by ſea and land, for maintaining the ſecurity and rights of his own dominions, for ſupporting his allies, and for oppoſing views of aggrandiſement and ambition on the part of France.

On the 25th of March, 1794, lord Grenville and S. Comte Woronzow ſigned a convention at London, on behalf of his Britannic majeſty and the empreſs of Ruſſia, in which their majeſties agree to employ their reſpective forces in carrying on the war in which they were engaged againſt France; and they reciprocally promiſe *not to lay down their arms*, but by common conſent. Notwithſtanding this ſolemn treaty, Catharine took no active part whatever in the war. Another treaty was concluded between his Britannic majeſty and the king of Sardinia. A treaty was likewiſe concluded between his highneſs the prince of Heſſe-Caſſel and his Britannic majeſty.

On the 21ſt of January 1794, the two houſes met. The ſpeech from the throne enumerated with ſome degree of minuteneſs the advantages obtainted by the allies, and exhorted to a ſpirited proſecution of the war, and to a reliance on the reſources of the country, and the ſtrength of our allies, for ultimate ſucceſs. The addreſs to his majeſty, in which the parliament agreed to ſupport him in the continuance of the war, was carried in favour of miniſtry by a very great majority.

In March following, the receſſion of the king of Pruſſia from the great cauſe of the allies, agitated the political world for ſeveral weeks, when it was announced that the whole proceeded from his inability to ſupply his troops from the reſources of his own country. The parliament, influenced by the arguments which were advanced by the miniſter, voted the ſum of 2,500,000l. to be granted to his majeſty, to enable him to fulfil the ſtipulations of the treaty lately concluded with Pruſſia for the more vigorous proſecution of the war, and for ſuch exigencies as might ariſe in the year 1794. Notwithſtanding this freſh treaty, the Pruſſian monarch ſoon after entirely relinquiſhed the war, having found full occupation for himſelf and his troops in endeavouring to ſuppreſs the inſurrections in Poland.

On the firſt of June 1794, the Britiſh fleet under the command of admiral lord Howe obtained a ſignal victory over that of the French, in which two ſhips were ſunk, one burnt, and ſix brought into Portſmouth harbour.

On the 8th of December 1795, a meſſage from his majeſty was brought down to the Houſe of Commons, ſignifying a diſpoſition to enter into a negotiation with France, the government of that country having at length aſſumed ſuch a form as to render a treaty with it practicable. Mr. Wickham, the Britiſh plenipotentiary to the Swiſs Cantons, was appointed, in conſequence, to make ſome overtures, through the medium of Mr. Barthelemi, the French envoy at Baſle; but this feeble attempt at negotiation ſoon terminated without effect.

An apparently much more ſerious offer of this nature was made the following year. About the latter end of the month of September, 1796, through the intervention of the Daniſh miniſter at Paris, a paſſport was applied for and obtained, for a confidential perſon to be ſent to Paris from the court of London, commiſſioned to diſcuſs with the French government the means moſt proper for conducing to the re-eſtabliſhment of peace. Lord Malmeſbury was the perſon appointed by the Britiſh court to undertake this miſſion. His lordſhip accordingly repaired to Paris, where he continued about two months. It was propoſed, on the part of England, as the baſis of the treaty, that France ſhould reſtore the Netherlands to the emperor, and evacuate Italy; in which caſe England engaged to reſtore all the conqueſts made on that power in the Eaſt and Weſt-Indies. The French directory replied that they could not conſent to propoſals contrary to the conſtitution, to the laws, and to the treaties which bind the republic. Thus ended this negotion.

The beginning of the year 1797 was diſtinguiſhed by as extraordinary an event as perhaps ever occurred in this or any other war—the invaſion of Great-Britain by a force of twelve hundred men without artillery, and almoſt without accoutrements. The alarm at firſt was general and great throughout the whole of Pembrokeſhire, on the coaſt of which the landing was made; but the men ſurrendered on the approach of a very inadequate force, and almoſt without reſiſtance. On inquiry, it appeared that they conſiſted entirely of galley ſlaves, and other criminals, from Breſt: and the object was ſuppoſed to be at once to create an alarm on the Britiſh coaſt, and to rid the French republic of a number of deſperate perſons: but whatever the intentions of the enemy might be, they met, on the whole, with a complete diſappointment; for, not only the expedition proved entirely fruitleſs, but, as two of the ſhips which diſembarked the men were returning into Breſt harbour, they were captured by the St. Fiorenzo and Nymph frigates.

The apprehenſions excited by this circumſtance had ſcarcely ſubſided, when a more ſerious cauſe of alarm occurred to agitate the minds of the public. The bank of England diſcontinued the iſſuing of ſpecie in their cuſtomary payments. A run (to ſpeak in the commercial phraſeology) had taken place upon ſome of the country banks; and the great demand for ſpecie from the bank of England induced the directors to lay the ſtate of their company before the miniſter; in conſequence of which an order of council was made on the 26th of February, prohibiting the farther iſſue of ſpecie from the bank. This order

was

was afterwards ſanctioned and ratified by an act of parliament, by which the reſtriction was continued to midſummer, and afterwards by another act continuing it to the end of the preſent war.

On the third of March, government received intelligence of an important advantage obtained by the Britiſh fleet, under the command of ſir John Jervis, over a Spaniſh fleet of much ſuperior force, on the 14th of February, off Cape St. Vincent. The Engliſh admiral, by a ſucceſsful manœuvre, ſeparated the rear of the enemy's fleet from the main body, and captured two ſhips of 112 guns, one of 84, and one of 74.

The ſeamen of England, however, who had ſo long been the defence and the glory of the nation, ſeemed ſuddenly to conſpire its overthrow. In the the middle of April a moſt alarming mutiny broke out on board the grand Channel fleet at Spithead, under the command of lord Bridport. The ſailors required an advance of their pay, and certain regulations to be adopted relative to the allowance of proviſions. They appointed delegates, two for each ſhip, who for ſeveral days had the entire command of the whole fleet, over which no officer had the leaſt authority. In this critical ſituation, government deemed it moſt expedient to promiſe a full compliance with all their demands; on which they cheerfully returned to their duty. But in a week or two afterwards, no act of indemnity having been offered in parliament for the ſecurity of thoſe concerned in the mutiny, they again roſe, deprived their officers of their authority, and the diſpute ſeemed to wear a more gloomy aſpect than before. A bill, ſecuring to the ſeamen what they had been promiſed, was therefore haſtily paſſed through both houſes, and lord Howe went down to Portſmouth to act as mediator. The delegates of the fleet declared themſelves ſatisfied, and harmony and good order was immediately reſtored.

The ferment, however, ſtill, remained in other parts of the navy; and ſoon after, the ſeamen of ſome ſhips lying at Sheerneſs began to mutiny, and behaved riotouſly; and ſo contagious was the ſpirit of inſurrection now become among the ſeamen, that almoſt all the ſhips of admiral Duncan's fleet at Yarmouth appointed delegates, and ſailed away to the Nore, to join the ſhips from Sheerneſs. New grievances were required to be redreſſed, and new and extravagant demands to be complied with; government was now convinced that to yield would only be to encourage a repetition of ſimilar proceedings; and every diſpoſition was therefore made to force theſe ſhips to ſubmiſſion. All communication between them and the ſhore was cut off, and no proviſions or water ſuffered to go to them. The mutineers, to ſupply themſelves with theſe, detained all veſſels coming up the river, and took out of them whatever they choſe, for which their delegates, the principal of whom was one Richard Parker, a man of ſtrong natural abilities, gave draughts on the treaſury, as taken for the uſe of the navy of England. At length being reduced to great want of water, and diſſenſions and diſtruſt prevailing among themſelves, ſeveral ſhips left the mutinous fleet, and ſurrendered themſelves at Sheerneſs. Some of theſe were fired upon by the others; but at length they all came in, and gave up their delegates; who, with a number of others that were conſidered as principals in the mutiny, were tried by a court-martial. Some of them were executed, others ſentenced to different puniſhments, and the reſt pardoned. Richard Parker, who had acted as commander of the fleet while in a ſtate of mutiny, was the firſt who was tried and executed. He diſplayed great preſence of mind, and ſuffered with the utmoſt firmneſs and fortitude.

As if to eraſe this ſtain from the annals of the Britiſh navy, the fleet of admiral Duncan, conſiſting principally of the ſhips which had been engaged in this unhappy and diſgraceful mutiny, ſailed ſoon after to watch the motions of the Dutch fleet in the Texel, where it remained for ſome time blockaded, till, on its venturing out, an engagement enſued, in which the Engliſh fleet obtained a complete victory, taking the Dutch admiral De Winter, the vice-admiral, and nine ſhips.

In conſequence of this ſignal victory, admiral Duncan was created viſcount Duncan.

In the courſe of this year, another attempt was made by the Britiſh cabinet to negotiate a treaty of peace with France. The preliminaries of a peace between the French republic and the emperor having been ſigned at Leoben, in the month of April, by which the Netherlands were given up to France; the difficulty which had broken off the laſt negotiation, appeared to be in ſome meaſure removed, and applications were again made to the French government for paſſports for a perſon who might enter into diſcuſſions relative to the baſis of a future treaty. Lord Malmeſbury was again appointed to this miſſion; but the French directory objected to his coming to Paris, and appointed Liſle for the place of the conference with commiſſioners they ſent thither for that purpoſe. What the Netherlands, however, had been in the former attempt to treat, the Cape of Good Hope and Ceylon proved in the preſent; and, after a ſtay of nearly three months, lord Malmeſbury, not being able to declare himſelf empowered to conſent to the ſurrender of all the conqueſts made from France or her allies, was abruptly ordered to depart, and on the 20th of September returned as before, not having effected the object of his miſſion.

This year very gloomy proſpects preſented themſelve in Ireland; in the northern parts of which, the peaſants roſe in large bodies, and committed ſuch depredations, that general Lake found it neceſſary, in the beginning of March, to publiſh a proclamation, ordering every perſon in the northern diſtrict to deliver up their arms of all kinds to the military, and declaring the whole diſtrict in a ſtate of inſurrection. The coercive meaſures adopted by government were ſtrenuouſly oppoſed in the Iriſh parliament, as tending to defeat the very purpoſes for which they were avowedly adopted; but as they were declared to be expedient, and even indiſpenſable, by a great majority in both houſes, they were purſued with the utmoſt vigour, and very diſaſtrous conſequences enſued.

The number of inſurgents inſtigated by a rebellious party, who had aſſumed the title of United Iriſhmen, increaſed in ſuch an alarming degree, that the whole kingdom of Ireland was put under martial law. Many actions took place between the king's troops and the rebels; which, though they terminated in general in favour of the loyaliſts, rather increaſed than diminiſhed the number of the diſaffected; and ſuch was the prevalence of party rancour and animoſity, that the inhabitants of this unhappy country were expoſed to the moſt ſhocking outrages, both from the military and the inſurgents. Several trials took place for treaſon and conſpiracies, ſome executions enſued, and other puniſhments were inflicted on convicted criminals; and in this perturbed ſtate was the ſiſter kingdom at the cloſe of the year 1797.

For the purpoſe of ſpreading an alarm throughout this country, the executive directory ordered, in the month of October, that an army ſhould forthwith be aſſembled on the French coaſts, to be called the "army of England," and to be commanded by general Buonaparte, for the deſign of invading England; and the merchants of Paris voluntarily offered to ſubſcribe to a loan, for the carrying the avowed deſign into effect.

The event however proved that the deſtination of this mighty armament was far more remote than was generally apprehended. Every preparation was made on the part of the Engliſh government, to counteract ſo wild a project: military aſſociations were formed, and

and the maſs of the people, waving all political prejudices, embarked moſt cordially in every meaſure for the defence of their country, againſt the attacks of the inveterate enemies of their civil and religious liberties. But the French directory meditated a plan of extending their arms to the wilds of Arabia, ſubjugating Egypt, and, as many conjectured, of purſuing their paſſage to Hindoſtan, in the Eaſt-Indies, where they indulged a vain expectation of ranſacking all the territories of the Engliſh Company, and returning home with an enormous addition to that plunder, which they had already amaſſed by the ſpoils of every place they had ſeized on by force of arms. All their towering hopes and expectations were, however, totally fruſtrated, by an event which remains to be related.

After receiving intelligence of the conqueſt of Malta, and the departure of the French fleet from that iſland, a ſquadron was diſpatched in queſt of them, by admiral lord St Vincent, from his fleet under the command of rear admiral Sir Horatia Nelſon, an officer of approved valour and experience. A long time elapſed before he fell in with them; and, in the interval, the public mind was univerſally agitated, for the reſult of an expedition ſo highly important to the intereſts of Great-Britain.

However, on the 1ſt of Auguſt, the enemy's fleet was deſcried from the maſt-head, a few leagues diſtant to the eaſtward, in the bay or road of Aboukeir. He inſtantly directed his courſe towards them, and found them at anchor, in a line extending from N. W. to S. E. They were at ſingle anchor, with ſprings on their cables, and riding head to wind, which was from the north weſt. To approach them it was neceſſary to ſail round an iſland, and a reef which projected from it, to the diſtance of ſeveral miles from the point on which the ſmall fort of Aboukeir ſtands. The wind was perfectly fair both for this and for approaching the fleet; but, unfortunately, in rounding the reef, the Culloden, the leading ſhip, commanded by the gallant Trowbridge, ran aground, and could not be got at all into action. After this accident Nelſon found himſelf with ten ſhips only (three having fallen ſeveral leagues aſtern) to fight thirteen of the enemy, and ſeveral of theſe of ſuperior force to any of his.

In this action, ſeven ſhips of 74 guns each, were taken; one of 80, and one of 74 were burnt, beſides a frigate of 36 guns, and another of the ſame force, that was ſunk. One ſhip of 80 guns, one of 74, one of 48, and one of 44 guns eſcaped.

This victory was the moſt ſplendid and deciſive of a ſeries, in which, in the courſe of five years, ſuch a number of French ſhips of the line were taken, as were ſufficient of itſelf to form a great navy, and had reduced the maritime power of France, from being the ſecond in Europe, below that of Ruſſia, and to a level with that of Sweden. This ſtupendous victory alſo ſpread the renown of Britiſh valour, and the terror of Britiſh arms, among the nations who were almoſt ignorant of the Britiſh name, as well as fruſtrated all attempts of invaſion, and fully defeated the chimerical project of the directory of France concerning Egypt. The gallant admiral obtained the reward he ſo juſtly merited in a peerage and penſion, and his name will be tranſmitted with honour to poſterity.

A Genealogical Liſt of the Royal Family of Great-Britain.

George III. king of Great-Britain, France, and Ireland, elector of Hanover, and ſon of Frederic-Lewis, was born June 4, 1738; ſucceeded his grandfather George II. on Oct. 25, 1760: married, Sept. 8, 1761, to the princeſs Charlotte of Mecklenburgh Strelitz, born May 16, 1744, by whom he has iſſue.

1. George, prince of Wales, born Aug. 12, 1762.
2. Frederic, duke of York, biſhop of Oſnaburgh, born Aug. 16, 1763; married, Sept. 29, 1791, Frederique Charlotte Ulrique Catherina, eldeſt daughter of the king of Pruſſia.
3. William-Henry, duke of Clarence, born Aug. 21, 1765.
4. Charlotta-Auguſta-Matilda, Princeſs Royal, born Sept. 29, 1766.
5. Edward, born Nov. 2, 1767.
6. Auguſta-Sophia, born Nov 8, 1768.
7. Elizabeth, born May 22, 1770.
8. Erneſt-Auguſtus, born June 5, 1771.
9. Auguſtus-Frederic, born Jan. 27, 1773.
10. Adolphus-Frederic, born Feb. 27, 1774.
11. Mary, born April 25, 1776
12. Sophia, born Nov. 3, 1777.
13. Amelia, born Aug. 7, 1783.

The King's Brother and Siſter.

1. Auguſta, ducheſs of Brunſwick, born Aug. 11, 1737.
2. William-Henry, duke of Glouceſter, born Nov. 25, 1743; married, Sept. 6, 1776, Maria, counteſs-dowager of Waldegrave, by whom he has one ſon and two daughters.

CHAP. XI.

WALES.

Boundaries and Extent, Climate, Produce, Rivers Inhabitants, Cities, Mountains, Trade, Hiſtory, &c.

THOUGH this principality is politically annexed to England, yet as it is diſtinct from it in language and manners, we have aſſigned it a ſeparate article. This country was formerly of much greater extent than it is at preſent; but the Saxons having conquered all the plain country, obliged the ancient Britons to retreat weſtward; and, ever ſince that period, Monmouthſhire and Herefordſhire have been reckoned part of England. Wales is bounded on all ſides by the ſea and the Severn, except on the eaſt, where it joins to the counties of Cheſter, Salop, Hereford, and Monmouth. Its length, from the ſouthermoſt part of Glamorganſhire, to the extremity of Flintſhire, is computed at 114 miles; and its greateſt breadth, from the river Wye, eaſt, to St. David's, in Pembrokeſhire, weſt, is about 96 miles. It is ſituated between 51 and 54 deg. north lat. and between 2,41 and 4,56 deg. weſt long. and contains 7011 ſquare miles.

The ſeaſons are pretty much the ſame in Wales as in the northern parts of England, and the air is ſharp, but wholeſome. The ſoil, eſpecially towards the north, is mountainous, but contains rich vallies, producing large crops of wheat, rye, and other corn. Vaſt herds of black cattle, for which this country is famous, ſheep, deer, and goats, are fed on the mountains. Their cows are remarkable for yielding large quantities of milk. Their horſes are remarkably ſmall, but can endure vaſt fatigue. Here are mines of ſilver, copper, lead, and ſome iron; quarries of free-ſtone, and abundance of coal-pits.

In Wales, there are upwards of thirty rivers; the principal are the Clywd, Wheeler, Dee, Severn, Elwy, and Alen, which furniſh Flintſhire with great quantities of fiſh. This country likewiſe abounds in lakes; the chief are Lhyn, Tigid, or Pimble Meer; and Lhyn Sauedhan, or Brecknock Meer; the latter of which is ſo full of fiſh, that the inhabitants ſay, two-thirds of it is water, and the reſt fiſh. At Holywell, a ſmall town in Flintſhire, is a mineral water, eſteemed

eſteemed ſalutary in many diſorders; it is an excellent cold-bath, and has been very beneficial to many who have uſed it.

The inhabitants of Wales are computed at about 300,000; and the land-tax, ſome years ago, brought in 43,752l. a year. The revenue accruing to the prince of Wales from this principality is about 8000l. per annum. The Welſh are, if poſſible, more jealous of their liberties than the Engliſh, and far more iraſcible; but their anger ſoon abates; and they are remarkable for their ſincerity and fidelity. They are fond of carrying back their pedigrees to the moſt remote antiquity; but we have no criterion for the authenticity of their manuſcripts, ſome of which they pretend to be co-eval with the incarnation: however, great part of their eccleſiaſtical hiſtory is certainly more ancient and better atteſted than that of the Anglo-Saxons. In moſt places of North-Wales, they continue the ancient method of entertaining the company who come to their inns with the Welſh harp; and the novelty of this reception, joined to the agreeable wildneſs of the muſic, renders it generally very acceptable to ſtrangers.

The Welſh clergy having refuſed to conform to the rites of the church of Rome, were all maſſacred by order of Auguſtine, who had been ſent by the pope into England, in the reign of Ethelbert, king of Kent, to convert the nation to Chriſtianity; and, after their paſtors were gone, the inhabitants were eaſily overcome. At preſent, the eſtabliſhed religion is conformable with that of the church of England, though there are many Romiſh ceremonies ſtill remaining, and numbers of families who yet profeſs that mode of worſhip. Moſt of the clergy are natives of the country, and, though they underſtand Engliſh perfectly well, yet the public worſhip is frequently performed in Welſh, except in thoſe towns where the Engliſh is the prevailing language. Moſt places in Wales are now bleſſed with free-ſchools, and the dark ignorance with which it was formerly over-run, is happily removed by the ſociety for propagating Chriſtian Knowledge. Among the many methods put in practice for this purpoſe, is the circulating ſchools, which conſiſt of perſons nominated ſchool-maſters, who are appointed to travel from place to place, inſtructing the poor, both old and young, in reading, prayer, and in the tenets of the Proteſtant religion. This laudable ſociety expends conſiderable ſums in bibles, common prayers, and other religious books, which are diſtributed gratis to the colliers, &c. The principality alſo contains great numbers of Proteſtant Diſſenters. At Trevecha, in South-Wales, the counteſs of Huntingdon inſtituted a ſeminary for training up ſtudents in divinity: here have been alſo ſeveral places of public worſhip erected, under that lady's patronage, where the reformed doctrines are preached both in Welſh and Engliſh.

This country was formerly famous for its poets and bards, among whom was Thalieſſin, who flouriſhed about the year 456, and part of whoſe works being repeated to Henry II. of England, were the means of diſcovering the burying-place of king Arthur and his wife. Learning ſuffered greatly in this country by the extirpation of the bards, whoſe poetical genius was ſuppoſed to raiſe in the inhabitants an enthuſiaſtic warmth for independency, which, according to ſome authors, induced Edward I. to make a general maſſacre of them. Numbers of learned men flouriſhed in Wales before the Reformation, particularly Giraldus Cambrenſis; and, ſince that period, it has been rendered conſpicuous by ſeveral divines and antiquaries. Among the former were Hugh Broughton, Hugh Holland, and Williams, archbiſhop of York, lord keeper in the time of Charles I. Among the latter were ſeveral gentlemen of the name of Llhuyd (Lloyd) particularly the author of the Archæologia; and Rowland, author of the Mona Antiqua. There is no doubt but learning was at a great height in Wales, when the Engliſh ſcarce knew the uſe of letters; though this is ſuppoſed to have conſiſted chiefly in the knowledge of the antiquity, language, and hiſtory, of their own country; but the ſcene was afterwards changed, and ignorance took full poſſeſſion of the ancient Britons. Wickliffiſm took ſhelter in Wales when it was perſecuted in England; and, ſince the Reformation, this country has produced ſeveral excellent antiquaries and divines. Some of the Welſh at preſent make a conſiderable figure in the republic of letters, and many of their clergy are excellent ſcholars. The purity of the Welſh language will evidently appear from their Paternoſter, which here follows: "Ein Tad, yr hwn wyt yn y nefoedd, ſancteidder dy enw; deued dy deyrnas; bydded dy ewyllys ar y ddaear, megis y mae yn y nefoed: dyro i ni heddyw ein bara beunyddiol; a maddeu i ni ein dyledion, fel y maddeuwn ni i'n dyledwyr; ac nae arwain ni i brofedigaeth, eithr gwared ni rhag drwg: canys eiddot ti yw'r deyrnas, a'r gallu, a'r gogoniant, yn eos oeſoedd. Amen."

There are no cities or public edifices in Wales which are remarkable, either for populouſneſs or magnificence: we ſhall however, deſcribe ſome of the principal.

Beaumaris, the chief town of the iſle of Angleſey, has two good ſtreets, a handſome church, and a harbour. Denbigh is a good town, and Wrexham has a very handſome church. Cardigan has an elegant church, a county gaol, a public hall, and a good harbour. Caermarthen has a fine ſtone bridge over the Towy, and a very commodious quay. Pembroke has two handſome bridges over Milford-Haven, two churches, and a cuſtom-houſe. Caermarthen and Pembroke are eſteemed the two politeſt cities in Wales, and are inhabited by numbers of gentlemen and wealthy tradeſmen. Milford-Haven, in Pembrokeſhire, is ſuppoſed to be one of the fineſt harbours in Europe; but notwithſtanding many efforts have been made, and conſiderable ſums granted by parliament to render it uſeful, it ſtill remains neglected. Haverfordweſt is a handſome town, having three pariſhes, a commodious quay, a ſtone bridge over the Dougledye, a free grammar-ſchool, a charity-ſchool, a cuſtom-houſe, and an alms-houſe.

The copper-mine, which is now working to ſuch extraordinary advantage in Angleſea, is ſituated on an eminence called Paris Mountain, in the iſland of Mona, the ancient ſeat of the Druids in North Wales, at about eight miles diſtant from Holyhead road, and two miles inward. The ore found here is the richeſt and moſt abundant in its produce of any mine of this metal that our country ever produced. It is found ſo near the ſurface of the earth, with ſo little labour and expence, that the proprietors are enabled to underſel all other dealers in this uſeful article. We have been under the neceſſity of importing yearly an immenſe quantity of this metal from Sweden before this diſcovery was made, which was a conſiderable loſs to this country, the balance of trade being againſt us, by being obliged to purchaſe of the Swedes for ready money. The proprietors have ſeven veſſels of about 150 tons burthen, continually employed in conveying the copper, which is packed up in caſes, in ſheets, to a wharf they have below the Tower. All our men of war are ſheathed with this copper. Not only great part of Europe, but moſt other countries, are ſupplied with this article from Angleſey. The Eaſt-India-Company exported, in the year 1789, upwards of ſixty tons for China, and the demand has ſince increaſed. This celebrated mine is not only remarkable for its abundant produce, but for the ſuperior quality of the metal, being the pureſt of any upon the globe. The clear profit, upon an average for ſome years paſt, has heen between 80 and 90,000l. annually. The principal proprietor is the earl of Uxbridge, ſon of the late Sir Nicholas Bailey.

This principality, we may obſerve, was, in ancient

 times,

times, a far more populous and wealthy country than at preſent; and, though it contains no regular fortifications, yet many of its old caſtles are ſo ſtrongly built, and advantageouſly ſituated, that they might be turned into ſtrong forts by a little expence.

Every part of Wales abounds in Roman and Britiſh camps, walls, caſtles, and other antiquities. In the iſland of Angleſey are ſeveral rude monuments, called by the inhabitants Cromlechen. They are formed of a number of rough ſtones, ſet up on an end, which ſerve as ſupporters to one of ſeveral tons weight, laid on the ſummit, It is uncertain what was the original intent of erecting them, but they are ſuppoſed to have been ſepulchres, either of the Druids, whoſe chief reſidence was in this iſland, anciently called Mona; or of princes and other diſtinguiſhed perſons. Rude monuments of the ſame nature are to be found in moſt of the counties in Wales, particularly in Brecknockſhire, of which the moſt remarkable are a pillar about ſix feet high, two broad, and ſix inches thick, called the maiden ſtone; on one ſide of which are the figures of a man and woman, very badly executed: and St. Eltut's Hermitage, which is formed of four rough ſtones, of which three are fixed in the ground, and the fourth laid on the top for a cover. Ancient coins, both Roman and Britiſh, of gold and other metals, are frequently found in this principality; and, in 1692, a golden turquoiſe, conſiſting of three or four bars, about four feet in length, twiſted together like a hatband, was dug up in a garden near the caſtle of Harlech, in Merionethſhire.

The prodigious mountains in Wales may be juſtly eſteemed natural curioſities. Among the moſt remarkable of theſe are Snowdon-Hills, Penmaenmawr, and Moel y Wydhva. Snowdon-Hills are properly diſtinguiſhed by their names, the tops being covered with ſnow moſt part of the year: one of theſe mountains has been found, by trigonometrical menſuration, to be 1240 yards in perpendicular height. Penmaenmawr projects over the ſea, to the great terror of the traveller, the high road being cut through the rock, and, though the ſide next the ſea is guarded by a wall, yet the large pieces of rock which ſometimes fall from the top, render it a very dangerous paſſage. From the ſummit of Moel y Wydhva may be ſeen, in a clear day, part of England, Ireland, and Scotland. Theſe mountains are called the Britiſh Alps, and produce many animals which are to be found only on them and the Alps in Italy. Caerphili caſtle is another curioſity. This building, from its ſize and ſtructure, is ſuppoſed to have been a Roman garriſon, and is, without exception, the fineſt piece of ruins now remaining in Britain. Its dimenſions ſeem to have been almoſt equal to thoſe of Windſor-caſtle; and one of the round towers, which overhangs its baſis above nine feet, is eſteemed as great a natural curioſity as the leaning tower of Piſa in Italy.

At Lhanfannam, in Flintſhire, on the ſide of a rock, is a cave, in which are 24 ſeats, known by the name of Arthur's round table. In this county is alſo the famous well, called St. Winifred's-well, the ſpring of which boils with vaſt impetuoſity out of a rock, and is formed into a beautiful polygonal well, covered with a rich arch ſupported by pillars, and the roof is moſt exquiſitely carved in ſtone: over the ſpring is alſo a chapel, a neat piece of Gothic architecture, but in a very ruinous ſtate. King James II. paid a viſit to the well of St. Winifred in 1686, and was rewarded for his piety by a preſent which was made him of the very ſhift in which his great grandmother Mary Stuart loſt her head. The ſpring is ſuppoſed to be one of the fineſt in the Britiſh dominions, and, by two different trials and calculations lately made, is found to fling about twenty-one tons of water in a minute: it never freezes, or ſcarcely varies in the quantity of water in droughts, or after the greateſt rains; after a violent fall of which, it becomes diſcoloured by a wheyiſh tinge. Near Caermarthen may be ſeen ſeveral vaſt caverns, ſuppoſed to have been copper-mines of the Romans. At the ſame place is a fountain, which, like the ſea, ebbs and flows twice in 24 hours: and on the coaſt of Pembrokeſhire is a pool called Baſharſton-Meer, which is ſuppoſed to be unfathomable; and, by its violent noiſe, to have a ſubterraneous communication with the ſea. The laſt curioſity we ſhall particularize is the dyke, near Knighton in Radnorſhire, which Offa, the Mercian, threw up as a boundary between his ſubjects and the Britons.

The Welſh, with reſpect to commerce and manufactures, are on a footing with many of the weſtern and northern counties of England. Their trade is moſtly inland, and they import numbers of black cattle, which afford excellent beef, into England. The town of Pembroke employs near 200 merchant ſhips, and its inhabitants carry on an extenſive trade. In Brecknockſhire are ſeveral woollen manufactures; and Wales carries on a great coal trade with England, and even Ireland. Denbigh is famous for gloves and tanned leather.

The tutelar ſaint of the Welſh is St. David, commonly called St. Taffy: his badge is a leek, worn in commemoration of him on the 1ſt of March, and for which various reaſons have been aſſigned. The arms of the prince of Wales differ from thoſe of England only by the addition of a label of three points: the motto is, "Ich Dien," I ſerve. His cap, or badge of oſtrich feathers, was occaſioned by a trophy of that kind which Edward the Black Prince took from the king of Bohemia, when he was killed at the battle of Poictiers.

HISTORICAL ACCOUNT OF WALES.

THE ancient hiſtory of Wales is uncertain, on account of the number of petty princes who governed it. We are, however, certain, that the love of independence was ſo ſtrongly rooted in the breaſts of the Britons, that they defended their country during a long ſeries of years againſt all the force of the Romans; and even when the greater part of their country was ſubdued, and the ſoil drenched with the blood of its inhabitants, many of them retired to the mountains, where they bid defiance to the Roman arms.

The Saxons alſo attempted the conqueſt of this country, but penetrated no further than the counties of Monmouth and Hereford, which were afterwards conſidered as parts of England. The Welſh, however, were far from being ſubdued; they continued an independent people, and were ſtill governed by their own princes and their own laws.

The firſt blow to the liberties of the Welſh was given about the year 870, when Roderic, king of Wales, divided his dominions among his three ſons; theſe diviſions were Demetia, or South Wales; Poveſia, or Powis-Land; and Venodotia, or North Wales. This diviſion gave riſe to many wars, during which the kingdom of Poveſia, or Powis-Land, was conquered, and part of it annexed to North Wales, and part to South; diviſions which ſubſiſt even to this day.

Henry I. of England planted a colony of Flemings on the borders of Wales, about the year 1112, hoping that they would ſoon form a barrier to England. But, though the Welſh were unable to drive the Flemings from their ſettlements, they reſiſted, with remarkable intrepidity, ſeveral attempts made by the Norman kings of England to deprive them of their liberty. At laſt, their old and infirm prince Llewellin put himſelf under the protection of Henry III. to whom he did homage for his kingdom, in order to procure the aſſiſtance of that prince againſt his ferocious ſon Griffin,

who had taken up arms againſt his father. This incident, which happened in 1237, furniſhed a pretence for conſidering Wales as a fief of England, and of making an entire conqueſt of that country.

On the death of that prince, his ſon Llewellin ſucceeded to the crown, who, diſdaining the homage to which old Llewellin had ſubmitted, Edward raiſed a formidable army at a prodigious expence, with which he penetrated as far as Flint, and, taking poſſeſſion of the iſle of Angleſey, he drove the Welſh to the mountains of Snowdon, and obliged them to ſubmit to pay a tribute. The Welſh, however, made ſeveral efforts under Llewellin; but at laſt, in 1285, he was killed in battle. He was ſucceeded by his brother David, the laſt independent prince of Wales, who, falling into Edward's hands through treachery, was by him moſt barbarouſly and unjuſtly hanged; and Edward, from that time, pretended that Wales was annexed to the crown of England. It was about this time, probably, that Edward perpetrated the inhuman maſſacre of the Welſh bards. Perceiving that his cruelty was not ſufficient to complete his conqueſts, he ſent his queen, in the year 1282, to be delivered in Caernarvon-caſtle, that the Welſh, having a prince born among themſelves, might the more readily recognize his authority. This prince was the unhappy Edward II. and from him the title of prince of Wales has always deſcended to the eldeſt ſons of the Engliſh kings. The hiſtory of Wales and England became now the ſame. The eldeſt ſons of the kings of England have not only ever ſince held the titular dignity, but actually kept a court at Ludlow; and a regular council, with a preſident, was named by the crown, for the adminiſtration of all the affairs of the principality. This piece of policy was thought ſo neceſſary, that, when Henry VIII. had no ſon, his daughter Mary was created princeſs of Wales.

CHAP. XII.

IRELAND.

Situation, Extent, Boundaries, Diviſions, Produce, Rivers, Lakes, Inhabitants, Learning, &c.

THIS iſland is ſituated on the weſt ſide of England, between the parallels of 51 and 55 deg. 20 min. north lat. and 6 and 10 deg. weſt long. or between the middle parallel of the eighth clime, where the longeſt day is ſixteen hours and a half, and the twenty-fourth parallel, or the end of the tenth clime, where the longeſt day is ſeventeen hours and a half. This kingdom is 290 miles in length, 172 in breadth, and contains an area of 31,966 miles: it alſo contains 11,067,712 Iriſh plantation acres, which makes 17,227,864 acres of Engliſh ſtatute meaſure, and is ſaid to bear proportion to England and Wales as eighteen to thirty. It is bounded on the north by the Deucaledonian Sea; on the ſouth and weſt by the Atlantic Ocean; and on the eaſt by the Iriſh Sea, or St. George's Channel, which divides it from the weſtern ſhores of Great Britain. It is ſixty miles diſtant from Holyhead in Wales, but not more than twenty miles from the Mull of Galloway in Scotland. Its name is probably derived from a Phœnician or Gallic term, ſignifying the furtheſt habitation weſtward.

With regard to the diviſions of Ireland, even modern authors are not agreed, ſome dividing it into five circuits, and others into four provinces; but as the latter method is more generally followed, and at the ſame time more ancient, we have thought proper to adopt it. The provinces are, Leinſter, Ulſter, Connaught, and Munſter.

1. The province of Leinſter is ſituated on the eaſt, and contains twelve counties; viz.

Counties.	Chief Towns.
Dublin	Dublin
Louth	Drogheda
Wicklow	Wicklow
Wexford	Wexford
Longford	Longford
Eaſt Meath	Trim
Weſt Meath	Mullingar
King's County	Philipſtown
Queen's County	Maryborough
Kilkenny	Kilkenny
Kildare	Naas and Athy
Carlow	Carlow

2. Ulſter province is ſituated in the north, and contains nine counties; viz.

Down	Down Patrick
Armagh	Armagh
Monaghan	Monaghan
Cavan	Cavan
Antrim	Carrickfergus
Londonderry	Derry
Tyrone	Omagh
Fermanagh	Enniſkillen
Donegall	Lifford

3. Connaught is ſituated in the weſt, and includes five counties; viz.

Leitrim	Carrick on Shannon
Roſcommon	Roſcommon
Mayo	Ballinrobe and Caſtlebar
Sligo	Sligo
Galway	Galway

4. Munſter is ſituated in the ſouth, and contains ſix counties; viz.

Clare	Ennis
Cork	Cork
Kerry	Tralee
Limerick	Limerick
Tipperary	Clonmel
Waterford	Waterford

The air of Ireland is nearly the ſame with that of England in the ſame latitude, except in ſome parts where it is rendered more groſs and impure by lakes, bogs, and marſhes. The climate, however, is more temperate, it being cooler in the ſummer, and warmer in the water than in England. It is more ſubject to violent winds, clouds, and rain, than to hard froſts in winter; and even in ſummer rain is very frequent, and often prejudicial to the fruits.

The ſoil is various; in ſome places it is ſo rich as to want no manure, and in others ſo barren, that no huſbandry can render it fertile. In the county of Roſcommon is a fine vale called Sheep-Walk, extending twenty-one miles in length, and remarkable for its fertility and fine paſture. The ſoil in many places is a blackiſh earth, in ſome a blackiſh clay, and in others a mixture of earth, ſand, and clay; but the red earth and chalky ground, ſo common in England, is not found in Ireland. In many parts of the kingdom, the upper ſtratum is good mould, but very thin, and nothing under it but ſtone. Theſe parts, however, produce conſiderable crops of corn. Where the lands are not naturally fertile, the inhabitants have ſpared no pains in manuring them with the dung of animals, aſhes of ſea-weeds, mud, and ſometimes lime, in order to enrich the ſoil. By theſe, and various other improvements lately made in agriculture, the lands in Ireland produce much larger quantities of corn, flax, artificial graſſes, culinary vegetables,

tables, &c. than formerly. This happy change is in a great meaſure owing to a ſociety eſtabliſhed at Dublin for the improvement of various arts and manufactures, among which huſbandry engages a very conſiderable ſhare of their attention. The premiums offered by this ſociety have introduced the cultivation of clover, trefoil, ſaintfoin, lucern, rye-graſs, and various other vegetables for the food of cattle. Many unprofitable bogs have alſo been drained, and rendered excellent land. Paſture-land abounds in Ireland, where vaſt numbers of black cattle, hogs, and ſheep, are reared and fed; and hence the inhabitants are able to ſupply the prodigious quantities of ſalt proviſions, butter, &c. annually ſhipped off at Cork, and other parts of the kingdom, to foreign markets, which are the ſtrongeſt proofs of the natural fertility of the ſoil. The Iriſh wool is very valuable, and great quantities of it are exported to England.

Among the uncultivated parts of Ireland are the large bogs, found in various parts of the kingdom. Some of theſe bogs are dangerous; they are generally covered with fine graſs, and the ſoil ſo very ſpongy, that it will bear neither man nor beaſt. Some of them ſhake under foot in an alarming manner, but they may be often croſſed with ſafety.

This country is greatly enriched with the numerous rivers, enchanting lakes, ſpacious bays, commodious havens, harbours, and creeks, with which it abounds. The Shannon is a very noble river, larger than any in England, but not navigable above fifty miles, on account of a ridge of rocks ſouth of Killaloe, and ſtopping all navigation further up; but this might be remedied by a ſhort canal, at the expence of ten or twelve thouſand pounds, and communications might alſo be made with other rivers, to the great benefit of the nation. This river runs from north to ſouth upwards of 300 Engliſh miles, ſpreading itſelf into many large and beautiful lakes of different extent, from five to fifteen miles, abounding with ſalmon, pike, &c. of a very large ſize; and ſome of the lakes are adorned with fertile and beautiful iſlands. The Lee riſes in the county of Cork, below which city falls into the ſea, after an eaſterly courſe of above twenty-ſix miles. The Liffey riſes in the county of Wicklow, and falls into the Iriſh ſea below Dublin. The Boyne riſes in the King's County, and falls into the ſea at Drogheda. The Barrow, Nore, and Suir, water the ſouth part of the kingdom, and, after uniting their ſtreams below Roſs, fall into the channel at Waterford-Haven. The Bann, famous for a pearl and ſalmon fiſhery, riſes in the county of Down, and falls into Lough-Neagh, in the county of Armagh.

Ireland contains a great number of lakes, or loughs, particularly in the provinces of Ulſter and Connaught. Though thoſe loughs, in the main, have but few properties that are not common with the like bodies of water in other countries; yet they have given riſe to many fabulous accounts concerning the natives, which diſgrace their true hiſtory. The great lake Neagh, between the counties of Antrim, Down, and Armagh, is remarkable for its petrifying quality. Some of the Iriſh lakes afford the moſt beautiful and romantic proſpects, particularly that of Killarney, which takes its name from a ſmall town in the county of Kerry. This lake, which may be divided into three, is entirely ſurrounded with mountains, rocks, and precipices, the immenſe declivities of which are covered with woods, intermixed with ever-greens, from near their tops to the lakes themſelves; among which are a number of rivulets tumbling over the precipices, ſome from heights of little leſs than 300 feet. On the top of one of the ſurrounding mountains is a ſmall round lake about a quarter of a mile in diameter, called the Devil's Punch Bowl. From the ſurface of the lake to the top of the cavity, or brim of the bowl, may be about 300 yards; and when viewed from the circular top, it has a moſt aſtoniſhing appearance. The depth of it is vaſtly great, but not unfathomable, as the natives pretend. The diſcharge of the ſuperfluous waters of this bowel, through a chaſm into the middle lake, forms one of the fineſt caſcades in the world, viſible for 150 yards. The echoes among the hills ſurrounding the ſouthern parts of the lake, which is moſtly incloſed, are equally delightful and aſtoniſhing. The proprietor, the earl of Kenmare, has placed ſome cannon in the moſt proper places, for the amuſement of travellers; and the diſcharge of theſe pieces is tremendous, reſembling moſt the rolling of a violent peal of thunder, which ſeems to travel the ſurrounding ſcenery, and die away among the diſtant mountains. Here alſo muſical inſtruments, eſpecially the horn and trumpet, afford the moſt delightful entertainment, and raiſe a concert ſuperior to that of a hundred performers. Among the vaſt and craggy heights that ſurround the lake, is one ſtupendous and frightful rock, the front of which towards the water is a moſt horrid precipice, called the *eagle's neſt*, from the number of thoſe birds which have their neſts in that place. Many of theſe lakes contain large quantities of fiſh.

Here are a great number of ſpacious bays, havens, harbours, and creeks, which every where indent the coaſt, and render this country, beyond any other, the beſt fitted for foreign commerce. The moſt conſiderable are thoſe of Carrickfergus, Strangford, Dundrum, Carlingford, Dundalk, Dublin, Waterford, Dungarvan, Cork, Kinſale, Baltimore, Glandore, Dunmanus, Bantry, Kinmare, Dinglas, Shannon-mouth, Galway, Sligo, Donegall, Killebegs, Lough-Swilley, and Lough-Foyle, beſides a great many barred havens, ſome of which have been much improved by act of parliament, particularly that of Dublin.

Many of the roads of Ireland are now the fineſt in Europe. They are carried ſeveral miles in ſtraight lines; to effect which, no expence has been ſpared to cut through mountains, and fill up vallies; in ſome places they are carried for many miles through the middle of bogs, which before were impaſſable. Add to this, that as there is no ſuch thing as a heavy waggon in the country, the roads are hard and ſmooth, in ſome meaſure reſembling the gravel walks in a garden.

The many rivers that water the plains of Ireland, render it very ſuſceptible of improvements, with regard to inland navigation; and the legiſlature, convinced of the great utility that muſt attend the communications between different places in the kingdom by means of canals, have, at different times, granted large ſums of money for carrying on theſe uſeful works. One of theſe canals is extended above ſixty miles, from the river Shannon to the Liffey near Dublin. By this artificial navigation, a communication is opened from the channel to the Atlantic Ocean. In ſurveying the grounds for this canal, it was found neceſſary to carry it through a bog twenty-four miles over, which greatly increaſed the labour and expence of the undertaking, in ſtrengthening the banks with additional works, to prevent them from falling in, to which they would otherwiſe have been very ſubject, from the ſpongy nature of the ſoil.

In this kingdom are ſeveral lofty chains, as well as high mountains; and the Iriſh have three words which expreſs the different degrees of their elevation and ſize, namely, knock, ſlieu, and bein or binn: knock ſignifies a low hill, unconnected with any other eminence; ſlieu denotes a craggy high mountain, gradually aſcending, and continued in ſeveral ridges; a bein or binn means a pinnacle, or mountain of the firſt magnitude, ending in a ſharp or abrupt precipice. The two laſt are often ſeen and compounded together in one and the ſame range. The mountains of Mourne and Iveagh, in the county of Down, are reckoned among ſome of the higheſt in the kingdom; of which Slieu Denard is calculated at a perpendicular

cular height of 1056 yards. Many other mountains are found in Ireland, ſome of which contain veins of iron, lead, copper, minerals, coals, quarries of ſtone, ſlate, and marble.

In the mountains of Wicklow are alſo ſome of thoſe deep vallies called glyns, very beautiful and pictureſque, together with ſome grand and aſtoniſhing water-falls.

The chief foreſts in Ireland lie in Leinſter and Ulſter, the King's and Queen's counties, and in thoſe of Wexford and Carlow, Donegall, Fermanagh, along Lough-Earne, and in the north parts of the counties of Tyrone and Down, wherein is ſome good timber; and the oak is eſteemed as good as any of the Engliſh growth, and as fit for ſhip-building.

The vegetable and animal productions of Ireland nearly reſemble thoſe of England and Scotland. Some of the meadows are covered with excellent graſs; others yield plenty of turf and peat, which are very ſerviceable for firing. Great quantities of hemp and flax are raiſed in the northern parts of the kingdom. Bees abound here, and vaſt quantities of wild honey are found in caverns and trunks of trees. Wolves were formerly very numerous here, but have long ſince been deſtroyed by the wolf-dogs, which are much larger than maſtiffs, ſhaped like greyhounds, yet very gentle and governable. Their herds of black cattle, flocks of ſheep, hogs, and alſo rabbits, are amazingly numerous: one rabbit-warren is affirmed to be forty miles in length; they have geeſe and fowls of all kinds, and a ſpecies of excellent hawks. The fiſh on the coaſts of Ireland are in greater plenty than on thoſe of England, and ſome of them larger and more excellent in their kind. The aſſertion that venomous animals will not live in Ireland, begins to loſe credit, as numbers of toads are found in that kingdom.

Moſt of the mines of Ireland have been diſcovered in this century; ſome contain a mixture of ſilver and lead; thirty pounds of lead ore is ſaid to produce a pound of ſilver; but the richeſt ſilver mine is at Wicklow; two mines, one of copper, and another of lead, have been diſcovered at Tipperary. Iron mines are diſperſed all over the kingdom; here are alſo quarries of free-ſtone, ſome of a grey or aſh-colour, and others blue. There are quarries of fine ſlate and marble in moſt of the counties. There is a peculiar ſpecies of coal at Kilkenny, reſembling the canal-coal of Lancaſter; very hard, of a bright black, burns freely, and emits little or no ſmoke; theſe qualities, with the ſerenity of the air and gravelly ſoil in that county, have given riſe to the well-known proverb, that "Kilkenny contains fire without ſmoke, water without mud, and air without fog." There are few mineral waters in Ireland; the principal ſpring of this kind is ſituated on the banks of the Liffey, at the village of Leixlip, ſeven miles from Dublin.

From the accounts laid before the houſe of commons in 1786 (as returned by the hearth-money collectors) the number of houſes in Ireland amounted to 474,234, and if (upon a moderate computation) we allow eight perſons to a houſe, it will make the population amount to 3,793,872.

The firſt ſettlers of Ireland are ſuppoſed to have been emigrants from different parts of the globe, and at different times. The Iriſh, in general, are a ſtrong bodied people, nimble, active, of great ſoftneſs and pliancy in their limbs, bold, haughty, ready of apprehenſion, cunning, hoſpitable, credulous, vain, full of reſentment, and violent in all their affections.

The Papiſts, in conſequence of a blind ſubmiſſion to their prieſts, are ignorant and ſuperſtitious. At home they are not remarkable for bravery, probably owing to the many legal diſabilities they labour under, which lays a reſtraint both on their mental and bodily faculties; but when employed in the ſervice of foreign princes, they generally diſtinguiſh themſelves by their courage and fidelity. O or Mac, which ſignify grandſon and ſon, uſually precede their ſurnames, eſpecially of the better ſort.

Theſe people are too juſtly accuſed of hard drinking, and are not ſuppoſed to have made a perſon welcome at their houſe, who is ſuffered to leave it ſober. Some writers have accuſed the Iriſh of want of genius, and others have even gone ſo far as to call them a nation of blunderers; but it is plain they were either actuated by partiality, or ignorant of proper diſtinction; for it is well known that Ireland has produced ſeveral men of unqueſtioned abilities; and at preſent the politer part of that nation do not yield the palm in any one reſpect to the Engliſh, of whoſe manners, language, dreſs and cuſtoms, they are true copyiſts.

The old, or mere Iriſh, as they are termed by the Proteſtants, are indeed a miſerable race, inhabiting the moſt unpoliſhed provinces of the kingdom, particularly Connaught. Theſe poor people are without diſpute the moſt ignorant; but at the ſame time appear to be the moſt oppreſſed people in Europe; being in a manner denied all the benefits common to a civilized people. Subjected even to a ſtate of ſlavery by their tyrannic lords or leaſeholders, their only wealth conſiſts of a cow; ſometimes, but very rarely, of a horſe; a ſmall number of poultry, and a ſpot for potatoes. Their food is coarſe bread, potatoes, eggs, butter, milk, and ſometimes fiſh; but ſeldom taſte butcher's meat of any kind. They reſide in miſerable huts, termed by them cabins, built of clay and ſtraw, which are generally divided in the centre by a partition of the ſame materials. In one part the family live and ſleep promiſcuouſly, having their fires of turf in the middle of the floor, with an opening through the roof for a chimney; the other being appropriated for the reception of a cow, and ſuch pieces of lumber as are not in immediate uſe. Their children, plump, robuſt, and hearty, ſcarcely know the uſe of clothes, and are not aſhamed to gaze upon ſtrangers, or make their appearance in that primitive manner, upon the roads.

In this idle and deplorable ſtate, many thouſands have been loſt to the community and to themſelves, who if they had been properly educated, and inſtructed in the real principles of Chriſtianity, and inured and encouraged to induſtry and labour, would have become uſeful members of ſociety, and alſo added conſiderable ſtrength to government.

The preſent inhabitants of Ireland are compoſed of three diſtinct claſſes of people; the old Iriſh, are poor, ignorant, and depreſſed, who inhabit, or rather exiſt, upon the interior and weſtern parts; the deſcendents of the Engliſh, who inhabit Dublin, Waterford, and Cork, and who gave a new appearance to the whole coaſt facing England, by the introduction of arts, commerce, ſcience, and more liberal and juſt ideas of the true God and primitive Chriſtianity; thirdly, the deſcendents of the Scots, who in the reign of James I. fled from that kingdom to avoid perſecution, and were the firſt who introduced the preſent great ſource of Iriſh wealth, the linen manufactory.

The gentry and better ſort of the Iriſh nation in general differ little in language, dreſs, manners, and cuſtoms, from thoſe of the ſame rank in Great-Britain, whom they imitate. Their hoſpitality is well known, but in this they are ſometimes ſuſpected of more oſtentation than real friendſhip. Their muſic is the bagpipe, but their tunes are generally of a very melancholy ſtrain; though ſome of the lateſt airs are more lively, and, when ſung by an Iriſhman, extremly diverting. The old Iriſh is generally ſpoken in the interior parts of the kingdom, where ſome of the old uncouth cuſtoms ſtill prevail, particularly their funeral howlings. They have a cuſtom of placing a dead corpſe before their doors, laid out upon a table, having a plate upon the body, to excite the charity of paſſengers. Their convivial meetings on Sunday afternoon, with dancing to the bagpipe, and more

often quarrelling among themſelves, is offenſive to every ſtranger; but, as we obſerved before, theſe cuſtoms are chiefly confined to the more unpoliſhed provinces of the kingdom, particularly Connaught, the common people there having the leaſt ſenſe of law and government of any in Ireland.

The eſtabliſhed religion of Ireland, is the ſame with that of England; but among the bulk of the people, in the moſt uncultivated parts, Popery is prevalent. The Iriſh Papiſts ſtill retain their nominal biſhops and dignitaries, who ſubſiſt on the voluntary contributions of their votaries. But Proteſtantiſm makes a very rapid progreſs in the towns and communities. The inſtitution of the incorporated ſociety for promoting the Engliſh Proteſtant working-ſchools, in 1717, has been amazingly ſucceſsful, as have many inſtitutions of the ſame kind, in introducing induſtry and knowledge among the Iriſh; and no country in the world can ſhew greater public-ſpirited exertions than have been made by the government of Ireland, ſince that time, for theſe laudable inſtitutions; but many of the parliamentary grants of this kind have been unhappily trifled with and perverted. There are many ſectaries in Ireland; particularly Preſbyterians, Baptiſts, Quakers, and Methodiſts, all of whom are either connived at or tolerated.

There are four archbiſhoprics of the eſtabliſhed church in Ireland, viz. Armagh, Dublin, Caſhell, and Tuam: the biſhoprics are, Clogher, Clonfert, Cloyne, Cork, Derry, Down, Dromore, Elphin, Kildare, Killaloe, Leighlin, Limerick, Meath, Oſſory, Raphoe, Waterford, Kilmore, and Killala.

The Iriſh language is a dialect of the Celtic, and fundamentally the ſame with the Erſe uſed by the Scots Highlanders, and not remarkably different from the Welſh. But it is now greatly altered from its original ſimplicity by provincial alterations, and the introduction of foreign works; and it is probable that in a few centuries the Iriſh will be conſidered as a dead language. The common people have a diſagreeable tone in ſpeaking, which diffuſes itſelf even among the better ſort who do not underſtand Iriſh.

Ancient Iriſh hiſtorians tell us, learning flouriſhed in this country when the reſt of Europe was overwhelmed with the groſſeſt ignorance. The old natives of Ireland alſo diſpute the honour of the poems of Oſſian with the Scots Highlands, inſiſting that he was a native of Ireland: however this be, it is well known that the Iriſh ſtill repeat many parts of his poems, which have been tranſmitted by tradition, from father to ſon, for many generations. With regard to writers, ſince the revival of learning, the Iriſh are little inferior to thoſe of their neighbours. Archbiſhop Uſher does honour to literature itſelf, Dean Swift, who was a native of Ireland, has perhaps never been equalled in the walks of wit, humour, and ſatire. The ſprightlineſs of Farquhar's wit is well known to all lovers of the drama. And among the men of diſtinguiſhed genius whom Ireland has lately produced, may alſo be particularly mentioned ſir Richard Steele, biſhop Berkeley, Parnel, Sterne, and Goldſmith.

The only univerſity in Ireland is that of Dublin, denominated Trinity-College, which was founded and endowed by queen Elizabeth. It conſiſts of two ſquares, in the whole of which are thirty-three buildings of eight rooms each. Three ſides of one of the ſquares are of brick, and the fourth is a very ſuperb library. The inſide is beautiful and commodius, and embelliſhed with the buſts of ſeveral ancient and modern worthies. The new ſquare, three ſides of which have been built within about twenty years, by parliamentary bounty, and from thence called Parliament-Square, is of hewn ſtone; and the front of it, near the city of Dublin, is ornamented with pilaſters, feſtoons, &c. The Provoſt's houſe has an elegant little front, entirely of Portland ſtone. The chapel, and the old hall, where college exerciſes are performed, are mean ſtructures; but the new hall, in which the members of the college dine, is a fair and large room.

This ſeminary originally conſiſted only of a provoſt, three fellows, and three ſcholars; it has from time to time been augmented to twenty-two fellows, ſeventy ſcholars, and thirty ſizers. The whole number of ſtudents is at preſent about 400, who are of three claſſes, fellow-commoners, penſioners, and ſizers or writers. Of the fellows, ſeven are called ſeniors, and the annual income of theſe is about 700l. The provoſtſhip is ſuppoſed to be worth 3000l. a year. Trinity-College has a power of conferring degrees of bachelors, maſters, and doctors in all the arts and faculties. The viſitors are, the chancellor or vice-chancellor, and the archbiſhop of Dublin. In the muſeum of this univerſity is a ſet of figures in wax, repreſenting females in every ſtate of pregnancy: they are done upon real ſkeletons, and are the labours of almoſt a whole life of a French artiſt.

In Ireland there are ſeveral free-ſchools for the inſtruction of youth, which are endowed both by public and private munificence. Many of theſe inſtitutions were founded by James I. and queen Elizabeth; one by the firſt duke of Ormond, and another by Eraſmus Smith, Eſq. in the year 1748, the free-ſchools in Ireland amounted to 168, in which 3006 children were educated. But the moſt extenſive and uſeful charity of this kind in Ireland, and perhaps in the univerſe, is the incorporated ſociety for promoting Engliſh Proteſtant working-ſchools already mentioned. James I. made great efforts for this purpoſe; but this beneficial undertaking was not incorporated by charter till 1733, by George II. and the parliament of Ireland appropriates near 3000l. a year to the uſe of it, and the late king contributed 1000l. immediately, and 1000l. per annum towards its ſupport. There is alſo a charitable inſtitution in Dublin, termed a charter nurſery, where the infants of the poor are received, fed, clothed, inſtructed, and taken very great care of, by proper perſons appointed, till they are old enough to be ſent to ſome of the above-mentioned ſchools: and in different parts of the kingdom, there are other nurſeries of the ſame kind.

In Ireland, the natural and artificial curioſities are not ſo numerous as they are remarkable. The Iriſh goſ-hawks and goſ-falcons are celebrated for their ſhape and beauty: beſides the ſhape and faſhion of their body, they ſtand ſo erect, and delight the eyes with ſuch an elegant form, that they give as it were a grandeur to the diverſion of hawking. The Iriſh wolf-dogs, before mentioned, have been accounted preſents worthy the acceptance of monarchs. The caves, glyns, and cataracts, already noticed, certainly deſerve to be mentioned among the natural curioſities of this kingdom. But that which merits our greateſt attention is the Giant's Cauſeway in the county of Antrim, about eight miles from Coleraine, which Dr. Pococke, a celebrated traveller and antiquary, has thus deſcribed: "I meaſured," ſays this learned writer, the moſt weſterly point at high water, to the diſtance of 360 feet from the cliff; but was told, that at low water, it extended ſixty feet further upon a deſcent, till it was loſt in the ſea. Upon meaſuring the eaſtern point I found it 540 feet from the cliff; and ſaw as much more of it as of the other, where it winds to the eaſt, and is, like that, loſt in the water. The cauſeway is compoſed of pillars all of angular ſhapes, from three ſides to eight. The eaſtern point, where it joins the rock, terminates in a perpendicular cliff, formed by the upright ſides of the pillars, ſome of which are thirty-three feet and four inches high. Each pillar conſiſts of ſeveral joints or ſtones, lying one upon another, from ſix inches to about one foot in thickneſs; and, what is very ſurpriſing, ſome of theſe joints are ſo convex, that their prominences are nearly quarters of ſpheres, round each of which is a ledge, which holds them together with the greateſt

A PROSPECT OF THE CITY OF DUBLIN
From the MAGAZIEN HILL in his MAJESTYS PHOENIX PARK

greateſt firmneſs, every ſtone being concave on the other ſide, and fitting in the exacteſt manner the convexity of the upper part of that beneath it. The pillars are from one to two feet in diameter, and generally conſiſt of about forty joints, moſt of which ſeparate very eaſily, and one may walk along upon the tops of the pillars as far as to the edge of the water. But this is not the moſt ſingular part of this extraordinary curioſity; the cliffs themſelves being ſtill more ſurpriſing. From the bottom, which is of black ſtone, to the height of about ſixty feet, they are divided at equal diſtances by ſtripes of a reddiſh ſtone, that reſemble a cement, about four inches in thickneſs; upon this there is another ſtratum of the ſame black ſtone, with a ſtratum five inches thick of the red. Over this is another ſtratum ten feet thick, divided in the ſame manner; then a ſtratum of the red ſtone, twenty feet deep, and above that a ſtratum of upright pillars; above theſe pillars lies another ſtratum of black ſtone, twenty feet high; and, above this again, another ſtratum of upright pillars, riſing in ſome places to the tops of the cliffs, in others not ſo high, and in others again above them; where they are called the chimneys. The face of theſe cliffs extends about three Engliſh miles."

The greateſt artificial curioſities in Ireland are the tall, ſlender, round towers, called Pharos, built of lime and ſtone, and diſperſed through various parts of the kingdom. They are ſuppoſed to have been erected by the Danes or Norwegians, as watch-towers or beacons.

Dublin, the capital of Ireland, is ſituated on the banks of the river Liffey, about three miles from the ſea, and at the bottom of a large bay of the ſame name. The whole extent of this city is about one-third of London, including Weſtminſter and Southwark; and one-fourth at leaſt of the whole has been built within theſe forty years; more than 4000 houſes having been erected in that ſhort period of time. Thoſe parts of the town that have been added ſince that time are ſubſtantially built, and the ſtreets in general well laid out, eſpecially on the north ſide of the river, where the moſt conſiderable additions have been made.

There are many ſpacious and regular ſtreets in the city, particularly Sackville-ſtreet, in the north-eaſt part of the town, which, with ſome alterations and improvements, would have been one of the fineſt, perhaps, in Europe. The moſt elegant, and beſt finiſhed piece of architecture in Dublin, is the lying-in-hoſpital. The view of Dublin from the top of any of their towers, is the moſt beautiful of any large city in the king's dominions, in a ſimilar point of view, from the neatneſs of the blue ſlating with which the houſes are univerſally covered. The bay below the city to the eaſt, with the adjacent country, adds greatly to the beauty of the proſpect.

The river Liffey, which runs through almoſt the centre of the city, from weſt to eaſt, and contributes much to its health, is but ſmall, not being more than one-fifth as wide as the Thames at London, conſequently cannot be ſuppoſed capable of bringing up to the town ſhips of very great burden. Over this river there are ſeven bridges, of which that called Eſſex-bridge is well built, and a new ſtreet is opened from the foot of this bridge to the caſtle, where the lord-lieutenant reſides, and adds greatly to the beauty and utility of the city. A ſpacious and elegant Exchange has been lately erected: it is a handſome ſtructure of white ſtone, richly embelliſhed with ſemi-columns of the Corinthian order, a cupola, and other ornaments. It coſt 40,000l. and was ten years in building. There are two large and elegant theatres here, which are generally well filled, and ſerve as a kind of nurſery to thoſe in London. Here are ſummer entertainments alſo, in imitation of thoſe in London. Adjoining to the lying-in-hoſpital, and belonging to it, is a large ſquare piece of ground encloſed, and three ſides out of four very prettily laid out in walks, plantations of ſhrubs, trees, &c. the fourth being taken up with one of the fronts of the hoſpital. The ground on the ſide oppoſite the hoſpital, being much higher than the reſt, is formed into a fine hanging bank, with a ſlope of near thirty feet, on the top of which is laid out a grand terrace-walk, commanding a fine view of the hoſpital. On the upper ſide of this terrace, and nearly encompaſſed by the groves and ſhrubberies, is built a beautiful orcheſtra. This garden, the moſt agreeable about Dublin, is much frequented in fine ſummer evenings by the genteeleſt company in the city; and is calculated for muſical entertainments ſimilar to Vauxhall gardens near London.

In the neighbourhood of St Stephen's-green, a new and ſpacious ſquare is erected; the houſes are lofty, uniform, and carried on with ſtone as high as the firſt floor, which gives the whole an air of magnificence equal to any thing of the kind in Great Britain, except at Bath. The parliament-houſe is a very elegant ſtructure, and was finiſhed in 1739, at the expence of 40,000l. The front of this ſuperb pile is of the Ionic order, and highly eſteemed for its elegance: the portico, in particular, is perhaps, without a parallel. Nor are the internal parts deſtitute of beauties; and the manner in which the building is lighted, has been much admired. One of the greateſt and moſt laudable undertakings this age can boaſt of, is the erecting a ſtone wall about the breadth of a moderate ſtreet in thickneſs, of a proportional height, and three miles in length, in order to form a pier for ſheltering veſſels in ſtormy weather.

The linen-hall is a fine building, erected at the public expence, and opened in the year 1728, for the reception of ſuch linen cloths as are brought to Dublin for ſale. It is entirely under the direction of the truſtees for the encouragement of the linen manufacture of Ireland. By this national inſtitution all frauds are prevented in this capital branch of trade, which finds employment for many thouſands of the induſtrious poor, and is the ſource of ſuch vaſt riches to the kingdom.

The barracks are pleaſantly ſituated on an eminence near the river. They conſiſt of four large courts, in which four battalions of foot, and one regiment of horſe, are generally quartered. They are thought to form the largeſt and moſt complete pile of building of that kind in Europe, being capable of containing 3000 foot, and 1000 horſe. The caſtle and city guards are daily relieved from hence.

The greateſt defect of this large and populous city is, the almoſt total want of good inns for the accommodation of ſtrangers and travellers. There are not above two or three that are barely tolerable. This may in ſome meaſure be accounted for by the long and ſometimes dangerous paſſage from Cheſter and Holyhead to Ireland, which prevents the gentry of England, with their families, from viſiting that iſland; but as it is now propoſed to make turnpike-roads to Port-Patrick in Scotland, from whence the paſſage is ſhort and ſafe, the roads of Ireland may by this means become more frequented, and good inns opened, eſpecially when the rural beauties of that kingdom, which are wonderfully adapted to delight the imagination of the curious traveller, are more generally known. Dublin is the ſee of an archbiſhop, who has a handſome cathedral, and a chapter conſiſting of a dean, chanter, chancellor, treaſurer, two archdeacons, and twenty-two prebendaries.

Among other eſtabliſhments for the good of this country, is the Dublin ſociety, which was incorporated in 1750; it has been of conſiderable benefit to the kingdom, by diſtributing premiums to a very conſiderable amount yearly, for encouraging and promoting huſbandry, and other uſeful arts and manufactures. Beſides the ſilk, woollen, and worſted manufactures carried on in that quarter of the ſuburbs, called the Earl of Meath's Liberty, and conſiderably

improved within theſe few years, other branches of uſeful manufacture are eſtabliſhing in different parts of the metropolis; and though the trade in Dublin has heretofore conſiſted chiefly in the importation of foreign commodities, yet now that the reſtriction of its woollen and moſt other goods are removed, it is hoped the daily enlargement of the export trade will cauſe a proportional increaſe of opulence. Dublin is remarkably well ſupplied with proviſions; with coals, chiefly from Scotland and Cumberland, and with water from the Liffey, by machines curiouſly conſtructed at Iſland-bridge on the north, and from a fine reſervoir on the ſouth. The Phœnix Park, at the weſt end of the town, was formerly part of the lands of the monaſtery of St John of Jeruſalem. It is an extenſive royal incloſure, ſeven miles in circuit, diverſified with wooland, champain, and riſing ground, and well ſtocked with deer; and, beſides the Hibernian ſchool, is adorned with the viceroy's beautiful villa, the ſeats of the principal ſecretary, and a few others. Two canals are begun on the oppoſite ſides of the river, with which they are immediately to communicate. The ſouthern navigation extends upwards of forty miles, to the river Barrow, which is navigable; and a branch of this canal is carrying on in a weſtern direction towards the Shannon. The northern canal has alſo for its object to communicate with that great river in the county of Longford, and, by a collateral cut, to unite with the Boyne navigation.

The chief magiſtrate, or mayor of Dublin, as in London, bears the title of Lord during his mayoralty. Every year the lord-mayor and twenty-four companies perambulate the city and its liberties. The rates of hackney coaches and chairs are fixed here, as in London, for the different diſtances, or ſet-downs, as they are called. But here are two ſorts of carriages peculiar to the place. The one is called a noddy, which is nothing more than an old caſt-off one-horſe chaiſe, or chair, with a kind of ſtool fixed on the ſhafts, juſt before the ſeat, on which the driver ſits, over the rump of the horſe, and drives you from one part of the town to another, at ſtated rates. Though this is neither a very ſafe nor eaſy vehicle, yet it is convenient for ſingle perſons, the fare being not much more than half that of a coach; and they will go to any part of the kingdom on reaſonable terms. The other is called a chaiſe-marine, and is little more than a common car with one horſe. They are uſed throughout the kingdom, for the conveyance of people on parties of pleaſure, by the genteel as well as the common, and for the carriage of goods and merchandize of every kind, hay, corn, ſtraw, dung, turf, &c. When uſed for parties of pleaſure, a mat is laid on the level part for the commonalty, and a bed for the genteeler ſort.

Beſides the lying-in-hoſpital already mentioned, here is another for lunatics, erected and endowed by the late celebrated Dr. Swift, a royal hoſpital for invalids, like that at Chelſea, beſides others for patients of every kind. Dublin has eighteen pariſh churches, eight chapels, three for French, and one for Dutch Proteſtants, ſeven Preſbyterian meeting-houſes, three for Methodiſts, two for Quakers, and eighteen Roman Catholic chapels. Some of the churches have been lately rebuilt, and others are now rebuilding in a more elegant manner. The ſpirit of elegance and improvement has extended itſelf over this whole kingdom, as well as over England and Scotland, ſo that the works of ornament as well as public utility in Ireland, almoſt keep pace with thoſe erecting, great as they are, over the different parts of Great Britain. The number of inhabitants in this city are now computed at about 400,000.

Cork ſtands 124 miles ſouth-weſt of Dublin, contains about 8,600 houſes, and upwards of 70,000 inhabitants, and, next to the capital, is the largeſt, moſt opulent and populous in the kingdom; it is encompaſſed by walls, and likewiſe by the channel of the river Lee, over which it has bridges on all ſides. This city is an epiſcopal ſee, and a place of great trade, ſituated fifteen miles up the river. The large veſſels generally ride at a place called Paſſage; but the ſmaller come up to the quay. Its haven is deep and well ſheltered from all winds. The city, together with its liberties, makes a county, and is governed by a mayor, aldermen, and ſheriffs. It has the moſt trade of any town in the kingdom, particularly in beef, pork, butter, and tallow, of which great quantities are exported to France, Holland, Flanders, and the American provinces; and many ſhips bound to the Weſt Indies, put in here to victual. It formerly had ſeveral abbeys, and has now many handſome public ſtructures, particularly a cathedral, cuſtom-houſe, and two gates, one on the north, and the other on the ſouth. Five miles below Cork, the channel of the river is divided into two by an iſland on which are ſeveral villages. Cork is nearly as large as Briſtol, but infinitely better ſituated as to its navigation. The churches here are the neateſt and moſt ſuperb of any in the kingdom. There is likewiſe a very large and magnificent theatre, in which dramatic performances are exhibited by a company from Dublin, during the ſummer vacation at the capital. Many of the ſtreets are narrow; but the houſes in general are well built.

Waterford is ſituated on the river Sure, and was originally built by certain pirates of Norway. Moſt of the houſes are built with timber, and make a very indifferent appearance; but the cathedral is eſteemed a very noble ſtructure. The city carries on a very conſiderable trade, particularly with England, and ſhips of burden come up cloſe to the quay, which is excellently adapted to the purpoſe of loading and unloading goods. Waterford-haven extends near eight miles and a half from north to ſouth, almoſt in a ſtraight line, the water all the way very deep and clear, and but little incumbered with rocks or ſand. The city and its liberties make a diſtinct county. There is a citadel on the weſt ſide, and on the eaſt a block-houſe and ſtore-houſe. The number of inhabitants is about 35,000.

Limerick is a handſome, populous, commercial, ſtrong place, ſituated on both ſides the Shannon. It is a county of itſelf, and of late years has increaſed prodigiouſly by the addition of handſome ſtreets and quays. The number of inhabitants are upwards of 40,000.

Kinſale is a neat, populous, and ſtrong town, ſtands at the mouth of the river Bann, or Bandon, and is only inferior to Cork in point of trade. Prodigious quantities of proviſions are ſhipped off from hence to Flanders, Holland, France, and the Weſt Indies. The port is barred, but ſhips of any burden may enter the harbour at high water. There is a light-houſe on a point of land called the Old Head of Kinſale, to direct ſhips in the night to the mouth of the river.

Belfaſt, a town in the county of Antrim, and chief ſeaport in the north of Ireland, on the river Lagon, which opens into a bay or arm of the ſea, called Belfaſt Lough, or Carrickfergus Bay. In the year 1791, it contained 3107 houſes, and 18,320 ſouls. It is, with regard to ſize, the fifth, and with reſpect to commerce the fourth, if not the third town in the kingdom. There are upwards of ſeven hundred looms in it, employed in cotton, cambric, ſail-cloth, and linen; theſe manufactures, with others of glaſs, ſugar, and earthen-ware, the exports of linen and proviſions, and a conſiderable trade with the Weſt Indies, have rapidly increaſed its importance.

Galway is ſeated near a noble bay, which, running above thirty miles up into the country from the weſtern ocean, has many harbours and roads on every ſide, and is ſheltered by ſeveral iſles at its mouth, between which are broad and deep channels called ſounds. It is a very neat, ſtrong, and flouriſhing

town, and very advantageouſly ſituated for trade with France, Spain, and the Weſt Indies. The buildings, both public and private, are moſt of them of ſtone, and very elegant. The town is walled, and was once the ſee of a biſhop, but is now within the archbiſhopric of Tuam. It carries on a conſiderable herring and ſalmon fiſhery, in the former of which it employs upwards of 600 boats, and is the only place upon the coaſt (Sligo excepted) that has any foreign trade. The harbour is about two miles from the town, to which it is navigable for veſſels of large burden.

The other towns, though leſs conſiderable, are thus deſcribed: Carrickfergus (or Knockfergus) by ſome deemed the capital of the province, has a good harbour and caſtle, but little commerce. Downpatrick has a flouriſhing linen manufacture. Derry (or Londonderry ſtands in Lough-Foyl, and is a ſtrong little city, having linen manufactures, with ſome commerce and ſhipping.

All this extreme part of Ireland is ſituated ſo near to Scotland, that they are in ſight of each others coaſts.

Donegall (otherwiſe called Tyrconnel) the county town of the ſame name, is a place of ſome trade; as is likewiſe Enniſkilling. The laſt mentioned places, and many more leſs conſiderable ones, are chiefly and moſt induſtriouſly employed in the manufacturing of linen and linen thread, to the great benefit of the whole kingdom.

The places already mentioned are the principal fortifications in the kingdom; but beſides theſe there are Culmore-Fort, Duncannon, Roſs-Caſtle, Charlemont, Maryborough, and Athlone.

The commerce and manufactures of Ireland nearly reſemble thoſe of England. The Iriſh chiefly export linen cloths, cambricks, lawns, hemp, flax, coarſe rugs, frizes, fine ſtuffs, ratteens, yarn, wool, beef, pork, raw and tanned hides, calf ſkins dried, butter, cheeſe, tallow, candles, ox and cow horns, horſe hair, ox hair, ſome lead, copper ore, dried fiſh, ſalmon, herrings, otter ſkins, goat ſkins, and rabbit ſkins.

By the late laws paſſed in favour of the trade of Ireland, it is probable that the exports will be greatly increaſed. The principal manufactures of Ireland, and indeed the chief branch of its commerce, conſiſts of linen cloths, lawns, and cambricks, to which great encouragement is given by the Britiſh legiſlature. The manufacture of ſtuffs in Ireland is exceedingly beautiful, but the importation of them into England is prohibited.

Reſpecting the conſtitution and government of Ireland, it is neceſſary to obſerve, that as Scotland and England are now one and the ſame kingdom, and yet differ in their municipal laws: ſo England and Ireland are diſtinct kingdoms, and yet in general agree in their laws.

After the conqueſt of Ireland by king Henry II. the laws of England were received and ſworn to by the Iriſh nation, aſſembled at the council of Liſſmore; and as Ireland, thus conquered, planted, and governed, continued dependent on England, it was thought neceſſary that it ſhould conform to, and be governed by, ſuch laws as the ſuperior ſtate thought proper to preſcribe. But this ſtate of dependence being almoſt forgotten, and ready to be diſputed by the Iriſh nation, it was thought proper, ſome years ago, to declare how that matter ſtood: and therefore, by ſtatute 6 Geo. I. it is declared, "that the kingdom of Ireland ought to be ſubordinate to, and dependent upon the imperial crown of Great-Britain, as being inſeparably united thereto; and that the king's majeſty, with the conſent of the lords and commons of Great-Britain, hath power to make laws to bind the people of Ireland."

This determination of the Britiſh parliament was, however, far from being cordially received by the Iriſh nation in general, many of whom diſputed, more than ever, the dependency of Ireland upon the parliament of Great-Britain. After many ſtruggles, perceiving their own ſtrength by means of their volunteer aſſociations, and encouraged and favoured by the ſeveral parties contending for the adminiſtration in England, the Iriſh, in the year 1782, obtained a formal repeal of the above ſtatute; which was conſidered as a renunciation, on the part of Great-Britain, of every claim of legiſlation over Ireland.

The conſtitution of the Iriſh government, as it ſtands at preſent, with regard to diſtributive juſtice, is nearly the ſame with that of England. The chief governor is at preſent generally ſtyled the lord-lieutenant. The appointment of this great officer is entirely in the king's power. His juriſdictions and authority are ample, and, in ſome degree, even royal; but, at the ſame time, they are modified by the terms of his commiſſion; being in ſome reſtrained, and in others enlarged, according to the monarch's pleaſure, or the exigencies of the times. The lord-lieutenant is uſually appointed for three years, but is often continued much longer. On his entering upon this great office, his letters patent are publicly read in the council-chamber; and, having taken the uſual oath before the lord-chancellor, the ſword, which is to be carried before him, is delivered into his hands, and he is ſeated in the chair of ſtate, attended by the lord-chancellor, the members of the privy-council, the peers and nobles, the king at arms, a ſerjeant at arms, and other officers of ſtate. He has a council compoſed of the great officers of the crown, viz. the chancellor, treaſurer, and ſuch of the archbiſhops, earls, biſhops, barons, judges, and gentlemen, as his majeſty is pleaſed to appoint.

The parliament in Ireland, like that of England, is the ſupreme court, convened by the king's writ, and prorogued or diſſolved at his pleaſure. Till very lately they were continued for the king's life; but, ſince the acceſſion of his preſent majeſty, Iriſh parliaments have been rendered octennial. It conſiſts, as in England, of a houſe of lords and commons, among the former of which are many Engliſh peers, and commons of Great-Britain; ſome few are Papiſts, who, being properly qualified, are allowed to ſit in this aſſembly; the number of commoners amount to about 300. The laws made by the parliament of Ireland are ſent to England for the royal approbation, when, if approved of by the king and council, they paſs the great ſeal of England, and are returned. Thus this parliament has power to make laws which are binding to the kingdom, raiſe taxes for the ſupport of government, and for the maintenance of an army of 16,000 men, who are placed in convenient barracks in different parts of the kingdom. The repreſentation of the people in the ſenate of Ireland, is ſimilar to that of England.

For the regular diſtribution of juſtice, there are in Ireland four terms held annually for the deciſion of cauſes; and four courts of juſtice, the chancery, king's bench, common-pleas, and exchequer. The high ſheriffs of the ſeveral counties were formerly choſen by the people, but are now nominated by the lord-lieutenant. From this general view, it appears that the civil and eccleſiaſtical inſtitutions are almoſt the ſame in Ireland as in England.

The revenues of Ireland are computed to exceed half a million ſterling, near 70,000l. of which is granted in penſions. The revenues are of two ſorts, public and private. The public revenues of that kingdom ariſe from hereditary and temporary duties, of which the king is the truſtee, for applying it to particular uſes: but the private revenue is the unlimited property of the crown, and ariſes from the ancient demeſne lands; from forfeitures for treaſon and felony; priſage of wines; light-houſe duties; and a ſmall part of the caſual revenue, not granted by parliament. Beſides theſe, large ſums are annually raiſed by the legiſlature for the noble purpoſes of

improving their country. To their patriotic ſpirit the prodigious works carried on in that kingdom owe their origin. They have already conſtructed ſeveral noble canals for the benefit of inland navigation; built bridges, churches, and other public ſtructures; made roads; given premiums for improvements in huſbandry, and other uſeful arts; and largely aſſiſted the uſeful deſign of Proteſtant working-ſchools. At the ſame time it muſt be obſerved, that the money neceſſary for theſe, and many other noble purpoſes, is raiſed in ſo eaſy a method, that the people are hardly ſenſible of the impoſt; no taxes are laid on their land, and few on any of the branches of their trade; the foreign commerce is not clogged with innumerable duties, nor the neceſſaries of life burdened with heavy taxes. In conſequence of this, labour is cheap, and their manufactures are ſent to market at a moderate price. They are in no fear of being underſold by foreigners, nor of not being able to ſupply the orders of their correſpondents. In a country like this, manufactures muſt flouriſh; and it will give pleaſure to every ingenuous mind to know, that the linens of Ireland are not excelled by any manufactured in Europe.

The coins of Ireland, are the ſame as thoſe uſed in England, with this difference only, that one of our ſhillings paſſes there for thirteen-pence, other pieces in the ſame proportion.

The land-forces maintained in Ireland of late, has been very conſiderable, which has been gradually increaſed by the many volunteer aſſociated companies which have been lately formed in that kingdom. The moſt uncultivated parts contain numbers of inhabitants that have very little knowledge either of divine or human laws, conſequently regular forces are abſolutely neceſſary for keeping them in order; though it muſt be confeſſed that many of the common people of Ireland have laboured under great oppreſſions.

HISTORY OF IRELAND.

The hiſtory of this kingdom, has been carried to a very remote antiquity, and may very juſtly be diſtinguiſhed into the legendary and authentic. Some of their writers have preſented us with a ſucceſſion of wiſe and learned kings, commencing a few years after the deluge: others have given an uninterrupted ſucceſſion of 197 kings of Ireland, to the year 1170; and even the more moderate Iriſh antiquaries carry their hiſtory up to about 500 years before the Chriſtian æra. But, as our limits will not petmit us to enlarge on the dark and conteſted parts of their hiſtory, we ſhall only obſerve, that it was about the middle of the fifth century that St. Patrick introduced the knowledge of letters, and planted Chriſtianity in Ireland. The ſoil was very friendly to religion, and afforded the monks at once a ſafe retreat, and ſufficient leiſure to purſue their ſtudies. The invaſion of the Danes and Norwegians, about the ſeventh century, deſtroyed the peace of this aſylum; and it is highly probable, that the greateſt part of the Iriſh coaſts were afterwards peopled by the Normans and Danes, commonly called Eaſterlings, who built the cities of Dublin, Limerick, Waterford, Wexford, and Cork, and reduced as much of the adjacent country as was convenient for their purpoſe. But, as the reſt of the kingdom offered nothing worth their contending for, the native Iriſh living moſtly in caverns, and a few wretched houſes made of hurdles, and covered with ſtraw and ruſhes, the Eaſterlings ſeemed ſatisfied with the ſea-coaſt, without attempting to extend their conqueſt to the inland parts of the country. Their numbers were indeed too inconſiderable to people the iſland, their manners too barbarous to civilize it, and their neceſſities too preſſing to be gratified with ſo unavailing an acquiſition.

It is, however, probable that theſe foreigners formed alliances with the natives, and reſembled them in their manners. The fertility of the ſoil, the temperature of the air, the convenience of its harbours, which to other nations are the ſource of riches, were to the Iriſh matters of reproach. The faireſt bleſſings of nature lav unimproved by ignorance, nouriſhed by pride. Their healthful vigour was impaired by inactivity, and they ſeem to have been equally void of the virtues as well as the vices of mankind.

There were five kings in Ireland, in the time of Henry II. of England. This prince, provoked at their piracies, and the aſſiſtance they gave his enemies, determined to ſubdue them. Accordingly, he applied to Adrian IV. who then filled St. Peter's chair, and obtained an ample bull for the conqueſt of Ireland. Soon after the pope's conſent was obtained, a fair pretence offered for carrying this deſign into execution. Dermot Mac Murrough, king of Leinſter, one of the moſt oppreſſive tyrants Ireland ever knew, invaded the territories of all his neighbours, and carried off the wife of O'Ruork, king of Meath. Fired with this indignity, the injured prince formed an alliance with Roderic, king of Connaught, and Dermot was driven out of Ireland. Thus diſtreſſed, he paſſed over to England, in order to implore the protection of Henry II. This event happened in the year 1167, while the Engliſh monarch was in Normandy, and prevented from aſſiſting Dermot in perſon. He, however recommended the cauſe of the Iriſh prince to ſeveral of his barons, particularly to Strongbow earl of Pembroke, Robert Fitz-Stephen, and Morris Fitz-Gerald. Strongbow was a nobleman of unbounded ambition and large poſſeſſions in Wales, where his tenants were numerous, and the ſituation of his eſtate very convenient for paſſing over to Ireland. Strongbow therefore readily undertook to aſſiſt Dermot in the recovery of his country, on condition that the latter ſhould give him his daughter in marriage, and leave him heir to his dominions. It was alſo agreed that Dermot ſhould cede for ever to Fitz-Stephens and Fitz-Gerald the town of Wexford, with the two hundreds adjoining. The treaty being finiſhed, the adventurers landed in Ireland, at the head of a ſmall body of forces, and ſoon reduced the city of Wexford; and the city of Dublin afterwards ſurrendered upon capitulation, by which it was agreed that the city ſhould continue in the poſſeſſion of Haſculf, the Daniſh prince.

Theſe ſucceſſes, which ought to have united, ſerved to divide the Iriſh. Diſſenſions, inſpired by revenge, envy, and avarice, prevailed among the chiefs, and Ireland fell a prey to the Engliſh; after a much leſs glorious ſtruggle indeed, but by the ſame vices and miſtakes which had before reduced Britain to a Roman province. Strongbow took the city of Waterford, drove the Daniſh prince from Dublin, and completed his marriage with Eve, the daughter of Dermot.

Henry, alarmed at theſe unexpected conqueſts in Ireland, and the death of Dermot, which happened ſoon after, reſolved to viſit that iſland in perſon. Accordingly he embarked his forces at Pembroke in Wales, on board 400 tranſports, in the autumn of the year 1171, and the next day landed in Ireland, about five miles from Waterford. All the Iriſh princes, except the king of Ulſter, immediately repaired to Henry, and ſubmitted to his government. Thus the king of England became maſter of Ireland, without ſhedding a drop of human blood, and in much leſs time than was ſufficient to travel over it. Henry kept a magnificent court, and held a parliament at Dublin, where he parcelled out the eſtates of Ireland among his followers, ſettled a civil adminiſtration

nearly

nearly reſembling that of England, planted a colony from Briſtol in that capital, and returned to England.

A few years after, Henry gave the title of lord of Ireland to his ſon John, who perſonally viſited that iſland in 1185, attended by a company of Norman knights. But John and his giddy courtiers made a very ill uſe of their powers, and, by their imprudent behaviour, incurred the hatred of the people. Richard I. was too much taken up with the cruſades to pay any great regard to the affairs of Ireland. King John, however, after his acceſſion to the crown, endeavoured to make amends for his former behaviour to the Iriſh. He enlarged his father's plan, and laboured to eſtabliſh a ſcheme of policy in that kingdom, upon the ſame footing as in England. For this purpoſe, he ordered ſterling money to be ſtruck at Dublin, according to the Engliſh ſtandard: he iſſued a proclamation to render that money current in both kingdoms: he divided the iſland into counties; appointed ſheriffs; ordered a fair copy of the Engliſh laws to be engroſſed, and depoſited in the exchequer at Dublin: he commanded the obſervance of the Engliſh laws and cuſtoms; erected courts of law on the ſame plan, and confined their proceedings to the ſame rules as thoſe in England. But, notwithſtanding theſe noble attempts to civilize the Iriſh, they were far from being ſufficient to anſwer the intended purpoſe: the original inhabitants in many parts of the iſland were ſtill governed by their own laws, and refuſed to conform to the cuſtoms of the Engliſh, or profit by their improvements. Their prejudices were greatly increaſed during the unſettled reign of Henry III. which gave them a very mean opinion of the Engliſh government; but during the life of his ſon Edward I. we have no account of their diſturbing the peace of their country.

During the reign of Robert Bruce in Scotland, the Iriſh ſeemed willing to transfer their allegiance from the Engliſh to the Scottiſh crown, and Bruce ſent his brother Edward, at the head of a conſiderable army, to aſſiſt them againſt the Engliſh. Edward defeated the enemy in ſeveral engagements, was actually crowned king at Dundalk, but miſcarried in his attempt upon Dublin, and was afterwards defeated and ſlain in battle by Birmingham, the Engliſh governor. After this deciſive action, the Iriſh ſubmitted, and Edward II. in order to gain their confidence, governed them with great moderation, and paſſed ſeveral excellent acts for the benefit of their country.

Several of the ſucceeding kings of England purſued the ſame conduct with ſucceſs; and many attempts were made to reduce the inhabitants to an entire conformity with the laws of England, but without ſucceſs. Henry VIII. perſuaded that the title of king would have a more powerful effect on the Iriſh than that of lord, paſſed an act of parliament, by virtue of which Ireland was erected into a kingdom. He was not deceived: the Iriſh, who had ſo long refuſed to acknowledge the authority to a lord, very readily paid a perfect ſubmiſſion to a king. Even O'Neil, who pretended to be the ſucceſſor to the laſt paramount king of Ireland, ſwore allegiance to Henry, who created him earl of Tyrone.

The dominion of the Engliſh over Ireland was however ſtill little more than nominal. The Iriſh princes and nobles, divided among themſelves, readily paid the exterior marks of obedience to a power they were not able to reſiſt; but, as no durable force was ever kept on foot to retain them to their duty, they often relapſed into their former ſtate of independence.

During the reign of queen Mary, the Iriſh ſeem to have been very quiet; but they proved thorns in the ſide of queen Elizabeth. The perpetual diſputes ſhe had with the Roman Catholics, both at home and abroad, gave her great uneaſineſs; and the pope and the houſe of Auſtria always found new reſources againſt her in Ireland. The Spaniards poſſeſſed themſelves of Kinſale; and the rebellions of Tyrone, who baffled and defeated her favourite general, the earl of Eſſex, are well known. But what Eſſex did not, perhaps could not perform, was attempted with ſucceſs by lord Mountjoy, the firſt Engliſhman who gave a mortal blow to the practices of the Spaniards in Ireland, by whoſe ſuggeſtions and aſſiſtance the flames of rebellion were kept up in that kingdom. Mountjoy totally defeated the combined forces of the Spaniards and Iriſh before Kinſale, and took Tyrone priſoner. But this happening at a time when Elizabeth was under dreadful apprehenſions from the Popiſh intereſt in Ireland, Tyrone was pardoned, in 1602, though ſhe had always intended to bring him to condign puniſhment.

The iſland was now entirely reduced to obedience; but a more difficult taſk ſtill remained, to civilize the inhabitants, to reconcile them to laws and induſtry, and to render their ſubjection durable and uſeful to the crown of England. James I. applied himſelf aſſiduouſly to this troubleſome, but neceſſary buſineſs. He formed a ſteady, regular, well-concerted plan; and in the ſpace of nine years made greater advances towards the reformation of that kingdom than had been done during the interval ſince the conqueſt was attempted. But ſuch was the influence of the pope and the Spaniards, that the earls of Tyrone and Tyrconnel, and their party, planned a new rebellion, and attempted to ſeize the caſtle of Dublin; but their plot being diſcovered, their chiefs fled beyond the ſeas. They were not idle abroad; for in 1608 they inſtigated Sir Calim O'Dagharty to a freſh rebellion, by promiſing him ſpeedy ſupplies of men and money from Spain. Sir Calim was ſlain in the diſpute, and his adherents were taken and executed. The attainders of the Iriſh rebels, which paſſed in the reigns of Elizabeth and James, veſted in the crown 511,465 acres in the counties of Donnegal, Tyrone, Coleraine, Fermanagh, Cavan, and Armagh; and enabled the king to make that Proteſtant plantation in the north of Ireland, which now, from the moſt rebellious province in the kingdom, is the moſt quiet and reformed. But thoſe prodigious attainders, though apparently juſt and neceſſary, operated fatally for the Engliſh in the reign of Charles I. The Iriſh Roman Catholics in general were influenced by their prieſts, to hope not only to repoſſeſs the lands of their forefathers, but to reſtore the Popiſh religion in Ireland. They therefore entered into a deep and moſt deteſtable conſpiracy for maſſacreing all the Engliſh Proteſtants in that kingdom. This infernal ſcheme was originally formed in the year 1641 by Roger More, a gentleman of narrow fortune, but deſcended from an ancient Iriſh family, and much celebrated among his countrymen for valour and capacity. Authors are not agreed with regard to the numbers who fell a ſacrifice to wanton barbarity, and frantic zeal.

However, the Iriſh did not long eſcape unpuniſhed; Cromwell retaliated the cruelties they had exerciſed on the innocent and peaceable Engliſh, on themſelves, broke their force and courage; and Ireton, his ſucceſſor, totally ſubdued the iſland. Five millions of acres, forfeited either by the Popiſh rebellion, or by their adherents to Charles I. were divided partly among the adventurers, who had advanced money to the parliament, and partly among the Engliſh ſoldiers, who had arrears due to them. Examples of a more ſudden and violent change of property are ſcarce to be found in hiſtory. The Iriſh having lately ſmarted ſo ſeverely, were quiet during the reign of Charles II. but ſoon after the acceſſion of James II. to the crown of England, the moſt violent and precipitate methods were taken to reſtore the Popiſh religion in Ireland. Tyrconnel was veſted with full authority, and carried over with him as chancellor, one Fitton, a perſon lately convicted of forgery and other crimes, but who compenſated for all his enormities by a headſtrong zeal for the

the Romiſh religion. The Catholics were alſo put in poſſeſſion of the council-table, of the courts of judicature, and of the bench of juſtices. The Proteſtant members were expelled from the parliament, and their places ſupplied by Catholics; it is therefore no wonder that this bigoted prince found ſhelter in Ireland, after he had abdicated the throne of England, and was even induced to hope that, by the aſſiſtance of his Popiſh ſubjects, he ſhould be able to recover the throne of his anceſtors. But the battle of the Boyne, where his whole army was totally defeated by king William, deſtroyed all theſe flattering ideas, and he was obliged to have recourſe to a foreign prince for protection.

Moſt of the large eſtates in Ireland were forfeited in conſequence of this defeat; and had the government diſpoſed of all the lands which fell into their hands, the greater part of Ireland muſt have been peopled with Britiſh ſubjects; but it was thought more prudent to endeavour to conciliate the minds of the Iriſh, than drive them to deſpair. It was alſo thought proper to preſerve a proper balance of intereſt between the Catholics and Proteſtants in that kingdom; and accordingly, after the friends to the Revolution and the Proteſtant religion were ſufficiently gratified out of the forfeited eſtates, the inſurgents, on a proper ſubmiſſion, were pardoned, and ſuffered to enjoy their fortunes, and the protection of the Britiſh government.

Theſe prudent and lenient meaſures have been attended with the deſired ſucceſs. Ireland is now a very reſpectable kingdom. Manufactures, eſpecially thoſe of linen, are carried on with ſpirit and advantage. Improvements are daily made in agriculture, and other uſeful arts. The inhabitants know their own intereſt and importance. The Catholics are greatly leſſened with regard to numbers; and the rays of learning have, in a great meaſure, diſperſed the clouds of ignorance, and diſſipated the fury of blind enthuſiaſtic zeal. Some acts of parliament have been made in their favour; ſalted beef, butter, pork, tallow, and other neceſſaries of life, are occaſionally permitted to be exported from Ireland into any of the ports of Great Britain. But notwithſtanding ſome laws and regulations had taken place in favour of Ireland, the inhabitants of that country were ſtill found to labour under conſiderable grievances, in conſequence of ſundry moſt unjuſt and unjudicious reſtraints of the parliament of England reſpecting their trade. In October 1779, both houſes of the Iriſh parliament preſented addreſſes to his majeſty, in which they declared that nothing but granting Ireland a free trade could ſave it from ruin.

The members of the oppoſition, in the Engliſh parliament very ſtrongly repreſented the neceſſity of an immediate attention to the complaints of the people of Ireland, and of a compliance with their wiſhes. The arguments on this ſide the queſtion were alſo enforced by the accounts which came from Ireland, that the volunteer aſſociations in that kingdom amounted to 40,000 men, unpaid, ſelf-appointed, and independent of government, well armed and accoutred, daily improving in diſcipline, and their number afterwards increaſed to 80,000. The Britiſh miniſtry appeared to be for ſome time undetermined what part they ſhould act in this important buſineſs: but the remembrance of the fatal effects of rigorous meaſures reſpecting America, and the very critical ſituation of Great Britain, at length induced the Britiſh miniſtry to bring in ſuch bills as were calculated to afford commercial relief to the people of Ireland. Laws were accordingly paſſed, by which all thoſe acts were repealed which had prohibited the exportation of woollen manufactures from Ireland, and other acts by which the trade of that kingdom to foreign countries had been reſtrained: and it was likewiſe enacted, that a trade between Ireland and the Britiſh colonies in America and the Weſt Indies, and the Britiſh ſettlements on the coaſts of Africa, ſhould be allowed to be carried on in the ſame manner, and ſubject to ſimilar regulations and reſtrictions, with that carried on between Great Britain and the ſaid colonies and ſettlements. Theſe laws in favour of Ireland were received with much joy and exultation in that kingdom.

The commercial advantages afforded the Iriſh by the acts above mentioned, have greatly contributed to promote the proſperity of their country; and, by the act repealing the ſtatute of 6 Geo. I. they are fully and completely emancipated from the juriſdiction of the parliament of Great Britain: the appellant juriſdiction of the Britiſh houſe of peers in Iriſh cauſes was likewiſe given up. In the year 1783, the government, the nobility, and the people of Ireland, vied with each other in countenancing and giving an aſylum to many families of the Genoeſe, who were baniſhed from their own country, and to others who voluntarily exiled themſelves for the cauſe of liberty, not willing to ſubmit to an ariſtocracy of their own citizens, ſupported by the ſwords of France and Sardinia. A large tract of land in the county of Waterford was allotted for their reception, a town was marked out, entitled New Geneva, and a ſum of money granted for erecting the neceſſary buildings. Theſe preparations for their accommodation were, however, rendered ultimately uſeleſs, by ſome miſunderſtanding (not fully comprehended) which aroſe between the parties; and the ſcheme accordingly fell to the ground.

The parliament of Ireland has extended liberal indulgences to the Roman Catholics of that kingdom, by eſtabliſhing the legality of intermarriage between them and the Proteſtants, by admitting them to the profeſſion of the law, and the benefit of education, and by removing all obſtructions upon their induſtry in trade and manufactures. A reciprocal preference in the corn trade with Britain has been eſtabliſhed. Further progreſs has been made in checking the immoderate uſe of ſpirituous liquors; and ſome wiſe inſtitutions have been ordained for the regulation of charitable foundations.

In the year 1793, in conſequence of the conceſſions of government, a bill paſſed the legiſlature, by which the Roman Catholics, being freeholders, are entitled to vote for members to ſerve in parliament.

A ſecret committee of the houſe of lords was formed, to inquire into the riſe and progreſs of that ſeditious ſpirit which appeared in different parts of that kingdom. After ſome time ſpent in the inquiry, the ſecret committee made a report of their diſcoveries, in which they declared that ſeditious clubs and meetings had been held in various parts of the kingdom, and that ſeveral of theſe advocates for liberty had aſſumed the national cockade, appeared in arms, and committed various inſults upon the eſtabliſhed modes of government. The lord-lieutenant and council, therefore, iſſued a proclamation grounded on the above report, directing the magiſtrates and peace officers of the town of Belfaſt and the diſtricts adjacent to diſperſe all ſeditious and unlawful armed aſſemblies, and, if reſiſted, to apprehend the offenders.

The embodying of the militia in this kingdom, in the ſame year, created riots and diſturbances in different places. At Caſtle-reah, in particular, on the 28th of June 1793, ſeveral perſons were killed, and the mob withſtood a party of the military for ſeveral hours. Subſequent to that time, there have been various meetings of rioters and armed men, in the other parts of the kingdom; and, in attempting to quell them by the aſſiſtance of the military, many have been killed on both ſides.

The government of Ireland, apprehenſive of the conſequences, that might attend popular meetings, have paſſed into a law an act "to prevent illegal aſſemblies of the people.

Notwithſtanding the Catholics of Ireland had been reſtored,

reſtored, in ſome meaſure, to their civil rights, by the conceſſion of the elective franchiſe, it does not appear that either their own leaders or their parliamentary adherents were ſatisfied with what had been granted, or were likely to be contented with leſs than a total repeal of all remaining diſqualifications; and when in the beginning of the year 1795, earl Fitzwilliam was appointed lord-lieutenant of Ireland, after the acceſſion of the Portland party to adminiſtration, they conſidered the point in diſpute as abſolutely conceded by the miniſtry. A committee was therefore appointed to bring forward a petition to parliament for a repeal of all remaining diſqualifications. Notice of this his lordſhip tranſmitted to the miniſter, ſtating at the ſame time his own opinion of the abſolute neceſſity of conceſſion, as a meaſure not only wiſe but eſſential to the public tranquility. To this no anſwer was received, and on the 12th of February Mr. Grattan moved for leave to bring in a bill for the further relief of his majeſty's ſubjects profeſſing the Roman Catholic religion; and after a feeble oppoſition, leave was given. By the intrigues, however, of another political party, at the head of which was Mr. Beresford, a gentleman who had united in his own perſon, or in that of his ſon, the important and diſcordant offices of miniſter—commiſſioner of the treaſury—of revenue—counſel to the commiſſioners—ſtore-keeper and banker—the meaſure was defeated, and lord Fitzwilliam ſuddenly recalled. His lordſhip left Dublin for England on the 25th of March, which day was obſerved in that city as a day of general mourning: the ſhops were ſhut; no buſineſs was tranſacted; and the citizens appeared in deep mourning. In College-green a number of reſpectable gentlemen, dreſſed in black, took the horſes from his excellency's carriage, and drew it to the water-ſide. His lordſhip wiſhed, as uſual on ſuch occaſions, to diſtribute money; but, with the nobleſt enthuſiaſm, the offer was rejected, even by a mob. The military had been ordered out, in expectation of ſome diſturbance; but nothing appeared among the populace but the ſerious emotions of ſorrow, and the utmoſt order and decorum.

Earl Camden, who was appointed to ſucceed his lordſhip, arrived in Dublin on the 31ſt of March, to aſſume the government. Some diſturbances took place on the evening of his arrival, but they were ſoon quelled by the interpoſition of the military. A ſyſtem of coercive meaſures has ſince been principally relied on; but theſe meaſures have only tended to render neceſſary the adoption of others ſtill more rigorous. The ſituation of the country, and the progreſs made by the principles of thoſe who ſtyle themſelves *United Iriſhmen*, have inſpired government with the greateſt alarm.

Their numbers increaſed to ſuch an alarming degree, that the whole kingdom was put under martial law. Several actions took place, in which the king's troops were, for the moſt part, ſucceſsful, which rather increaſed the number of the diſaffected, and was the occaſion of the moſt ſhocking outrages; inſomuch, that in the month of May, the Queen's County, as well as the County of Tipperary, was almoſt totally deſerted; and their emigration had come to ſuch a height, that in the latter county, a proclamation was iſſued, charging perſons with cowardice for leaving their houſes, and deſiring ſuch emigrants to return within eight and forty hours.

The king's troops, aided by the yeomen of Ireland, having in a great degree repreſſed the audacity of the rebels, their leaders perceived that their cauſe was loſing ground, and that they muſt either hazard an inſurrection or give up their hopes. The arreſt of the Leinſter provincial committee, and ſeveral other leading members of the union, on the ſame day, tended ſo much to diſcloſe the guilt of the party, and to weaken their organization, that the conſpirators reſolved, without delay, to make one deſperate effort. The outline of the plan was to ſurprize Dublin, the camp at Lehaunſtown, and the artillery ſtation at Chapelizod, on the ſame night. The inſurrection being commenced near the metropolis, (the ſignal for announcing which, was to be the detention of the mail coaches) it was expected that the north and ſouth would alſo riſe. The lord-lieutenant was to be ſeized, and all the privy council, ſeparately in their own houſes; and the night of the 23d of May was the time appointed for the execution of this horrid deſign.

The government, perfectly informed of the purpoſe of the conſpirators, cauſed, on the 19th and 21ſt of May, ſeveral of the leaders to be apprehended; and, on the 22d, the lord-lieutenant ſent a meſſage to both houſes of parliament, advertiſing them of the intended inſurrection. Notwithſtanding many military precautions, it took place in the neighbourhood of Dublin, on the night appointed, and every poſſible effort was made by the diſaffected within the town, to co-operate with thoſe without; the party in the provinces uſing, at the ſame time, every exertion, to bring the people there into action.

The meaſures taken in the metropolis prevented any movement whatever; but acts of open rebellion were committed in the counties of Dublin, Meath, and Kildare. About half paſt two, on the morning of the 24th, a regular attack was made by a rebel force upon the town of Naas, where lord Gosford commanded, with part of the Armagh militia, and detachments of the 4th dragoon guards, and Ancient Britons. The rebels conſiſted of about 1000 men, armed with muſquets and pikes, and they made their attack with great regularity, but were repulſed by the Armagh militia, with the loſs of near 200 men: they made another unſucceſsful attack the next day, and had again about the ſame number ſlain. There was alſo an attack made on a party of the 9th dragoons, which ſuffered much, but in the courſe of the day, general Dundas was enabled to come up with a conſiderable body of the rebels, near the hills of Kilcullen, where they were entirely routed, with very conſiderable loſs. There were, likewiſe, ſeveral bodies collected in the courſe of the night, in different parts near Dublin, which were attacked by the Rathfarnham cavalry, and by a detachment of the 5th dragoons, and diſperſed with ſome loſs; and ſome priſoners and horſes were taken. A rebel party, however, aſſembled at the border of the county of Dublin, near Dunboyne, overpowered ſome conſtables, and afterwards took the baggage of two companies, guarded by a ſmall party of fencibles; and, having committed many outrages, ſeveral of them were killed, but as the body remained undiſperſed, the lord-lieutenant, with the advice of the privy council, iſſued a proclamation, directing, that all perſons, acting, aiding, or in any manner aſſiſting in the rebellion, ſhould be puniſhed according to martial law.

Notwithſtanding all the meaſures adopted by government, the inſurgents appeared in the neighbourhood of Baltinglaſs, to the amount of 4 or 500; a party of the Antrim militia and of the 9th dragoons were ſent to attack them; and, at the ſame inſtant that theſe troops were advancing upon them, in the town of Stratford on Slaney, captain Stratford appeared at the other end of the town, with part of his corps, ſo that the rebels being attacked on both ſides, were compleatly routed, having between 100 and 200 killed, beſides many wounded, who made their eſcape. Near Hacketſtown 300 were left dead on the field, and about 400 to the north of Dublin, on the hill of Taragh, among whom was the commanding officer, in his uniform.

In the beginning of June the inſurrection broke out in great force in the county of Wexford, and the rebels aſſembled in ſuch numbers, that they cut off a party of 100 men of the North Cork militia, who

were ſent to meet them. Their number was ſtated to be at leaſt 4000, and many of them mounted. Colonel Campbell, at Athy, had partial engagements with the rebels; and many of them were defeated at Monaſtereven and Carlow, with very conſiderable loſs. Near Kildare 300, and near Newton-Ards 500 were ſlain, who had deſcended frem Vinegar Hill; and theſe ſucceſſes were followed by a victory obtained over them by Sir James Duff, who with infinite alacrity had opened the communication with Limerick, (that with Cork being already open) and arriving at Kildare, while the rebels had poſſeſſion of it, completely routed them, and took poſſeſſion of the place.

A proclamation was ſent forth at the ſame time by the principal Roman Catholic inhabitants, exhorting the deluded people to return to their duty and allegiance; and declaring their determination to ſtand or fall with the preſent exiſting conſtitution; in conſequence of which, the rebels on the Curragh of Kildare laid down their arms, and delivered up a number of their leaders.

Early on the 8th of June, major general Lake was attacked by the rebels in his poſition at New Roſs, and with great impetuoſity; but after a conteſt of ſeveral hours, they were completely repulſed, with a prodigious loſs. Lord Mountjoy fell in the beginning of the conteſt.

The inſurrection about this time broke out in the county of Antrim, having for its object the ſeizure of the magiſtrates, who were to aſſemble on a certain day, in the town of Antrim, of which they had taken poſſeſſion. But they were fruſtrated in their deſign; ſome of the magiſtrates having retired from the place, and others being officers of yeomanry, on permanent duty, did not attend the meeting. Major general Nugent, commander in chief in that quarter, ordered a body of troops to march with the utmoſt diſpatch through Liſburn to Antrim, which having been re-inforced by a party of the Monaghan militia, and the 22d dragoons, together with the Belfaſt yeomanry cavalry, made an attack upon the town; but being fired upon from the windows of the houſes, were obliged to retreat, with the loſs of three officers, and many privates killed and wounded, as well as two field pieces taken by the rebels. Colonel Clavering, on his arrival near Antrim, finding the rebels pouring into the town in great force, very judiciouſly took poſt on a hill, on the Liſburn ſide, and repreſented his ſituation to major general Goldie. In the mean time colonel Durham, with his whole detachment, proceeded within half a mile of Antrim; and after a cannonade of near an hour, drove the inſurgents completely out of the town, and retook the two field pieces, of which they had lately obtained poſſeſſion. The king's troops, in theſe rencounters, ſuſtained conſiderable loſs in killed and wounded, among whom were ſome officers of diſtinction; and particularly lord viſcount O'Neil, governor of the county, who died of a wound with a pike, from his own park-keeper.

A few days after their expulſion from Antrim, the inſurgents quarrelled amongſt themſelves, and out of 2000 who were in arms, the commander was able to retain with him only fifty; the reſt, partly through the perſuaſion of a priſoner, having left the camp, deſtroyed their arms, and declared that they never would again carry an offenſive weapon againſt his majeſty or his loyal ſubjects.

About the time when the laſt engagement happened in the north, general Needham was oppoſed to a great body of rebels, near Arklow. On the 10th of June they made their approach in two large columns, while the whole intermediate ſpace, embracing his entire front, was crowded by a rabble, armed with pikes and muſquets, and bearing down without any regular order. The general's poſition was very ſtrong: as ſoon as they were come within a ſhort diſtance, he opened a heavy fire of grape ſhot, which continued for two hours and a half, when the enemy fled in all directions.

Soon after, about forty rebels were killed at Ballinahinch, in lord Moira's wood, as they were beginning to aſſemble; and on the 12th of June, about 400 fell, in an action, in the ſame place. Their force, on the preceding day was ſuppoſed to be about 5000, but as many were preſſed into the ſervice, and were entirely unarmed, it was inferred, with great probability, that the number engaged was much leſs conſiderable.

On the 20th of June, marquis Cornwallis arrived in Dublin, in the capacity both of commander in chief, and lord-lieutenant of Ireland. The public virtues of this diſtinguiſhed nobleman; his military talents, and alſo the peculiar moderation and mildneſs of his character, are too well known to need any comment.

The following day, the great rebel camp at Vinegar Hill, near Wexford, was attacked by the king's troops, under colonel Moore, and vanquiſhed, after an action of an hour and a half. The rebels fled with precipitation, and left ſeveral pieces of cannon behind them. Colonel Moore, immediately after this victory, puſhed on to Wexford, which had been in poſſeſſion of the rebels, and entered it ſo opportunely, as to prevent its being laid in aſhes, and hinder the maſſacre of the remaining priſoners, by the rebels, who, on the preceding day, had murdered above ſeventy of them in cold blood, and thrown their bodies over the bridge.

The rebels having fled from Wexford, on the approach of colonel Moore, ſent a propoſal to general Lake, commander in chief of the king's troops, importing, that they were ready to lay down their arms, and return to their allegiance, provided their perſons and properties were duly guaranteed, on which conditions, they would uſe every influence in their power, to induce the people of the country to return to their allegiance. To this propoſal general Lake replied, that he could not attend to any terms offered by rebels in arms againſt their ſovereign; but, to the deluded multitude, he promiſed pardon, on delivering into his hands their leaders, ſurrendering their arms, and returning with ſincerity to their allegiance.

Various actions took place from this period to the cloſe of Auguſt, in ſome of which the king's troops experienced partial defeats, and in theſe they were in general taken by ſurpriſe; but, the rebel party, upon the whole, were routed, with great loſs in killed and wounded, inſomuch, that the leaders of the conſpiracy, ſo entirely deſpaired of their cauſe, that many of them conſented to make a full and voluntary confeſſion of all the circumſtances within their knowledge; and, it is from their own account, given on oath, that we are enabled to ſtate the riſe and progreſs of this horrid rebellion, and the correſpondence carried on with France. On condition of the full diſcloſure of what they knew, they were permitted to emigrate to ſome country to be agreed upon between them and government, giving ſecurity never to return to Ireland without permiſſion of his majeſty's miniſters; and thus this formidable rebellion was quelled in a conſiderable degree.

Much intereſting and important information was communicated by the principal leaders; as it appeared from the examinations of Dr. M'Nevin, Mr. Arthur O'Connor, Mr. Neilſon, and counſellor Emmet, that an executive directory of the Iriſh union was inſtituted at an early period of the diſcontents (1791,) of which lord Edward Fitzgerald, Dr. M'Nevin, Arthur O'Connor, and Mr. Emmet, were members; that in the year 1796, lord Edward Fitzgerald and Mr. Arthur O'Connor, ſet out for Paris, in order to negotiate with the executive directory of France, for the invaſion of Ireland by a French force; but that, fearful of a diſcovery of their intention, they proceeded no farther than the Rhine, where they

they met general Hoche, to whom they communicated the object of their miſſion; that that officer formed arrangements with the executive directory; that a fleet, with general Hoche and a formidable army on board, was, in conſequence of thoſe arrangements, ſent to Ireland in the month of December following; but not being expected by the directory of the union, till the ſpring of 1797, the people were not prepared to receive the enemy when they arrived at Bantry Bay. That Dr. M'Nevin afterwards went to France on a ſimilar miſſion, and ſucceeded in obtaining a promiſe from the directory, that another attempt ſhould be made; that a fleet was accordingly fitted out in the Texel, and ſeveral thouſand men embarked on board of it, for the purpoſe of invading Ireland; that the troops, after remaining ſome time on board, were diſembarked; that the fleet, which was under the command of admiral De Winter, put to ſea, without the troops (probably for the purpoſe of giving battle to the Britiſh ſquadron, and with the hope of clearing the way for the tranſports to come out;) and that the reſult was, the glorious victory atchieved by admiral Duncan on the memorable 11th of October. It appears alſo from the report, that the real object of the union had all along been the accompliſhment of a revolution, and the ſeparation of Ireland from Great-Britain; that parliamentary reform and catholic emancipation had been uſed as mere deluſive veils to cover their deſigns; that the French directory, between whom and the directory of the union a regular correſpondence for ſome time had been kept up, on being applied to for a loan to enable the promoters of the rebellion to effect the propoſed revolution, refuſed to comply with the requeſt, unleſs they were permitted to ſend an army of ſufficient force to take poſſeſſion of the country as a conqueſt to their arms; and, finally, that there was at that moment, an agent from the united Iriſhmen reſiding in Paris. Theſe were the leading points of the report of the ſecret committee, and which left no doubt of the real deſigns of the chief actors concerned in the rebellion.

In the month of September, about a thouſand French troops and general Humbert landed in Ireland, and ſucceeded ſo far as to take poſſeſſion of the town of Killala, and the palace of the venerable biſhop of the dioceſe, in which he and his family were confined as priſoners: but the French general was ſoon compelled to ſubmit to the king's troops under the command of general Lake, who obtained a complete victory over them in the battle of Ballinamuck, with a very trifling loſs; while that of the enemy muſt have been very conſiderable, as no leſs than twenty-four principal officers were taken priſoners, a great number of ſubalterns, and the whole amounted, according to the eſtimate of their own Chef de Brigade, to 844. The enemy in their retreat before the king's troops were compelled to abandon nine pieces of cannon, which they had taken in former actions with his majeſty's forces.

In the morning of the ſixteenth of the month above mentioned, a French national brig called the Anacreon, having on board general Rey, and the notorious James Napper Tandy, Chef de Brigade, appeared off the little town and iſland of Rutland, on the north weſt coaſt of the county of Donegal, a place ſo utterly unnoticed, ſave for its convenience for the herring-fiſhery, as not to be defended by a ſingle ſoldier. When the crew of the brig, who were for the moſt part Iriſh, made good their landing, they ſolicited information concerning the French army landed at Killala. Nothing could equal their dejection when they were told, not only that the whole French force had been deſtroyed; but that they had been joined by comparatively very few of their Iriſh rebel friends. The Anacreon was laden with many ſtands of arms to ſupply thoſe who ſhould join the French army; but ſuch was the caution or the terror of the country people, that as ſoon as the French appeared, they retired to the mountains; ſo that when Napper and his friends found that the good people of Rutland were not diſpoſed to further their deſigns; they deemed it moſt prudent to reimbark, and thus ended this raſh, frivolous and deſpicable attempt.

Fruſtrated in their plans of invaſion on the part of the French, and defeated in their own efforts to effect their rebellious deſigns againſt their king and country, the United Iriſhmen now ſeemed to look upon their cauſe as deſperate. They continued indeed to commit depredations and perpetrate their uſual cruelties; ſallying forth occaſionally, and ſkirmiſhing with parties of the king's troops, under a nefarious leader, called Holt; but being always repulſed in their attempts, their conſtant reſource was to flee to the bogs, mountains and faſtneſſes, and thereby eſcape the juſt vengeance of their purſuers. But all their hopes were daſhed at length, by the defeat and capture of a French fleet which had ſailed from Breſt, with a formidable armament for the purpoſe of a more powerful invaſion than had been previouſly attempted, and which, had a landing been effected, would no doubt have revived a rebellion.

The order of St. Patrick was inſtituted February 5, 1783, and the inſtallation of the firſt knights was performed on the 17th of March following. It conſiſts of the ſovereign and fifteen other knights companions. The lord-lieutenant of Ireland for the time being officiates as grand-maſter of the order, and the archbiſhop of Armagh is the prelate, the archbiſhop of Dublin the chancellor, and the dean of St. Patrick the regiſter of the order. The knights are inſtalled in the cathedral of St. Patrick, Dublin. Their robes are ſplendid, and the badge is three crowns united together in a croſs, with the motto round, *Quis ſeparabit?* "Who ſhall ſeparate?" 1783, faſtened by an Iriſh harp to the crown imperial. The coat is encircled with a ſtar of eight points. This is the only order of knighthood in Ireland.

CHAP. XIII.

THE ISLE OF MAN.

Situation, Boundaries, Extent, Climate, Air, Soil, Produce, Cattle, Inhabitants, Government, Towns, &c.

THIS iſland is ſituated in St. George's Channel, between England, Scotland, and Ireland, its diſtance from all three being nearly equal; a circumſtance to which, according to ſome authors, it owes its preſent name, which they derive from the Saxon word Mang, which ſignifies among. It was formerly diſtinguiſhed by ſeveral different appellations, as Mona, which ſeems to have been a generical name with the ancients for any detached iſland; Monoeda, Monabia, Menavia, Eubonia, and Manaw. Its length from north to ſouth is about thirty miles; its breadth from eaſt to weſt about twelve: the middle of the iſland lies in 54 deg. 16 min. north lat. and in 5 deg. 8 min. weſt long. It is divided into thirteen pariſhes, and has four towns, where the greater part of the trade of the iſland is carried on. The weather in this iſland is leſs variable than that of England, but the ſummers are ſhorter and cooler, and the winters more ſevere. The air is exceedingly pure and wholeſome, and the ſoil, in the hilly parts, barren; but in the vallies and champaign country very fruitful; theſe abound in corn, barley, oats, rye, hemp, flax, roots, pulſe, and fine paſture. It alſo abounds in a ſmall breed of black cattle, and on the mountains are great numbers of hogs and ſheep, which run wild, and are never houſed; the meat of both is excellent.

cellent. The horſes which are bred in this iſland are very ſmall, but ſwift and hardy. There are no foxes, badgers, otters, ſnakes, &c. and it is aſſerted, that a frog was not to be found in the place till ſome ſpawn was brought over from Ireland. Eagles, and a ſpecies of mottled hawks, inhabit the iſland; and, in a ſmall iſland called the Calf of Man, ſeparated from the Iſle of Man by a narrow channel, an infinite number of ſea-fowl harbour, among which are claik geeſe, or barnacles, and thoſe delicious birds called puffins, ſaid to breed in the holes of the rabbits, which for that time leave them to theſe ſtrangers. The old ones leave their young all day, and fly to the ſea, and, returning late at night with their prey, diſgorge it into the ſtomachs of their young; by which means they become almoſt an entire lump of fat.

A ridge of mountains, which runs almoſt the whole length of the iſland, furniſhes the inhabitants with excellent water, together with peat and turf for fuel.

The Iſle of Man contains about 20,000 inhabitants; who are in general very peaceable, hoſpitable to ſtrangers, and charitable to the poor. The lower claſs live in thatched huts, which they ſecure againſt the high winds, common to this place, by a contrivance made of ropes of ſtraw; but the gentry reſide in exceeding good houſes, built of ſtone, and roofed with ſlate. Their method of improving their lands is by manuring them with ſea-weed, lime, and marle, or ſometimes by folding their ſheep upon them, whereby they procure excellent crops of wheat, notwithſtanding which the common bread of the country is made of oatmeal.

The curioſities of this iſland conſiſt chiefly in Runic ſepulchral inſcriptions, written in the old Norwegian language; monuments of braſs and large white ſtones; daggers and other inſtruments of braſs, which have been found buried under ground, together with nails of pure gold.

Its trade conſiſts in black cattle, lamb's wool, fine and coarſe linen cloth, hides, ſkins, honey, tallow, and herrings, of which the inhabitants formerly exported twenty thouſand barrels annually to France and other foreign countries: and it is to be hoped that this fiſhery will now increaſe, the Britiſh parliament having latey given a very conſiderable ſum of money for the encouragement of that uſeful undertaking.

The language uſed by the natives, is radically Erſe, or Iriſh, with a mixture of Latin, Greek, Welſh, and Engliſh words. This compoſition is termed Manks: the New Teſtament and Common-Prayer have been tranſlated into this language. Strangers, being unacquainted with their laws and language, are forced to employ others to plead for them; and it is not long ſince they had any attornies.

The tenets of the church of England are profeſſed by the inhabitants. Chriſtianity was firſt planted here by St. Patrick, about the year 440. The cathedral is dedicated to St. Germain, who was the firſt biſhop of the Iſle. There are 17 pariſh churches in the Iſle of Man, and each of the market-towns has a chapel.

The biſhop of Sodor and Man enjoys all the ſpiritual rights and pre-eminence of other biſhops, but does not ſit in the Britiſh Houſe of Peers; his ſee never having been created into an Engliſh barony. One of the moſt excellent prelates who ever adorned the epiſcopal character, was Dr. Thomas Wilſon, biſhop of Man, who preſided over that dioceſe upwards of 57 years, and died in the year 1755, aged 93. He was eminently diſtinguiſhed for the piety and exemplarineſs of his life, his benevolence and hoſpitality, and his unremitting attention to the intereſts of the people intruſted to his care. He encouraged agriculture, eſtabliſhed ſchools for the inſtruction of the children of the inhabitants of the iſland, tranſlated ſome of his devotional pieces into the Manks language, to render them more generally uſeful, and founded parochial libraries in every pariſh in his dioceſe. His virtues were ſo numerous and conſpicuous, that he was a great bleſſing to the iſland, and an ornament to human nature. Cardinal Fleury had ſo much veneration for his character, that, out of regard to him, he obtained an order from the court of France, that no privateer of that nation ſhould ravage the Iſle of Man. The eccleſiaſtical courts are held by the biſhop either in perſon, or by his vicars general; the archdeacon in perſon, is his official. Eccleſiaſtical diſcipline is here maintained very ſtrictly according to the canons; and the better to ſecure it, the biſhop calls a convocation of his clergy, at leaſt once a year, in order to inquire how the diſcipline of the church has been obſerved, and to make ſuch conſtitutions as are neceſſary for its better government. In all the courts of this iſland, eccleſiaſtical and civil, both men and women, who are natives of the iſland, uſually plead their own cauſes. There are no Papiſts natives of this iſland, nor Diſſenters of any denomination, except Quakers. If the biſhop's tenant is found guilty of a capital crime, for which he may be tried in the biſhop's court, and by a jury of his tenants, he forfeits his lands to the biſhop, but his perſon and moveables are at the diſpoſal of the king.

The governor of this iſland reſides at Caſtle-Town, and is appointed by his majeſty. He has power over all officers, civil and military; and to him, as chancellor, there lies an appeal in matters of right and wrong, and from him to the king in council.

The Tingwald, or ſupreme court of the iſland, is held on a hill near the centre of the iſland, in the open air, and conſiſts of the governor, officers ſpiritual and temporal, the two deemſters, and twenty-four keys. The two deemſters are the temporal judges both in civil and criminal cauſes; and the twenty-four keys are perſons ſo denominated from ſolving, or as it were unlocking, the difficulties of the laws. Their buſineſs is to make new laws, aſſiſt the deemſters in interpreting them, and to decide all difficult caſes. In the tingwald every perſon has a right to preſent any uncommon grievance, and to have his complaints heard and redreſſed in the face of the whole country. All new laws, having firſt been agreed to by the governor, council, deemſters, twenty-four keys, and received the royal aſſent, are likewiſe publiſhed in this court.

The council of the Iſle of Man conſiſts of the governor, biſhop, arch-deacon, the two vicars-general, the receiver-general, the comptroller, the bailiff, and the attorney-general.

This iſland is divided into ſix ſheathings, each of which has its coroner, who, in the name of the ſheriff, is intruſted with the peace of his diſtrict, by ſecuring criminals, and bringing them to juſtice. A moar and a captain are likewiſe two officers belonging to every pariſh. The former of theſe, who are properly the king's bailiffs, are changed yearly, and obliged to be anſwerable for the rents in their reſpective diviſions. The captains have the care of the militia or trained bands.

In this iſland, if a ſingle woman proſecutes a ſingle man for a rape, and he is found guilty, the deemſter, or juſtice, delivers to the woman a rope, a ſword, and a ring, which gives her the choice of having him hanged, beheaded, or, by marrying him, ſaving his life.

The principal towns are Caſtle-Town or Caſtle-Ruſſin, Peele, Douglas, and Ramſea; all of which are ſituated on the ſea-coaſt.

Caſtle-Town is the metropolis of the iſland, and derives its appellation from a beautiful old, but ſtill entire caſtle, built of a coarſe kind of marble. Here the governor and chief officers reſide, the chancery is kept, and the aſſizes are held twice a year.

Peele was denominated Holm-Town by the Norwegians, from a ſmall iſland adjacent to it, wherein ſtands the cathedral, at this time in ruins, except the chancel, which is kept in repair by the biſhop. Thomas, earl of Derby, notwithſtanding this iſle was ſufficiently

ficiently ſtrengthened by nature, ſurrounded it with a wall, towers, and other fortifications. Of late the town of Peele has been much enlarged, ſeveral excellent houſes having been built by merchants ſettled there.

Douglas is the richeſt and moſt populous town in the whole iſland, has the beſt market, and enjoys the greateſt trade. The harbour, which has a fine mole extending into the ſea, is eſteemed one of the beſt in the three kingdoms. There is a free-ſchool, and noble warehouſes, vaults, and cellars belonging to the merchants.

Ramſea was formerly a very inconſiderable town, but its trade has increaſed conſiderably of late years. It is noted for a ſpacious bay, in which ſhips may ride ſafe from all winds, except the north-eaſt, and the harbour is tolerable.

HISTORY OF THE ISLE OF MAN.

THE Iſle of Man is a diſtinct territory from England, and is not governed by our laws; neither doth any act of parliament extend to it, unleſs it be particularly named therein, and then an act of parliament is binding there. Frequent mention is made in hiſtory of the kings of Man, but we can find no regular account of their ſucceſſion. This iſland was formerly a ſubordinate feudatory kingdom, ſubject to the kings of Norway; then to king John and Henry III. of England; afterwards to the kings of Scotland, and then to the crown of England; and at lengeth we find Henry IV. claiming the iſland by right of conqueſt; and diſpoſing of it to the earl of Northumberland; upon whoſe attainder it was granted, by the name of the Lordſhip of Man, to Sir John de Stanley, by letters patent, 7th Henry IV. In his lineal deſcendants it continued for eight generations, till the death of Ferdinando, earl of Derby, A.D. 1594, when a controverſy aroſe concerning the inheritance thereof, between his daughters and William his ſurviving brother; upon which, and a doubt that was ſtarted concerning the validity of the original patent, the iſland was ſeized into the hands of the queen (Elizabeth,) and afterwards various grants were made of it by James I. all which being expired, or ſurrendered, it was granted afreſh, in 7th James I. to William, earl of Derby, and the heirs male of his body, with remainder to his heirs general; which grant was the next year confirmed by act of parliament, with a reſtraint of the power of alienation by the ſaid earl and his iſſue male. On the death of James, earl of Derby, A. D. 1735, the male line of earl William failing, the duke of Athol ſucceeded to the iſland, as heir general by a female branch.

Though the title of king had been diſuſed for ſome time, the earls of Derby, as lords of Man, had maintained a ſort of royal authority therein, by aſſenting to, or diſſenting from laws, and exerciſing an appellate juriſdiction. Yet, though no Engliſh writ or proceſs from the courts of Weſtminſter was of any authority in Man, an appeal lay from a decree of a lord of the iſland to the king of Great-Britain in council; but the diſtinct juriſdiction of this little ſubordinate royalty being found inconvenient for the purpoſes of public juſtice, and for the revenue (in affording a commodious aſylum for debtors, outlaws, and ſmugglers) authority was given to the treaſury, by ſtat. 12 Geo. I. c. 28. to purſchaſe the intereſt of the then proprietors for the uſe of the crown; which purchaſe was at length completed in the year 1765, and confirmed by ſtatutes 5 Geo. III. c. 26. and 30. whereby the whole iſland, and all its dependencies, ſo granted as aforeſaid (except the landed property of the Athol family, their manorial right and emoluments, and the patronage of the biſhopric, and other eccleſiaſtical benefices,) are unalienably veſted in the crown, and ſubjected to the regulations of the Britiſh exciſe and cuſtoms.

CHAP. XIV.

THE ISLE OF WIGHT.

Situation, Extent, Climate, Soil, Produce, Chief Town, Forts, &c.

THIS delightful iſland is conſidered as part of the county of Southampton, and within the dioceſe of Wincheſter. It is ſituated over-againſt the coaſt of Hampſhire, being ſeparated from it by a channel, which varies in breadth from two to ſeven miles. Its greateſt length, from eaſt to weſt, is nearly twenty-three miles; and its breadth, from north to ſouth, about thirteen. The purity of the air, the fertility of the ſoil, and the beauty and variety of the landſcapes of the iſland, have obtained it the appellation of the garden of England. In the ſouthern parts, the air is in general particularly healthy; the ſoil is various; but ſo great is its fertility, that it was long ago computed that more wheat was produced here in one year, than could be conſumed by the inhabitants in eight; and under the great improvements of agriculture, and the additional quantity of land lately brought into tillage, its preſent produce is ſuppoſed to have more than kept pace with the increaſe of population. Through the middle of the iſland, a range of hills extends from eaſt to weſt, which afford fine paſture for ſheep. Every part of the iſland affords a great number of beautiful and picturеſque proſpects, not only in the paſtoral, but alſo in the great and romantic ſtyle; of theſe beauties, the gentlemen of the iſland have availed themſelves, as well in the choice of ſituation of their houſes, as in their other improvements; ſome of their country-ſeats are very elegant; in ſhort, the iſland itſelf is often viſited by parties of pleaſure on account of its delightful ſcenes. Domeſtic fowls and poultry are bred here in great numbers; and from this iſland the outward-bound ſhips and veſſels at Spithead, the Mother-Bank, and Cowes, commonly furniſh themſelves with thoſe articles.

There are thirty pariſhes in the Iſle of Wight. Moſt of the farm-houſes are built of ſtone, and even the cottages appear neat and comfortable, having each a little garden belonging to it. According to a very accurate computation, made in the year 1777, the inhabitants then amounted to 18,024, excluſive of the troops quartered there.

Newport, which may be conſidered as the capital town, ſtands nearly in the centre of the iſland. The three principal ſtreets extend from eaſt to weſt, and are croſſed at right angles by three others, all which are ſpacious, clean, and well paved. The river Medina empties itſelf into the channel at Cowes-Harbour, diſtant about five miles, and, being navigable up the river, renders it commodious for trade.

There are ſeveral forts in this iſland, which were all erected about the thirty-ſixth year of Henry VIII. when many other forts and blockhouſes were built in different parts of the coaſt of England. Cariſbrooke-Caſtle has been rendered remarkable by the confinement of king Charles I. who, taking refuge here, was detained a priſoner, from November 1647, to September 1648. After the execution of the king, this caſtle was converted into a place of confinement for his children; and his daughter, the princeſs Elizabeth, died in it.

CHAP. XV.

THE iſlands of Jerſey, Guernſey, Alderney, and Sark, in the Britiſh Channel, are all ſubject to England, and within the dioceſe of Wincheſter.

They lie in a cluſter in Mount St. Michael's Bay, between Cape La Hogue in Normandy, and Cape Frebelle in Brittany, Sark being four, Guernſey ſeven, and Alderney nine leagues from Jerſey.

The iſland of Jerſey, which was known to the Romans, and by them called Cæſarea, is ſituated in 49 deg. 26 min. weſt lon. eighteen miles weſt of Normandy, and eighty-four miles ſouth of Portland. It is about twelve miles in length, and eight in breadth. The rocks on the northern ſide form a natural and inacceſſible fortification; but to the ſouth the iſland is almoſt level with the water. The air is very ſalubrious; and the ſoil, particularly in the vallies, rich, fruitful, and well-cultivated; but there is no wood for firing. The higher land is generally appropriated for orchards, and great quantities of excellent cyder are made there. There are animals in this iſland which are not found in England, but it is well ſtocked with black cattle and ſheep. Fiſh and wild fowl of every kind abound there, and ſome of theſe are peculiar to the place. The Jerſey honey is eſteemed very delicious.

The whole iſland is divided into twelve pariſhes, and its capital town is St. Holier, which contains a number of exceeding good houſes, and make an elegant appearance. The people, who are about 20,000 in number, employ themſelves in cultivating their orchards, and a manufacture of knit ſtockings and caps, wherein their commerce chiefly conſiſts, though they carry on a conſiderable trade in fiſh to Newfoundland and the Mediterranean. Their language is French, but moſt of them intermix it with Engliſh words. The religion here, and likewiſe in the other three iſlands, is that of the church of England. The governor is appointed by the king, but the civil adminiſtration is veſted in a bailiff, aſſiſted by twelve jurats.

The property of this iſland formerly belonged to the Carterets, who were originally Normans; and Jerſey, being the chief remains of the duchy of Normandy, depending on the kings of England, ſtill preſerves the ancient feudal forms, particularly the aſſembly of ſtates, which is, as it were, a miniature of the Britiſh parliament, as ſettled in the reign of Edward the Firſt.

GUERNSEY, which is likewiſe part of the ancient Norman patrimony, is thirteen miles and a half from ſouth-weſt to north-eaſt, and twelve and a half where broadeſt, eaſt and weſt. It has an harbour, at St. Peter le Port, guarded by two forts, one called the Old-Caſtle, the other Caſtle-Cornet. The iſland is divided into ten pariſhes, to which there are but eight miniſters, four of the pariſhes being united; and Alderney and Sark, which are appendages of Guernſey, having one apiece. Though this is a much more deſirable ſpot, it is not ſo populous as Jerſey, and conſequently not ſo valuable, becauſe leſs cultivated. It abounds, however, in cyder, and in moſt other reſpects reſembles the iſland laſt deſcribed; but want of firing is the greateſt inconveniency that both iſlands labour under. The number of inhabitants in this, and the iſlands of Alderney and Sark, are computed at 20,000; they ſpeak the French language.

Alderney is ſeparated from Normandy, by a narrow ſtreight, called the Race of Alderney, from the prodigious velocity of the current; otherwiſe it is ſafe, and has depth of water for the largeſt ſhips. This iſland, which is about eight miles in compaſs, has nothing in it remarkable but a fine breed of cows, many of which have been brought into England, where they are known by the name of Norman cows. It has a healthy air, and fruitful ſoil.

Sark is a very ſmall iſland depending upon Guernſey, from which it does not differ in any thing material; the inhabitants are long-lived, and enjoy, from the products of nature, all the conveniencies of life; their number is about 300.

The Iſles of Scilly, anciently called the Silures, are a cluſter of dangerous rocks, to the number of 140, lying about thirty miles from the Land's-End, in Cornwall, of which county they are reckoned a part. Some of theſe iſlands are well inhabited, and have large and ſecure harbours. Theſe rocks being ſituated between the Engliſh Channel and St. George's Channel, many ſhips and lives have been deſtroyed by them.

CHAP XVI.

THE NETHERLANDS.

Situation, Extent, Diviſions, Rivers, Animals, Produce, Population, Trade, Language, Learning, Religion, &c.

THESE provinces, which are ſeventeen in number, obtained the general name of Netherlands, Pais Bas, or Low Countries, from their ſituation in reſpect of Germany. They were formerly part of Gallia Belgica, and afterwards of the circle of Belgium, or Burgundy, in the German empire. Their ſituation is between 2 and 7 deg. eaſt long. and between 49 and 54 north lat. and extend, from north to ſouth, 350 miles; the breadth, from eaſt to weſt, is 300. Their boundaries are, the German Sea, on the north; the Britiſh Channel, on the weſt; Germany, on the eaſt; and Lorrain in France, on the ſouth.

The United Provinces are, properly ſpeaking, eight; viz. Holland, Overyſſel, Zealand, Frieſland, Utrecht, Groningen, Guelderland, and Zutphen; but the two latter forming only one ſovereignty, they are always conſidered as ſeven.

The United Provinces are ſituated between 3 and 7 deg. eaſt long. and 51 and 54 north lat. being 150 miles in length, and almoſt the ſame in breadth. They are bounded by the German ſea, on the north and weſt; by Weſtphalia, on the eaſt; and by Flanders, Brabant, and the duchy of Cleves on the ſouth.

Theſe Provinces, which are about ninety miles diſtant from the Engliſh coaſt, lie very low, having neither mountains, riſing grounds, nor foreſts, to diverſify the ſcene; and the country, when viewed from a tower or ſteeple, has the appearance of a continued marſh or bog, drained at certain diſtances by innumerable ditches.

The climate in the ſouthern parts, does not differ materially from that of England, but in the northern, the winter is generally very ſharp, and the ſummer ſultry hot; neither the exceſſive heat or cold, however, laſts above a month or ſix weeks. The air is foggy, moiſt, and would be very unwholeſome, if not purified by the froſt in winter, when the eaſt wind uſually blows for about four months, during which ſeaſon their harbours are entirely frozen up. The ſoil is by nature unfavourable to vegetation, an obſtacle which the induſtry of the inhabitants has in a great meaſure ſurmounted, in making canals, &c. to drain their lands; which, by this method, are rendered fit for paſture, and in many places for tillage.

The principal rivers are, the Rhine, one of the largeſt and fineſt rivers in Europe; the Maeſe, the Scheldt, and the Vecht. There are many ſmaller rivers that join theſe, and a vaſt number of canals. There are few good harbours in the provinces. The beſt are thoſe of Rotterdam, Helvoetſluys, and Fluſhing. The harbour of Amſterdam, though one of the largeſt and ſafeſt in Europe, has a bar at the entrance of it, over which large veſſels cannot paſs, without being lightened. Haerlem, the only lake in this country, has a communication, by means of canals with Amſterdam and Leyden.

The animals are much the ſame as thoſe in England. The inhabitants buy lean cattle in Denmark and

and north of Germany, which they fatten to a prodigious bulk; and the horſes are larger than thoſe of any other nation. They have a good breed of ſheep, whoſe wool is highly valued; and it is ſaid that in ſome places they have wild boars and wolves. Storks build and hatch in their chimnies; but, being birds of paſſage, they leave the country, together with their young, about the middle of Auguſt, and do not return till February. The fiſh found in the ſeas and rivers there, are the ſame as ours, though larger; they have no herrings on their coaſts: but there are many excellent oyſter beds about the iſlands of the Texel.

Very little corn is produced in theſe provinces; but in ſome parts they grow madder, tobacco, and a little fruit. Vaſt quantities of the latter are ſent yearly from England, together with all kinds of roots and garden-ſtuff, particularly cauliflowers The provinces, however, in general, abound with rich paſtures, fine groves of trees, vegetables, &c. though not in ſuch perfection as thoſe of England.

The Seven United Provinces contain, according to the beſt accounts, 113 cities and towns, 1,400 villages, and about two millions of inhabitants, who are diſtinguiſhed by the general appellation of the Dutch. They are uſually tall and ſtrong built; the women have good ſkins and tolerable features, but both ſexes are very clumſy in their ſhapes, to which their dreſs contributes greatly, for the men wear coats without plaits, and their long pockets reach nearly to their arm-pits: the women have their petticoats, of which they wear a great number, no lower than the middle of their legs; their waiſts are exceſſively ſhort, and on their heads they ſometimes wear a plain round-ear cap, but frequently only a black ribband, tied in a particular manner: this, however, is not to be underſtood of the higher ranks of people, who imitate the French greatly in their method of dreſs and living. The manners of the people differ according to their ſituations in life. The gentry are polite and hoſpitable. The tradeſmen are no otherwiſe honeſt than the law, or the diſcernment of the perſons they deal with, obliges them to be ſo; for whenever they can evade the one, or impoſe upon the judgment of the other, they ſeldom fail to do it. The boors or huſbandmen are exceedingly dull of underſtanding, impatient if treated harſhly, but eaſily guided by gentle methods, and yielding to the conviction of plain reaſoning, if they are allowed time to comprehend it. The ſeamen are a plain, rough, ſurly, ill-mannered people, ſeldom making uſe of more words than is neceſſary about their buſineſs. Every claſs, however, agrees in being exceedingly induſtrious and frugal, never ſpending the whole of their income, let it be ever ſo trifling. They are naturally phlegmatic, and ſeldom in a paſſion, except heated by liquor, or provoked by any one acting contrary to their intereſt, which is dearer to them than life; in every other reſpect, they are quiet neighbours, and peaceable ſubjects. Though a Dutchman, when drunk, is guilty of every act of brutality, and though they have been known to exerciſe the moſt ſhocking inhumanities abroad, from lucrative views, yet in their own country they are in general quiet and inoffenſive. They are ſeldom ſeen to expreſs any great emotions of joy or ſorrow, and the paſſion of love is a thing talked of, but ſcarce ever felt by either ſex; for they are ſo ſimilar, that in diſplaying the diſpoſitions of the men, thoſe of the women are likewiſe delineated. The Dutch drink great quantities of ſpirituous liquors, wine, &c. and both men and women ſmoke tobacco. They are remarkabe for cleanlineſs: and nothing can exceed the neatneſs of their houſes, which is greatly owing to the neceſſity they are under of perpetually rubbing and ſcouring, from the moiſture of the air, which cauſes metals to ruſt, and wood to mould, more than in any other country.

The nobility, magiſtrates, and rich merchants, who have retired from trade, endeavour to rival each other in the beauty of their equipages, and the elegance of their houſes and furniture. Among the middling ranks of people, there is ſcarce any diſtinction between maſters and ſervants, and it would be difficult for a ſtranger, at firſt ſight, to know the one from the other. There is no country where fewer failures or bankruptcies occur. Hence, in the midſt of a multitude of taxes and contributions, ſuch as no other country experiences, they flouriſh and grow rich. From this ſyſtematic ſpirit of regularity and moderation, joined to the moſt obſtinate perſeverance, they ſucceeded in the ſtupendous works of draining their country of thoſe immenſe deluges of water that had overflowed a conſiderable part of it during many ages, while at the ſame they brought under their ſubjection and command the rivers and ſeas that ſurround them, by dykes of incredible thickneſs and ſtrength, and made them the principal bulwarks on which they rely for the protection and ſafety of their territories againſt the incurſions of an enemy. To this end, they have covered their frontiers and cities with innumerable ſluices; by means of which, at the ſhorteſt notice, the moſt impetuous inundations are admitted, ſo that they become in a few hours inacceſſible.

Their remarkable frugality and perſeverance have alſo enabled them, though labouring under the greateſt difficulties, not only to throw off the Spaniſh yoke, but to attack that powerful nation in the moſt tender parts, by ſeizing her rich galleons, and forming new eſtabliſhments in Africa, and the Eaſt and Weſt-Indies, at the expence of Spain, and thereby becoming, from a deſpicable province, a moſt formidable enemy. The riſe of their military and marine eſtabliſhments was alſo equally wonderful, ſince, in their celebrated contention with Louis XIV. and Charles II. of England, they maintained no leſs than 150,000 forces, and upwards of eighty-ſhips of the line. But a ſpirit of frugality is not now ſo univerſal among the Dutch as it was formerly: the rich traders and mechanics begin to adopt Engliſh and French luxuries in dreſſing and living; their nobility and high magiſtrates, who have retired from trade, rival thoſe of any other part of Europe in their tables, buildings, furniture, and equipages; and gaming is likewiſe practiſed among many of their faſhionable ladies.

The ſummer diverſions of the Dutch differ little from thoſe of the Engliſh; and in winter they ſhoot wild geeſe and ducks: they delight in ſkaiting, at which they are very expert; and it is amazing to ſee with what inconceivable velocity both men and women dart, or rather fly along upon the ice, having perhaps at the ſame time a load on their heads.

The uſual way of paſſing from town to town, is by covered boats, called treckſcuits, which are dragged along the canals by horſes on a ſlow uniform trot, ſo that paſſengers reach the different towns where they are to ſtop, preciſely at the appointed inſtant of time. This method of travelling is exceedingly convenient to the inhabitants, and very cheap, but at the ſame time extremely dull and diſagreeable. The principal people travel on the ice in ſledges, which a man, placed behind, puſhes along with great ſwiftneſs.

Almoſt every town of the United Netherlands, enjoys the benefit of a navigable canal, which is now become the principal method of communication between one town and another. Among the many benefits derived from theſe canals may be reckoned that of ſending goods into various parts of Germany and the Auſtrian and French Netherlands, from the principal trading towns of Holland, at a very ſmall expence: ſome of the canals communicate with the Rhine, others with the Maeſe, and others with the Ems. Hence a very extenſive inland commerce is carried on throughout this country; and the goods imported from foreign ſtates, by the great trading towns of Rotterdam, Amſterdam, &c. are diſperſed into various parts in large quantities; ſo that theſe

provinces

provinces may be conſidered as one large mart of trade. The canals are lined for ſeveral miles together with elegant neat country-houſes, ſeated in the middle of gardens and pleaſure-grounds intermixed with figures, buſts, ſtatues, temples, &c. to the very water's edge: genteel families, in fine weather, ſpend much of their time in theſe little temples, ſmoking, reading, or viewing the paſſengers, to whom they appear to behave with complaiſance and politeneſs. A treckſcuit, in which goods are conveyed on theſe canals, is divided into two different apartments, called the roof and the ruim; the firſt for gentlemen, and the other for common people, who may eat, drink, read, or converſe with people of various nations, with great facility.

The United Provinces for commerce and manufactures are the grand magazine of Europe, and goods may be purchaſed here ſometimes cheaper than in the countries where they grow. Their Eaſt-India-Company, which is the moſt opulent and powerful of any in the world, have had the monoply of the fine ſpices for more than 100 years, and, till the late war with England, was extremely wealthy and powerful; but their commerce hath greatly ſuffered ſince that period. Their capital city in India is Batavia, which is ſaid to exceed in magnificence, opulence, and commerce, all the cities of Aſia. Here the viceroys appear in greater ſplendor than the ſtadtholder; and ſome of the Dutch ſubjects in Batavia ſcarcely acknowledge any dependence on the mother-country. Their India ſettlement on the Cape of Good Hope, being the grand rendezvous of the outward and home-ward-bound ſhips of all nations, is extremely pleaſant, healthful, and uſeful.

In Holland, the manufactures conſiſt in fine linen, table damaſks, woollen-cloths, ſail-cloth, paper, delft-ware, pots, tobacco-pipes, refined ſalt, ſugar-works, oil-mills, cotton, ſilk, wax-bleaching, leather-dreſſing, hemp, and ſtarch. Vaſt ſums are amaſſed annually by their mills for ſawing timber, uſed in building ſhips and houſes; and great wealth is acquired by the herring, whale, and cod-fiſheries, which they have wreſted from the native proprietors, and in theſe the provinces of Holland and Zealand are chiefly concerned, and employ a vaſt number of ſhips; in the two firſt only, about 850 ſail. The herrings cured there are preferable to thoſe of any other nation; and, in a good ſeaſon, the profits on this branch of trade only are ſaid to amount to 2,000,000 of Holland guilders yearly, clear of all deductions.

The principal trading company in Holland is that to the Eaſt-Indies incorporated in 1602. About the year 1660 the Dutch divided 40 per cent. and afterwards 60; the dividends are at preſent much reduced; but, in 124 years, the proprietors, on an average, divided yearly above 24 per cent. and, ſo late as in 1760, they divided 15 per cent. The Dutch Weſt-India-Company was incorporated in 1621, and, in the year 1760, divided only two and a half per cent. The bank of Amſterdam is immenſely rich, and under an excellent direction. According to Mr. Anderſon, the caſh, bullion, and pawned jewels in this bank, which is kept in the vaults of the ſtadthouſe, amount to thirty-ſix millions ſterling, though others ſay only thirty millions.

The conſtitution of the United Provinces is a very intricate article. They all, indeed, form a general confederacy; and the ſtatutes made in the aſſembly of the ſtates, after they have acquired the neceſſary ſanctions, become binding on all the inhabitants of the United Provinces. But, notwithſtanding this particular, each province has a ſeparate internal government, wholly independent of the others; but as theſe independent governments conſidered ſeparately, could not defend themſelves againſt the attempts of a foreign enemy, they are formed into one collective body, by a certain number of deputies, or repreſentatives, choſen by each, who conſtitute the legiſlative power, and are termed the States-General. Their power is, however, in ſome reſpects, limited; for, when a reſolution is taken by the States, it has not the force of a law till it has received the approbation of every province, every city, and every republic in that province; nor are even a majority of voices in theſe different and ſubordinate aſſemblies ſufficient, it muſt be unanimouſly approved, one diſſenting voice being ſufficient to render the whole abortive. But theſe tedious formalities are uſually laid aſide in times of imminent danger, when the approbation of the States-General is allowed to be ſufficient.

The council of State, which conſiſts of deputies from the ſeveral provinces, is next in authority to the States-General. It is compoſed of twelve perſons, of whom Holland ſends three, Guelderland one, Zealand two, Utrecht one, Frieſland two, Overyſſel one, and Groningen two. In this council they do not vote by provinces, as in the States-General, but by perſonal voices, and every deputy preſides in his turn. When the votes happen to be equal, the ſtadtholder has a deciſive voice. The buſineſs of this council conſiſts in preparing eſtimates, finding out ways and means for raiſing the public revenues, and other matters neceſſary to be laid before the States-General.

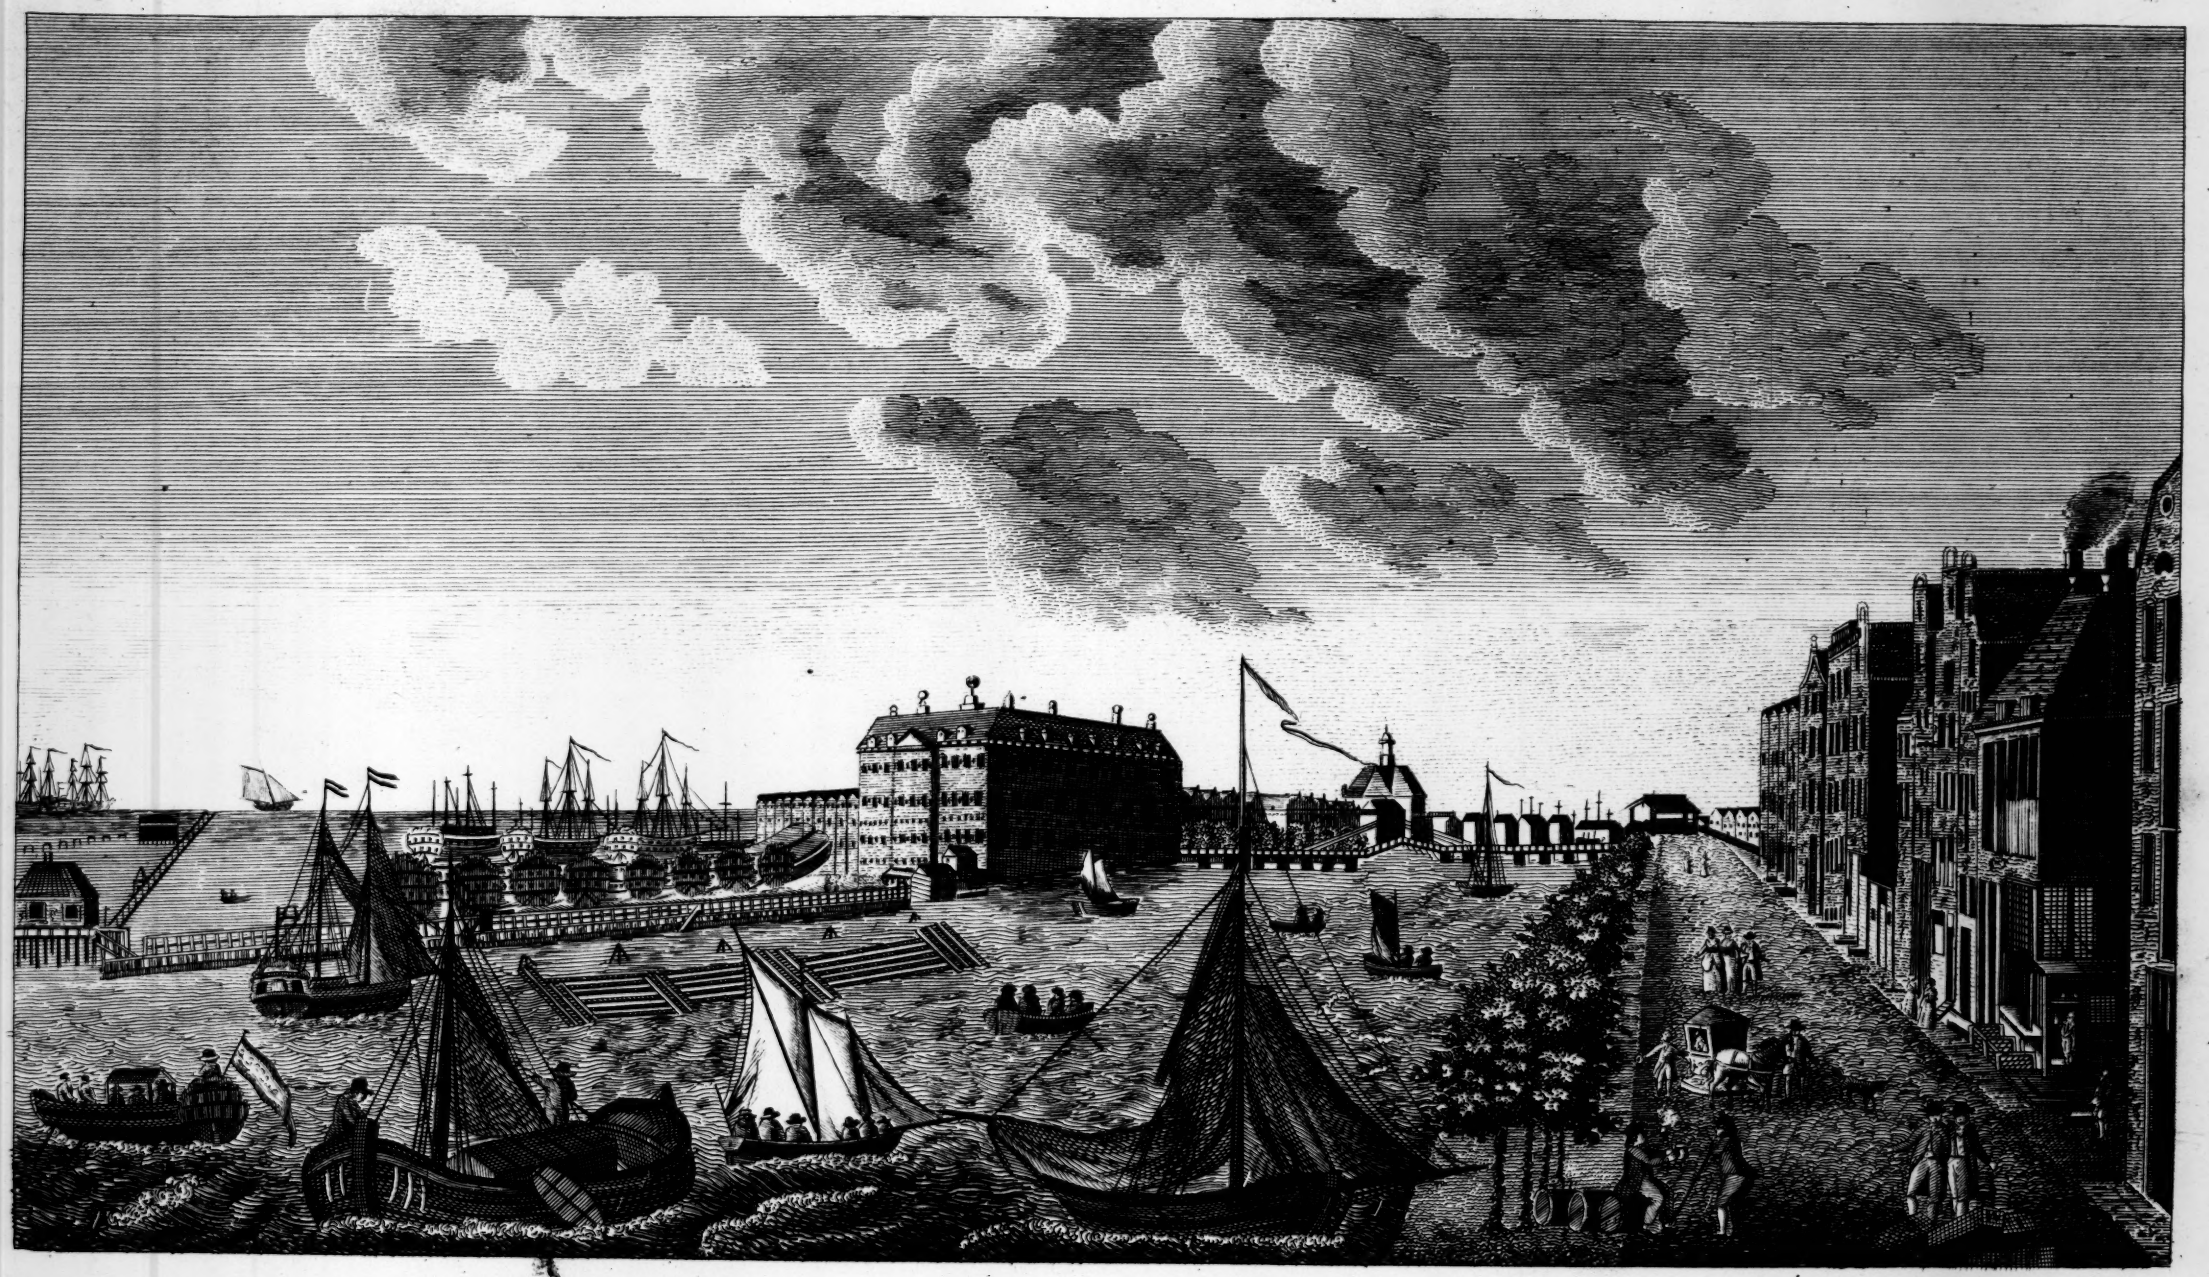
The chamber of accounts is ſubordinate to theſe two bodies, which is likewiſe compoſed of provincial deputies, who audit all public accounts. The admiralty forms a ſeparate board, and the executive part of it is committed to five colleges in the three maritime provinces of Holland, Zealand, and Frieſland. In Amſterdam, which takes the lead in all public adminiſtrations, the magiſtracy is lodged in thirty-ſix ſenators, who are choſen for life; and every vacancy among them is filled up by the ſurvivors. The ſame ſenate alſo elects the deputies to repreſent the cities in the province of Holland, in which the people neither chooſe their repreſentatives nor their magiſtrates.

The power of the ſtadtholder is very limited, except when he appears at the head of an army. He is indeed preſident of the ſtates of every province, and can, by his influence, procure ſuch deputies to be ſent to the aſſembly of the States-General as are friends to his intereſt, and may change the deputies, magiſtrates, and officers, in every province and city. To his office are annexed certain prerogatives, which vary in different provinces; but they may all be changed by the authority of the States-General. The appointment of the ſtadtholder from the States is 100,000 guilders, or 9,500l. ſterling, beſides which he has ſeveral principalities and large eſtates of his own.

The States of the provinces are ſtyled Noble and Mighty Lords, but thoſe of Holland Noble and Moſt Mighty Lords; and the States-General, High and Mighty Lords, or, the Lords the States-General of the United Netherlands, or, their High Mightineſſes.

Juſtice is ſaid to be no-where diſpenſed with more impartiality than in this country. Every province has its tribunal, to which, except in criminal caſes, appeals lie from all the petty and country courts. The ſtadtholder has the power of pardoning condemned malefactors.

In the eighth century, chriſtianity was firſt introduced into the Netherlands by St. Winifred. After that period, Popery continued to be preferred till the Reformation, when many of the people embraced Proteſtantiſm; which giving umbrage to the king of Spain, he iſſued orders to puniſh with death all thoſe whom the church of Rome declared heretics. This occaſioned the total alienation of the ſeven Dutch provinces, the eſtabliſhed religion of which, at this time, is the Preſbyterian or Calviniſm; but all perſuaſions and ſects are tolerated; and the inhabitants of Holland live together as citizens of the world; their



A Perspective View of the ADMIRALTY OFFICE DOCK YARD STOREHOUSES &c. at Amsterdam

their differences in opinion make none in affection, and they are aſſociated together by the common ties of humanity and the bonds of peace, under the protection of the laws of the ſtate, with equal encouragement to arts and induſtry, and equal freedom of ſpeculation and inquiry. The Papiſts and Jews are very numerous; none but Preſbyterians are admitted into any office or poſt in the government, except the army.

The language of theſe provinces is Low Dutch: it is compounded of the Teutonic, or ancient German, with ſeveral French and Latin words The ſound of this langnage, to thoſe who are ignorant of it, is harſh and unpleaſing; but this is greatly ſoftened by the accent and pronunciation of the more learned and polite. Engliſh and French are ſpoken by the higher ranks of the people. Many of the Dutch have diſtinguiſhed themſelves by their learning, and ſome even by their wit and ingenuity. They are famous for controverſial divinity, which at one time inſinuated itſelf ſo much into the ſtate, that it had nearly proved fatal to the government. They boaſt of excellent writers in all branches of medicine, and numerous commentators upon the claſſics. Their Latin poems and epigrams are very common, and, about the year 1747, Van Haaren publiſhed ſome poems in favour of liberty. In the other departments of literature, the Dutch publications are mechanical, and ariſe chiefly from their employments in the church, univerſities, or ſtate. The city of Haarlem diſputes the invention of printing with the Germans; and the magiſtrates keep in their town-houſe the firſt book printed by Coſter, about the year 1440. Among the principal of the Dutch writers, are, Eraſmus, Grotius, Boerhaave, Grævius, Burmann, and Van Haaren.

In the United Netherlands, there are five univerſities, viz. Leyden, Utrecht, Groningen, Harderwicke, and Francker. Leyden is the oldeſt and largeſt in theſe provinces, and was founded in 1575. It enjoys many privileges, has a library well furniſhed, particularly with manuſcripts; a phyſic-garden ſtocked with all kinds of plants, many of which have been brought from the Cape of Good Hope and the Eaſt-Indies; an anatomy-hall, and an obſervatory. The profeſſors, who are uſually men of eminence, read public lectures four times a week, gratis; but every perſon who attends a courſe of private lectures, which laſts a whole year, pays about three guineas: the lectures are always in Latin. The profeſſors wear gowns only when they preſide at public diſputations, read public lectures, or meet in the ſenate: their ſalaries are from one to two hundred pounds per annum. The ſtudents do not lodge in the univerſity, but where they pleaſe in the town: they have no diſtinct habit, and all wear ſwords. The univerſity of Utrecht was founded in 1636, and is in a very flouriſhing ſtate, though it does not enjoy the privileges of moſt other univerſities, being entirely ſubordinate to the magiſtrates of the city. The number of ſtudents are computed at 2000. The univerſity of Groningen was founded in 1615, and well endowed out of the revenues of the ſuppreſſed monaſteries. The univerſity of Harderwicke was only a *Schola illuſtris* till 1648, when it acquired its preſent title. The univerſity at Francker was founded in the year 1585, and has a fine phyſic-garden. The external appearance of theſe univerſities is rather mean, and the buildings old; but theſe defects are amply compenſated by the variety of ſolid and uſeful learning taught in them.

In theſe univerſities, no oaths or religious teſts are impoſed; ſo that Roman Catholic parents, and even Jews, ſend their children here with as little ſcruple as Proteſtants. Theſe ſeminaries of learning have each three or four divinity profeſſors, as many of phyſic, and two or three of law; beſides others of hiſtory, language, and eloquence, or the belles lettres; and others of philoſophy, mathematics, the Greek and Roman antiquities, and the Hebrew and Oriental languages. There are abundance of youth, of the principal nobility and gentry, from moſt countries in Europe, at theſe ſeminaries of literature; and, as every one may live as he pleaſes, without being obliged to be profuſe in his expences, or ſo much as quitting his night-gown for weeks or months together, foreigners of all ranks and conditions are to be ſeen here.

At theſe ſeats of learning, the force of example is ſtrikingly exhibited; for frugality in expence, order, a compoſed behaviour, attention to ſtudy, and aſſiduity in every thing, being the characteriſtics of the natives, ſtrangers who continue among them ſoon adopt their manners and method of living. And, though the ſtudents are under no reſtraint, yet they are in general remarkable for their ſobriety and good manners, and the diligence and ſucceſs with which they apply themſelves to their reſpective ſtudies.

Amſterdam is the capital of all the United Netherlands. Its ſituation is on the river Amſtel, and an arm of the ſea called Wye. It is in 52 deg. 20 min. north lat. and 4 deg. 30 min. eaſt long. and erected in a moraſs, on ſtrong and extenſive piles, in the form of a creſcent. The ſtadthouſe alone hath upwards of 130,000 ſtrong piles of wood for its foundation.

The city of Amſterdam, next to London, is thought to be the moſt extenſive city in Chriſtendom. It is one of the greateſt trading ports, and not perhaps inferior to any city for riches. It is ſurrounded with brick walls, and a large ditch, and the gates are built with free-ſtone. The walls are high, kept in good repair, and flanked with twenty-ſix baſtions.

The houſes of Amſterdam, in general, are handſomely built, either with brick or ſtone. The ſtreets are ſpacious, well paved, embelliſhed with trees, and have canals paſſing through them. Here are eleven Dutch Calviniſts, one high Dutch, two French, and three Engliſh churches; but only the Calviniſts have the privilege of uſing bells. The Roman Catholics have twenty ſeven chapels, and a kind of cloiſter, the nuns of which, however, are allowed to go abroad, and to marry if they pleaſe. The Jews, Arminians, Anabaptiſts, &c. have likewiſe places of worſhip.

This city has a great ſhare not only of the trade carried on in Europe, but in all the reſt of the world; and in particular, it is in poſſeſſion of one half of that vaſt commerce carried on by the Dutch to the Eaſt-Indies, and governs the whole.

This city cannot properly be ſaid to be adorned with any ſquares: the principal place ſo called is the dam, which is very irregular, and has no capital building but the ſtadthouſe, which is a noble oblong edifice of free-ſtone, 282 feet in length, 235 in breadth, and 116 in height.

The new church of St. Catherine is a magnificent edifice, and contains many curious pieces of ſculpture, painted windows, &c.

The admirality houſe is an old building, having been formerly a nunnery. The arſenal is a fine ſtructure, 200 feet long and 22 broad. Near the arſenal is the dock, which is 508 feet in length, and has the ſtore-houſes, ſhip carpenters houſes, &c. contiguous. The Eaſt-India Houſe is a very large building, and contains a prodigious quantity of various articles. The India company hath likewiſe a magazine or arſenal independent of that juſt mentioned.

Amſterdam contains many hoſpitals, which together maintain and relieve great numbers of both ſexes. Beſides theſe, here are many places where people may have diet and lodging for life, on advancing a certain ſum of money, which is not very conſiderable. At many parts of the city poor boxes hang on chains, being locked up and ſecured by the overſeers of the poor, who every quarter diſtribute the money. The play-houſes pay half their profits to the uſe of the poor. All who entertain people at fairs are obliged to contribute a third of their profit;

and all who paſs through pay a penny for the ſame purpoſe.

The number of inhabitants is computed at about two hundred thouſand, of which a great part are Papiſts and Jews. The greateſt diſadvantages this city labours under are the want of good air and water.

Rotterdam is ſituated at the conflux of the Maes and Rotter, from the latter of which, and Dam, its name is formed. It is 12 miles from the Hague, and 28 from Amſterdam. The ſtreets are ſpacious, adorned with lofty trees and beautiful canals; by ſome of the laſt of which ſhips of the greateſt burden are brought into the very heart of the city. Over the Maes, which is very broad, is a bridge, on which is placed a braſs ſtatue of Eraſmus. The Haaring-Vliet, and the Boom Quay, are noble ſtreets; the latter lies along the Maes; and on one ſide has a magnificent row of trees and houſes, or rather palaces, extending above half a mile; and on the other the river, where ſhips are continually ſailing up and down, or at anchor. The principal buildings in the town are the exchange, the Eaſt and Weſt-India houſes, the bank, the arſenal, and the great church, or that of St. Laurence.

Leyden is one of the largeſt, pleaſanteſt, and moſt magnificent cities in Holland. It is ſituated ſix miles eaſt from the ocean, and 19 ſouth of Amſterdam. It was erected on the ancient channel of the Rhine, which paſſes through, interſects, and divides it into ſeveral iſlands, that meet again about the white Gate. It has 8 gates, 24 wards, ſubdivided into 90 leſſer parts, 50 iſlands, of which 31 may be ſailed round by boats, 180 ſtreets, 145 bridges, and 42 towers on the walls. The ditches are broad, deep, and circumſcribed by a quickſet hedge. The eſplanade is adorned with rows of trees, and has the rampart on one ſide, and gardens or meadows on the other. The houſes are magnificent and neat, the ſtreets broad and clean, and the canals regular and agreeable. In the middle of the town is a round ſtrong tower, called the Burgh, which meaſures 610 feet in circumference, and has an aſcent of 50 ſteps, and a fine proſpect from its ſummit. The great church is a noble ſtructure, with a lofty roof, large windows, and three rows of elegant pillars on each ſide of the choir. This, as well as the other churches, contains ſeveral remarkable monuments, and other curioſities. Among the reſt, in the church of Notre Dame, is the monument of the celebrated Joſeph Scaliger. Here are many hoſpitals, which are kept with that remarkable neatneſs peculiar to the Dutch. The orphan-houſe only, maintains 900 children. The ſtadthouſe is a capacious building, with a handſome ſtone front. In the burgo-maſter's chamber is a fine piece of painting, by Luke of Leyden, repreſenting the Laſt Day of Judgment.

The univerſity belonging to this city is its greateſt glory. It was founded, A. D. 1573, by the ſtates-general, as ſome recompence to the inhabitants for the great hardſhips they had undergone, and loſſes they had ſuſtained, when they were beſieged by the Spaniards.

Utrecht is a handſome, large, and rich city, ſituated on the ancient Rhine. The principal ſtreets are cut through with canals, two of which run through the whole city, namely, the Vaert, and the new Gracht, over which there are thirty-five bridges. Theſe are the principal canals of the town, and the buildings on the banks of the new Gracht are magnificent. The market-place is very large, and the centre of ſeveral handſome ſtreets. The houſes are of brick, and many of them ſtately. Without the town there are beautiful rows of trees, to which the Engliſh have given the name of the Mall, by reaſon of their having ſome reſemblance to St. James's Park. There is a public library, well ſtocked with books in all branches of learning. The town-houſe is a very noble building. The painters' hall abounds with fine pieces; they have alſo a phyſic-garden, but of no great note. Utrecht gave birth to pope Adrian VI. whoſe houſe they always ſhow to foreigners, and to the celebrated Ann Mary Schurman, ſo admired in the laſt century for her learning; it is eighteen miles S. S. E. of Amſterdam.

The Hague, though but a village, is one of the moſt conſiderable places in Holland, and is ſaid to contain about 40,000 inhabitants: it is exceedingly beautiful, and ſituated upon the higheſt ground in the whole country, ſo that the air is more ſalutary than that of the other cities. It has neither gates nor walls, but is ſurrounded by a moat, over which there are a number of draw-bridges; and, being the reſidence of the ſtadtholder, it is likewiſe that of foreign miniſters, and the reſort of all perſons of diſtinction who viſit Holland. The ſtreets and ſquares are ſpacious, particularly de Plaats, which is an open, airy place, in form of a triangle, and adorned with elegant buildings. An eminence, called the Vyverberg, is laid out into ſeveral fine ſhady walks, and, at the bottom, is the Vyver, a large baſon of water. But the moſt celebrated part of the Hague is the Voorhout, which conſiſts of a mall, and three ſpaces on each ſide for coaches, the whole being in much the ſame taſte as St. James's-Park. Here people of diſtinction take the air in their coaches.

Middleburg is at preſent a large and handſome city, and has the firſt ſeat in the aſſembly of the ſtates of Zealand. The town-houſe is a magnificent building, ornamented with a great number of ſtatues of the comtes and comteſſes of Holland and Zealand. The fortifications of Middleburg are very ſtrong and regular, having been much augmented by the Dutch ſince they became maſters of it. They have eight gates, and twelve baſtions to defend the walls and ramparts, with large and deep ditches filled with water; beſides which its ſituation is ſuch as to enable the inhabitants to lay the country about it under water when they pleaſe. The number of inhabitants is about 26,000.

Leuwarden, the capital of Friefland, ſtands ſixty miles north-eaſt of Amſterdam. It is a large, well-built, and populous town: the ſtreets are clean, the houſes ſplendid, the bridges well paved, and the gardens pleaſant: the churches, governor's palace, and the ſenate-houſe, are fine ſtructures. This city and Francker chooſe their own magiſtrates.

Groningen, twenty-ſeven miles from Leuwarden, and eighty from Amſterdam, is the capital of the province of the ſame name. The town is large and populous, being the ſeat of the high colleges, containing twenty-ſeven ſtreets: here are many fine houſes, beſides churches, three ſpacious market-places, and ſeveral public ſtructures. Ships of conſiderable burden can come up to this city, by which means it enjoys a pretty good trade.

Deventer, the province of Overyſſel, ſtands forty-four miles from Utrecht: it is a neat, populous, well-built, and ſtrongly-fortified city, containing ſeveral churches belonging to different ſects. Five annual fairs are held here. Along the river ſide is a fine quay, adorned with rows of trees.

Nimeguen, in the province of Guelderland, is fifty-two miles diſtant from Amſterdam. It is a large ancient city, ſtrongly fortified, and pleaſantly ſituated. On the eaſt ſide of it ſtands an old caſtle, and it alſo contains ſeveral churches belonging to different ſects. The peace between the French and confederates was concluded here in 1678.

Amersfoort, in the province of Utrecht, ſeventeen miles diſtant from the city of that name, is an ancient and large town, but of no great ſtrength, being commanded by a neighbouring hill. The buildings are in general very neat. They have three churches here, one of which is a large and ſtately fabric. They have

have likewiſe a public ſchool, where ſeveral eminent perſons have had their education.

There are but few natural and artificial curioſities in theſe provinces. In Overyſſel, there are ſtones, the enormous ſize of which cauſe an equal aſtoniſhment in the ſpectator with thoſe of Stonehenge upon Saliſbury-Plain; and near Maeſtricht, under a hill, there is a ſtone quarry, which is worked into a kind of ſubterraneous palace, ſupported by pillars twenty feet high. In Frieſland, they have a ſpecies of bituminous earth, that takes fire in a ſurpriſing manner: and, in the ſixteenth century, according to ſome hiſtorians, burnt the length of two leagues before it could be extinguiſhed. Among the chief artificial curioſities may be placed the prodigious dykes, ſeventeen ells thick, with the mounds and canals, made to protect them from thoſe dreadful inundations from which they ſuffered greatly in the laſt century: theſe ſtupendous works excite the admiration of every beholder. Several muſeums, containing valuable antiquities and curioſities, are to be found in this country, particularly in the univerſity of Leyden, where is to be ſeen a ſhirt made of the entrails of a man; alſo two Egyptian mummies, being the bodies of two princes of great antiquity, with all the muſcles and tendons of the human body, curiouſly ſet up. In the city of Nimeguen are many Roman antiquities; and, in the church at Gouda, there are ſome exquiſite paintings upon glaſs. At Saardam (famous for being the place where Peter the Great ſerved his apprenticeſhip to ſhip-building, and laboured at that trade) the town-houſe is adorned with paintings; and there is a remarkable clock and dial, which coſt 150,000 guilders.

The taxes in theſe provinces are ſo heavy, eſpecially in Holland, that it is not without reaſon that a certain author aſſerts, that the only thing that has eſcaped taxation there is the air they breathe. Thoſe taxes conſiſt of an almoſt general exciſe, a land-tax, a poll-tax, and hearth-money, ſo that the ordinary revenues of the republic are computed at between two and three millions ſterling annually. Out of 100 guilders, the province of Holland contributes 58, and, conſequently, above one-half of the whole public expences. For the encouragement of trade, the duties on goods and merchandize are ſaid to be exceeding low. Notwithſtanding the number and greatneſs of the taxes, every province is ſaid to labour under very heavy debts, eſpecially Holland, and the public credit is not in the moſt flouriſhing condition.

With reſpect to their land-forces in time of peace, they ſeldom exceed 40,000, and very often fall ſhort of that number. They employ a great many foreigners, eſpecially Swiſs and Scots, in their ſervice; and, in time of war, hire whole regiments of Germans. The chief command of the army is veſted in the ſtadtholder, under whom is the field-marſhal-general. In 1756, the expences of the army only amounted to 9,765,004 guilders. No nation in the world can fit out a more formidable fleet than the Dutch, having always vaſt quantities of timber prepared for building of ſhips, and ſuch numbers of ſhip-carpenters and mariners: however, in time of peace, they uſually have no more than thirty in commiſſion, for the protection of their trade in the Mediterranean, and to convoy their homeward-bound Indiamen, &c. By the laſt accounts, their navy conſiſts of one ſhip of 76 guns, three of 70, four of 68, five of 60, eight of 56, four of fifty, five of 44, nine of 40, and ten of 36 (forty-nine in all) beſides veſſels of inferior force: they have alſo many ſhips upon the ſtocks.

Every province being a ſovereignty in itſelf, has conſequently the right of coinage; but all the money muſt be of the ſame intrinſic value. The coins are as follow: a deut, worth about half a farthing; a grot Flemiſh, two farthings; a ſtiver, equal to a penny Engliſh; a dubbekin, to two-pence; a ſchilling, to ſix-pence; but there are alſo ſchillings worth only five-pence halfpenny; a guilder, tweny-pence; a thaler, or dollar, thirty-pence; a lowen-thaler, or lion-dollar, forty-two pence; a rix-thaler, or rix-dollar, fifty-pence; a ducatoon, ſixty-three pence. The gold ducat is worth about eight ſhillings and eight-pence; and the ruyder is almoſt equal to a guinea. Beſides theſe, there are half and three guilder pieces, and half and quarter rix-dollars.

One of the moſt ancient as well as powerful orders of Europe was that of the Teutonic knights, which is now divided into two branches; the firſt for Papiſts, and the other for Proteſtants. This branch have a houſe at Utrecht, where they tranſact their buſineſs. The enſign is a croſs pattie, enamelled white, ſurmounted with another, black; above the croſs is a ball twiſted, white and black. It is worn pendant to a broad black watered ribband, which is worn about the neck. The ſame croſs is embroidered on the left breaſt of the upper garment of each knight. The nobles of Holland, if they propoſe a ſon to be a knight, enter his name in the regiſter, and pay a large ſum of money to the uſe of the poor maintained by the order, and the candidate ſucceeds in rotation, if he brings with him proof of his nobility for four generations on the father's and mother's ſide.

With reſpect to the arms or enſigns armorial of the Seven United Provinces, or the States of Holland, they are, Or, a lion, gules, holding with one paw a cutlaſs, and with the other a bundle of ſeven arrows cloſe bound together, in alluſion to the ſeveral confederate provinces, with the following motto, *Concordia res parvæ creſcunt*, i. e. "Small things increaſe by concord."

The hereditary ſtadtholder, William V. of Orange-Naſſau, captain-general and admiral of the Seven United Provinces, was born in 1748, married in 1767, the princeſs Frederica of Pruſſia, born in 1751. Their children are, Frederica-Louiſa, born 1770; William-Frederic, hereditary prince and count of Buren, born in 1772; William-George, born in 1774. Wilhelmina-Carolina, born in 1743, and married to the prince of Naſſau-Weilburgh, is ſiſter of the ſtadtholder.

The hiſtory of the United Provinces will be given in that of the Auſtrian and French Netherlands.

CHAP XVII.

THE AUSTRIAN AND FRENCH NETHERLANDS.

Situation, Extent, Boundaries, Diviſions, Climate, Soil, Productions, Mountains, Mines, Rivers, Commerce, Manufactures, Cities, Inhabitants; their Manners, Cuſtoms, Religion, Language, Learning, Government, Revenues, Forces, Hiſtory.

THESE Netherlands are ſituated between the 2d and 7th deg. eaſt long. and between the 49th and 51ſt of north lat. being 200 miles in length, and as many in breadth, containing the following provinces, viz. 1. Brabant. 2. Antwerp. 3. Malines. 4. Limburg. 5. Luxemburg. 6. Namur. 7. Hainault. 8. Cambreſis. 9. Artois. 10. Flanders.

Theſe provinces are bounded by the United Netherlands on the north; by Germany on the eaſt; by Lorrain, Champagne, and Picardy in France, on the ſouth; and by another part of Picardy, and the Engliſh ſea, on the weſt. This country belongs to the Auſtrians, French, and Dutch, and the particular provinces and towns appertaining to each ſtate will be found in the following diviſions.

1. *Province*

1. *Province of Brabant.*

Subdiviſions.	*Chief Towns.*	
Dutch Brabant	Boiſleduc	N.
	Breda	N.
	Bergen-op-Zoom	N.
	Grave, N. E.	
	Lillo	N. W.
	Steenbergen	N. W.
Auſtrian Brabant	Bruſſels, E.	
	Louvain	In the middle.
	Vilvorden	In the middle.
	Landen	In the middle.

Antwerp and Malines are provinces independent of Brabant, though ſurrounded by it, and ſubject to the Houſe of Auſtria.

4. *Province of Limburg, S. E.*

Chief Towns	Limburg, ſubject to Auſtria.	
	Maeſtricht	Subject to the Dutch.
	Dalem	Subject to the Dutch.
	Fauquemont, or Valkeuburg	Subject to the Dutch.

5. *Province of Luxemburg, S. E.*

Auſtrian Luxemburg	Luxemburg.	
French Luxemburg	Thionville	S. E.
	Montmedy	S. E.

6. *Province of Namur, in the middle, ſubject to Auſtria.*

Chief Towns	Namur, on the Sambre and Maeſe.	
	Charleroy, on the Sambre.	

7. *Province of Hainault.*

Auſtrian Hainault	Mons	In the middle
	Aeth	In the middle
	Enguien	In the middle
French Hainault	Valenciennes	S. W.
	Bouchain	S. W.
	Candé	S. W.
	Landrecy	S. W.

8. *Province of Cambreſis, S. W.*

Subject to France	Cambray.	
	Crevecœur, S. of Cambray.	

9. *Province of Artois, S. W.*

Subject to France	Arras, S. W. on the Scarpe.	
	St. Omer, E. of Boulogne.	
	Aire, S. of St. Omer.	
	St. Venant, E. of Aire.	
	Bethune, S. E. of Aire.	
	Terouen, S. of St. Omer.	

10. *Province of Flanders.*

Dutch Flanders	Sluys, N.	
	Axel, N.	
	Hulſt, N.	
	Sas Van Ghent, N.	
Auſtrian Flanders	Ghent, on the Scheldt.	
	Bruges	N. W. near the ſea.
	Oſtend	N. W. near the ſea.
	Newport	N. W. near the ſea.
	Oudenarde, on the Scheldt.	
	Courtray	On the Lys.
	Dixmude	On the Lys.
	Ypres, N. of Liſle.	
	Tournay, on the Scheldt.	
	Menin, on the Lis.	
French Flanders	Liſle, W. of Tournay.	
	Dunkirk, on the coaſt, E. of Calais.	
	Douay, W. of Arras.	
	Mardike, W. of Dunkirk.	
	St. Amand, N. of Valencien.	
	Gravelines, E. of Calais.	

In the inland parts of theſe Netherlands, the climate is much more ſettled than ours, but their winters are uſually more ſevere. The air is better than that of the United Provinces, except on the coaſts of Brabant and Flanders, where it is exceedingly unwholeſome. The ſoil differs according to the ſituation; for in ſome parts it is a deep rich mould, while others exhibit nothing but barren ſands. The animal productions of theſe are the ſame as in the United Provinces; and the vegetable conſiſt in corn, fruits, garden-ſtuff of all kinds, paſture, and prodigious quantities of flax, in the cultivating of which the inhabitants have rendered even the barren parts of their country profitable. This country in general is remarkable for breeding black cattle; and the province of Luxemburg abounds in corn, great part of which is ſent to foreign markets.

In the province of Limburg, there are a few inconſiderable mountains; excepting which, the whole country is a flat, interſperſed with ſome riſing hills; which are generally covered with wood. Formerly there were ſeveral very large foreſts in this country, of which Ardennes was the principal, but now great part of them are turned into arable lands.

In the provinces of Luxemburg, Limburg, and Liege, are mines of iron, copper, lead, brimſtone, and quarries of various kinds of marble; and in the province of Namur there are coal-pits, and a ſpecies of bituminous fat earth proper for fuel, with a great plenty of foſſil nitre.

The principal rivers are the Maeſe, Scheldt, Sambre, Demer, Dyle, Nethe, Geet, Sanne, Ruppel, Lis, Scarpe, Deule, and Dender. The moſt conſiderable of theſe, and into which all the reſt fall, are the Maeſe and the Scheldt. The Scheldt has already been mentioned in the United Provinces. The principal canals are thoſe of Bruſſels, Ghent, and Oſtend. The firſt of theſe extends to the Scheldt, which is fifteen miles.

With reſpect to the trade and commerce of the Auſtrian Netherlands, we have to obſerve, that in ancient days theſe countries were the centre of the woollen manufactures, which are now the manufactures of Great-Britain, originally derived from the Flemings, whoſe country was thereby rendered immenſely rich and populous.

One of the principal branches of manufacture at preſent carried on in theſe provinces, is the lace known by the name of bone-lace, of which the fineſt and beſt of the kind in Europe is made at Bruſſels. The variety of it is very great; and we are told of lace made in that part of the country, which has been ſold at from 30l. to 50l. ſterling a yard: by which extraordinary improvements they have ſo far ſurpaſſed the French and Italians, and even the Venetians themſelves, that thoſe laſt have very little trade for their lace, though they were once juſtly famed for the fineſt in the world. The principal places for this manufacture are, Mechlin, Bruſſels, Louvain, Valenciennes, Antwerp, and the adjacent towns; and it employs a great number of people, eſpecially women and children.

Fine thread is another of their manufactures, the great quantity of fine lace cauſing a great demand for fine thread, as their linens require a proportional quantity of linen yarn; and both theſe together conſtitute another manufacture of no little concern to the people.

Their manufacture of linen is very conſiderable, and conſiſts of two ſorts chiefly, viz. cambricks and lawns. Their cambricks are made ſo fine, as to have been ſold at from twenty to thirty ſhillings per yard in theſe countries. They were formerly made only in the provinces of Artois and Cambreſis, from which laſt they had their name of Cambricks; but the demand for them being ſo great of late years, the whole country has been ſcarcely large enough to carry on this

this manufacture, eſpecially that part of it bordering on France, together with the great cities of Douay, Liſle, Mons, Ypres, Ghent, and Bruges, and all the cities upon the Lower Scheldt; which manufacture alſo is of a magnitude greater than can be eaſily repreſented.

Another manufacture in which the Flemings are employed, is that of the woollen, which includes the tapeſtry made at Arras, Dourlens, Douay, and the adjacent country; alſo ſome druggets and fine ſtuffs, made at Liſle, and in the country near it: moſt of which are, however, conſumed amongſt themſelves, though ſome go to France.

The exports of their manufactures are ſo conſiderable, that very good judges have eſtimated them at no leſs, in fine ſiſter-thread, bone-lace, and linen (including their lawns and cambricks) than to the value of two millions ſterling a year, from thoſe provinces called the Auſtrian Netherlands, including part of the conquered provinces, as well as the diſtrict called Walloon Flanders, and the province of Artois. Nor in this account are there included their exports of tapeſtry or woollen ſtuffs; of all which they export large quantities into France and Germany.

The Flemings have of late years much improved in the manufacture of ſilk; for they not only make at preſent ſufficient for their own uſe, but for exportation. Thoſe ſilks they make now chiefly at Liſle, Bruſſels, and Antwerp; and this manufacture was greatly encouraged by the public, inſomuch that the Flemings, in the year 1725, began to caution the Eaſt-India Company, then attempted to be eſtabliſhed at Oſtend, to bring no more ſilks into the country, leſt it ſhould prove the means to ſupplant and deſtroy their own manufacture of ſilk, which employed ſo many thouſands of their people.

Ship-building is a great article of trade; not that the Flemings, who have but two ports, can be ſuppoſed to build abundance of ſhips; but by ſhips here is meant only galliot, hoys, lighters, bilanders, and ſuch like veſſels, all of which they call ſchips. Of thoſe they have ſuch great numbers, that there muſt be abundance of hands employed in building them, and eſpecially in the conſtant repairing and refitting, which they are always wanting. In time of war it has been frequent to have ſeven or eight hundred of them brought together for carrying proviſion, military ſtores, ammunition, and the like; and it is likely that they have not fewer than twenty thouſand of this ſort of veſſels in the ſeveral provinces. All thoſe are built within themſelves; and it is no little trade they are obliged to carry on, for the ſupply of deals, timber, planks, maſts, yards, anchors, iron work, and other materials for this buſineſs; beſides pitch, tar, oil, hemp, &c.

When theſe things are conſidered, we need not wonder how all this great multitude of people, who inhabit theſe provinces, are employed and maintained. The carrying on ſuch valuable manufactures muſt employ innumerable hands; and the quantity of goods they export muſt bring great returns home, as well in goods as money, by which the Flemings are far from being poor. On the contrary, they are generally well circumſtanced, there being but few hands among them but what can earn their bread; the very children, even from five years old, being ordinarily employed.

Some Roman monuments of temples and other buildings are found in many parts. In 1607 ſixteen hundred gold pieces were found at Dendermonde, and proved to be a collection of ancient medals of Antoninus Pius, Aurelius, and Lucius Verus. The other curioſities conſiſt chiefly in their public edifices and churches, in many of which the paintings are exquiſitely fine. Formerly there was not one of theſe but deſerved a particular deſcription, and volumes have been filled with this ſubject only.

At preſent their noble fortifications, pubic buildings, and trade, are greatly gone to decay. The following are now the moſt conſiderable.

Bruſſels gives name to the territory, and is the capital not only of Brabant but of the Netherlands, though only the ſecond in rank. This city is well built and populous, and carries on a conſiderable trade all over Europe in camblets, laces, and tapeſtries, which are manufactured here. The public buildings in general, particularly the palaces and courts of the ſeveral princes, counts, and other perſons of diſtinction, together with the churches and cloiſters, are large and magnificent. The inns or eating-houſes here are equal to any in the world: a ſtranger may dine any time between twelve and three, on ſeven or eight diſhes, for leſs than a ſhilling Engliſh. The wines alſo are very good and cheap; and, for ſixpence Engliſh by the hour, you may have a coach to carry you to any part of the city.

Ghent, is the capital of Flanders, and one of the largeſt cities in Europe, being ſeven miles in compaſs within the walls. It abounds in monaſteries, churches, hoſpitals, and market-places. The ſtadthouſe and cathedral are grand ſtructures; and under the latter is a noble crypta, or ſubterraneous church.

Antwerp is a large well built city, containing twenty-two ſquares, and above two hundred ſtreets, which are all exceedingly ſpacious. Moſt of the houſes are of free-ſtone, very high, with courts before, and gardens behind. The churches are exceedingly magnificent, particularly the cathedral, which has one of the fineſt ſteeples in the world: moſt of the pictures with which they are adorned are painted by Rubens, and Quintin Maſſeys, the famous blackſmith. The ſtadthouſe is very elegant, as is alſo the Exchange, which coſt the city 300,000 crowns building. This town, from being once the emporium of the European continent, is now almoſt deſtitute of trade; the Dutch, ſoon after they threw off the Spaniſh yoke, having ſunk veſſels loaded with ſtone in the mouth of the Scheldt, and thereby ſhut up the entrance of that river to ſhips of large burden: the reader need not be informed by what motives this avaricious people were inſtigated by that cruel act.

Louvain, the capital of the Auſtrian Brabant, was formerly exceeding populous, but now there are meadows, vineyards, and gardens within the walls. The public buildings are very beautiful, particularly the ſtadthouſe, the church of St. Peter, that belonging to the Jeſuits, and the Engliſh convent for ladies. The great trade once carried on in this city is inconceiveable; but at preſent it is only famous for brewing excellent beer.

The inhabitants of theſe Netherlands are ſuppoſed to amount to about a million and a half, and are diſtinguiſhed by the appellation of Flemings. They are in general a heavy, blunt, honeſt people, and exremely indelicate in their manners. They differ, however, according to the ſituation of the places wherein they reſide. Thoſe which border on France reſemble that people in their behaviour, dreſs, &c. while thoſe who live near Holland imitate the Dutch. The Flemings were known formerly to fight deſperately in defence of their country; they make, however, no great figure at preſent. They are ignorant, and fond of religious exhibitions and pageants.

The eſtabliſhed religion here is the Roman Catholic, but every ſect may live peaceably, and enjoy the free exerciſe of their perſuaſions, though not in a public manner. The inhabitants on the frontiers of Holland ſpeak Dutch; as thoſe who reſide in the provinces ſubject to France uſe a very bad French; the reſt are a mixture between both, and their language is a different dialect of the German from that of the Dutch.

They have three Univerſities, viz. Louvain, Douay, and St. Omer. The firſt was founded in 1426, by John IV. duke of Brabant, and enjoys great privileges, granted to it at different times by the dukes of

that country and the popes. It conſiſts of above forty colleges, and in the hall where the public exerciſes are performed, are three ſpacious rooms, where lectures are read every morning in divinity, law, and phyſic, to which the ſtudents in every college may reſort.

The archbiſhoprics are Cambray, and Malines, or Mechlin; the biſhoprics are, Antwerp, Bruges, Ghent, Tournay, Arras, Ypres, Namur, Ruremonde, and St. Omer.

Very little can be ſaid with reſpect to learning in theſe provinces. The moſt celebrated geniuſes of theſe Netherlands were produced among the Jeſuits, and their works treated chiefly on theology, the civil and canon law, and Latin poems and plays. Strada is celebrated as an excellent hiſtorian and poet. But the Flemings have long excelled in painting and ſculpture, witneſs the works of Rubens and Vandyke; and Fiamingo, or the Flemiſh models for heads, particularly thoſe of children. Their painters and ſculptors form a ſchool by themſelves.

The Auſtrian Netherlands were conſidered as a circle of the empire, of which the archducal houſe, as being ſovereign of the whole, was the ſole director and ſummoning prince. This circle contributed its ſhare to the impoſts of the empire, and ſent an envoy to the diet, but was not ſubject to the judicatories of the empire. At preſent they muſt be conſidered as annexed to France, and under the ſame conſtitution and government.

Theſe revenues aroſe from the demeſne lands and cuſtoms: but ſo much was the trade of Auſtrian Flanders reduced, that they are ſaid not to have defrayed the expence of their government. The French Netherlands brought in a conſiderable revenue to the nation.

The arms of Flanders are, *Or*, a lion ſable, langued gules.

HISTORY OF THE NETHERLANDS.

THE ſeventeen provinces of the Netherlands were anciently called Gallia Belgica, and the greater part of them conquered by the Romans, in whoſe poſſeſſion they continued till the northern nations broke into Italy, and put an end to the weſtern empire. After being deſerted by the Romans, they were poſſeſſed by the Goths, and other northern people, and the country divided into ſmall governments, independent of one another. In this ſtate they continued for ſome years; but at laſt, partly by marriage, and partly by conqueſt, they became annexed to the dominions of the duke of Burgundy.

About the year 1543, the emperor Charles V. united the ſeventeen provinces into one body, and ordered that they ſhould for ever continue under the ſame prince, without being in the leaſt ſeparated or diſmembered. Purſuant to this order, and at the unanimous requeſt of the ſtates of all the provinces, he publiſhed a perpetual and irrevocable edict, by which it was enacted, that in order to keep all thoſe provinces under the ſame prince, the right of ſucceſſion ſhould always take place, both in a right and collateral line, notwithſtanding the common laws of ſome provinces to the contrary. Charles even attempted to incorporate the Netherlands with the Germanic body, and to form them into a circle of the empire, under the the title of the circle of Burgundy, in order to engage the princes of the empire to intereſt themſelves in the preſervation of theſe provinces. But the inhabitants of the Netherlands, always jealous of their liberty, were far from being pleaſed with their incorporation, and when ſummoned to pay their ſhare of the expences of the empire, they refuſed the order; and the German princes, in return, declared they would take no part in the wars of Flanders, but would, for the future, conſider thoſe provinces as no part of the Germanic body.

As Philip of Auſtria and his ſon Charles were both born in the Netherlands, they entertained for theſe provinces that natural affection which moſt men have for their native country; and knowing how remarkably tenacious the inhabitants were of their liberties, and of the privileges granted them by former princes, they took care to preſerve them, and even ſuffered the ſtates, who are the proper guardians of the liberties of the people, to ſhare, in ſome degree, the ſupreme authority with them. Happy had it been for both prince and people, if this generous conduct had been obſerved by ſucceeding princes; but Philip II. ſon to Charles V. had not the ſame affection for the Netherlands; nor did he poſſeſs thoſe generous ſentiments, with which his father laboured to inſpire him. Born in Spain, he had no affection for the country of his anceſtors; and when he removed from the Netherlands to take poſſeſſion of the crown of Spain, he left the government in the hands of a weak woman, aſſiſted by the proud and haughty cardinal de Glanville. This gave occaſion to continual conplaints; but Philip was deaf to their remonſtrances; and, inſtead of making uſe of the mild and moderate meaſures of his anceſtors, he had recourſe to the moſt violent and cruel proceedings. The Spaniards whom he ſent thither, being born and educated under a deſpotic government, jealous of the liberties, and envious of the riches of the people, trampled on their privileges, and treated them like ſlaves.

Exaſperated at theſe proceedings, and preferring death to the loſs of liberty, a general inſurrection enſued, and the inſurgents were headed by the prince of Orange, and the counts Hoorn and Egmont. The reformation of Luther was at that time gaining ground apace in many of the provinces, and all his diſciples joined the malcontents. Alarmed at the progreſs of this rebellion, and determined, if poſſible, to cruſh the reformation in its birth, Philip eſtabliſhed a kind of inquiſition in the Netherlands, and many thouſands of innocent perſons were put to death.

Several battles were fought between the contending parties, in one of which the malcontents were totally defeated, and the counts Hoorn and Egmont taken priſoners and beheaded. The prince of Orange had the good fortune to eſcape, and, retiring into Holland, prevailed upon that and ſeveral of the adjacent provinces to form a league for their mutual defence; and the treaty was accordingly ſigned at Utrecht in the year 1579. And though theſe revolters were at firſt thought ſo deſpicable as to be termed beggars by the court of Spain, yet their enemies ſoon perceived their miſtake: a brave and hardy people, fighting for every thing that is dear to them, are never a deſpicable enemy. Headed by their own princes, and aſſiſted by Elizabeth, queen of England, they defeated their tyrants, and forced the crown of Spain, about the year 1609, to declare them a free people, and they were afterwards acknowledged by all Europe to be an independent ſtate, under the appellation of The United Provinces.

Since that period they have been conſidered as a powerful republic; and during the uſurpation of Cromwell, and the reign of Charles II. their naval force was nearly equal to that of England, and far ſuperior to that of any other power in Europe. When the houſe of Auſtria, which for ſome ages ruled over Germany, Spain, and part of Italy, with which they afterwards continued to carry on bloody wars, was become no longer formidable; and when the jealouſy of the public was excited againſt the Bourbon family, which was favoured by the government of Holland, who had diſpoſſeſſed the prince of Orange of the ſtadtholderſhip; the ſpirit of the people was ſuch, that they revived it in the perſon of the prince, afterwards William III. king of Great-Britain; and during

during his reign, and that of queen Anne, they were principals in the grand confederacy againſt Louis XIV. king of France, whom they at length humbled.

The other provinces of the Netherlands were not ſo fortunate, but were reduced by the duke of Alva to the obedience of Spain, by whom they were, however, in a great meaſure, reſtored to their ancient privileges; every province was allowed its great council or parliament, whoſe concurrence was neceſſary in making laws, or raiſing money for the uſe of the government.

Ten of theſe provinces, generally called the Low Countries, remained in poſſeſſion of the Spaniards, till the duke of Marlborough, general of the allied army, gained the memorable victory of Ramillies, in the year 1706; in conſequence of which, Bruſſels, the capital, and great part of theſe provinces, acknowledged Charles VI. for their ſovereign; and his daughter the late empreſs queen, by virtue of the pragmatic ſanction, enjoyed the poſſeſſion of them till the year 1741, when the French conquered them all, except part of the province of Luxemburg. They were, however, reſtored to their former ſovereign by the treaty of Aix-la-Chapelle, in 1748, the French retaining only Artois, the Cambreſis, part of Flanders, part of Hainault, and part of Luxemburg.

The late differences between the States-General and the emperor of Germany, may probably be attributed to their ſeparation from Great Britain. The emperor complained of a violation of treaties ſubſiſting between the ſtates and his anceſtors, and repreſented to them, that the ſhutting up the Scheldt had long been a ſubmiſſion not obligatory on the Auſtrian Low Countries; which right his Imperial majeſty inſiſting on, a ſhip was ſent out by his order, the captain and crew of which were expreſsly forbidden to ſubmit to any detention or examination from any ſhips of the republic it might meet with on the Scheldt, or to make the leaſt declaration at any of their cuſtom-houſes on that river. This ſhip, with another afterwards ſent, were ſtopt in their paſſage up the Scheldt to Antwerp; which conduct the emperor conſidered as inſulting his flag, and as equivalent to a declaration of war on the part of the republic: he thereupon recalled his miniſter from the Hague, and made the neceſſary diſpoſitions for aſſembling an army of 80,000 men in the Low Countries.

The Dutch, by their manifeſto, pleaded, that by Art. XIV. of the treaty concluded at Munſter, Jan. 30, 1648, it was agreed that the Scheldt ſhould remain ſhut by their High Mightineſſes. They likewiſe referred to ſeveral other treaties in vindication of their conduct, and particularly a convention, reſpecting Art. XVII. of the barrier treaty, ſigned Dec. 22, 1718, in which the ceſſion of the lands and diſtricts pertaining to the poſſeſſion of the Scheldt was ſpecially and expreſsly confirmed and made clear; and inſiſted, that they had, to the great detriment of the republic, fulfilled the engagements they had entered into for the preſervation of the pragmatic ſanction, and had aſſiſted the houſe of Auſtria with all their forces. The manifeſto, among other matters, alſo repreſents, that notwithſtanding their High Mightineſſes had often replied to ſeveral pretences alledged againſt them, it was inſiſted on the part of his Imperial majeſty, in April 1784, that the guardſhip belonging to the republic, which had been ſtationed off Lillo ſince the peace of Munſter, 1648, that is 136 years, ſhould be removed, his majeſty pretending that the Lower Scheldt, as far as Saltingen, belonged to him.

The negotiations between theſe two powers not producing the deſired effect, and the republic avowing their determination to ſupport what they deemed to be their incontrovertible right, great preparations were made for immediate hoſtilities againſt the Dutch; and ſeveral hundreds of the Imperialiſts, with ſome field-pieces, advancing towards the counterſcarp of Lillo, the commanding officer of that place ordered the ſluices to be opened Nov. 7, 1784, which effected an inundation that laid under water many miles of flat conntry around the forts on the Scheldt, to preſerve them from an attack.

A treaty of accommodation was concluded between the parties in the beginning of the year 1786; by which it appears, that the Scheldt is agreed to be open to the emperor for inland navigation, though ſhut towards the ocean in favour of Holland, according to the treaty of Munſter. Each of the contracting parties are at liberty to make what regulations may be thought expedient for carrying on internal commerce. As the imports of the Dutch carried through the Imperial dominions are beyond all compariſon greater than the exports made from the emperor's dominions into thoſe of the United Provinces; conſequently, ſhould any diſpute ariſe in future, the emperor will have an advantage of more than ten to one in his favour. Beſides, the emperor may impoſe what duties he thinks proper on the Batavian veſſels that ſhall ſail through that part of the Scheldt which he commands; and the Dutch, in return, may lay what duties they pleaſe upon the Imperial veſſels ſailing into any part of their territories.

In 1792, the French inſiſted on their right to the navigation of the Scheldt, in prejudice to the claim of the United Provinces; but they were at length obliged to give it up.

Since the commencement of the troubles on the Continent in 1792, a treaty of defenſive alliance (conſiſting of ten articles) has been entered into between the king of Great Britain and their noble and high mightineſſes the States General, "for the good of both parties, and for the maintenance of their general and ſeparate tranquility." And

On the 16th of November, 1792, his Britannic majeſty cauſed to be preſented to the States-General, by his ambaſſador lord Auckland, a declaration, expreſſive of the deſire of the king his maſter, to cement and perpetuate the intimate union eſtabliſhed between the two powers, for the maintainance of their own rights and ſecurity, &c. To which their high mightineſſes returned an immmediate anſwer to the ſame effect.

CHAP. XVIII.

GERMANY.

Situation, Extent, Boundaries, Diviſions, Climate, Soil, Productions, Mountains, Rivers, Mineral Waters, Curioſities, Learning, Religion, Language, &c.

THE empire of Germany is ſituated between 45 and 55 deg. of north lat. and between 5 and 19 deg. of eaſt long. It is about 600 miles in length, and 520 in breadth; and is bounded on the north by the German Ocean, Denmark, and the Baltic; on the eaſt, by Poland and Hungary, including Bohemia; on the ſouth, by Switzerland and the Alps, which divide it from Italy; and on the weſt, by Prance and the Low Countries, from which it is ſeparated by the Rhine, the Maeſe, and the Moſelle.

Germany is divided into nine circles, whereof three are in the north, three in the middle, and three in the ſouth.

The northern circles contain - -	Upper Saxony, Lower Saxony, Weſtphalia.
The circles in the middle - - - -	Upper Rhine, Lower Rhine, Franconia.
The ſouthern circles - - - - - -	Auſtria, Bavaria, Swabia.

1. UPPER

1. Upper Saxony Circle.

Pomerania in the north; chief towns Stettin and Stralſund.

Brandenburgh in the middle, ſubject to its own elector the king of Pruſſia; chief towns Stendel, Berlin, Potſdam, Frankfort, and Cuſtrin.

Saxony Proper, in the ſouth, ſubject to its own elector; chief towns Wittinburg, Bautzen, Gorlits, Dreſden, and Miſſein.

Thuringia landgrave Weſt; chief town Erfort, ſubject to the elector of Mentz.

The duchies of Saxe Meinungen; chief town Meinungen; Saxe Zeits; chief town Zeits: Saxe Altenburg, chief town Altenburg; Saxe Weimar, chief town Weimar; Saxe Gotha, chief town Gotha; Saxe Eiſnach, chief town Eiſnach; Saxe Saalfeldt, chief town Saalfeldt: ſubject to their own dukes.

The counties of Schwartſburg, chief town Schwartſburgh; Belchingen, chief town Belchingen; Mansfeldt, chief town Mansfeldt: ſubject to their reſpective counts.

The duchies of Hall, middle; chief town Hall, ſubject to Pruſſia; Saxe Naumberg, chief town Naumberg, ſubject to its own duke.

The counties of Stolberg, chief town Stolberg; Hohenſtein, chief town Northhauſen.

Principality of Anhalt, chief towns Deſſau, Zerbſt, Bernberg, and Kothen.

Biſhopric of Saxe Hall, chief town Hall.

Biſhopric of Voigtland, chief town Plawen; ſubject to the elector of Saxony.

Duchy of Merſberg, middle, chief town Merſberg; ſubject to the elector of Saxony.

2. Lower Saxony Circle.

Holſtein duchy, north of the Elbe; chief towns Keil, ſubject to Holſtein-Gottorp; Meldorp and Glucſtat, ſubject to Denmark; Hamburg and Lubec, Imperial cities.

Lauenburg duchy, chief town Lauenburg; ſubject to Hanover.

Duchies of Brunſwick Proper, chief town Brunſwick; Wolfenbuttle, chief town Wolfenbuttle; counties of Rheinſtein, chief town Rheinſtein; Blanckenburg, chief town Blanckenburg; ſubject to the duke of Brunſwick Wolfenbuttle.

Duchies of Calenburg, chief town Hanover; Grubbenhagen, chief town Grubbenhagen; Gottingen, chief town Gottingen: ſubject to the elector of Hanover, king of Great Britain.

Lunenburg duchy, chief towns Lunenburg and Zell, ſubject to Hanover.

Bremen and Verden duchies, chief towns Bremen, an Imperial city, and Verden; ſubject to Hanover.

Mecklenburg duchy, chief towns Schwerin and Guſtrow.

Biſhopric of Hilderſheim, chief town Hilderſheim, an Imperial city; ſubject to its biſhop.

Duchy of Magdeburg, chief town Magdeburg; ſubject to the king of Pruſſia.

Duchy of Halberſtadt, chief town Halberſtadt; ſubject to the king of Pruſſia.

3. Westphalia Circle.

North diviſion. County of Embden, or E. Frieſland, ch. town Embden, an Imperial city; ſubject to the king of Pruſſia: counties of Oldenburgh and Delmenhurſt, ch. towns Oldenburgh and Delmenhurſt; ſubject to the king of Denmark; Hoye and Diepholt, ch. towns Hoye and Diepholt; ſubject to Hanover.

Middle diviſion. Biſhopric of Munſter, ch. town Munſter; ſubject to its biſhop: biſhoprics of Paderborn and Oſnaburg, ch. towns Paderborn and Oſnaburg; ſubject to its biſhop: county of Lippe, ch. town Lippe Pyrmont; ſubject to its own count: duchy of Minden and county of Ravenſburg. ch. towns Minden and Ravenſburgh; ſubject to Pruſſia: duchy of Weſtphalia, ch. town Arenſburgh; ſubject to the elector of Cologn: counties of Tecklenburg, ch. town Tecklenburg; Ritberg, ch. town Ritberg; Schawenburg, ch. town Schawenburg; ſubject to their counts.

Weſtern diviſion. Duchy of Cleves, chief town Cleves; ſubject to the king of Pruſſia; duchies of Berg and Juliers, ch. towns Duſſeldorf, Juliers, and Aix; ſubject to the elector palatine: county of Mark, ch. town Ham; ſubject to Pruſſia: biſhopric of Liege, ch. town Liege; ſubject to its own biſhop: county of Bentheim, ch. town Bentheim; ſubject to Hanover: county of Steinfort, ch. town Steinfort; ſubject to its count.

4. Upper Rhine Circle.

Landgraviate of Haſſe-Caſſel, ch. town Caſſel; Heſſe Marpurg, ch. town Marpurg; Heſſe Darmſtadt, ch. town Darmſtadt; ſubject to their reſpective landgraves.

Haſſe Homberg, ch. town Homberg; Haſſe Rhinefeldt, ch. town Rhinefeldt; Haſſe Wanfried, ch. town Wonfield.

Counties of Naſſau Dillenburgh, ch. town Dillenburg; Naſſau Diets, ch. town Diets; Naſſau Hadamar, ch. town Hadamar; Naſſau Kerberg, ch. town Kerberg; Naſſau Siegen, ch. town Siegen; Naſſau Idſtein, ch. town Idſtein; Naſſau Weilburg, ch. town Weilburg; Naſſau Wiſbaden, ch. town Wiſbaden; Naſſau Bielſtein, ch. town Bielſtein; Naſſau Otweiler, ch. town Otweiler; Naſſau Uſingen, ch. town Uſingen; each county ſubject to its own count, of the houſe of Naſſau.

Territory of Frankfort, ch. town Frankfort on the Main, an Imperial city; a ſovereign ſtate.

County of Erpach, ch. town Erpach Eaſt; ſubject to its own count.

Biſhopric of Spire, ch. town Spire, on the Rhine, an Imperial city; a ſovereign ſtate.

Duchy of Zwebruggen, or Deux-Ponts, ch. town Deux-Ponts, in the palatinate; ſubject to the duke of Deux-Ponts.

County of Catzenelbogen, ch. town Catzenalbogen on the Lhon; ſubject to Haſſe-Caſſel.

Counties of Waldec, ch. town Waldec; ſubject to its own count; Solms, ch. town Solms; ſubject to its own count: Hanau, ch. town Hanau; ſubject to Heſſe-Caſſel: Eyſenberg, ch. town Eyſenberg; ſubject to its own count: Sayn, ch. town Sayn; Wied, ch. town Wied; Witgenſtein, ch. town Witgenſtein; Hatzfield, ch. town Hatzfield; Weſterberg, ch. town Weſterberg.

Abbey of Fuld, ch. town Fulda; ſubject to its abbot.

Hirſchfelt, ch. town Hirſchfelt; ſubject to Heſſe-Caſſel.

5. Lower Rhine Circle.

Palatinate of the Rhine, on both ſides of that river, ch. towns Heidelbergh on the Neckar, Philiſburg, Manheim, and Frankendal on the Rhine; ſubject to the elector palatine.

Archbiſhoprics and electorates of Cologn, ch. town Cologn on the Rhine; Mentz, ch. towns Bon on the Rhine, Mentz on the Rhine, and Aſchafenburgh on the Maine; Triers, ch. town Triers on the Moſelle: ſubject to their reſpective electors.

Biſhopric of Worms, Worms on the Rhine, an Imperial city; a ſovereign ſtate.

Duchy of Simmeren, ch. town Simmeren; ſubject to its own duke.

Counties of Rhinegraveſtein, ch. town Rhinegraveſtein; Meurs, ch. town Meurs, ſubject to Pruſſia: Veldentz, ch. town Veldentz, ſubject to the elector palatine: Spanheim, ch. town Creutznach; Leymingen, ch. town Leymingen.

6. Fran-

6. FRANCONIA CIRCLE.

Biſhoprics of Wurtſburg, ch. town Wurtſburg; Bamberg, ch. town Bamberg; Aichſtadt, ch. town Aichſtadt: ſubject to their reſpective biſhops.

Marquiſates of Cullenbach, ch. town Cullenbach; Anſpach, ch. town Anſpach; ſubject to their reſpective margraves.

Principality of Henneberg, ch. town Henneberg.

Duchy of Coburg, ch. town Coburg; ſubject to its own duke.

Duchy of Hildburghauſen, ch. town Hildburghauſen; ſubject to its own duke.

Burgraviate of Nuremberg, Nuremberg, an Imperial city; an independent ſtate.

Territory of the great maſter of the Teutonic Order, Mergentheim, ch. town Mergentheim.

Counties of Reineck, ch. town Reineck; Bareith, ch. town Bareith, ſubject to its own margrave: Papenheim, ch. town Papenheim, ſubject to its own count; Wertheim, ch. town Wertheim; Caſſel, ch. town Caſſel; Schwartzenburg, ch. town Schwartzenburg, ſubject to its own count: Holac, ch. town Holac.

7. AUSTRIA CIRCLE.

The whole circle belongs to the emperor, as head of the houſe of Auſtria.

Archduchy of Auſtria Proper, ch. town Vienna.

Duchies of Stiria and Cilley, ch. towns Graz and Cilley: Carinthia, ch. towns Glagenfurt and Lavemund; Carniola, ch. towns Laubach, Zerknits, Trieſte, and St. Veits; Goritia, ch. town Gorits.

County of Tyrol, ch. town Inſpruck.

Archbiſhoprics of Brixen and Trent, ch. towns Brixen and Trent, on the continent of Italy and Switzerland.

8. BAVARIA CIRCLE.

Duchy of Bavaria Proper, on the Danube, ch. towns Munich, Landſhut, Ingolſtadt, Donawert, and Ratiſbon, an Imperial city; ſubject to the elector palatine, as ſucceſſor to the late elector of Bavaria.

Palatinate of Bavaria, ch. towns Amberg and Sultſbach; ſubject to the elector of Bavaria

Frieſſengen, ch. town Frieſſengen; ſubject to its own biſhop.

Biſhopric of Paſſau, ch. town Paſſau; ſubject to its own biſhop.

Duchy of Neuburg, ch. town Neuburg on the Danube, ſubject to the elector palatine.

Archbiſhopric of Saltſburg, ch. town Saltſburg and Hallen; ſubject to its own biſhop.

9. SWABIA CIRCLE.

Duchy of Wurtemburgh, ch. towns Stutgard, Tubingen, and Hailbron, on or near the Neckar; ſubject to the duke of Wurtemburgh Stutgard.

Marquiſates of Baden, ch. towns Baden, Baden Dourlach, on or near the Rhine; ſubject to their own reſpective margraves.

Biſhopric of Augſburg, ch. towns Augſburg, an Imperial city, Hockſtet and Blenheim, on or near the Danube; ſubject to its own biſhop.

Territory of Ulm, Ulm on the Danube, an Imperial city; a ſovereign ſtate.

Biſhopric of Conſtance, ch. town Conſtance on the lake of Conſtance; ſubject to its own biſhop, under the houſe of Auſtria.

Principalities of Mindelheim, ch. town Mindelheim; Furſtenburg, ch. town Furſtenburg; Hohenzollern, ch. town Hohenzollern; ſubject to their reſpective princes.

Counties of Oeting, ch. town Oeting; Koningſeck, ch. town Koninſeck; Hohenrichburgh, ch. town Gemund.

Baronies of Waldburg, ch. town Waldburg; Limpurg, ch. town Limpurg.

Abbies of Kempten, ch. town Kempten on the Iller; Buchaw, ch. town Buchaw; Lindau, ch. town Lindau on the lake of Conſtance; Imperial cities.

Imperial cities or ſovereign ſtates; Nordlingen, Memmingen, Rotweil on the Neckar, and many more.

Black Foreſt and county of Rheinfield, ch. towns Rheinfield and Lauſſenburg; marquiſate of Burgaw, ch. town Burgaw; territory of Briſgaw on the Rhine, ch. town Friburg and Briſac; ſubject to the houſe of Auſtria.

Germany being a very extenſive tract, the climate muſt vary according to the ſituation of places. In the north the air is cold, and the weather changeable, both which are unfavourable to vegetation; in the ſouth it is much warmer, eſpecially in winter; and in the centre of the country it is ſettled, temperate, and ſerene. Upon the whole, neither the climate nor air are materially different from thoſe of England. The ſoil varies as much as the climate: in many parts it is exceedingly fruitful, being cultivated quite to the tops of the mountains, but in others it is bare and ſterile; and as agriculture is now making great progreſs in Germany, there is no doubt but this land will be turned to ſome advantage.

There are few animals which are not to be found either in one part or the other of Germany; horſes, oxen, cows, ſheep, and goats from the domeſtic part of theſe; and in the foreſts are bears, wolves, lynxes, foxes, wild cats, wild goats, boars, of the legs of which hams are made, and ſent to moſt parts of Europe, being eſteemed great delicacies, and are preferred by many of the Engliſh to thoſe of Weſtmoreland, &c. for grain and the delicacy of their flavour; badgers, martens, hares, rabbits, deer, and the chamois goat. A ſpecies of leopards and beavers are likewiſe found in Moravia. The glutton of Germany is ſaid to be the moſt voracious of all animals.

There are a great variety of tame and wild fowl in Germany, which are ſent to all parts of Europe, viz. Turkeys, geeſe, ducks, pigeons, wild geeſe, wild ducks, ſwans, buſtards, pheaſants, wood-cocks, partridges, grouſe, ſnipes, fieldfares, quails, ortolans, ſpoonbills, falcons, herons, hawks, larks, and other ſinging birds.

In Germany, the rivers and lakes abound with ſalmon, pike, carp, trout, perch, roach, jack, ſturgeon, barbel, eels, eel-pouts, crabs, &c. and in the Danube or Iſter, are ſeveral fiſh, which ſeem to be of the ſalt-water-kind. Among the moſt remarkable of theſe is the hanſon, which bears ſome reſemblance to our ſturgeon; but is almoſt as large as the crocodile, ſome of them being eighteen or twenty feet long; it is ſaid that ſhoals of them will aſſemble at the ſound of a trumpet or horn. By the Germans they are eſteemed very delicate eating.

The cultivated parts of this country yield corn, turkey-wheat, buck-wheat, rye, ſpelt, barley, oats, peas, beans, vetches or tares, lentils, chiches, millet, aniſe, cummin, hemp, flax, hops, tobacco, madder, woad, ſaffron, carthamus or baſtard ſaffron, truffles, potatoes, and every ſpecies of culinary herbs and roots. The fruits produced there are apples, pears, plums, oranges, lemons, citrons, olives, figs, peaches, apricots, medlars, almonds, cheſnuts, filberds, and walnuts. Vineyards are cultivated in different parts of Germany, according to which the wine varies in its flavour; but thoſe held in the greateſt eſteem are the Rheniſh, Moſelle, Franconian, Weckar, Hocker, and Muſcadel. Auſtria likewiſe yields excellent wine, particularly Rheniſh, and Moſelle, which have a medicinal quality. In this empire vaſt quantities of honey are produced.

In Germany there are many large tracts of mountains, among the moſt conſiderable of which are the Alps, that divide from Italy, and thoſe that ſeparate Saxony, Bavaria, and Moravia from Bohemia. Great part of this empire, however, is a ſpacious plain, in-

interſperſed

terſperſed here and there with agreeable hills, which only tend to heighten the beauty of the ſcene.

Germany was formerly a very woody country, and there are ſtill large foreſts remaining; but that called the Hercynian, which in the time of Cæſar was nine days' journey in length, is now divided into woods, which go by particular names, and in many places it is quite deſtroyed. The trees produced in this country are oak, beech, pine, white and red fir, alder, aſh, birch, lime-tree, aſp, or black poplar, larch, plane-tree, cheſnut, olive, and walnut. Great quantities of pot-aſh, pitch, and charcoal are made in different parts of this empire; and for the benefit of the ſilk manufacture, the mulberry-tree, particularly the white ſort, is greatly cultivated.

No country can boaſt a greater variety of noble large rivers than Germany. At their head ſtands the Danube or Donaw, ſo called from the ſwiftneſs of the current, and which ſome pretend to be naturally the fineſt river in the world. From Vienna to Belgrade in Hungary, it is ſo broad, that in the wars between the Turks and Chriſtians ſhips of war have been engaged on it; and its conveniency for carriage to all the countries through which it paſſes is inconceivable. The Danube, however, contains a vaſt number of cataracts and whirlpools; its ſtream is rapid, and its courſe, without reckoning turnings and windings, is computed to be 1620 miles. The other principal rivers are the Rhine, Elbe, Oder, Weſer, and Moſelle.

The chief lakes of Germany, not to mention many inferior ones, are thoſe of Conſtance and Bregentz. Beſides theſe, are the Chiemſee, or the lake of Bavaria; and the Zirnitzer-ſee, in the duchy of Carniola, whoſe waters often run off and return again in an extraordinary manner.

Beſides theſe lakes and rivers, in ſome of which are found pearls, Germany contains large noxious bodies of ſtanding water, which are next to peſtilential, and afflict the neighbouring natives with many deplorable diſorders.

Germany is ſaid to contain more of theſe than all Europe beſides. The Spa waters, and thoſe of Seltzer and Pyrmont, are well known. Thoſe of Aix-la-Chapelle are ſtill more noted. They are divided into the Emperor's Bath, and the Little Bath; and the ſprings of both are ſo hot, that they let them cool ten or twelve hours before they uſe them. Each of theſe, and many other waters have their partiſans in the medical faculty; and if we believe them, cure diſeaſes internal and cutaneous, either by drinking or bathing. The baths and medicinal waters of Embs, Wiſbaden, Schwalbach, and Wildungen, are likewiſe reported to perform wonders in almoſt all diſeaſes. The mineral ſprings at the laſt mentioned place are ſaid to intoxicate as ſoon as wine, and therefore they are incloſed. Carlſbad and Baden baths have been deſcribed and recommended by many great phyſicians, and uſed with great ſucceſs by many royal perſonages. It is, however, not improbable that great part of the ſalutary virtues aſcribed to theſe waters is owing to the exerciſe and amuſements of the patients, and numbers of the company which crowd to them from all parts of the world; many of whom do not repair thither for health, but for amuſement and converſation.

Moſt parts of Germany abound in mines; many of ſilver, quickſilver, copper, tin, iron, lead, ſulphur, nitre, and vitriol. In Auſtria, Bavaria, Sileſia, and the Lower Saxony, are found ſalt-petre, ſalt-mines, and ſalt-pits; as likewiſe carbuncles, amethiſts, jaſper, ſapphire, agate, alabaſter, pearls of various kinds, rubies, and turquois ſtones. Quarries of curious marble, ſlate, chalk, ochre, alum, bitumens, and ſeveral other foſſils, are found in Bavaria, Tirol, and Liege. In ſeveral places ſtones are dug out of the ground, bearing on them the repreſentation of divers animals, trees, and ſometimes even a human form may be diſtinguiſhed. Coal-pits are found in moſt of the circles, which in their quality do not materially differ from thoſe of England; and in the electorate of Mentz are found ſome curious pieces of earth, among which is the Terra Sigillata, being of a hard conſiſtence, with white, yellow, and red veins: it is ſaid to be an antidote againſt all kinds of poiſon.

As the empire of Germany is a collection of ſeparate ſtates, each having a different government and police, it hath been difficult to ſpeak with preciſion as to the number of inhabitants: but according to the beſt calculations that have hitherto appeared, they cannot, excluſive of Bohemia, fall far ſhort of ſeventeen millions. This calculation extends only to the principal parts of Germany; and when the inferior parts are added, the number in all, including Bohemia, is now computed at twenty-ſix millions. In their perſons they are tall, fair, and of agreeable features. Both ſexes affect rich dreſſes, which in faſhion reſemble thoſe worn in France and England. At ſome of the courts of Germany the ladies appear in rich furs, loaded with jewels. The wives and daughters of the burghers formerly dreſſed inconceivably fantaſtic, but experience has ſince taught them better, and their appearance is now conformable to their ſtation. With regard to the peaſants and labourers, their dreſs in many parts of Germany is the ſame as in other parts of Europe, according to their employments, conveniency, and circumſtances.

The Germans are naturally frank, honeſt, and hoſpitable, and free from artifice or diſguiſe. Their nobility and gentry are indeed ridiculouſly proud of anceſtry and titles, but at the ſame time they are very complaiſant and affable to ſtrangers, and of the ſtricteſt honour. Their fondneſs for title, however, is attended with many inconveniences. They think that the cultivation of the lands is below their attention, though it might treble their revenue. Hence their younger ſons generally engage in the ſervice of the emperor, the electors, or ſome foreign ſtate, or procure ſome rich eccleſiaſtical preferment.

Induſtry, application, and perſeverance, are the great characteriſtics of the German nation, eſpecially the mechanical part of it. Their works of art would be incredible, were they not viſible, eſpecially in watch and clock making, jewellery, turnery, ſculpture, drawing, painting, and certain kinds of architecture.

The Germans have been charged with intemperance in eating and drinking, and perhaps not unjuſtly, owing to the vaſt plenty of their country in wine and proviſions of every kind. But thoſe practices ſeem now to be wearing out. At the greateſt tables, though the gueſts drink pretty freely at dinner, yet the repaſt is commonly finiſhed by coffee, after three or four public toaſts have been given. But the people have more feaſting at marriages, funerals, and on birth-days.

In Germany, the domeſtic diverſions differ but little from thoſe practiſed in England; they conſiſt of billiards, cards, dice, fencing, and the like. In ſummer, the gentry viſit the baths and other places of public reſort. Their favourite field diverſion is hunting; beſides which, the Germans have bull and bear-baiting, and the like.

Chriſtianity, according to moſt authors, was introduced into Germany by St. Clements, St. Creſcens, St. Mark, and ſeveral other holy men; and that ſo early as the middle of the ſecond century, it was in a flouriſhing ſtate there. But this muſt not be underſtood of the whole empire; for it is well known that the remote northern parts remained in Paganiſm till about the end of the ſeventh, or beginning of the eighth century, and the Saxons were not converted till the time of Charlemagne, during whoſe reign the Chriſtian religion was tolerably well eſtabliſhed. After his deceaſe, the popes, taking advantage of the bigotry of ſucceeding emperors, got the entire management of the church into their hands, and exer-

ciſed

ciſed an unlimited power over the whole empire. The Bohemians were the firſt who had an idea of reformation, and made ſo glorious a ſtand for many years againſt the errors of Rome, that they were permitted to take the ſacrament in both kinds, and allowed other freedoms not tolerated in the Romiſh church. This was in a great meaſure owing to the celebrated Engliſh reformer John Wickliff, who lived about 150 years before Luther. In the ſixteenth century the Popiſh tyranny cauſed univerſal murmurings and diſguſt, which encouraged Dr. Martin Luther, John Huſs, and Jerome of Prague, to preach openly againſt the errors of the church of Rome, for which the two latter, notwithſtanding the emperor's ſafe conduct, were infamouſly burnt at the council of Conſtance. The ſtates of the empire, who embraced the new tenets, proteſted againſt the concluſion of a diet held at Spire, in 1529, it being therein reſolved, that all innovations in religion, till the decree of a future council could be obtained, were unlawful; and from this meaſure they obtained the name of Proteſtants. A religious war broke out, which was not entirely put a ſtop to till the year 1555, when it was agreed by the treaty of Augſburgh, that the Proteſtants ſhould enjoy a full toleration and liberty; and this toleration was more amply explained and confirmed by ſubſequent treaties. At preſent Germany is pretty equally divided between Papiſts and Proteſtants, the latter of which are again divided into Lutherans and Calviniſts, or Reformed; though there are many ſectaries, and great numbers of Jews in the empire. Sometimes the people profeſs one religion, and their ſovereigns another, as in Pruſſia, where the king and his court are Calviniſts, and moſt of his ſubjects Lutherans. This was likewiſe the caſe in Saxony; but the two laſt electors embraced the religion of Rome, in order to enjoy the crown of Poland. It has been mutually agreed, that when theſe changes happen, the prince ſhall leave his ſubjects the free exerciſe of their religion, with their whole form of church and ſchool-diſcipline, and all other privileges whatſoever. The Roman Catholic, Lutheran, and Calviniſm, are the only religions tolerated in the empire.

In Germany, the Archbiſhop and Biſhop-ſees are variouſly repreſented by different authors; ſome of whom repreſent Vienna as being a ſuffragan to the archiepiſcopal ſee of Saltzburg; and others as being an archbiſhopric, but depending immediately upon the pope. The others are the archbiſhop of Mentz, who has under him twelve ſuffragans; but one of them, the biſhop of Bamberg, is ſaid to be exempted from his juriſdiction:—Triers has three ſuffragans; —Cologne has four;—Magdeburg has five;—Saltzburg has nine, beſides Vienna,—and Bremen three.

At different periods ſince the Reformation, it has been found expedient, to ſatisfy the claims of temporal princes, to ſeculariſe the following biſhop-ſees, Bremen, Verden, Magdeburg, Halberſtadt, Minden, Lubec, and Oſnaburg, which laſt goes alternately to the houſes of Bavaria and Hanover, and is at preſent held by his Britannic majeſty's ſecond ſon. Such of thoſe ſees as were archbiſhoprics are now conſidered as duchies, and the biſhoprics as principalities.

The German language is a dialect of the Teutonic, without the leaſt affinity to the Celtic, and is called High Dutch, being the mother tongue of the whole empire. It abounds with conſonants, is extremely harſh to the ear, and varies ſo much in its dialect, that the people of one province ſeldom underſtand thoſe of another. Latin and French are the moſt uſeful languages in Germany, when a traveller is ignorant of High Dutch. We ſhall here inſert their Lord's prayer:

Unſer Vater, der du biſt im himmel, geheiliget werd dein name. Zukomme dein reich. Dein wille geſchehe, wie im himmel alſo auch auf erden. Unſer taglich brodt gib uns heute. Und vergib uns unſer ſchuld, als wir vergeben unſern ſchuldigern. Unde fuhre uns nicht in verſuchung. Sondern erlo ſe uns von dem boſen. Den dein is das reich, und die krafft, und die herlichkeit, en ewigheit. Amen.

It may be juſtly be ſaid, that no country has produced a greater variety of authors than Germany, and the inhabitants in general apply themſelves with great aſſiduity to reading and ſtudy. No man can be a graduate in their univerſities, who has not publiſhed one diſputation at leaſt; by which means thouſands of theſes and diſputations are annually publiſhed, and books multiplied without end. The German authors are generally condemned for being extremely prolix, dry, and voluminous in all their writings, and entirely ignorant of the engaging art of enlivening their performances, by mixing the entertaining with the inſtructive.

Many of the Germans have greatly diſtinguiſhed themſelves in various branches of learning and ſcience; Stahl, Van Swieten, Storck, and Hoffman, have contributed greatly to the improvement of phyſic; Ruvinus and Dillenius, of botany; Heiſter, of anatomy and ſurgery; Newman, Patt, and Margiff, of chemiſtry; and Leibnitz, Wolfius, Puffendorff, Zimmerman, Thomaſius, Otto Van Gueriche, Kepler, &c. have acquired fame by their philoſophical writings. Rabener has immortalized his name by his ſatirical works. Geſner's Idylls and Death of Abel have been favourably received in the Engliſh tranſlations. The late profeſſor Gellert's elegant writings, which are much eſteemed, ſeem particularly adapted to touch the heart, and inſpire ſentiments of morality and piety. Haller the famous phyſician, Hagedom, Leſſing, Kleiſt, Gerſtenberger, Klopſtock, Ramber, and others, have excelled in poetry; and Schlegel, Cronegh, Wicland, and Wieſe, have diſtinguiſhed themſelves by their dramatic writings. Their romances are dry and unintereſting. In ſacred literature, Raphaelies, Michaelis, and Walch, are famous; and ſome of the beſt editions of the Greek and Latin claſſics have been publiſhed by Cellarius, Burman, Taubman, Reiſhe, Ecneſti, Reimarus, Havercamp, and Heyne.

With reſpect to the fine arts, the Germans have acquitted themſelves very well. Germany has produced ſome good painters, architects, ſculptors, and engravers. They even pretend to have been the firſt inventors of engraving, etching, and mezzotinto. Printing, if firſt invented in Holland, was ſoon after greatly improved in Germany. The Germans are generally allowed to be the firſt inventors of great guns, as alſo of gunpowder, in Europe, about the year 1320. Germany has likewiſe produced ſome excellent muſicians; Handel, Bach, Haſſe, and Haydn, of whom Handel ſtands at the head, having arrived at the ſublime of muſic.

In this country there are 36 univerſities, of which 17 are proteſtant, 17 Roman catholic, and two mixed; beſides a vaſt number of colleges, gymnaſia, pedagogies, and Latin ſchools. There are alſo many academies and ſocieties for promoting the ſtudy of natural philoſophy, the belles-lettres, antiquities, painting, ſculpture, architecture, &c. as the imperial Leopoldine academy of the *naturæ curioſi*: the academy of ſciences at Vienna, at Berlin, at Gottingen, at Erfurth, at Leipſic, at Duiſburg, at Gieſen, and Hamburg. The three younger ſons of his Majeſty George III. namely, prince Erneſt Auguſtus, Frederic Auguſtus, and Adolphus Frederic, were in the year 1786 ſent to the univerſity of Gottingen for education. Each of them is accompanied by a governor, a preceptor, and a gentleman; the expences of their table were fixed at 600 crowns per week, and their different maſters are allowed an extraordinary appointment of 1000 crowns per annum each. In 1734, his late Majeſty King George II. converted this place (which was the ancient gymnaſium) into an univerſity. Its library is the beſt in Germany.

The

There are academies for painting at Dreſden and Nunemburg; a royal military academy at Berlin; and the Imperial Franciſcan academy of fine arts is at Augſburg, to which the Latin ſociety at Jena may be added. The moſt celebrated public libraries are thoſe of Vienna, Berlin, Halle, Wolfenbuttle, Hanover, Gottingin, Weymar, and the council library at Leipſic.

The moſt common ſilver coin in Germany is a rix-dollar, worth about 4s. 6d. a German florin or guilder is worth about half a crown, and a gold ducat about 9s. A crown in ſpecie is equal to an Engliſh crown, but a crown current only to 3s. 6d. A German mark is 1s. 6d. All princes and other powers in the empire, who poſſeſs gold and ſilver mines, have the privilege of coining money, as far as the quantity they yield; ſome in a larger, others in a ſmaller ſpecie: but there are only three or four mints allowed in each circle, unleſs an eſtate of the empire has mines of its own, and wants to erect a mint near them. By the laws of the empire, each coin ought to paſs an annual examination, when all the money ſhould anſwer to the ſame ſtandard as that of Leipſic. The German coin in general is neither ſterling nor due weight, and, to the great diſadvantage of the public, is allowed to be more clipt than that of any other country in Europe.

We ſhould now proceed to a deſcription of the cities, towns, ports, and other edifices in the German empire, with their revenues, and other peculiarities; but this being a very copious article, eſpecially in Germany, our limits will therefore only permit us to mention ſome capital places belonging to it.

Vienna, the capital of the whole archduchy of Auſtria, is ſituated on the Danube. The ſituation is pleaſant, for to the eaſt and north the country around is entirely level, but to the weſt and ſouth are ſeen a range of mountains, which are thick planted with trees and vines; and the Danube, which is here very wide, divides itſelf in that part of the town into ſeveral arms, forming many iſlands, which are ſtocked with wood. The circumference of that which is properly the fortified city of Vienna is not large, and only contains about 60,000 ſouls: but the ſuburbs are therefore the more ample; and, according to the eſtimate of a late traveller, the city and the ſuburbs together contain 250,000 inhabitants. In the city itſelf there are numerous and beautiful palaces: but the ſtreets are not ſpacious, and are, in part, crooked. Thoſe people of faſhion who have no country ſeats, or who are prevented by their public employments from leaving Vienna, generally reſide in the ſuburbs during ſummer. It is divided into four quarters, which contain fifteen ſquares or public places, that of the court is large and beautiful; in it, between two fountains, is a ſuperb monument, built by the emperor Leopold; in the high market-place is a marble monument, repreſenting the marriage of Joſeph and the Virgin, erected in the year 1732. Vienna contains fifty churches or chapels, and 21 convents; the metropolitan church is a dark Gothic building, richly adorned on the outſide with ſculpture, and within with thirty-eight altars, moſtly of beautiful marble; a great number of relics, jewels, &c. and an ancient vault in which the archdukes are interred. Here is a mauſoleum of Frederic III. which coſt 40,000 ducats, and a monument in honour of prince Eugene, of Savoy. Near it is the palace of the archbiſhop. In a chapel belonging to the Capuchins, the princes of the royal family are buried, without pomp, with hardly their names over their tombs. The univerſity of Vienna was inſtituted in the year 1365, from a college founded about a century before, and is divided into four faculties and four nations, Auſtrian, Saxon, Hungarian, and Rheniſh. The library is not very numerous; it is open two or three hours morning and afternoon. The imperial library contains about 5000 or 6000 volumes, printed in the fifteenth century, rare manuſcripts, and a very extenſive and valuable collection of prints, and is well furniſhed with uſeful modern books. It is open three or four hours every morning to the public. The imperial cabinet is very rich in medals, and ſtill more ſo in natural hiſtory. The ſuburbs are far larger than the city itſelf. They lie round it, but are removed to the diſtance of 500 or 600 common paces from the works of the fort. The garriſon of Vienna conſiſts of one regiment of foot. Proviſions are brought to Vienna from the different parts of Auſtria and other countries belonging to the emperor, in the greateſt plenty and variety. A modern traveller ſays, he has ſeen a ſcore of wild hogs and a dozen ſtags in the game market at the ſame time, and hares, literally, by cartloads, with abundance of pheaſants and partridges. Every kind of bird ſeems to be an article of food, and none rejected; hawks, jays, magpies, are brought to market, and even the bullfinch and robin are not ſpared. The livers of geeſe are eſteemed a great delicacy, and in the fiſh-market are found with ſturgeon, carp, pike, tench, and trout, tortoiſes, frogs, and ſnails. The manufactures of Vienna are numerous, and the trade extenſive.

The inhabitants of this city are remarkable for their luxurious manner of living; in the winter they frequent the operas; and when the Danube is frozen over, and the ground covered with ſnow, the ladies divert themſelves in ſledges of different forms, ſuch as griffins, tygers, ſwans, ſcallop-ſhells, &c. Here the lady ſits dreſſed in velvet lined with rich furs, and adorned with laces and jewels, having on her head a velvet cap ſet off with plumes of feathers, ribbons, and bells. This diverſion being chiefly taken in the night, their ſervants ride before the ſledge with torches, and a gentleman ſitting on the ſledge behind, guides the horſe. The deſtructive practice of gaming is more prevalent here than in any other town in the empire. His preſent Imperial majeſty has greatly meliorated the condition of his Auſtrian ſubjects, given great encouragement to the Proteſtants, and ſuppreſſed many Popiſh religious houſes, convents, &c.

Berlin is not only the capital of the electorate of Brandenburg, but of the whole Pruſſian dominions, and may, with juſtice, be deemed one of the fineſt and largeſt cities of Germany. It is the royal reſidence, conſiſts of five towns united together, and has received aſtoniſhing improvements of late years. The ſtreets are handſome, long, and capacious. Here are ſome very elegant ſquares, and many fine palaces. One of the principal public edifices is the royal palace, a prodigious pile, but irregular, as it was erected at different times, and by various architects. It is decorated with admirable paintings, and beautiful tapeſtry, and furniſhed with a greater quantity of plate than any other court in Europe. It contains likewiſe a fine cabinet of rarities, natural and artificial, an excellent collection of medals, a diſpenſary, and one of the fineſt libraries in Europe Among the other principal ſtructures are the council-houſe, Calviniſt gymnaſium, great garriſon church, provincial council-houſe, Jews ſynagogue, and royal magazine. In the laſt mentioned place a great quantity of rough wool is kept, to be regularly delivered out to poor manufacturers, that it may be ſpun and wove, and afterwards dyed and ſold by the managers of the Orphan-houſe at Potzdam, to which charity the profits are appropriated. In Berlin is a fine hoſpital, in which above 800 children are educated gratis. The Lutheran gymnaſium, or School of Athletic Exerciſes, is ſituated in the Grey Cloiſter; and at the King's Gate is the court of cadets, in which young noblemen and gentlemen are inſtructed in all the exerciſes neceſſary to qualify them for a military life. All the above, except the royal palace, are in Berlin, properly ſo called. The palace itſelf is in the quarter called Old Coln; and in the ſuburbs are the magni-

ficent

ficent garden of count Reuſſen, the beautiful houſe and garden called Monbijou, and the houſe and garden of Belvidere. The hoſpital of invalids is a ſtately and magnificent building, and above 1000 perſons are maintained in it, conſiſting of officers and ſoldiers, with their wives and children; and theſe, beſides lodging and fuel, have a certain weekly allowance of money, bread, &c. There are ſeveral bridges over the river Spree, and, in particular, one which is elegant and magnificent: it conſiſts of five arches, and has a fine metal ſtatue on it of the great elector Frederick William. In the magnificent and noble Calviniſt church of Old Coln, is the burial-place of the royal family, near which are the riding academy the royal ſtables, a ſchool of exerciſes, and many other buildings, public and private. In the ſugar-houſes of Berlin as much ſugar is refined as ſerves the whole Pruſſian dominions. Many other manufactures are carried on here, particularly one of porcelain, inferior in no reſpect to that of Meiſſen, except in the paintings. The great population and improvement of this city, as well as other parts of the Pruſſian dominions, have been aſcribed to the emigration and influence of the French refugees, who introduced a variety of arts, manufactures, &c. before unknown in the Pruſſian territories. The canals cut to Berlin from the Havel, the Oder, and the Elbe greatly promote the trade of the city, and ſupply the inhabitants with plenty of fiſh; and as the late king of Pruſſia always made a point of embelliſhing and aggrandizing this metropolis, it is no wonder that it ſhould be the admiration of all who viſit it. The following inſtitutions add to the beauty of the capital, as well as to the benefit of the inhabitants, viz. the academy of ſciences, the academy of belles lettres, the college of phyſic and ſurgery, the anatomical theatre, the tapeſtry manufactory, the opera-houſe, the arſenal, ſeveral well regulated hoſpitals, and many Lutheran, Calviniſt, and two Roman Catholic churches.

Independent of theſe there are a variety of pleaſant gardens, walks, &c.

The police of Berlin is well regulated, and the inhabitants more ſecure from the depredations of robbers than in moſt other cities. Round the environs are many pleaſant villages, canals, pleaſure houſes, gardens, &c. Among the palaces in the vicinity, belonging to the ſovereign, are thoſe of Schoenhauſen and Charlottenburg. The firſt is about the diſtance of two miles from Berlin, ſituated on the river Panka, which waters its fine gardens. Buſching tells us, that in the year 1755 the number of its inhabitants, including the garriſon, amounted to 126,661.

Dreſden, the capital, not only of Meiſſen, but of all Saxony, is ſituated 76 miles north of Prague, and 210 north-weſt of Vienna. This city is one of the fineſt in Germany, with reſpect to the pleaſantneſs of its ſituation, the beauty of its ſtructures, and the number and magnificence of its embelliſhments. Many of its parts are defended by a double ditch, and the baſtions have ſtone facings. The houſes, which are built of free ſtone, are lofty and ſubſtantial; and the ſtreets are ſtraight, ſpacious, elegantly paved, and well lighted. The cathedral church is a noble ſtructure; and ſeveral large ſquares give the whole city an uncommon air of magnificence. The ſtone bridge over the Elbe, which divides the city into the Old and New Town, and conſiſts of 17 arches, is one of the nobleſt ſtructures in the univerſe. At the entrance of New Dreſden is a noble building, called the Palace of the Indies: it conſiſts of three ſtories, all the apartments of which are filled with the moſt curious Japan and China wares. All the houſehold goods are Indian; and there is one ſet of furniture ſcarce to be paralleled, which conſiſts of feathers of various colours, all natural, but inlaid with ſo much art, that it might be taken for a fine flowered ſattin. A very pleaſant garden belongs to this magnificient palace, which runs down to the Elbe, and is adorned with ſtatues of white marble; beſides two noble obeliſks, and two very fine fountains. Near the Palace of the Indies ſtands a magnificent ſtructure, built by the ſtates of Saxony, for maintaining two companies of cadets, all gentlemen of the country, who are here inſtructed in the ſeveral ſciences. In the ſame ſtreet there is an amphitheatre, or area, for the battles of wild beaſts, ſuch as lions, tigers, bears, and, in ſhort, all the fierceſt animals from the four quarters of the world; of which great numbers are kept for that purpoſe. Here is an hunting-houſe, where bears are kept; with fountains and ponds, in which they waſh; and ragged poſts round them, by which they climb up to ſcaffolds on the top, where they dry themſelves. Here is a place called the Horn Gallery, which has ſeveral apartments, painted with a repreſentation of hunting wild beaſts and fowls. In the old town there is a large caſtle; and ſome of the fortifications ſtill to be ſeen, which were made by Charlemagne.

The elector's palace, or caſtle, joins to the bridge at the entrance of the New Town. It is an ancient ſtructure, and makes but a mean appearance. The inſide, however, far ſurpaſſes the outſide; the apartments being noble, and ſplendidly furniſhed. There is a great gallery, which contains antique buſts, veſſels, pictures, and ſeveral other curioſities: a ſpacious hall, adorned with fine drawings of cities, pictures of giants, the habits of many nations; and divers large chambers, full of a ſurprizing collection of rarities, and the greateſt curioſities, both of art and nature, eſpecially pictures of a very great value, and wonderful performances in clock-work. In this palace are two chapels, one for the Roman Catholics, the other for the Lutherans. The firſt was heretofore a theatre for the operas; but one of the electors turned it into a chapel, on account of the marriage of his only ſon with the eldſt daughter of the emperor Joſeph. The ſecond, which was always the chapel of the Proteſtant electors of Saxony, he left for the uſe of his wife, who conſtantly adhered to that religion. The treaſure of it is extremely rich, conſiſting of veſſels, and other moveables, of gold and ſilver, heretofore conſecrated and given to this chapel by the electors. In this palace is the regal treaſury, commonly called the Grune Gewolbe, or the Green Vault, compoſed of three arched rooms, which contain prodigious riches, and ſhine all over with gold and precious ſtones; ſo that it is one of the fineſt places in the world. Here are ſeveral ſets of brilliant diamonds, rubies, emeralds, pearls, ſapphires, and other precious ſtones; every ſet is complete, and conſiſts of buttons, buckles, loops for hats, &c. ſwords, hangers, ſword-belts, canes, muffs, ſnuff-boxes, watches, twezer-caſes, pocket-books, in ſhort, all the jewels that can poſſibly be imagined, even to the furniture of a horſe; and they are ranged with admirable nicety, in caſes of cryſtal.

In the elector's ſtables, and the riding-houſe, is a great number of exceeding fine horſes; and ſome of all ſorts of the rareſt breed, which have iron racks and copper mangers. There is a curious fountain and pond near them, ſurrounded with baluſtrades, for the horſes to water and waſh in: and before the ſtables there is a long arched walk, painted with curious horſes; over which there is a gallery, with the pictures of all the dukes and electors of Saxony, in their robes, and military habits; particularly the two generals, Hengiſt and Horſa, under whom the Saxons invaded England, are depicted here, after the romantic manner they are deſcribed by our monkiſh hiſtorians. In the chambers over the ſtables are kept the rich harneſſes, and other ſumptuous equipages, many of which are of the Turkiſh mode, plated with maſſy ſilver, and adorned with precious ſtones. Here are a great many curioſities, particularly a gun, which diſcharges 40 times ſucceſſively, without intermiſſion; and a ſilver equeſtrian ſtatue, which moved by a ſpring, carries a cup of wine.

The number of inhabitants in the city and ſuburbs, which are very extenſive, is ſuppoſed to be 110,000. The electorate of Saxony, reckoned the richeſt country in Germany, is ſaid to contain 210 walled towns, ſixty-one market-towns, and upwards of 2000 villages: its revenue amounts to 1,350,000l.

Hanover, the capital of that electorate, is ſituated on the river Leine, which divides it into the Old and New Towns. The ſtreets are regular, broad, and well lighted, and contain about 1200 houſes, many of which are built of timber and clay. The electoral palace being in 1741 deſtroyed by fire, was rebuilt with great magnificence. Some manufactures are carried on in this city, and near it are the palace and elegant gardens of Herenhauſen. In the electorate are fifty-eight cities, and ſixty market-towns, beſides villages, containing about 750,000 people. The city and ſuburbs of Bremen contain about 50,000 inhabitants, and have a conſiderable trade by the Weſer. The biſhopric of Oſnaburg lies between the Weſer and the Ems. Its chief city has been long famous for the manufactures which go by its name, and for the beſt Weſtphalia hams. The other towns belonging to the electorate of Hanover have trade and manufactures; but theſe dominions have ſuffered greatly ſince the acceſſion of the Hanover family to the crown of Great Britain.

Breſlau, the capital of Sileſia, is ſituated at the conflux of the Oder and Ohlau. Including the ſuburbs, it is of great extent, having many large regular ſquares, broad ſtreets, and public edifices, but the fortifications are very inconſiderable. In this city all ſects of Chriſtians, and even Jews are tolerated, but the magiſtracy of it is Lutheran. The buildings worthy notice are ſome of the churches, the biſhop's palace, the Popiſh univerſity, ſeveral of the monaſteries and nunneries, and the exchange. There are alſo ſome good public libraries, two armories, a college of phyſicians, and a mint. Breſlau is extremely populous, and the manufactures of Sileſia, which are very conſiderable, principally centre there, ſo that ſeveral fairs are held annually in it, which occaſions a great reſort of Hungarian, Bohemian, Poliſh, and other foreign merchants. The revenue to his Pruſſian majeſty is ſaid to amount to near a million ſterling.

The imperial town of Hamburgh is ſituated on the Elbe, being almoſt in a circular form, and ſix miles in compaſs. This city, which is divided into the old and new towns, has ſix gates, and three entrances by water, viz. two from the Elbe and one from the Alſter, which are ſtrongly fortified with moats, ramparts, baſtions, and outworks. The ramparts are exceedingly lofty, planted with trees, and of ſuch a breadth as to admit ſeveral carriages to go abreaſt. The public edifices, churches excepted, make no great appearance. The cathedral is very ancient, and its tower leans as if it would fall every inſtant, but on account of the beauty and ſingularity of its architecture, it has not yet been taken down. The Exchange at Hamburgh is very commodious, but far inferior to that of London. The yard, arſenal, and two armories, are worthy the inſpection of a traveller. The trade of Hamburgh is very extenſive, all the commodities and manufactures of the ſeveral cities and ſtates of Germany being generally exported from thence. Its principal imports are the woollen manufactures and other goods of Great Britain, to the amount of ſeveral hundred thouſand pounds annually. Its trade with Spain, Portugal, and Italy, which is very conſiderable, is chiefly carried on in Engliſh bottoms: and they employ fifty or ſixty ſhips every year in the whale-fiſhery. The inland trade of this great city is quite equal to its foreign, and exceeded by no country in Europe, except thoſe of London and Amſterdam.

Frankfort, a free and imperial city, and the uſual place of the election and coronation of the kings of the Romans, is ſituated in a healthy, fertile, and delightful country along the Maine, by which it is divided into two parts, and both are computed to contain about 3000 houſes. It is of a circular form, without any ſuburbs; but the ſtreets are generally narrow, and the houſes are moſtly of timber and plaſter, and covered with ſlate; though there are ſome handſome private ſtructures, of a kind of red marble, that have the appearance of palaces. The fortifications are regular and ſolid; the ditches are deep, and filled with freſh water.

The natural and artificial curioſities of Germany are very numerous. Near Blackenburgh are two rocks, exactly repreſenting two monks in their proper habits. In Harts-foreſt is a cave, of which the end has never yet been diſcovered, though travellers have advanced into it for near twenty miles. Near Hamelen, about thirty miles from Hanover, there is likewiſe a cave, at the mouth of which ſtands a monument, to commemorate the loſs of 130 children, who are ſaid to have been ſwallowed up in this place in the year 1284. In one part of Saxony, ſtones are dug up in a field, which exhibit a lively repreſentation, by fair copper ſtrokes, of fiſhes of divers ſorts, frogs, and other animals, that abound in a neighbouring lake.

Among their artificial rarities, we may notice the great tun at Heidelburgh, which holds 800 hogſheads, and is generally full of the beſt Rheniſh wine. The churches, palaces, caſtles, bridges, and other public buildings in this empire are well worthy attention, particularly the former, many of which are of Gothic architecture, and ſtrike the beholder with an idea of rude magnificence: the cathedrals and churches are adorned on the inſide with a profuſion of gold, ſilver, diamonds, and other precious ſtones. The Imperial library at Vienna is a great literary curioſity: it contains upwards of 80,000 volumes, amongſt which are many valuable manuſcripts in moſt of the oriental languages.

The ſituation of Germany being in a manner in the centre of Europe; its vicinity to the ſea, and its inland navigation, all conſpire to the advantage of its commerce. Beſides the productions of their mines and minerals, the exports of this empire conſiſt in the following articles: corn, hemp, hops, flax, aniſe, cummin, ſaffron, madder, truffles, tobacco, lean cattle, butter, cheeſe, honey, wax, wines, particularly the Rheniſh and Moſelle; linen, ſtuffs, yarn, ſilk and cotton ſtuffs, ribbons, toys, turnery wares in woods, metals, and ivory; goat-ſkins, wool, timber, both for ſhipbuilding and houſes; cannon, bullets, bombs, bomb-ſhells, iron-plates, and ſtoves; tin-plates, ſteel-work, copper, braſs-wire; hog's briſtles, mum, beer, tartar, ſmalts, zaffer, Pruſſian-blue, printers-ink, mirrors, glaſſes, earthen-ware; the fineſt porcelain in the world, and ſeveral other things.

After the revocation of the edict of Nantz by Louis XIV. numbers of Proteſtant refugees ſettled in different parts of Europe, and thoſe which took ſhelter in Germany introduced with themſelves a great number of manufactures into that empire. At preſent the inhabitants make velvets, ſilks, rich ſtuffs, ſtuffs half ſilk and half cotton, variety of woollen ſtuffs and cloths, fine and coarſe linen, cheſque linen, ribbons, lace, yarn, thread, Sileſia linen; canvas, fuſtians, table-linen, ticking, fine and coarſe woollen hoſe, and caps; gold and ſilver galloon, embroidery, fine hats, tapeſtry, and Spaniſh rough and ſmooth leather. The manufactures of paper, tobacco, wax, clock-work, guns, locks, tin-plates, and white iron, are very conſiderable. The artificers of Nuremburg are ſaid to ſurpaſs thoſe of any other country in the working of ſteel, iron, braſs, alabaſter, and in toys of every kind. The Germans likewiſe excel in printing cottons, in dyeing, in making fine lacquered works, mirrors, glaſs-ware; and the porcelain of Mieſſen, in the electorate of Saxony, is eſteemed even preferable to that of China for the beauty of its painting,

painting, and the fineneſs of the earth with which it is made.

In Germany, there are near 300 ſovereign princes, and every one of them arbitrary with regard to the government of his own eſtates; but theſe princes form a political confederacy, of which the emperor is the head. Charles the Great, generally ſtyled Charlemagne, founded the German empire about the year 800, and the Imperial crown was hereditary in his family till the extinction of his male iſſue, which happened in January 912. During this period the emperor was arbitrary, but then he conſulted perſons celebrated for their abilities, and the rectitude of their conduct. On the death of Henry IV. which happened in the year 1106, a conſtitution was formed, by which the right of hereditary ſucceſſion to the Imperial crown was aboliſhed, and a free and voluntary election eſtabliſhed.

About the middle of the thirteenth century, the chief princes of Germany aſſumed the title of electors; and, at the ſame time, appropriated to themſelves the power of electing the head of the empire. The corporation, or body of eſtates over which the emperor preſides, not in a dictatorial but executive capacity, conſiſts of three claſſes, or colleges. The firſt of theſe is called the electoral college; the ſecond, the college of princes; and the third, the college of imperial towns. The electoral college conſiſts of nine members, all of whom have particular offices in the imperial court, and in them is veſted the ſole power of electing the emperor. They are ranked in the following order; viz. 1. The archbiſhop of Mentz, high-chancellor of the empire in Germany. 2. The archbiſhop of Treves, high-chancellor of the empire in France. 3. The archbiſhop of Cologne, high-chancellor of the empire in Italy. 4. The king, or rather elector of Bohemia, cup-bearer. 5. The elector of Bavaria, grand ſerver, or officer who ſerves out the feaſts. 6. The elector of Saxony, grand marſhal of the empire. 7. The elector of Brandenburgh, (now king of Pruſſia) great-chamberlain. 8. The elector Palatine, great-ſteward. 9. The elector of Hanover, king of Great Britain, arch-treaſurer. Before the emperor calls a diet, it is neceſſary for him to have the advice of thoſe members: the electors of Saxony and Bavaria have juriſdiction, the former over the northern, and the latter over the ſouthern circles, during the vacancy of the Imperial throne.

The college of princes of the empire is compoſed of more members, but enjoys leſs power than that of the electoral. The members of this college are alſo divided into two claſſes, eccleſiaſtical and temporal. The eccleſiaſtical princes are as abſolute as the temporal ones in their ſeveral dominions. The chief of theſe, beſides the three already mentioned, are the archbiſhop of Saltſburgh, the biſhops of Bamburgh, Wirtzburgh, Worms, Spire, Munſter, Straſburgh, Paderborn, Oſnaburg, Lubeck, &c. The chief of the ſecular princes are the landgrave of Heſſe, the dukes of Brunſwick, Wolfenbuttel, Wirtemburgh, Saxe-Gotha, Mecklenburgh, the marquiſſes of Baden and Culmbach, with the princes of Naſſau, Anhalt, Furſtenburgh, and many others, who have all high titles, and are ſovereigns in their own dominions. The free cities are likewiſe ſovereign ſtates; thoſe which are imperial, or compoſe a part of the diet, bear the imperial eagle in their arms; thoſe which are hanſe-towns, have ſtill great privileges and immunities, but they ſubſiſt no longer as a political body. Germany abounds with many abbots and abbeſſes, whoſe juriſdictions are likewiſe abſolute, ſome of them very conſiderable, and all of them choſen by their reſpective chapters.

The diet meets at Ratiſbon, on the emperor's ſummons. This aſſembly, beſides the election of an emperor, makes laws, raiſes taxes, determines differences between the ſeveral princes and ſtates, and can relieve ſubjects from the oppreſſions of their ſovereigns.

But beſides this general diet of the empire, there are yearly meetings of the ſtates of one, two, or three of the circles that lie contiguous to one another, called from thence correſponding circles, of which there are three claſſes, the Upper Rhine, the Lower Rhine, and Weſtphalia; Upper and Lower Saxony; Franconia, Suabia, and Auſtria. Theſe aſſemblies take cognizance of the coin, the public peace, the magazines, fortifications, and commerce.

There are in Germany two ſupreme courts, erected for determining the great cauſes of the empire, ariſing between its reſpective members; namely, the Imperial chamber, and the Aulic council, or chamber of Vienna. The Imperial chamber conſiſts of fifty judges or aſſeſſors. The preſident and four others are appointed by the emperor; each of the electors chooſe one, and the other princes and ſtates the reſt. All cauſes may be brought into this court by appeal. The Aulic council was originally nothing more than a revenue court of the dominions of Auſtria. But as the power of that family increaſed, the juriſdiction of the Aulic council has been excluded; till at laſt, to the great diſguſt of the princes of the empire, it uſurped upon the powers of the Imperial chamber, and even upon thoſe of the diet. It conſiſts of a preſident, a vice-chancellor, a vice-preſident, a certain number of Aulic counſellors, of whom ſix are Proteſtants, beſides other officers, but the emperor is in reality the ſole maſter. Theſe courts decide all cauſes according to the laws and conſtitution of the empire, and the principles of the civil law.

After the votes of the diet are collected, and ſentence pronounced, the emperor may, on an emergency, commit the execution of it to a particular prince or princeſs, whoſe troops live at free quarter upon the eſtates of the delinquent party.

The conſtitution of the Germanic body is of itſelf a ſtudy of no ſmall difficulty. It may be neceſſary, in this place, to inform the reader of the meaning of a term which has of late frequently occurred in the German hiſtory, namely, that of the pragmatic ſanction. This is a proviſion made by the emperor Charles VI. for preſerving the indiviſibility of the Auſtrian dominions in the perſon of the next deſcendant of the laſt poſſeſſor, whether male or female. This proviſion has been often diſputed by other branches of the houſe of Auſtria, who have been occaſionally ſupported by France from political views, though the pragmatic ſanction is ſtrongly guaranteed by almoſt all the powers of Europe. The emperor Joſeph II. elector of Bavaria, and the late king of Poland, attempted to overthrow it, as being deſcended from the daughters of the emperor Joſeph elder brother to Charles VI. The court of Spain have likewiſe repeatedly oppoſed it.

In France, the lives and fortunes of the ſubjects were entirely at the diſpoſal of the grand monarque; but few of the territories of the German princes are ſo large as to be aſſigned to viceroys, to be oppreſſed at pleaſure by unfeeling officers; nor are they entirely without redreſs when they ſuffer any grievance; they may appeal to the general diet or great council of the empire for relief. With reſpect to the burghers and peaſants of Germany, the former, in many places, enjoy great privileges: the latter alſo, in ſome parts, as in Franconia, Suabia, and on the Rhine, are generally a free people, or perform only certain ſervices to their ſuperiors, and pay the taxes; whereas in the marquiſate of Brandenburgh, Pomerania, Luſatia, Moravia, Bohemia, Auſtria, &c. they may juſtly be denominated ſlaves, though in different degrees. The ſubjects of the petty princes in Germany are generally the moſt unhappy; for theſe princes uſually affecting the ſplendour and grandeur of the more powerful, in the number and appearance of their officers and domeſtics, in their palaces, gardens, pictures, curioſities,

ſities, guards, bands of muſic, tables, dreſs, and furniture, are obliged, in order to ſupport all this vain parade, to lay enormous taxes and burdens on their ſubjects and dependants.

With reſpect to the revenues of the empire, we ſhall only make thoſe of the emperor, and a few of the moſt powerful electors, the ſubject of this article. The annual income of the emperor is not more than 5 or 6000l. ſterling, principally ariſing from ſome incoſinderable fiefs in the Black Foreſt. The Auſtrian revenues, the value of money in Germany being conſidered, appear immenſe, amounting to 7,000,000l. ſterling in Germany and Italy—a prodigious ſum in thoſe countries. The revenues of his Pruſſian majeſty cannot eaſily be calculated, but they are computed at half a million ſterling per annum; and his father, who never enjoyed the Siberian revenues, left above ſeven millions in his coffers. The revenues of the other princes of Germany are in proportion to thoſe already enumerated; but it is difficult, perhaps impoſſible, in a country comprehending ſo many different ſtates, to make any computation that can be ſatisfactory to the public. To behold the magnificence of many of the German courts, a ſtranger is apt to conceive very high ideas of the incomes of their princes, which is chiefly owing to the high price of money in that country, and, of courſe, the low price of proviſions and manufactures.

For maintaining the ſtrength and forces of Germany, and to provide for other contingencies, a conſtitution was ſettled by Charles V. whereby every ſtate of the empire was to be taxed in proportion to its ability. This tax, or quota, is entered into a public regiſter, called the matricula of the empire, and kept in the office of the elector of Mentz; it contains the aſſeſſments of men and money, which every prince and ſtate, who are members of the empire, is to advance, when the imperial army takes the field. The contributions in money are called Roman months, on account of the monthly aſſeſſments formerly paid to the emperors when they viſited Rome; but thoſe aſſeſſments are ſubject to great mutability. However, upon a moderate computation, the ſecular princes can bring into the field 379,000 men, and the eccleſiaſtical 74,500; in all 453,500; of thoſe 90,000 are ſuppoſed to be furniſhed by the emperor, as head of the houſe of Auſtria.

By this computation, which is far from being exaggerated, it appears, that the emperor and empire form the moſt powerful government in Europe, and that if the whole force was properly directed under an able general, Germany would have nothing to fear from any of its ambitious neighbours; but the different intereſts purſued by the ſeveral princes of Germany, render the power of the emperor of little conſequence, except with regard to his own forces, which are indeed very formidable. The imperial army, in 1775, was computed to amount to 200,000 effective men.

The arms of the empire are a black eagle with two heads, hovering with expanded wings, in a field of gold; and over the heads of the eagle is ſeen the imperial crown. On the breaſt of the eagle is an eſcutcheon quarterly, of eight, for Hungary, Naples, Jeruſalem, Arragon, Anjou, Guelders, Brabant, and Barr. The empreſs-dowager Eleanor, in 1662 and 1666, created two orders of ladies, or female knights; and the order of St. Thereſa was inſtituted by the late empreſs-queen.

The emperors of Germany, as well as the kings of Spain, confer the order of the *Golden Fleece*, as deſcended from the houſe of Burgundy. This order was inſtituted at Bruges, in Flanders, on the 10th of January 1429, by Philip duke of Burgundy, on the day of his marriage with his third wife. It is ſuppoſed that he choſe the badge, it being the chief of the ſtaple manufactures of his country. It conſiſted at firſt of thirty knights, including the ſovereign, who were of the firſt families of the Low Countries, and it ſtill continues to be ranked with the moſt illuſtrious orders of knighthood in Europe. There are at preſent two branches of it; the emperor is ſovereign of the one, and the king of Spain of the other; all the knights muſt prove their noble deſcent from the 12th century. They uſually wear a Golden Fleece proper, pendent to a broad plain red ribband round their necks; but on days of ceremony, they wear the collar of the order, which is compoſed of double ſteels, interwoven with flint ſtones emitting ſparks of fire, the whole enamelled in their proper colours, at the end of which a golden fleece hangs on the breaſt. The fuſils are joined two and two, as if they were double BB's, the cypher of Burgundy, and the flint ſtones, the ancient arms of the ſovereigns of that duchy, with their motto, *Anteferit quam flamma micet*, "He prefers what ſhines with flame." The motto of the Order is, *Pretium non vile laborum*, "Not a mean reward of our labours."

In our account of Orders in the Netherlands, we have already noticed the *Teutonic Order*; and ſhall only add, that this order owed its origin to ſome religious Germans at Jeruſalem, during the cruſades, who aſſumed the title of the Teutonic knights, or brethren of the hoſpital of our Lady of the Germans at Jeruſalem. Conrade, duke of Suabia, invited them into Pruſſia about the year 1230; they ſoon after conquered Pruſſia for themſelves, and became one of the moſt powerful orders in Europe, but, by the order dividing againſt itſelf, they afterwards loſt their power and poſſeſſions; and Albert, marquis of Brandenburgh, grand-maſter of the order, on his abjuring Popery, abdicated the grand maſterſhip, ſubdued Pruſſia, and expelled all the Papiſts who followed not his example. The members of this order muſt take the oath of celibacy.

When the order of the *Red Eagle* was inſtituted, is not certainly known. The margrave of Bareith is ſovereign of it. The badge is a golden ſquare medal enamelled white, on which is an eagle diſplayed red. It is worn pendent to a broad red watered ribband, edged with yellow, and worn ſcarf-wiſe. This order is commonly beſtowed on general officers.

In the year 1690, the *Order of Sincerity* was eſtabliſhed by John George, elector of Saxony, and Frederick III. elector of Brandenburg, in terminating their diſputes, and as a confirmation and ſurety hereafter of their amity. The knights of this order wear a bracelet of gold: on one ſide are the names of the two princes, with this device——*Amitié ſincere*, "Sincere Friendſhip;" on the other ſide are two armed hands, joined together, and placed on two ſwords, with two palm branches croſſed with this motto—*Unis pour jamais*, "United for ever."

The order of the *Noble Paſſion* was inſtituted in 1704, by John George duke of Saxe Weiſſenfels, of which the duke is ſovereign. The badge is a gold medal, enamelled white, on which is a ſtar of eight points, gold, charged with a croſs red, ſurmounted with an oval blue, on which are the letters J. G. in a cypher, the whole encircled with theſe words—*J'aime l'honneur qui vient par la vertu*, "I love the honour which comes by virtue." Each knight of this order is to contribute to the maintenance of the maimed or decayed ſoldiers in the ſervice of the ſovereign.

The order of the *Death's Head* was inſtituted in 1652, by the duke of Wirtemburgh, and revived in the year 1709, by his daughter Louiſa-Elizabeth, widow of Philip, duke of Saxe Merſburg. None but women of virtue and merit (birth and fortune not regarded) can be received into it; and the ſovereign muſt be a princeſs of the houſe. The badge of the order is a death's head, enamelled white, ſurmounted with a croſs pattée black: above the croſs pattée another croſs compoſed of five javels, by which it hangs to a black ribband edged with white, and on the ribband theſe words——*Memento mori*, "Remember

"Remember death," worn at the breaſt. They are to avoid gambling, theatrical amuſements, and luxuries of all kinds.

In the year 1702, the order of *the Chace* was inſtituted by the duke of Wirtemburgh, and improved in the year 1719. The badge of this order is a gold croſs of eight points enamelled red; in the ſpaces between the branches of the croſs is an eagle diſplayed, red, and between the points of each traverſe a bugle horn, and in the centre the letter W, and over it a ducal coronet enamelled in proper colours. It is worn pendent to a broad ſcarlet watered ribband, paſſing ſcarf-wiſe from the left ſhoulder to the right ſide. On the left ſide of the coat is a ſilver ſtar embroidered of the ſame figure as the badge, in the middle a green circle with the motto—*Amicitiæ virtutiſque fœdus*, "The bond of friendſhip and virtue." St. Hubert is the patron of this order; and the feſtival is held on his anniverſary.

The order of *St. Hubert* was firſt inſtituted by a duke of Juliers and Cleves, in memory of a victory gained by him on St. Hubert's day, in 1447: it was afterwards revived in the year 1709, by the elector palatine. The number of counts and barons of the order, who enjoy the memorial lands annexed to it, is limited to twelve, but the number of princes and private gentlemen is not fixed. The elector palatine is grand-maſter of the order. The badge is a croſs of eight points, from the angles iſſue rays, and in the middle of a circle is enamelled the figure of St. Hubert kneeling before a crucifix, placed between the horns of a ſtag ſtanding in a wood, having in the centre this device in the Runic language—*Conſtans in fidelitate*, "Conſtant in fidelity," on a red ground. All the knights have either military employments or penſions; before admitted, they are to prove the nobility of their deſcent for four generations, and, on the day of reception, are to pay 100 ducats to the poor.

The order of *St. Rupert* was inſtituted in 1701, by the archbiſhop of Saltzburgh, in honour of the founder and patron of the ſee he held, and as the apoſtle of his country. It is compoſed of twelve knights, who are diſtinguiſhed by a chain of gold round the neck, to which is pendent a badge, which is a croſs of eight points enamelled blue; and in the centre the image of St. Rupert. This order is in good eſteem, as the archbiſhop is the richeſt and moſt powerful prince in Bavaria, next to the elector.

In the year 1729, the order of *St. George, the Defender of the immaculate Conception*, was inſtituted by Albert, elector of Bavaria. The badge they wear is a ſtar of eight points, and on the centre is enamelled the image of St. George on horſeback ſlaying a dragon. The croſs is enamelled blue edged with white. On days of ceremony they wear the badge pendent to a collar compoſed of oblong plates with crowns at each end, and columns ſurmounted with globes, each column ſupported by two lions holding in their exterior paws two ſcymetars, the whole joined together with lozenge chains enamelled blue with white; on the oblong plates is this motto—*In fide, juſtitia, et fortitudine*, "In faith, juſtice, and fortitude." The knights of this order are obliged to prove their nobility by father and mother for five generations.

The military and civil order of the *Golden Lion* was inſtituted by the preſent landgrave of Heſſe-Caſſel. The badge is an octagonal medal enamelled red, in the centre a lion rampant, gold, ducally crowned; it is pendent to a broad watered crimſon ribband, worn ſcarf-wiſe. This order is moſtly conferred on general officers.

The military *Order of Merit* was alſo inſtituted by the preſent landgrave; the badge (which is worn at the coat, pendent to a blue ribband edged with ſilver) is a gold croſs of eight points enamelled white, and in the centre this motto—*Pro virtute et fidelitate*, "For virtue and fidelity."

HISTORY OF GERMANY.

THE manners of the ancient Germans are well deſcribed by Tacitus, a Roman hiſtorian. They were noble, magnanimous, and beneficent. Their hoſpitality was remarkable; and their love of independence carried to an amazing height. Inſpired with an unconquerable enthuſiaſm for defending their liberty, they nobly withſtood the Roman power, even in its greateſt height. At that time the Germans were ſo far from being formed into a ſingle community, that they were divided into a vaſt number of ſmall kingdoms, or commonwealths. Each had its own form of government, laws, policy, and intereſt. But they were all equally fond of liberty, and avowed enemies of all kinds of invaſion.

Induced by theſe noble principles, they beheld with jealouſy and deteſtation the daily encroachments made by the Romans on all their neighbours; and to lend their aſſiſtance to thoſe nations who were threatened with the chains of ſlavery. Hence aroſe thoſe wars and conqueſts which ended in the reduction of their country. The artful Romans took the advantage of their being divided into a multitude of ſmall republics; they fomented jealouſies among ſome, and found means to bribe others. Againſt ſome they uſed force; againſt others the arts of flattery. By this means they conquered gradually that power, which, when properly united, bad defiance to the Roman legions. But though Germany was reduced to a Roman province, the inhabitants regained thier liberty, when the power of the empire was divided; and made ample repriſals on their conquerors.

Affairs in this ſituation continued till the beginning of the ninth century, when Charlemagne, or Charles the Great of France, was advanced to the Imperial throne on Chriſtmas-Day. He was the ſon of king Pepin, and ſucceeded him in the kingdom of France when Deſiderius, king of Lombardy, poſſeſſed that throne, who, having inſulted the pope and clergy of Rome, and compelled them to part with a great deal of that power they had uſurped, Charles invaded Lombardy, defeated and depoſed Deſiderius; and going afterwards to Rome, the pope, who looked upon him as his deliverer, declared him a patrician, a title equal almoſt to that of emperor; inveſting him with authority to confirm future popes, and grant the Italian biſhops and inveſtitures of their ſees. This prince reigned 14 years, and died anno 814.

The ſucceſſors of Charlemagne did not long enjoy the honour of a throne founded by their great anceſtor. In the year 880 the ſtates of the empire aſſumed their original independence, and placed the Imperial crown on the head of Arnolph, king of Bohemia: and, ſince that period, Germany has been conſidered as an elective monarchy. The princes of the moſt powerful families in Germany, according to the prevalence of their intereſt and arms, have mounted the throne. The houſes of Saxony, Franconia, and Suabia, have ſwayed the Imperial ſceptre; but, in the year 1440, it paſſed to the houſe of Auſtria, who have ever ſince enjoyed it, except a ſhort interval, when the duke of Bavaria, on the death of Charles VI. was placed on the throne: he did not long poſſeſs the Imperial dignity, but died of a broken heart.

The events that happened during the reigns of theſe emperors, conſiſt chiefly of conteſts between them and the popes of Rome; and from theſe conteſts the famous factions of the Guelphs and Ghibelines, in the 13th century, had their riſe; the former being attached to the popes, and the latter to the emperors; and theſe, by their virulence and inveteracy againſt each other, filled the empire with diſtraction for ſeveral centuries. Frederic III. duke of Auſtria, who aſcended the Imperial throne in 1440, was very ſucceſsful in his wars, and enjoyed the throne fifty-three years. He was ſucceeded by his ſon Maximilian I. who eſpouſed the heireſs of Charles,

duke of Burgundy; and by this marriage, that duchy, together with the ſeventeen provinces of the Netherlands, were annexed to the houſe of Auſtria.

Charles V. the greateſt prince that had filled the Imperial throne ſince Charlemagne, was elected emperor, on the death of his grandfather Maximilian, which happened in the year 1519. He was heir to the crown of Spain in right of his mother Joanna. During his reign the empires of Mexico and Peru in America were conquered, by which he became the ſovereign of much larger and richer territories than any other prince in Europe. In his reign the reformation began in Germany. Charles violently oppoſed the followers of Luther, and a civil war broke out in the empire. This, together with the wars in which Charles was almoſt perpetually engaged againſt France, rendered his reign exceedingly troubleſome. He was at firſt very fortunate, and is ſaid to have been victorious in above thirty pitched battles which he fought in perſon: in the decline of life his good fortune began to forſake him; on which he abdicated the throne, and retired into a monaſtery, where he died about two years after. He was ſucceeded in the year 1558 by his brother Ferdinand I. who was very moderate with regard to the religious diſturbances which ſtill continued in Germany, and died in 1564.

Maximilian II. aſcended the Imperial throne on the death of his father, without any new election, purſuant to the conſtitution of the empire. His reign was continually diſturbed by internal commotions, chiefly on account of religion, and alſo invaded by the Turks; but he died in peace in 1576, and was ſucceeded by Rodolph, who obtained the Imperial ſceptre on the death of his father: he was involved in a war with the Hungarians, and oppoſed by his brother Matthias. Perceiving that it would be in vain to endeavour to reduce the Hungarians to obedience while they were aſſiſted by his brother, he therefore gave that kingdom, together with the duchy of Auſtria, to Matthias. This produced the deſired effect, and Rodolph lived in peace the remaining part of his reign. On his death,

Matthias was elected emperor. During his reign the reformers were divided into two ſects, called Lutherans and Calviniſts, and oppoſed each other with ſo much fury, that the empire was threatened with a civil war. But the ambition of Matthias, who had taken meaſures for exterminating both parties, reconciled them. At the ſame time, by perſecuting the reformed in Bohemia, the people flew to arms, and threw the Imperial commiſſioners out of a window at Prague. This occaſioned a dreadful war in that kingdom, which laſted thirty years. The perſecution in Bohemia convinced both the Lutherans and Calviniſts that nothing but a cloſe union could prevent the deſtruction meditated by the emperor. Accordingly they formed a confederacy, called the Evangelical League, at the head of which was Frederic, the elector palatine, then the moſt powerful Proteſtant prince in Germany, and ſon-in-law to James I. of England. This was counterbalanced by a Catholic league.

Matthias dying in 1618, was ſucceeded in the Imperial throne by his couſin Ferdinand II. but the inhabitants of Bohemia refuſed to acknowledge him for their king, and offered their crown to the elector palatine, who was imprudent enough to accept it. While he continued at the head of the Evangelical League, he was very ſucceſsful; but was not able to ſupport the crown he had imprudently received. He was totally defeated at the battle of Prague, and deprived of his palatinate.

The Catholics conſidered this victory over Frederic as a prelude to the deſtruction of the Proteſtant cauſe in Germany; but their expectations were built on a ſandy foundation. The reformers had ſtill generals able to lead their armies, among whom were the margrave of Baden Dourlach, Chriſtian duke of Brunſwick, and the famous count Mansfield. Other Proteſtant princes alſo now perceived the neceſſity of joining their brethren, in order to ſupport the religion they had embraced. Among theſe was Chriſtian IV. king of Denmark, who was placed at the head of the Evangelical League. Chriſtian engaged the Imperial army commanded by count Tilly, and was totally defeated. The Proteſtants were not however intimidated: they formed a freſh confederacy at Leipſic, at the head of which was the celebrated Guſtavus Adolphus, king of Sweden. His victories ſucceeded each other with aſtoniſhing rapidity, and the houſe of Auſtria trembled for its power, when he was killed in the battle of Lutzen, in the year 1632. But the Proteſtant cauſe did not fall with Guſtavus. The generals formed under his care purſued the plan he had formed, and the emperor was convinced that there was no other method of ſaving the houſe of Auſtria, than that of putting an end to the war. Accordingly a peace was concluded at Munſter, in the year 1648. By this treaty the Proteſtant religion was eſtabliſhed in all parts of Germany where it was profeſſed, and the claims and pretenſions of moſt of the princes and ſtates of Europe were finally ſettled. Before this event happened, Ferdinand II. died, and his ſon Ferdinand III. was placed on the Imperial throne.

In the year 1658, Leopold ſucceeded his father Ferdinand III. He was one of the moſt ſevere and unamiable princes of his time, ſo that he was at once hated and dreaded by his ſubjects. Soon after his acceſſion to the Imperial throne, he found himſelf oppreſſed by two powerful nations, France and Turky. The French took Alſace, and many other frontier places of the empire from him; and the Turks, after over-running Hungary, laid ſiege to Vienna. Reduced to this extremity, Leopold had had recourſe to John Sobieſki, king of Poland, for aſſiſtance. That prince, though he had before received very indifferent treatment from the houſe of Auſtria, marched at the head of a powerful army againſt the Infidels, and, being joined by the duke of Lorrain, the Imperial general, attacked the beſiegers in their trenches, drove them from their works, and totally defeated the grand Turkiſh army. In the mean time, the French purſued their conqueſts in ſo rapid a manner, that the other powers of Europe were alarmed, and a grand confederacy, conſiſting of the Empire, Great-Britain, the Dutch, and the northern powers, was formed, in order to check the progreſs of the French, and render abortive the ambitious and chimerical plan contrived by Louis XIV. for founding an univerſal monarchy. Though the arms of John Sobieſki had driven the Turks from their conqueſts, the Hungarians, exaſperated at the inhuman tyranny of the emperor, and encouraged by the protection of the Porte, were ſtill in arms. At laſt a peace was concluded at Ryſwick, in 1697; and, two years after, the Turks conſented to a peace, which, in 1699, was ſigned at Carlowitz.

Peace had not long taken place in Europe, when Charles II. of Spain died, and, by his will, left his dominions to Philip, duke of Anjou, grandſon to Louis XIV. who immediately ſeized the Spaniſh dominions, and proclaimed Philip king of Spain. This acquiſition in favour of the houſe of Bourbon, alarmed all the European powers; and a powerful confederacy was again formed, in order to humble the exorbitant ambition of Louis XIV. The emperor claimed the Spaniſh crown for his younger ſon Charles, as the lawful heir to thoſe dominions. Accordingly Leopold invaded Italy; and the allied army, conſiſting of Britiſh, Dutch, and German forces, under the command of the celebrated duke of Marlborough, oppoſed the French in the Low Countries, where the armies of Louis were conſtantly defeated.

In the midſt of this ſucceſs, Leopold died, and was ſucceeded in the Imperial throne by his ſon Joſeph, who endeavoured to throw the whole burden of the war on the Engliſh, though carried on ſolely for his benefit. He was even ſuſpected of having formed a deſign to ſubvert the liberties of Germany; but before he could carry his plan into execution, or even reduce his Hungarian ſubjects to obedience, he died in 1711.

Joſeph dying without iſſue, was ſucceeded by his brother Charles VI. the prince whom the confederates were labouring to place on the throne of Spain, in oppoſition to the duke of Anjou. A peace was concluded at Utrecht in 1713, whereby the Spaniſh dominions in Italy, and the Netherlands, were ceded to the emperor. Charles now turned his whole force againſt the Turks, and they were ſoon after totally defeated by prince Eugene at the battle of Peterwaradin.

The ſame general, in the year 1717, obtained another victory over the Infidels, before Belgrade; in conſequence of which that important city fell into the hands of the Imperialiſts. Convinced, by theſe ſucceſſive defeats, that the war, if continued, muſt be attended with very diſagreeable conſequences, the Turks offered to conclude a peace with the emperor, and the treaty was accordingly ſigned at Paſſarowitz in 1718. Charles, now free from the embarraſſments of war, employed his time in making arrangements for ſecuring and augmenting his hereditary dominions in Italy. Fortunately for him, the crown of Great Britain had devolved to the houſe of Hanover, ſo that his connections with Geo. I. and II. gave him a deciſive weight in Europe.

Charles, who had no male iſſue, in the year 1722 formed a deſign for ſettling his hereditary dominions on his eldeſt daughter, the archduchеſs Maria Thereſa. But this plan did not interrupt his aſſiduity with regard to his hereditary dominions. On the contrary, he purſued his meaſures with ſo high a hand, that he gave great offence to George I. and, about the year 1724, a breach enſued between them. This conteſt might have proved fatal to the repoſe of Europe, had not each of the contending monarchs been principally attentive to a favourite object, to the attainment of which every other particular was to be ſacrificed. That of the emperor was the ſettlement of his hereditary dominions on his daughter; and the aggrandiſement and ſafety of Hanover poſſeſſed the chief place in the mind of the Britiſh monarch. It is, therefore, no wonder that mutual conceſſions in favour of theſe deſirable acquiſitions ſhould reſtore peace and harmony between the two princes. The ſettlement Charles had made of his hereditary dominions on his daughter, was confirmed by a diet of the empire, and, being guaranteed by the principal powers of Europe, obtained the name of the Pragmatic Sanction.

Charles, having obtained this great object of his attention, turned his arms againſt the Turks; but his famous general, prince Eugene, was now dead, and he had no other capable of ſupplying his place. The Infidels were therefore generally victorious. The meaſures of the court of France being then pacific, he obtained, by the mediation of that power, a much better peace than he had reaſon to expect. By this treaty Belgrade was ceded to the Porte, and the rivers Danube and Saave made the boundaries between the two empires on the ſouth. On the 28th of October, 1740, Charles VI. died.

Maria Thereſa, his eldeſt daughter, ſome time before married to the duke of Lorrain, was declared queen of Hungary and Bohemia, and the lawful heireſs of all the emperor's hereditary dominions, agreeable to the pragmatic ſanction.

But notwithſtanding the above treaty had been guaranteed in the moſt ſolemn manner by different powers, ſeveral princes, on the death of Charles, ſet up claims in direct oppoſition to that treaty. The young king of Pruſſia, at the head of a powerful army, reduced great part of Sileſia, under pretence that it had been long unjuſtly detained from his family. The king of Spain and the elector of Bavaria alſo claimed part of theſe eſtates, though they had never mentioned their pretenſions in the time of Charles VI. The French, perſuaded that a proper opportunity now offered for recovering what they had loſt by the treaty of Utrecht, poured their armies into Bohemia, and threatened deſtruction to the houſe of Auſtria. Thus encompaſſed with armies, and in danger of falling a ſacrifice to thoſe very powers who had ſo lately guaranteed the pragmatic ſanction, the archduchеſs determined to throw herſelf into the arms of her Hungarian ſubjects, though they had never ſhewn any firm attachment to her family. Accordingly ſhe ſummoned all the chiefs of that kingdom, and in a moſt pathetic ſpeech recommended herſelf and her infant ſon to their protection. Touched with her youth and beauty, and enraged at the unjuſt proceedings of her enemies, the Hungarians promiſed to ſpend the laſt drop of their blood in her ſervice. This fidelity of theirs to the late empreſs-queen, notwithſtanding the provocations they had received from her houſe, will always be recorded to their honour.

Affairs now began to wear a more pleaſing aſpect. A peace was concluded with the king of Pruſſia, and the Auſtrian generals drove the French out of Bohemia. The duke of Bavaria was in the mean time placed on the Imperial throne, under the title of Charles VII. but his dominions being conquered by the Auſtrian forces, he retired to Frankfort on the Maine.

His Britannic majeſty George II. now declared in favour of the queen of Hungary, and defeated the French at the battle of Dettingen, in 1743. In the mean time Charles VII. was miſerable on the Imperial throne, and would have accepted peace from the queen of Hungary on almoſt any terms; but ſhe haughtily, and, indeed impolitically, refuſed every overture of accommodation, and ſeemed determined to be amply revenged for the injuries ſhe had ſuffered. This obſtinacy offered a pretence for the king of Pruſſia's entering Bohemia, under colour of ſupporting the Imperial dignity. He was very ſucceſsful in his invaſion, but perceiving it was in vain to expect aſſiſtance from the French, notwithſtanding their repeated promiſes, he abandoned all his conqueſts, and retired into Sileſia. Soon after this retreat of his Pruſſian majeſty, Charles VII. died of a broken heart, and the duke of Lorrain, then grand duke of Tuſcany, and conſort to the queen of Hungary, was placed on the Imperial throne. This event happened in the year 1745.

The war was now transferred to the Low Countries, where the French were very ſucceſsful under the command of count Saxe. The misfortunes which attended the allied army in Flanders retarded the operations of the empreſs-queen againſt the king of Pruſſia; and prince Charles of Lorrain being defeated by that monarch, a peace was concluded, by which Sileſia was ceded to his Pruſſian majeſty, and guaranteed by the king of Great Britain. This peace was, however, of no long continuance; the king of Pruſſia diſcovered, or at leaſt pretended to diſcover, a ſecret convention, by which the empreſs-queen, the empreſs of Ruſſia, and the king of Poland, as elector of Saxony, had engaged to ſtrip him of all his dominions, and divide them among themſelves. His Pruſſian majeſty therefore ſuddenly entered Saxony, drove the king of Poland out of his electorate, and took poſſeſſion of Dreſden. This irruption was however ſoon after terminated by a peace, under the mediation of the king of Great Britain, by which the king of Pruſſia acknowledged the grand duke of Tuſcany emperor of Germany.

The war was ſtill continued in the Low Countries, but was terminated, in the year 1748, by the

treaty

treaty of Aix-la-Chapelle, which, however, did not put a period to the troubles of Germany for any long ſpace of time, for it ſoon appeared the jealouſy of the king of Pruſſia was not founded on imagination only.

The empreſs-queen and the empreſs of Ruſſia, ſupported by France, kindled again the flames of war in the empire. The king of Pruſſia declared that he would oppoſe with all his power the entrance of the Ruſſian forces into Germany, and his Britannic majeſty proteſted againſt the French marching into that country. Theſe two reſpectable powers thus agreeing in this fundamental principle, all former animoſities were buried in oblivion, and the Britiſh parliament agreed to pay his Pruſſian majeſty an annual ſubſidy of 670,000l. during the continuance of the war, the flames of which now broke out in Germany with greater fury and more deſtructive violence than ever.

The armies of his Pruſſian majeſty, like an irreſiſtible torrent, burſt into Saxony, totally defeated marſhal Brown at the battle of Lowoſitz, obliged the Saxon forces to lay down their arms, though almoſt impregnably fortified at Pirna, and cauſed the elector of Saxony to fly for protection to his regal dominions in Poland. The emperor now interpoſed his authority, and commanded the king of Pruſſia to deſiſt immediately from troubling the repoſe of Germany. This Imperial order being diſregarded, his Pruſſian majeſty was put under the ban of the empire, and the army of execution was ordered to be raiſed. The French poured their armies into Germany on one ſide, and the Ruſſians on the other. Few hiſtories afford an inſtance of conduct and intrepidity equal to that diſplayed by his Pruſſian majeſty on this alarming occaſion; it was indeed aſtoniſhing. He broke into Bohemia with inconceivable rapidity, and defeated near Prague the Auſtrian army, commanded by marſhal Brown and prince Charles of Lorrain. In this action, 20,000 were killed, wounded, or taken priſoners. This victory left the city of Prague open, which the king of Pruſſia immediately beſieged; but before he could reduce it, the greater part of his forces were defeated at Colin by marſhal Daun, which obliged him to raiſe the ſiege and retire to Eiſenach. This defeat, however, was far from intimidating the Pruſſian monarch; he ſoon after attacked the combined army of France and the empire, at Roſbach, and obtained a complete victory, ſeized their baggage, and 164 pieces of cannon. This victory was ſoon after followed by another of ſtill more importance; he attacked the grand Auſtrian army commanded by prince Charles of Lorrain, and the marſhals Daun and Nadaſti, at Liſſa, and totally defeated them. By this time the Ruſſians had advanced to Zorndorff, where they were alſo defeated by the Pruſſians.

We cannot undertake, in this compendium, to follow the armies of the contending powers in Germany through all the various ſcenes of action; let it ſuffice to ſay, that the greateſt defeat his Pruſſian majeſty received during the whole war, was by the Ruſſians, near Frankfort on the Oder. His affairs indeed now ſeemed deſperate, but he had reſources within himſelf that aſtoniſhed all the world; he aroſe with new luſtre after every defeat. He maintained a war againſt theſe formidable powers, till jealouſy among the contending parties occaſioned it to languiſh, and before the cauſe could be removed, the empreſs of Ruſſia died on the 5th of January, 1762. George II. had died on the 25th of October, 1760.

Theſe critical events ſaved the houſe of Brandenburgh; nor were the Auſtrian generals themſelves very forward to complete the deſtruction of Pruſſia. —Already ſufficiently haughty and deſpotic, it was thought very imprudent to increaſe the power of the court of Vienna. The new czar of Ruſſia recalled his forces, and the Engliſh miniſtry had entered into a negotiation with France for putting an end to the troubles of Europe. This had a great effect on the belligerent powers in Germany; and on the 15th of February, 1763, a definitive treaty of peace between the emperor and empreſs-queen of Hungary, and the king of Poland, elector of Saxony, on the one part; and the king of Pruſſia, on the other; was concluded at Hubertſburg near Leipſic; by which it was agreed that every thing ſhould remain in the ſame ſtate as at the beginning of this bloody war, which had proved fatal to many of the beſt generals in Europe; the king of Pruſſia loſt above forty, among whom was the great marſhal Keith, and general Schwerin. Marſhal Brown fell in the battle of Prague, and Daun was dangerouſly wounded at Torgau.

The emperor died at Vienna in the year 1765, and his ſon Joſeph, who had been crowned king of the Romans in 1764, ſucceeded to the Imperial throne. This prince was of a pacific and humane diſpoſition, had diſcovered great talents for government, and given ſeveral pleaſing inſtances of his ardent deſire to render his ſubjects happy. He attended to their complaints in perſon, and redreſſed every grievance as ſoon as it was known. He viſited his Italian dominions incog. and regulated many abuſes which had crept into the government. He procured a perſonal interview with the late king of Pruſſia, though this did not prevent hoſtilities from being commenced between Auſtria and Pruſſia, on account of the ſucceſſion to the electorate of Bavaria. Though vaſt armies were brought into the field on both ſides, no very important action happened, and an accommodation at length took place.

He was a prince of a philoſophical turn of mind, and mixed with his ſubjects with an eaſe and affability that are very uncommon in perſons of his rank. He loved the converſation of ingenious men, and appeared ſolicitous to cultivate that extenſive knowledge, which ennobles thoſe who poſſeſs the elevated ſtation to which he had been raiſed.

He expired on the 20th of February, 1790, in the 26th year of his reign, and the 49th of his age. As king of Hungary and Bohemia, he was only in the 10th year. He ſucceeded to the Imperial crown on the death of his father Francis, on the 10th of Auguſt, 1765; and to the hereditary dominions in the houſe of Auſtria on the death of his mother, on the 29th of November, 1780. He was twice married; firſt, to a princeſs of Parma; then to one of the princeſſes of the houſe of Bavaria.

Peter Leopold, grand duke of Tuſcany, ſucceeded his brother Joſeph II. and engaged the public praiſe by repeated inſtances of moderation and ſolid principles. The French revolution now attracted the attention of the powers of Europe. A conference was held at Pilnitz between the emperor, the king of Pruſſia, and the elector of Saxony, at which the plan of attacking France was propoſed and diſcuſſed. Leopold for ſome time was very irreſolute, but at laſt ſeemed to be reſolved on war, when he died of a pleuritic fever, on the 1ſt of March, 1792, after an illneſs of four days.

His ſon Francis was raiſed to the Imperial throne in the middle of July following. He embraced the politics of his predeceſſor, and embarked with zeal in the war againſt France. The conſequences of this war, as more properly belonging to the affairs of France, are related in our account of that nation, under which they will appear more clear and connected.

CHAP.

CHAP. XIX.

THE KINGDOM OF PRUSSIA.

Extent, Boundaries, Diviſions, Climate, Produce, Religion, Inhabitants, Government, Revenues, &c.

THE Kingdom of Pruſſia, formerly called Ducal Pruſſia, belongs to the houſe of Brandenburg; and is quite diſtinct from Royal Pruſſia, which is ſubject to Poland. Its greateſt length is about 160 miles, and its breadth about 112. To the north it is bounded by part of Samogitia; to the ſouth, by Poland Proper and Maſovia; to the eaſt, by part of Lithuania; and to the weſt, by Poliſh Pruſſia and the Baltic.

The ancient inhabitants of this kingdom were the Boruſſi, and from them the preſent appellation of Pruſſia is evidently derived. Pruſſia, ſince the beginning of the preſent century, has become a very reſpectable power upon the continent of Europe; but as the territories of his Pruſſian majeſty lie ſcattered in different parts of Germany, &c. it was thought proper to exhibit the whole in the following table:—

Countries Names.		Chief Towns.
Poland	Ducal Pruſſia	Koningſburg.
	Royal Pruſſia	Elbing.
Upper Saxony	Brandenburg	Berlin.
	Pomerania	Camin.
	Swediſh Pomerania	Stettin.
Lower Saxony	Magdeburg	Magdeburg.
	Halberſtadt	Halberſtadt.
Bohemia	Glatz	Glatz.
	Sileſia	
Minden		Minden.
Weſtphalia	Ravenſburg	Ravenſburg.
	Lingen	Lingen.
	Cleves	Cleves.
	Meurs	Meurs.
	Mark	Ham.
Eaſt Frieſland		Embden.
Lippe		Lipſtadt.
Gulich		Gulich.
Tecklenburgh		Tecklenburgh.
Netherlands	Guelder	Guelders.
Switzerland	Neufchatel	Neufchatel.

Beſides the above dominions, the preſent king of Pruſſia poſſeſſes great part of Sileſia, which, under various pretences, he has wreſted from Auſtria: he has alſo ſeized upon Thorn, with the countries on the Viſtula, the Neiſter, and other territories contiguous to his own dominions, cloſe to the walls of Dantzick.

The air of Pruſſia, being purified by frequent high winds, is tolerable wholeſome: the winters are long and ſevere, and the autumns frequently wet and ſtormy. The ſoil, where cultivated, proves fruitful in corn and other commodities. The woods furniſh the inhabitants with wax, honey, pitch, and a quantity of pot-aſhes. Here is alſo a ſort of manna, and a ſpecies of worm or inſect called kermes, from which a beautiful red colour is extracted. Its animal productions are horſes, ſheep, deer, and game, bears, wolves, lynxes, wild boars, and foxes. The rivers and lakes abound with fiſh; and amber, which is thought to be formed of an oil coagulated with vitriol, is found in pits on its coaſts, towards the Baltic. Wood for fuel, and pit-coal, are very plentiful.

The preſent inhabitants of Pruſſia are the deſcendents of Germans, Lithuanians, and Poles, with a mixture of the French, Engliſh, and Dutch. The number of perſons, capable of bearing arms, are computed at upwards of 600,000, and, ſince the year 1719, it is ſuppoſed that about 34,000 coloniſts have removed thither from France, Switzerland, and Germany; of which, 17,000 were Saltzburghers. Theſe emigrants have built 400 ſmall villages; eleven towns, eighty-ſix ſeats, and fifty new churches, in that part of the country called Little Lithuania; they have likewiſe founded 1000 village-ſchools. The manners of the inhabitants, and their cuſtoms and diverſions, differ but little from thoſe of the other inhabitants of Germany, to which the reader is referred.

The eſtabliſhed religion in Pruſſia is the reformed, according to the tenets of Luther and Calvin; but, through his majeſty's wiſdom and moderation, Papiſts, Antipædobaptiſts, and almoſt all other ſects, are here tolerated. Schools for the inſtruction of youth are diſperſed throughout the kingdom. There is an Univerſity at Koningſburg, founded by the margrave Albert in the year 1544, which has thirty-eight profeſſors, excluſive of tutors: in the ſame city is a college, ſtyled Collegium Fredericianum.

Koninſburg, which is the capital of the whole kingdom, ſtands in 54—43 N. lat and 21—35 E. long. on the river Pregel, over which it has ſeven bridges. It is well built, contains and 60,000 inhabitants, a great number of elegant houſes, and a variety of gardens both public and private, is well fortified, and has an exceeding good harbour, well furniſhed with ſhips. Here is alſo a magnificent palace, the greater part of which was built by the margrave Albert. It is a very extenſive building, and in it moſt of the public offices, courts, and colleges are held. The gardens and parks belonging to it are likewiſe both ſpacious and beautiful; and near it is the Gallegium Fredericianum. In the year 1544, the above-mentioned Albert founded here a college, which has thirty-eight profeſſors, excluſive of tutors. The other public buildings of note, are the Exchange, and Town-Houſe, both very ſtately. Here is alſo the citadel called Frederic's-Burg, built in the year 1657, which is a regular ſquare, ſurrounded with broad ditches and the river Pregel. Beſides the hoſpitals and alms-houſes, here is a charitable fund, from which above eight hundred people receive weekly penſions This city was formerly a Hanſe-Town, and its trade is ſtill very conſiderable. In the year 1752, near five hundred ſhips arrrived in this port.

Thirty miles weſt of Koningſburg is Pilau, a town of conſiderable ſtrength, with a fine harbour, both which are defended by a ſtrong fort mounted with a great number of cannon. It is ſituated at the mouth of the bay or lake called Freſche-Hoff; and this peninſula is ſo delightful, that it is called the paradiſe of Pruſſia. Pilau is a place of good trade, and the larger veſſels conſigned to Koningſburg, deliver and take in their cargoes here, the Freſche-Hoff not having a ſufficient depth of water to carry them up to Koningſburg. In the village of Wogram, not far from hence, the ſturgeons are boiled and packed up, and cavier made of their roes, of which the greater part is exported to England.

The largeſt and moſt wealthy town in Pruſſia, next to Koninſburg, is Tilſet. It ſtands on the river Memel, and carries on a conſiderable trade, eſpecially with Koningſburg. Here is a ſalt factory, and a caſtle; and in the neighbouring county, which is remarkably fertile, great numbers of cattle are bred, and excellent butter and cheeſe made.

For curioſities and antiquities, natural and artificial, ſee Germany.

The late king of Pruſſia, by an indefatigable attention to the commerce and manufactures of his kingdom, brought them into a very flouriſhing ſtate: he derived an amazing revenue from this country, which about a century and a half ago was the ſeat of boors and barbariſm. It is ſaid that amber alone, of which Pruſſia has been conſidered as the native country, brings him in 26,000 dollars per annum. Beſides

amber, the exports of this country conſiſt of a variety of naval ſtores, linſeed, hemp-ſeed, oatmeal, cavier, mead, fiſh, and tallow; and 500 ſhips, chiefly from Koningſburg, are ſaid to be employed annually in the conveyance of theſe articles to foreign countries. The manufactures of Pruſſia conſiſt principally in iron-work, copper and braſs ſcroll, glaſs, paper, gunpowder, cloth, ſilk, linen, camblet, knit ſtockings, and other articles. The lakes and canals afford great conveniencies for tranſporting merchandize; and, for its extent, the kingdom of Pruſſia has the moſt inland navigation of any other in Europe, the Netherlands excepted—The principal rivers are the Viſtula, the Pregel, the Memel, the Paſſage, and the Elbe.

The king of Pruſſia is abſolute throughout his dominions, and, under him, the government is veſted in a regency of four chancellors of the ſtate, viz. the great maſter, the great burgrave, the great chancellor, and the great marſhal. There are alſo ſome other councils, and thirty-ſeven bailiwicks. The ſtates of this kingdom conſiſt of counſellors of ſtate, and of deputies from the nobility and commons: his majeſty has likewiſe erected a board for commerce and navigation, and there are ſeveral tribunals for the adminiſtration of juſtice.

The revenues of the king of Pruſſia ariſe principally from his demeſnes, the duties of cuſtoms and tolls, and the ſubſidies granted annually by the ſeveral ſtates. Since the acceſſion of Poliſh or Royal Pruſſia, his revenues are greatly increaſed: the local ſituation of theſe additional territories was of vaſt importance, as they lay between his German dominions and his kingdom of Pruſſia; but this acquiſition has rendered his kingdom compact, ſo that his troops may march from Berlin to Koninſburg without interruption, not to mention the benefit ariſing to trade and commerce by this means.

The Pruſſian military eſtabliſhment is under the moſt excellent regulation. Every regiment has a particular diſtrict aſſigned it, where the young men proper for bearing arms are regiſtered, till called upon to join their regiments, where, being incorporated with veterans, they ſoon become excellent ſoldiers. By this means, the king is never at a loſs in forming his troops, or recuiting his army, which even in time of peace conſiſts of about 180,000 of the beſt diſciplined troops in the world, and, during the laſt war, that force was augmented to 300,000 men. But this great military force, however it may aggrandize the power and importance of the ſovereign, is utterly inconſiſtent with the intereſts of the people; and in a country naturally ſo independent to it, has occaſioned ſo great a drain from population, and ſuch a withdrawing of ſtrength from the labours of the earth, that the preſent king has endeavoured in ſome meaſure to ſave his own peaſantry, by drawing as many recruits as he could from other countries.

The arms of the kings of Pruſſia are, Argent, an eagle diſplayed ſable, crowned, Or, for Pruſſia. Azure, the imperial ſceptre, Or, for Courland. Argent, an eagle diſplayed, gules, with ſemicircular wreaths, for the marquiſate of Brandenburg. To theſe are are added the reſpective arms of the ſeveral provinces ſubject to the crown of Pruſſia. The four orders of knighthood are as follow:

1. The order of *Concord*, inſtituted by Chriſtian Erneſt, margrave of Brandenburg, in the year 1660, to diſtinguiſh the part he had acted in reſtoring peace to many of the princes of Europe. The badge is a gold croſs of eight points, enamelled white; in the centre a medal bearing two olive-branches paſſing ſaltier-wiſe through two crowns, and circumſcribed with the word *Concordans*, "Agreeing." The croſs is ſurmounted with an electoral crown, and worn pendent to an orange-coloured ribband. 2. The order of *Generoſity*, inſtituted by Frederic III. elector of Brandenburg, and afterwards king of Pruſſia. The knights wear a croſs of eight points enamelled blue, having in the centre this motto, *La Generoſité*, "Generoſity," pendent to a blue ribband. 3. The order of the *Black Eagle* was inſtituted by the ſame prince, on the day of his coronation, at Koningſburg, in the year 1700; the ſovereign is always grand maſter, and the number of knights, excluſive of the royal family, is limited to thirty: none but ſovereign princes can be admitted into this order, till after having been previouſly received into that of Generoſity. The enſign of the order is a gold croſs of eight points enamelled blue, having at each angle a ſpread eagle, enamelled black, being the arms of Pruſſia, and charged in the centre with a cypher of the letters F. R. pendent to a broad orange ribband worn ſaſhways over the left ſhoulder; and a ſilver ſtar embroidered on the left ſide of the coat, whereon is an eſcutcheon, containing a ſpread eagle, holding in one claw a chaplet of laurel, and in the other a thunderbolt, with this motto round it in gold letters, *Suum cuique*, "To every one his own." The knight-caps are of black velvet with white plumes. 4. The order of *Merit* was inſtituted by his late majeſty, in the year 1740. The king is ſovereign, and the number of knights unlimited. The enſign is a croſs of eight points enamelled blue, and edged with gold, having in the centre a cypher of the letters F. R. and in each angle an eagle diſplayed black; on the two upper points the regal crown of Pruſſia; on the reverſe, the motto, *Pour le Merit*, "For Merit." The badge is worn round the neck, pendent to a black ribband, edged with ſilver. This order is conferred as the reward of merit of perſons either in arts or arms, without diſtinction of birth, religion, or country.

HISTORY OF PRUSSIA.

THE origin of the inhabitants of Pruſſia, like that of moſt other nations, is loſt in the darkneſs of antiquity: we know, however, that in very early times the ancient Pruſſians were a very brave and warlike people, and refuſed to ſubmit to the neighbouring princes, who, on various pretences, attempted to reduce them to ſlavery. In particular, they made a noble ſtand againſt the kings of Poland, and in the year 1163 the Poliſh monarch Boleſſaus IV. was by them defeated, and ſlain.

They remained Pagans in opinion, and independent in circumſtances, till the time of the cruſades, when the German knights of the Teutonic order, about the year 1230, attempted to convert them by force of arms. Several bloody wars enſued, in which the inhabitants of Pruſſia were almoſt extirpated by the zealous fury of the Teutonic knights; and the latter having ravaged the country with incredible barbarity, attempted to repeople it with Germans.

In 1466 a treaty was entered into between Caſimir, king of Poland, and the Teutonic knights, in which it was agreed, that the country now called Poliſh Pruſſia ſhould continue a free province under the protection of the king, and that the knights ſhould poſſeſs the remainder, on condition of acknowledging themſelves vaſſals to Poland. This treaty was however ſoon broken, another ſeries of bloody wars enſued, and the knights attempted to become independent of the Poles, but their attempts proved abortive.

In 1525, Albert, margrave of Brandenburg, and the laſt grand-maſter of the Teutonic order, concluded a peace, and entered into a treaty at Cracow, in which it was ſtipulated that the margrave ſhould be acknowledged duke of the eaſt part of Pruſſia, which on that account was called Ducal Pruſſia, but ſtill it was to remain as a fief of Poland. In this manner the ſovereignty of the Teutonic order ended in Pruſſia, after it had ſubſiſted near 300 years.

In

In 1657, the elector Frederic William of Brandenburg, deservedly called the Great, had Ducal Prussia confirmed to him; and by the conventions of Welau and Bromberg, it was freed by John Casimir, king of Poland, from vassalage; and he and his descendents were declared independent and sovereign lords of this part of Prussia.

As the Protestant religion had been introduced into this country by the margrave Albert, and the electors of Brandenburg were now of that persuasion, the Protestant interest favoured them so much, that Frederic, the son of Frederic-William the Great, was raised to the dignity of king of Prussia, in a solemn assembly of the states, proclaimed January 18, 1701, and soon after acknowledged as such by all the powers of Christendom. His grandson, Frederic II. in the memoirs of his family, gives us no high idea of this first king's talents for government, but expatiates on those of his own father, Frederic-William, who succeeded in 1713. He certainly was a prince of strong natural abilities, and considerably increased the revenues of his country, but too often at the expence of humanity. At his death, which happened in 1740, he is said to have left seven millions sterling in his treasury, which enabled his son, by his wonderful victories, and the more wonderful resources by which he repaired his defeats, to become the admiration of the age. He improved the arts of peace as well as of war, and distinguished himself as a poet, philosopher, and legislator. Some of the principal transactions of his reign have already been related in our account of the history of Germany. In the year 1783, he published a rescript, signifying his pleasure that no kneeling in future should be practised in honour of his person, assigning for his reason, that this act of humiliation was not due but to the Divinity; and near 2,000,000 of crowns were expended by him in 1782, in draining marshes, establishing factories, settling colonies, relieving distress, and in other purposes of philanthropy and policy.

The late king of Prussia, who succeeded his uncle, August 17, 1786, made many salutary regulations for his subjects, and has established a court of honour to prevent the diabolical practice of duelling in his dominions.

And not long before his death, he instituted two hospitals for the aged of both sexes, and of all countries; and he granted 500,000 rix-dollars for the new establishments forming in Western Prussia, besides 100,000 rix-dollars for cutting a new canal from the eastern parts of Brandenburgh to Berlin.

CHAP. XX.

BOHEMIA.

Situation, Boundaries, Extent, Divisions, Climate, Mountains, Manufactures, People, Religion, Chief Towns, Revenue, &c.

THIS kingdom is situated between 48 and 52 deg. north lat. and between 12 and 19 deg. of east. long. It is bounded on the north, by Saxony and Brandenburgh; on the south, by Austria and Bavaria; on the east, by Poland and Hungary; and on the west, by the palatinate of Bavaria, comprehending, formerly, Bohemia Proper, Silesia, and Moravia. It is about 300 miles in length, from north to south, and 250, from east to west.

Bohemia Proper, W. is mostly subject to the house of Austria; its chief towns are Prague, Koningsgratz, E. Glatz, E. and Egra W. being in length 162 miles, and 142 in breadth, and containing an area of 12,060 square miles.

Silesia, E. mostly subject to the king of Prussia, has for its chief towns, Breslaw, Glogaw, N. Crossen, N. Jugendorf, S. Tropaw, S. subject to the house of Austria; and Teschen, S. also subject to Austria, being in length 196 miles, and in breadth ninety-two, and contains an area of 10,250 square miles.

Moravia, S. is entirely subject to the house of Austria; its chief towns are, Olmutz, Brin (middle,) and Igla, S. W. being in length 120 miles, and eighty-eight in breadth, and contains an area of 5,424 square miles.

The climate of Bohemia is rather unwholesome, owing, as is supposed, chiefly to the large woods with which it abounds. The soil is in general tolerably fertile, being well watered with rivers, particularly the Elbe, Muldaw, and Eger.

The mountains of Bohemia contain rich mines of coals, alum, silver, quicksilver, copper, iron, lead, vitriol, sulphur, and salt-petre; in other respects, there is nothing remarkable in them. There are numerous droves of cattle, together with excellent chaces, and wild fowl; as also bears, wolves, foxes, martins, badgers, beavers, and others; with well tasted fish of all kinds in the rivers and ponds.

The chief manufactures of Bohemia are linen, copper, iron, and glass; the exports consist chiefly of cattle, corn, metals, precious stones, linen, and wines.

In the days of the emperor Rodolphus II. Bohemia was computed to contain 34,700 villages, 732 small towns, 124, castles, and above 3,000,000 inhabitants, but it is thought they are less numerous at present. They resemble the Germans in their persons and habits; the peasants are naturally brave, and more inclined to arms than arts; they are open and agreeable in conversation, but superstitious, and easily imposed upon by artful and designing men. There are no gentry in Bohemia; every lord is sovereign in his own estate, and every tenant a slave; but the present emperor has generously discharged the Bohemian peasants on the imperial demesnes, from the state of villenage in which they have been so long and so justly retained; and it will be happy if his imperial majesty's example should be followed by the Bohemian nobility, and their vassals be permitted to enjoy the rights of human nature.

Formerly, the Bohemians were the most intrepid asserters of civil and religious liberty; and accordingly, at the time of the reformation, nobly opposed the emperor, at the head of the imperial army; but animosities prevailing among their leaders, they were obliged, after making the most generous struggles for independency, to submit. Exasperated at their opposition, their despotic masters employed every method in their power to break the spirit of the Bohemians, in order to render them more submissive to an arbitrary government, and an ignorant, bigoted clergy. The customs and diversions of Bohemia are the same with those practised in Germany.

The established religion of Bohemia is Popery. The Protestant religion was early planted here by John Huss and Jerome of Prague; but since the banishment of its professors in the year 1639, that religion has not been tolerated. A few years since a mysterious kind of Protestantism sprung up in Moravia, under the auspices of count Zinzendorff, and has been since propagated in various parts of the globe; they have still a chapel in London, and have obtained an act of parliament for a settlement in the plantations. The only archbishop in Bohemia is that of Prague; but there are three bishops under him; namely, those of Koningsgratz, Breslau, and Olmutz.

The proper language of Bohemia in the Sclavanian, but the inhabitants generally speak German.

The only university in Bohemia is that of Prague; it was founded by the emperor Charles IV. and has generally 1400 students; but when the celebrated John

John Huſs was rector of this seat of learning, it is alleged that their number amounted to 44,000.

Prague, the capital of Bohemia (in E. long. 14. deg. 20 min. N. lat. 50) is one of the most magnificent cities in Bohemia, and so large in circumference, that the grand Prussian army could never completely invest it, so that, in case of a regular siege, it can make a vigorous defence. The houses are wholly built of stone, and for the most part, consist of three stories. The bridge over the Moldaw is a noble structure. The streets are spacious, and well laid out, and many of the public structures large and magnificent; in it are computed, ninety-two churches and chapels, with about forty cloisters; but the city, considering its extent, is not very populous, the number of inhabitants being computed at only 70,000 Christians, and 30,000 Jews. The trade is not considerable, but the Jews carry on a large commerce in jewels.

Breslau, the capital of Silesia, we have already described in our account of Prussia.

Olmutz, the capital of Moravia, in E. long. 16 deg. 45 min. N. lat. 49 deg. 40 min. situated on a navigable river called Morawa, is a neat, strong, and populous city. The streets are regular, and the public structures elegant. It contains twenty-six churches, five chapels, seven cloisters of monks, and two of nuns, several hospitals, one correction and orphan-house, one college and seminary, an university, a riding academy, and a learned society. It is a bishop's see, which about the year 880 was filled by St. Cyril.—Here are manufactures of woollen, iron, glass, paper, and gunpowder; and the inhabitants carry on a great trade with Hungary, Poland, Silesia, and Austria.

There are several other considerable places in Bohemia, some of which are fortified; but not remarkable either for strength, buildings, commerce, or manufactures.

Originally the constitution of this kingdom was a limited and elective monarchy. But Ferdinand I. by his marriage with Anne, heiress of Bohemia and Hungary, annexing those kingdoms to the house of Austria, they have both become hereditary, and the governments despotic. The appearance of the old constitution is indeed still preserved, and is composed of the clergy, nobility, and representatives of towns, forming a kind of parliament. They meet every year at Prague; but never refuse to grant any thing their sovereign demands. This kingdom is frequently described as part of Germany, but with little reason, for it is not in any of the nine circles, nor does it contribute any thing to the forces or revenues of the empire, nor is it subject to any of its laws. The affairs of state are directed by a chancellor, who has under him a vice-chancellor, and several assessors and counsellors.

The revenues of Bohemia are said to amount to about 80,000l. a year; but they are in general whatever the sovereign is pleased to exact from the states of the kingdom, when they are annually assembled at Prague. The standing militia of the Austrian hereditary countries is 24,000, towards which Bohemia furnishes 9000. In times of war, these serve to fill up the marching regiments.

The Bohemian arms are, Argent, a lion gules, the tail moved, and passed in saltier, crowned langued, and armed, Or. For the orders of knighthood and coins, see GERMANY.

HISTORY OF BOHEMIA.

During the early times we have very little account of these people. The Bohemian nobility used to elect their own princes, though the emperors of Germany sometimes imposed a king upon them, and at length usurped that throne themselves. In 1414, when Sigismund, king of Hungary, and afterwards emperor, filled the throne of Bohemia, the two celebrated reformers, John Huss, and Jerome of Prague, were burnt at Constance, though the emperor had given them his protection. This occasioned an insurrection in Bohemia; and the inhabitants of Prague threw three of the emperor's officers out of the windows of the council chambers, into a ditch which surrounds the city. The famous Ziska, assembling an army of 40,000 Bohemians, routed the emperor's forces in several engagements, and drove the Imperialists out of the kingdom. The death of Ziska was fatal to the Hussites, whose divisions among themselves enabled the emperors to keep possession of Bohemia; but being afterwards convinced, that unless they acted with more unanimity, their cause would soon be desperate; they accordingly formed a league, called the Union, and had once more recourse to arms, electing, in the year 1619, a Protestant king in the person of prince Palatine, son-in-law to James I. of England. The battle of Prague put a final period to Bohemian liberty; the elector palatine was totally defeated by the emperor's generals, and obliged to seek refuge in Holland; and, during his exile, subsisted on a pension from the court of England. The Bohemians, after a war of thirty years duration, which almost desolated the whole empire, now remain subject to the house of Austria.

CHAP. XXI.

HUNGARY.

Situation, Extent, Boundaries, Divisions, Climate, Rivers, Mines, Produce, Inhabitants, Religion, Curiosities, History, &c.

THAT part of this country which now belongs to the house of Austria (for it formerly included Transylvania, Sclavonia, Croatia, Morlachia, Servia, Walachia, and other countries) is situated between the 17th and 23d deg. of east long. and the 45th and 49th deg. of north lat. being about 300 miles in length, and 200 in breadth. It is bounded by Poland on the north, by Transylvania and Walachia on the east, by Sclavonia on the south, and by Austria and Moravia on the west. This kingdom is usually divided into the Upper and Lower Hungary, in the following manner:

Upper Hungary, North of the Danube.	*Lower Hungary, South of the Danube.*
Chief Towns.	Chief Towns.
Presburg, situate on the Danube.	Buda on the Danube.
Newhausel, N. W.	Gran on the Danube, above Buda.
Leopoldstad, N. W.	Komorra on the Danube, in the island of Schut.
Chremnitz, N. W.	Raab on the Danube, opposite to the island of Schut.
Shemnits, in the middle.	Atlenburg, opposite to the island of Schut.
Esperies, N.	Weissenburgh, or Alba Regalis, situated east of the lake called Platten Sea.
Caschaw, N.	Kanisba, S. W. of the Platten Sea.
Tokay, N. E.	Five Churches, north of the river Drave.
Zotmar, N. E.	Temeswar.
Unguar, N. E.	
Mongats, N. E.	
Waradin Great, E.	
Segedin, S. E.	
Agria, in the middle.	
Pest on the Danube, opposite to Buda.	
Temeswar.	

Formerly

Formerly the laſt of theſe provinces was governed by an independent king, and has been conſidered as diſtinct from Hungary: it has been ſeveral times in poſſeſſion of the Turks; but the Auſtrians gaining poſſeſſion of it, incorporated it with the kingdom of Hungary in 1778. It has been divided into four diſtricts, namely, Cſadat, Temeſwar, Werſchez, and Lugos.

In the ſouthern parts of Hungary the climate is very unhealthy, proceeding from the number of lakes, ſtagnant waters, and marſhes, which infect the air; but in the northern parts, where it is exceedingly mountainous, it is much more ſalutary. The ſoil of the plain which extends from Preſburg to Belgrade, a tract of three hundred miles, is, without exception, very rich.

The principal rivers in Hungary are the Danube, Drave, Save, Teyſſe, Meriſh, and Tames. There are ſeveral extenſive lakes in the vallies between the Carpathian mountains, and all abound with fiſh. The Hungarian baths and mineral waters are eſteemed ſuperior in quality to any in Europe, and are very numerous. While the Turks were in poſſeſſion of this kingdom there were magnificent baths erected at ſeveral places, eſpecially at Buda; but ſince the expulſion of the Infidels, theſe buildings have been ſuffered to decay.

In Hungary the mines have been famous for many centuries; but at preſent they are not worked with the ſame vigour as formerly. The long and deſtructive wars between the Turks and Chriſtians have greatly affected the produce of the mines; many of the works being deſtroyed, moſt of the workmen were driven from their habitations, and others periſhed by the ſwords of the enemy. Several of the mines are, however, ſtill worked, to the great emolument of the natives, and advantage of the government. Some of them produce gold, others ſilver, and many excellent copper. Vitriol, iron, orpiment, quickſilver, chryſocolla, lapis calaminaris, and terra ſigillata, are alſo very plentiful here. The Hungarian gold and ſilver formerly employed mint-houſes, not only in Hungary, but in Germany, and on the continent of Europe.

The level country produces corn, graſs, eſculent plants, tobacco, ſaffron, aſparagus, melons, hops, pulſe, millet, buck-wheat, delicious wine, fruits of various kinds, peaches, mulberry-trees, cheſnuts, and wood: the corn in particular is in ſuch plenty, that it ſells for one-ſixth part of its price in England; and the wines, particularly Tokay, are preferable to thoſe of any other country. The moſt remarkable animals are a fine breed of horſes, generally of a mouſe colour; and a particular breed of large rams near Preſburg. The foreſts are beautiful, and the meadows feed numerous herds of cattle. Here are alſo buffaloes, aſſes, mules, bears, lynxes, ſtags, deer, chamois goats, ſheep, ſwine, &c. various kinds of wild fowl, ſuch as partridges, woodcocks, moor-fowls, and likewiſe ſome birds.

The inhabitants of Hungary are deſcended from the ancient Hunns, Sclavonians, and other northern nations, who were not able for a long time to drive the Romans out of the country, ſome of whoſe deſcendents are ſtill to be diſtinguiſhed in the inland parts, by their ſpeaking Latin. Both Hungaries at preſent, excluſive of Tranſylvania and Croatia, are ſaid to contain about two millions and a half of people. It is thought that, before the Turks were in poſſeſſion of Conſtantinople, Hungary was one of the moſt powerful and populous kingdoms in Europe: and the Hungarians ſtill value themſelves on being deſcended from thoſe heroes who formed the bulwark of Chriſtendom againſt the bigoted fury of the Infidels. They are ſtill a brave and magnanimous people: and their anceſtors, even at the beginning of the preſent century, were ſo jealous of their liberties, that, rather than ſuffer the tyranny of the houſe of Auſtria, they have often ſubmitted to that of Othman. In their perſons they are well made: and their fur caps, their cloſe-bodied coats, girded by a ſaſh, and their cloak or mantle, which is ſo contrived as to buckle under one arm, that the right hand may be always at liberty, give them an air of military dignity. Their uſual arms are a broad ſword and a kind of pole-axe, beſides their muſkets and piſtols. They ſhave their beards, but preſerve their whiſkers on their upper lips. The nobility affect great pomp and magnificence, and are greatly addicted to feaſting and drinking. The women are eſteemed handſome, and their dreſs gives them an air of dignity. When they go abroad, they generally wear ſhort cloaks and a veil. Both men and women, in what they call the mine towns, wear fur, and even ſheep-ſkin dreſſes. They are in general indolent, and leave trade, manufactures, and agriculture, to ſtrangers, many of whom, particularly Greeks and Jews, are ſettled in this country; the flatneſs of which renders travelling commodious, either by land or water. The diverſions of the inhabitants are of the warlike and athletic kind.

In the province of Temeſwar, there are many faraons, or gypſies, ſuppoſed to be the real deſcendants of the ancient Egyptians, whom they are ſaid to reſemble in their features, in their manners, and cuſtoms, and in their propenſity to melancholy. The laſcivious dances of Iſis, the worſhip of onions, many remarkable ſuperſtitions and ſpecifics practiſed by the Egyptians, with their method of hatching eggs by means of dung, are affirmed to be ſtill in uſe among the female gypſies in Temeſwar. The number of inhabitants in this province is about 450,000.

The religion eſtabliſhed in this country is the Roman Catholic: for, though the Reformation was introduced hither in the 16th century, and made a conſiderable progreſs, the profeſſors of it are now but barely tolerated, though much more numerous than the Papiſts. The Greeks and Jews are alſo very numerous, the latter of whom pay double taxes. The archbiſhoprics are, Preſburg, Gran, and Colocza: the biſhoprics, Great Waradin, Agria, Veſprin, Raab, and five churches.

The Hungarians being of various origin, it is no wonder they have a variety of dialects, one of which (uſed by the people called Zigduns) is ſaid to approach near the Hebrew. The principal part ſpeak German, and almoſt all, even of the common people, ſpeak Latin.

Here are four univerſities, viz. Firnan, Buda, Raab, and Caſcham; the profeſſors in all which are commonly Jeſuits, who inſtruct the Roman Catholic youth in the arts and ſciences. The Proteſtants are brought up at German and other univerſities; though even in Hungary they have their gymnaſiums and ſchools, but they are under ſeveral reſtrictions.

Among the natural curioſities of this country, are the rocks and caverns: the rock called Benikora is 3000 paces in perpendicular height. In a mountain near Szelitze, is a cavern, the aperture of which, fronting the ſouth, is eighteen fathoms high, and eight broad; its ſubterraneous paſſages conſiſt entirely of ſolid rock, ſtretching away further ſouth than has been yet diſcovered; as far as it is practicable to go, the height has been found to be fifty fathoms, and the breadth twenty-ſix: this cavern is ſaid to be exceedingly warm in the depth of winter, and ſurpriſingly cold in the hotteſt part of the ſummer: here great numbers of hares, foxes, bats, owls, and other animals, take up their winter abode.

The chief artificial curioſities of Hungary, are the bridges, baths, and mines. The bridge of Eſſeck, built over the Danube and Drave, is, properly ſpeaking, a continuation of bridges, five miles in length, fortified with towers at certain diſtances. This was an important paſs during the wars between the Turks and Hungarians. Between Buda and Peſt is a bridge

of boats acroſs the Danube half a mile long; and, about twenty Hungarian miles from Belgrade, are the remains of a bridge erected by the Romans, ſuppoſed at that time to have been one of the moſt magnificent in the world. Some of the churches are of admirable architecture, and ſeveral of the baths are exceedingly elegant.

The cities and bublic buildings have loſt much of their ancient magnificence, but ſome of the fortifications are ſtill very ſtrong, and kept in good order. Preſburg, though the capital of the kingdom, is neither large nor well built, and is defended only by a double wall and ditch. Beſides the cathedral, here are ſeveral Popiſh, and one Lutheran church, a Jeſuits college, three convents, and two hoſpitals. On a hill above the town ſtands the caſtle, in which the regalia were kept, but have lately been removed to Vienna. The crown was ſent in the year 1000, by pope Sylveſter II. to Stephen, king of Hungary, and was made after that of the Greek emperors; it is of ſolid gold, ornamented with fifty-three ſapphires, fifty rubies, one large emerald, and 338 pearls: beſides theſe ſtones, are the images of the apoſtles and patriarchs. The pope added to this crown a ſilver patriarchal croſs, which was afterwards inſerted in the arms of Hungary. At the ceremony of the coronation, a biſhop carries it before the king, who afterwards brandiſhes it towards the four cardinal points, to ſhew that he will defend his country againſt all its enemies. From the croſs above-mentioned is derived the title of Apoſtolic King; the uſe of which was renewed under the reign of the empreſs-queen Maria Thereſa. The ſceptre and the globe of the kingdom are Arabian gold. The ſword is two-edged, and rounded at the point. Firnan, on the river Tina, is a handſome royal town, in which are a great number of churches and convents, and an academy of Jeſuits.

Czernnitz, capital of the county of Bars, is one of the chief of the mine towns. Schemnitz is the principal mine town in Hungary. Buda, formerly the capital of Hungary, retains little of its ancient magnificence, but its ſtrength and fortifications; and the ſame may be ſaid of Peſt, which lies on the oppoſite ſide of the Danube. Raab, Gran, and Comorra, are likewiſe ſtrong cities. Tokay, already noticed for its excellent wines, is ſituated near the confluence of the Theiſſe and Bodragh. Great Waradin is a well-fortified city, and the ſee of a biſhop, ſituated on the river Koros, 110 miles eaſt of Buda.

The principal manufactures of Hungary are thoſe of copper, braſs, iron, and other hard-wares. The exports conſiſt chiefly of wine, horſes, cattle, metals, minerals, ſaffron, wool, and leather. The commerce is chiefly carried on by the Greeks and Jews.

The government of Hungary preſerves the remains of many checks upon the regal authority; for which purpoſe they have a diet or parliament, a Hungary office, which has ſome affinity to our chancery, and is held at Vienna; and a ſtadtholder's council, which comes pretty near the Britiſh privy-council, but has a municipal juriſdiction, and is held at Preſburg. Every royal town has its ſenate; and the ſefran chafs reſemble our juſtices of the peace. Beſides this, they have an exchequer, and nine chambers and other ſubordinate courts. The Hungarians have an utter averſion to the title of queen, and even called the late empreſs, king Thereſa.

The emperor can at any time raiſe 50,000 Hungarians in their own country, but ſeldom draws out of it more than 10,000, which troops are well known to the world by the appellation of huſſars. The Hungarian infantry are termed heydukes, and wear feathers in their caps according to the number of enemies they pretend to have killed. Both horſe and foot are an excellent militia, very good at a purſuit, or ravaging and plundering a country, but not equal to regular troops in a pitched battle. The huſſars are not near ſo large as the German horſe, and therefore ſtand upon the ſhort ſtirrups when they ſtrike.

Hungary was formerly remarkable for its coinage; and in the cabinets of the curious are ſtill extant a complete collection of the coins of their ancient kings; and numbers of curious Greek and Roman medals have been diſcovered in this country.

The ordinary revenues of this kingdom is ſaid to exceed a million ſterling, ariſing from the mines, duties on cattle, royal demeſnes, ſalt-works, contributions, cuſtoms, &c.

HISTORY OF HUNGARY.

The firſt account we have of this country is, that the Huns ſettled here in the third century, and gave it their own name; for, before that time, it was a part of the ancient Pannonia. It was at firſt divided into many ſmall principalities: theſe at length united under one head, who was ſtyled duke of Hungary. The laſt who enjoyed that title was Geyſa, who, on being converted to Chriſtianity, reſigned his government to his ſon Stephen, in the year 1000. Stephen, on his aſcending the throne, aſſumed the title of king; and is ſaid to have governed his people with prudence and equity. Hungary, however, continued many years to be an elective kingdom, but generally in one family; and the conſtitution of the government to be a limited monarchy. In 1310, Charles Robert aſcended the throne of Hungary, and ſubdued Bulgaria, Servia, Croatia, Sclavonia, and ſeveral other provinces, which he annexed to his own dominions; but ſome of theſe conqueſts were afterwards reduced by the Venetians. In the fifteenth century, the Turks invaded Hungary, when Ladiſlaus, an infant, filled the throne; but were bravely repulſed by the celebrated Hunniades, who continued regent of the kingdom during the minority of Ladiſlaus.

On the death of that prince, the Hungarians, in 1438, placed Matthias Corvinus, the ſon of Hunniades, on the throne, in gratitude for the great ſervices that hero had done his country. Hungary was now almoſt a perpetual theatre of war between the inhabitants and the Infidels, with various ſucceſs, till the year 1526, when Lodowick, king of Hungary, engaging Solyman, emperor of the Turks, with very unequal forces, was defeated and ſlain in battle. By this victory Solyman made himſelf maſter of great part of Hungary. John, waywode of Tranſylvania, aſcended the throne on the death of Lodowick; but was ſoon after depoſed by Ferdinand, brother to the emperor Charles V. Solyman reſtored John; and this conteſt occaſioned a war between the German and Turkiſh emperors, which laſted near 200 years. In 1527, Ferdinand, archduke of Auſtria, was placed on the Hungarian throne; and in 1722, in a diet held at Preſburg, the hereditary ſucceſſion in Hungary was ſecured to the houſe of Auſtria.

CHAP. XXII.

TRANSYLVANIA, SCLAVONIA, CROATIA, AND HUNGARIAN DALMATIA.

General Deſcription of theſe Countries.

IT was thought moſt proper to include theſe countries under one diviſion, as we have no account ſufficiently exact of their extent and boundaries. The moſt authentic is as follows: Tranſylvania is bounded on the eaſt by Moldavia and Walachia; on the weſt

by the Upper and Lower Hungary; on the north by Upper Hungary and Poland; and on the ſouth by Walachia. Its length is computed at 180 miles, and its breadth 120, and contains 14,400 ſquare miles. This country is both mountainous and woody, and its produce, vegetables, and animals, are nearly the ſame with thoſe of Hungary. The air is ſalutary and temperate; but their wine is inferior to the Hungarian. The foreſts are very extenſive. The chief rivers are the Szamos, the Marro, and the Aluta. Here are ſeveral remarkable ſprings, gold, ſilver, copper, lead, iron mines, &c. and minerals, the produce of which they export into Hungary and other parts. All ſects are tolerated in this country.

Hermanſtadt, the chief city, and Kronſtadt, are both large and well fortified; as are Clauſenburg and Weiſenburg. The other large places are Sageſwar, Millenback, and Newmark. All ſorts of proviſions are very cheap, and excellent in their kinds. The ſeat of government is at Hermanſtadt, and the governor is aſſiſted by a council made up of Roman Catholics, Calviniſts, and Lutherans. The diet, or parliament, meets by ſummons, and receives the commands of the ſovereign, to whom of late they have been more devoted than formerly. They have a liberty of making remonſtrances and repreſentations when aggrieved. They owe not much more than a nominal ſubjection to the Auſtrians, who leave them in poſſeſſion of moſt of their privileges. Their interior government ſtill partakes greatly of the ancient feudal ſyſtem, being compoſed of many independent ſtates and princes. The number of inhabitants in this country is not aſcertained; but as it is aſſerted they can bring 30,000 men into the field, it cannot be inconſiderable: its military force is at preſent reduced to ſix regiments of 1500 men each.

This principality is part of the ancient Dacia, the people of which were a fierce and warlike race, and very troubleſome to the Romans. On the decline of their empire, it was firſt over-run by the Goths, and afterwards by the Hunns. In the year 1526, two rival princes contended for this principality; one of them was ſupported by the German Emperor, and the other by the Turk; whereupon this country became the ſeat of war for many years; but, at length, by the treaty of Carlowitz, in 1699, the ſovereignty of Tranſylvania, as alſo Sclavonia, was confirmed to the houſe of Auſtria by the Turks. In October 1784, on account of ſome oppreſſions charged on the nobility, near 16,000 aſſembled, and committed great depredations on thoſe whoſe conduct had been blamed. Several had their palaces burnt, and were glad to eſcape with their lives. The malcontents were diſappointed in their attempt on Clauſenburg; and afterwards offered to ſeparate and go home in peace, on condition of a general pardon, better treatment from the nobility, and a freedom from vaſſalage. Theſe diſturbances were happily quelled by the wiſe and lenient conduct of the late emperor.

The only biſhopric in this principality is Hermanſtadt; and indeed the Tranſylvanians at preſent ſeem to trouble themſelves little either about learning or religion, though the Roman Catholic is the eſtabliſhed church, but Proteſtants are very numerous. Stephen I. king of Hungary, introduced Chriſtianity here about the year 1000, and the country was afterwards governed by a Hungarian vaivod, or viceroy.

Sclavonia is ſituated between the 16th and 23d deg. of eaſt long. and the 45th and 47th of north lat. It is bounded on the north by Hungary, on the eaſt by the bannat of Temeſwar and Servia, on the ſouth by Servia and Boſnia, and on the weſt by Stiria and Croatia; about 150 miles in length, and from 25 to 45 in breadth. It is a fine, level, fruitful country, where cultivated; but having been, for many years, a frontier province againſt Turkey, and ſubject to the ravages of the Chriſtian, as well as the Turkiſh armies, it has produced but little corn or wine. The Raſcians inhabit the eaſtern diviſion of the country; and the natives, in general, are of good ſtature, a brave hardy race, ſoldiers from their cradles, their country having been long the ſeat of war. The ancient Sclavonia contained many large countries; ſome have extended it from the Adriatic to the Euxine Sea. It is ſaid to have taken its name from the Sclavi, a Scythian nation, which ſubdued Greece as well as this country, in the reign of the emperor Juſtinian. The Venetians made a conqueſt of Sclavonia, and compelled the natives to ſubmit to the vileſt drudgeries; inſomuch that ſome derive the word ſlave from this people, thus oppreſſed and abuſed by their conquerors. The Hungarians and Venetians poſſeſſed this country alternately. The king of Hungary was ſovereign of Sclavonia, when Solyman the Magnificent invaded and reduced it, in the year 1540, and the Turks remained poſſeſſed of it till the year 1687; ſoon after which they loſt this, and all the territories which the Auſtrians poſſeſs north of the Save and Danube.

The ſtates hold diets of their own, and likewiſe ſend repreſentatives to thoſe of Hungary. A viceroy or ban preſides over Sclavonia, Croatia, and part of Dalmatia.

Croatia is ſituated between the 15th and 17th deg. of eaſt long. and the 45th and 47th of north lat. being about eighty miles in length, and ſeventy in breadth. The towns are all blended together, but Zagrab is ſuppoſed to be the capital; as to the manners, cuſtoms, &c. of the Croats, they are entirely ſimilar to thoſe of the Tranſylvanians. Theſe people had formerly monarchs of their own, who ſtyled themſelves kings of Croatia and Dalmatia; and once this country was divided between the Hungarians and the Turks, but, at preſent, the greateſt part of it is ſubject to the houſe of Auſtria, which, however, exerciſes very little power over it, except in what concerns the military arrangements; for the Croats are moſt excellent irregular troops, and are celebrated in modern hiſtory under the appellation of Pandours.

Dalmatia is bounded on the north by Boſnia and Croatia, on the eaſt by Servia, and on the ſouth and weſt by the Adriatic, or Gulf of Venice. It is reckoned to contain 477,000 ſquare miles, and in the year 1783, 367,000 inhabitants. In the fifteenth century the Venetians made themſelves maſters of it, but at preſent they only poſſeſs the chief maratime places; the other parts being divided among the Auſtrians, Turks, and Raguſans. This country is exceedingly mountainous; notwithſtanding which, it is prodigiouſly fertile, for the hills are covered with olives, vines, and myrtles, and their bowels contain plenty of gold and ſilver ore. The plains produce great quantities of paſture, which feed vaſt flocks of ſheep, and abundance of cattle. The language and cuſtoms of the people are Sclavonic, and they profeſs the Roman Catholic religion. There is one archbiſhopric and five biſhoprics in Dalmatia, viz. Zara, Zengh, Modrus, Fenen, Sebenico, and Tran. The principal town is Zara, which ſtands on a ſmall peninſula, being divided from the land only by a deep ditch, into which the ſea flows at high-water, under a drawbridge: it is ſo well fortified as to be deemed impregnable; and the inhabitants pretend that the body of St. Simeon, who took the infant Jeſus in his arms, lays in their cathedral, which is dedicated to that ſaint. There are ſeveral magnificent ſtructures in Zara, particularly the archbiſhop's palace, convents, hoſpitals, the arſenal, magazines, and barracks. Segna is a royal free town, fortified both by nature and art, and is ſituated near the ſea, in a bleak, mountainous, and barren ſoil. The biſhop of this place is a ſuffragan to the archbiſhop of Spalatro. Ottoſchatz is a frontier fortification on the river Gatzka. The governor reſides in the old palace called the Royal Caſtle.

Under Dalmatia is included Morlachia, a country full of high mountains, being a part of the ancient Liburnia:

Liburnia: it is about eighty miles in length, and ſixty in breadth.

The inhabitants of Morlacchi, generally called Morlacks, or Morlacchi, are thus deſcribed by a late traveller in thoſe parts. With regard to their character, they are much injured by their maritime neighbours. The inhabitants of the ſea coaſt of Dalmatia tell many frightful ſtories of their avarice and cruelty: but theſe are all either of an ancient date, or, if any have happened in later times, they ought rather to be aſcribed to the corruption of a few individuals, than to the bad diſpoſition of the nation in general; and, though thieviſh tricks are frequent among them, a ſtranger may travel ſecurely through their country, where he is faithfully eſcorted, and hoſpitably treated. The greateſt danger is from the Haiduks, or Banditti, of whom there are great numbers among the woods and caves of theſe dreadful mountains on the confines. There a man ought to get himſelf eſcorted by a couple of theſe "honeſt fellows;" for they are not capable of betraying him, although a banditti; and their ſituation is commonly more apt to raiſe compaſſion than diffidence. They lead their life among the wolves, wandering from one precipice to another, expoſed to the ſeverity of the ſeaſons, and frequently languiſh in want of the neceſſaries of life, in the moſt hideous and ſolitary caverns: yet they very ſeldom diſturb the tranquility of others, and prove always faithful guides to travellers; the chief objects of their rapine being ſheep and oxen, to ſupply themſelves with food and ſhoes. Sometimes it happens, that, in their extreme neceſſity, the Haiduks go in parties to the ſhepherds cottages, and rudely demand ſomething to eat; which they do not fail to take immediately by force if the leaſt heſitation is made. It is ſeldom indeed that they meet with a refuſal, or with reſiſtance, as their reſolution and fury are well known to be equal to the ſavage life they lead. Four Haiduks are not afraid to aſſault a caravan of fifteen or twenty Turks, and generally plunder and put them to flight. The greateſt part of the Haiduks look upon it as a meritorious action to ſhed the blood of the Turks; to which cruelty they are eaſily led by their natural ferocity, inflamed by a miſtaken zeal for religion.

The Morlacchi are repreſented as open and ſincere, to ſuch a degree that they would be taken for ſimpletons in any other country; and, by means of this quality, they have been ſo often duped by the Italians, that *the faith of an Italian*, and *the faith of a dog*, are ſynonimous among the Morlacchi. They are very hoſpitable to ſtrangers; and their hoſpitality is equally conſpicuous among the rich and poor. The rich prepares a roaſted lamb or ſheep; and the poor, with equal cordiality, offers whatever he has; nor is this generoſity confined to ſtrangers, but generally extends itſelf to all who are in want. When a Morlack is on a journey, and comes to lodge at a friend's houſe, the eldeſt daughter of the family, or the new-married bride, if there happens to be one, receives and kiſſes him when he alights from his horſe, or at the door of the houſe; but a foreigner is rarely favoured with theſe female civilities; on the contrary, the women, if they are young, hide themſelves and keep out of his way.

The Morlacchi in general have little notion of domeſtic economy, and readily conſume in a week as much as would be ſufficient for ſeveral months, whenever any occaſion of merriment preſents itſelf. A marriage, the holiday of the ſaint, protector of the family, the arrival of relations or friends, or any other joyful incident, conſumes of courſe all that there is to eat and drink in the houſe. Yet the Morlack is a great economiſt in the uſe of wearing apparel; for, rather than ſpoil his new cap, he takes it off, let it rain ever ſo hard, and goes bareheaded in the ſtorm. In the ſame manner he treats his ſhoes, if the road is dirty and they are not very old. Nothing but an abſolute impoſſibility hinders a Morlack from being punctual; and, if he cannot repay the money he borrowed at the appointed time, he carries a ſmall preſent to his creditor, and requeſts a longer term. Thus it happens ſometimes, that from term to term, and preſent to preſent he pays double what he owed, without reflecting on it.

Friendſhip, that among us is ſo ſubject to change on the ſlighteſt motives, is laſting among the Morlacchi. They have even made it a kind of religious point, and tie the ſacred bond at the foot of the altar. The Sclavonian ritual contains a particular benediction for the ſolemn union of two male or two female friends in the preſence of the congregation. The male friends thus united are called Pobratimi, and the female Proſeſtreme, which mean half-brothers and half-ſiſters. Friendſhips between thoſe of different ſexes are not at this day bound with ſo much ſolemnity, though, perhaps, in more ancient and innocent ages, it was alſo the cuſtom.

From theſe conſecrated friendſhips among the Morlacchi, and other nations of the ſame origin, it ſhould ſeem that the *ſworn brothers* aroſe; a denomination frequent enough among the common people of Italy, and in many parts of Europe. The difference between theſe and the Pobratimi of Morlachia conſiſts not only in the want of the ritual ceremony, but in the deſign of the union itſelf: for, among the Morlacchi, the ſole view is reciprocal ſervice and advantage; but ſuch a brotherhood among the Italians is generally commenced by bad men, to enable them the more to hurt and diſturb ſociety. The duties of the Probratimi are, to aſſiſt each other in every caſe of need or danger, to revenge mutual wrongs, and ſuch like. The enthuſiaſm is often carried ſo far as to riſk and even to loſe their life for the Pobratimi, although theſe ſavage friends are not celebrated like a Pylades. If diſcord happens to ariſe between two friends, it is talked of over all the country as a ſcandalous novelty; and there have been ſome examples of it of late years, to the great affliction of the old Morlacchi, who attribute the depravation of their countrymen to their intercourſe with the Italians. Wine and ſtrong liquors, of which the nation is beginning to make daily abuſe, will of courſe produce the ſame bad effects as among others.

But as the friendſhips of the Morlacchi are ſtrong and ſacred, ſo their quarrels are commonly unextinguiſhable. They paſs from father to ſon; and the mothers fail not to put their children in mind of their duty to revenge their father, if he has had the misfortune to be killed, and to ſhew them often the bloody ſkirt and arms of the dead. And ſo deeply is revenge rooted in the minds of this nation, that all the miſſionaries in the world would not be able to eradicate it. A Morlack is naturally inclined to do good to his fellow-creatures, and is full of gratitude for the ſmalleſt benefit; but implacable if injured or inſulted.

A Morlack who has killed another of a powerful family, is commonly obliged to ſave himſelf by flight, and to keep out of the way for ſeveral years. If, during that time, he has been fortunate enough to eſcape the ſearch of his purſuers, and has got a ſmall ſum of money, he endeavours to obtain pardon and peace; and, that he may treat about the conditions in perſon, he aſks and obtains a ſafe conduct, which is faithfully maintained, though only verbally granted. Then he finds mediators; and, on the appointed day, the relations of the two hoſtile families are aſſembled, and the criminal is introduced, dragging himſelf along on his hands and feet, the muſket, piſtol, or cutlaſs, with which he committed the murder, hung about his neck; and, while he continues in that humble poſture, one or more of the relations recites a panegyric on the dead, which ſometimes rekindles the flames of revenge, and puts the poor proſtrate in no ſmall danger. It is the cuſtom in ſome places for

the offended party to threaten the criminal, holding all kinds of arms to his throat, and, after much entreaty, to conſent at laſt to accept of his ranſom. Theſe pacifications coſt dear in Albania; but the Morlacchi make up matters at a ſmall expence; and every-where the buſineſs is concluded with a feaſt at the offender's charge.

The Morlacks, whether they happen to be of the Roman or of the Greek church, have very ſingular ideas about religion; and the ignorance of their teachers daily augments this monſtrous evil. They are as firmly perſuaded of the reality of witches, fairies, enchantments, nocturnal apparitions, and ſortileges, as if they had ſeen a thouſand examples of them. Nor do they make the leaſt doubt about the exiſtence of vampires; and attribute to them, as in Tranſylvania, the ſucking the blood of infants. Therefore, when a man dies ſuſpected of becoming a vampire, or vukodlak, as they call it, they cut his hams, and prick his whole body with pins; pretending that, after this operation, he cannot walk about. There are even inſtances of Morlacchi, who, imagining that they may poſſibly thirſt for children's blood after death, entreat their heirs, and ſometimes oblige them to promiſe, to treat them as vampires when they die.

The boldeſt Haiduk would fly trembling from the apparition of a ſpectre, ghoſt, phantom, or ſuch like goblins as the heated imaginations of credulous and prepoſſeſſed people never fail to ſee. Nor are they aſhamed when ridiculed for this terror, but anſwer, much in the words of Pindar, "Fear that proceeds from ſpirits cauſes even the ſons of the gods to fly." The women, as may naturally be ſuppoſed, are an hundred times more timorous and viſionary than the men; and ſome of them, by frequently hearing themſelves called witches, actually believe they are ſo.

A moſt perfect diſcord reigns in Morlacchia, as it generally does in other parts, between the Latin and Greek communion, which their reſpective prieſts fail not to foment, and tell a thouſand little ſcandalous ſtories of each other. The churches of the Latins are poor, but not very dirty: thoſe of the Greeks are equally poor, and ſhamefully ill kept. Our author has ſeen the curate of a Morlack village ſitting on the ground in the church-yard, to hear the confeſſion of women on their knees by his ſide: a ſtrange poſture indeed: but a proof of the innocent manners of thoſe good people, who have the moſt profound veneration for their ſpiritual paſtors, and a total dependence upon them; who, on their part, frequently make uſe of a diſcipline rather military, and correct the bodies of their offending flock with the cudgel. Perhaps this particular is carried to an abuſe as well as that of public penance, which they pretend to inflict after the manner of the ancient church. They moreover, through the ſilly credulity of thoſe poor mountaineers, draw illicit profits, by ſelling certain ſuperſtitious ſcrolls and other ſcandalous merchandize of that kind. They write in a capricious manner on the ſcrolls called zapiz, ſacred names which ought not to be trifled with, and ſometimes adding others very improperly joined. The virtues attributed to theſe zapiz are much of the ſame nature as thoſe which the Baſilians attributed to their monſtrouſly cut ſtones. The Morlacchi uſe to carry them ſewed to their caps, to cure or to prevent diſeaſes; and they alſo tié them for the ſame purpoſe to the horns of their oxen. The compoſers of this trumpery take every method to maintain the credit of their profitable trade, in ſpite of its abſurdity, and the frequent proofs of its inutility. And ſo great has their ſucceſs been, that not only the Morlacchi, but even the Turks near the borders, provide themſelves plentifully with zapiz from the Chriſtian prieſts, which not a little increaſes their income, as well as the reputation of the commodity. The Morlacchi have alſo much devotion, and many of the ignorant people in Italy have little leſs, to certain copper and ſilver coins of the low empire; or to Venetian cotemperary pieces, which paſs among them for medals of St. Helen; and they think they cure the epilepſy, and ſuch like. They are equally fond of an Hungarian coin called petizza, which has the Virgin and Child on the reverſe: and one of theſe is a moſt acceptable preſent to a Morlack.

The bordering Turks not only keep with devotion the ſuperſtitious zapiz, but frequently bring preſents and cauſe maſſes to be celebrated to the images of the Virgin; which is doubtleſs in contradiction to the alcoran; yet when ſaluted, in the uſual manner in that country, by the name of Jeſus, they do not anſwer. Hence, when the Morlacchi, or other travellers, meet them on the confines, they do not ſay, *Huaglian Iſſus*, "Jeſus be praiſed;" but, *Huaglian Bog*, "God be praiſed."

Innocence, and the natural liberty of paſtoral ages, are ſtill preſerved among the Morlacchi, or at leaſt many traces of them remain in the places further diſtant from our ſettlements. Pure cordiality of ſentiment is not there reſtrained by other regards, and diſplays itſelf without any diſtinction of circumſtances. A young handſome Morlack girl, who meets a man of her diſtrict on the road, kiſſes him affectionately, without the leaſt vicious or immodeſt thought; and our author has ſeen all the women and girls, all the young men and old, kiſſing one another as they came into the church-yard on a holiday; ſo that they looked as if they had been all belonging to one family. He has often obſerved the ſame thing on the road, and at the fairs in the maritime towns, where the Morlacchi came to ſell their commodities. In times of feaſting and merriment, beſide the kiſſes, ſome other little liberties are taken with the hands, which we would not reckon decent, but are not minded among them; and, when they are told of it, they anſwer, it is only toying, and means nothing. From this toying, however, their amours often take their beginning, and frequently end ſeriouſly when the two lovers are once agreed. For it rarely happens, in places far diſtant from the coaſt, that a Morlack carries off a girl againſt her will, or diſhonours her: and, were ſuch attempts made, the young woman would, no doubt, be able to defend herſelf: the women in that country being generally very little leſs robuſt than the men. But the cuſtom is, for the woman herſelf to appoint the time and place of being carried off; and ſhe does ſo in order to extricate herſelf from other ſuitors, from whom ſhe may have received ſome love-token, ſuch as a braſs ring, a little knife, or ſuch like trifles. The Morlack women keep themſelves ſomewhat neat till they get a huſband; but, after marriage, they abandon themſelves totally to a loathſome dirtineſs, as if they intended to juſtify the contempt with which they are treated. Indeed it cannot be ſaid that even the young women have a grateful odour, as they are uſed to anoint their hair with butter, which, ſoon becoming rancid, exhales no agreeable effluvia.

The unmarried women dreſs in the moſt complex and whimſical manner, in reſpect to the ornaments of the head; for when married they are not allowed to wear any thing elſe but a handkerchief, either white or coloured, tied about it. The girls uſe a ſcarlet cap, to which they commonly hang a veil, falling down on the ſhoulders, as a mark of their virginity. The better ſort adorn their caps with ſtrings of ſilver coins, among which are frequently ſeen very ancient and valuable ones; they have moreover ear-rings of very curious work, and ſmall ſilver chains, with the figures of half-moons faſtened to the ends of them. But the poor are forced to content themſelves with plain caps; or if they have any ornaments, they conſiſt only of ſmall exotic ſhells, round glaſs beads, or bits of tin. The principal merit of theſe caps, which conſtitute the good taſte as well as vanity of the Morlack young ladies, is to attract and fix the eyes of all who are near them by the multitude of ornaments, and the noiſe

they make on the leaſt motion of their heads. Hence half-moons of ſilver, or of tin, little chains and hearts, falſe ſtones and ſhells, together with all kind of ſplendid trumpery, are readily admitted into their head-dreſs.

In ſome diſtricts, they fix tufts of various coloured feathers, reſembling two horns, on their caps; in others, tremulous plumes of glaſs; and, in others, artificial flowers, which they purchaſe in the ſea-port towns; and, in the variety of thoſe capricious and barbarous ornaments, ſometimes a fancy not inelegant is diſplayed. Their holiday-ſhifts are embroidered with red ſilk, and ſometimes with gold, which they work themſelves while they attend their flocks; and it is ſurpriſing to ſee how nicely this work is executed. Both old and young women wear about their necks large ſtrings of round glaſs-beads, of various ſize and colour; and many rings of braſs, tin, or ſilver, on their fingers. Their bracelets are of leather, covered with wrought tin or ſilver; and they embroider their ſtomachers, or adorn them with beads or ſhells. But the uſe of ſtays is unknown, nor do they put whalebone or iron in the ſtomacher.

A broad woollen girdle ſurrounds their petticoat, which is commonly decked with ſhells, and of blue colour, and therefore called modrina. Their gown, as well as petticoat, is a kind of ſerge; and both reach near to the ancle: the gown is bordered with ſcarlet, and called ſadak. They uſe no modrina in ſummer, and only wear the ſadak without ſleeves over a linen petticoat or ſhift. The girls always wear red ſtockings; and their ſhoes are like thoſe of the men, called opanke. The ſole is of undreſſed ox-hide, and the upper part of ſheeps-ſkin thongs knotted, which they call apute; and theſe they faſten above the ancles, ſomething like the ancient cothurnus. The unmarried women, even of the richeſt females, are not permitted to wear any other ſort of ſhoes; though after marriage they may, if they will, lay aſide the opanke, and uſe the Turkiſh ſlippers.

The girls keep their hair treſſed under their caps, but when married they let it fall diſhevelled on the breaſt; ſometimes they tie it under the chin; and always have medals, beads, or bored coins, in the Tartar or American mode, twiſted among it. An unmarried woman, who falls under the imputation of want of chaſtity, runs the riſk of having her red cap torn off her head publicly in church by the curate, and her hair cut by ſome relation, in token of infamy. Hence, if any of them happen to have fallen into an illicit amour, they commonly of their own accord lay aſide the badge of virgnity, and remove into another part of the country.

Among the Morlacchi, nothing is more common than marriages concluded between the old people of the reſpective families, eſpecially when the parties live at a great diſtance, and neither ſee nor know each other; and the ordinary motive of theſe alliances is the ambition of being related to a numerous and powerful family, famous for having produced valiant men. The father of the future bridegroom, or ſome other near relation of mature age, goes to aſk the young woman, or rather a young woman of ſuch a family, not having commonly any determinate choice. Upon this all the girls of the houſe are ſhewn to him, and he chooſes which pleaſes him beſt, though generally reſpecting the right of ſeniority. A denial in ſuch caſes is very rare; nor does the father of the maid enquire much into the circumſtances of the family that aſks her. Sometimes a daughter of the maſter is given in marriage to the ſervant or tenant, as was uſual in patriarchal times; ſo little are the women regarded in this country. On theſe occaſions, however, the Morlacchi girls enjoy a privilege which ours would alſo wiſh to have, as in juſtice they certainly ought. For he who acts by proxy, having obtained his ſuit, is obliged to go and bring the bridegroom; and if, on ſeeing each other, the young people are reciprocally content, the marriage is concluded, but not otherwiſe.

In ſome parts it is the cuſtom for the bride to go to ſee the houſe and family of the propoſed huſband, before ſhe gives a definitive anſwer; and if the place or perſons are diſagreeable to her, ſhe is at liberty to annul the contract: but if ſhe is contented, ſhe returns to her father's houſe, eſcorted by the bridegroom and neareſt relations. There the marriage day is appointed; on which the bridegroom comes to the bride's houſe, attended by all his friends of greateſt note, who on this occaſion are called *ſvati*, and are all armed, and on horſeback, in their holiday-clothes, with a peacock's feather in their cap, which is the diſtinctive ornament uſed by thoſe who are invited to weddings. The company goes armed, to repulſe any attack or ambuſh that might be intended to diſturb the feaſt; for in old times theſe encounters were not unfrequent, according to the records of many national heroic ſongs. The bride is then conducted to a church veiled, and ſurrounded by the ſvati on horſeback; and the ſacred ceremony is performed amid the noiſe of muſkets, piſtols, barbaric ſhouts and acclamations, which continues till ſhe returns to her father's houſe, or to that of her huſband, if not far off.

Each of the ſvati has his particular inſpection, as well during the cavalcade as at the marriage-feaſt, which begins immediately on their return from church. The parvinaz precedes all the reſt, ſinging ſuch ſongs as he thinks ſuitable to the occaſion. The bariactar brandiſhes a lance with a ſilken banner faſtened to it, and an apple ſtuck on the point; there are two bariactars, and ſometimes four, at the more noble marriages. The ſtariſvat is the principal perſonage of the brigade; and the moſt reſpectable relation is commonly inveſted with this dignity. The ſtacheo's duty is to receive and obey the orders of the ſtariſvat. The two diveri, who ought to be the bridegroom's brothers when he has any, are appointed to ſerve the bride. The knum correſponds to our ſponſors; and the komorgia, or ſekſana, is deputed to receive and guard the dowry. A ciaous carries the mace, and attends to the order of the march, as maſter of the ceremonies: he goes ſinging aloud, *Breberi, Davori, Dobraſrichia, Jara, Pico;* names of ancient propitious deities. Buklia is the cup-bearer of the company, as well on the march as at table; and all theſe offices are doubled, and ſometimes tripled, in proportion to the number of the company.

The entertainment on the firſt day is ſometimes made at the bride's houſe, but generally at the bridegroom's, whither the ſvati haſten immediately after the nuptial benediction; and at the ſame time three or four men run on foot to tell the good news; the firſt who gets to the houſe has a kind of towel, embroidered at the ends, as a premium. The domachin, or head of the houſe, comes out to meet his daughter-in-law; and a child is handed to her, before ſhe alights, to careſs it; and if there happens to be none in the houſe, the child is borrowed from one of the neighbours. When ſhe alights, ſhe kneels down, and kiſſes the threſhold. Then the mother-in-law, or in her place ſome other female relation, preſents a corn-ſieve, full of different kinds of grain, nuts, almonds, and other ſmall fruit, which the bride ſcatters upon the ſvati, by handfuls, behind her back.

The bride does not ſit at the great table the firſt day, but has one apart for herſelf, the two diveri, and the ſtacheo. The bridegroom ſits at table with the ſvati; but in all that day, conſecrated to the matrimonial union, he muſt neither unlooſen or cut any thing whatever. The knum carves his meat, and cuts his bread. It is the domachin's buſineſs to give the toaſts; and the ſtariſvat is the firſt who pledges him. Generally the bukkara, a very large wooden cup, goes round, firſt to the ſaint protector of the family; next to the proſperity of the holy faith; and ſometimes

ſometimes to a name the moſt ſublime and venerable. The moſt extravagant abundance reigns at theſe feaſts; and each of the ſvati contributes, by ſending a ſhare of proviſions.

The dinner begins with fruit and cheeſe; and the ſoup comes laſt, juſt contrary to our cuſtom. All ſorts of domeſtic fowls, kid, lamb, and ſometimes veniſon, are heaped in prodigious quantities upon their tables; but very rarely a Morlack eats veal, and perhaps never, unleſs he has been perſuaded to do it out of his own country. This abhorrence to calves fleſh is very ancient among the Morlacchi. St. Jerom, againſt Jovinian, takes notice of it; and Tomeo Marnavich, a Boſnian writer, who lived in the beginning of the laſt age, ſays, that the Dalmatians, uncorrupted by the vices of ſtrangers, abſtained from eating calves fleſh, as an unclean food, even to his days. The women relations, if they are invited, never dine at table with the men, it being an eſtabliſhed cuſtom for them to dine by themſelves.

After dinner, they paſs the reſt of the day in dancing, ſinging ancient ſongs, and in games of dexterity, or of wit and fancy; and in the evening, at a convenient hour after ſupper, the three ritual healths having firſt gone round, the knum accompanies the bridegroom to the matrimonial apartment, which commonly is the cellar or the ſtable, whither the bride is alſo conducted by the diveri and the ſtacheo; but the three laſt are obliged to retire, and the knum remains alone with the new married couple. If there happens to be any bed prepared better than ſtraw, he leads them to it: and having untied the bride's girdle, he cauſes them both to undreſs each other reciprocally.

It is not long ſince the knum was obliged to undreſs the bride entirely; but that cuſtom is now out of uſe; and, inſtead of it, he has the privilege of kiſſing her as often as he pleaſes, wherever he meets her; which privilege may poſſibly be agreeable for the firſt months, but muſt ſoon become very diſguſtful. When they are both undreſſed, the knum retires, and ſtands liſtening at the door, if there be a door. It is his buſineſs to announce the conſummation of the marriage, which he does by diſcharging a piſtol, and is anſwered by many of the company. The next day the bride, without her veil and virginal cap, dines at table with the ſvati, and is forced to hear the coarſe equivocal jeſts of her indelicate and ſometimes intoxicated company.

The ancient Huns called the nuptial feaſts *drave*, but they are by our Morlacchi called *ſdravize*, from whence our Italian word *ſtravizzo* is undoubtedly derived. They continue three, ſix, eight, or more days, according to the ability or prodigal diſpoſition of the family where they are held. The new married wife gets no inconſiderable profit in theſe days of joy; and it uſually amounts to much more than all the portion ſhe brings with her, which often conſiſts of nothing but her own clothes and perhaps a cow; nay, it happens ſometimes that the parents, inſtead of giving money with their daughter, get ſomething from the bridegroom by way of price.

The bride carries water every morning, to waſh the hands of her gueſts as long as the feaſting laſts; and each of them throws a ſmall piece of money into the baſon after performing that function, which is a very rare one among them, excepting on ſuch occaſions. The brides are alſo permitted to raiſe other little contributions among the ſvati, by hiding their ſhoes, caps, knives, or ſome other neceſſary part of their equipage, which they are obliged to ranſom by a piece of money, according as the company rates it. And, beſide all theſe voluntary or extorted contributions already mentioned, each gueſt muſt give ſome preſent to the new-married wife at taking leave the laſt day of the ſdravize; and then ſhe alſo diſtributes ſome trifles in return, which commonly conſiſt in ſhirts, caps, handkerchiefs, and ſuch like.

There is very little variation in the performance of the nuptial rites through all the vaſt country inhabited by the Morlacchi; and thoſe in uſe among the peaſants and common people of the ſea-coaſt of Dalmatia, Iſtria, and the iſlands, differ but little from them. Yet among theſe particular varieties, there is one of the iſland Zlarine, near Sebenico, remarkable enough; for there the ſtariſvat (who may naturally be ſuppoſed drunk at that hour) muſt, at one blow with his naked broad ſword, ſtrike the bride's crown of flowers off her head, when ſhe is ready to go to bed. And in the iſland of Pago, in the village of Novoglia (probably the Giſſa of ancient geographers) there is a cuſtom more comical, and leſs dangerous, but equally ſavage and brutal. After the marriage-contract is ſettled, and the bridegroom comes to conduct his bride to church, her father or mother, in delivering her over to him, makes an exaggerated enumeration of her ill qualities: "Know, ſince thou wilt have her, that ſhe is good for nothing, ill-natured, obſtinate," &c. On which the bridegroom, affecting an angry look, turns to the young woman, with an "Ah! ſince it is ſo, I will teach you to behave better;" and at the ſame time regales her with a blow or a kick, or ſome piece of ſimilar gallantry, which is by no means figurative. And it ſeems in general, that the Morlack women, and perhaps the greateſt part of the Dalmatians, the inhabitants of the cities excepted, do not diſlike a beating either from their huſbands or lovers.

The women in the neighbourhood of Derniſh are obliged, during the firſt year after marriage, to kiſs all their national acquaintances who come to the houſe; but after the firſt year they are diſpenſed from that compliment; and indeed they become ſo intolerably naſty, that they are no longer fit to practiſe it. Perhaps the mortifying manner in which they are treated by their huſbands and relations is, at the ſame time, both the cauſe and effect of their ſhameful neglect of their perſons. When a Morlack huſband mentions his wife, he always premiſes, By your leave, or begging your pardon. And when the huſband has a bedſtead, the wife muſt ſleep on the floor near it. Our author often lodged in Morlack houſes, and obſerved that the female ſex is univerſally treated with contempt: it is true, that the women are by no means amiable in that country; they even deform and ſpoil the gifts of nature.

Among us, where the ladies ſuffer ſo much, notwithſtanding all the care and circumſpection uſed before and after labour, the pregnancy and births of theſe women would be thought very extraordinary: ſince a Morlack woman neither changes her food, nor interrupts her daily fatigue, on account of her pregnancy; and is frequently delivered in the fields, or on the road, by herſelf; and takes the infant, waſhes it in the firſt water ſhe finds, carries it home, and returns the day after to her uſual labour, or to feed her flock. The little creatures, thus careleſsly treated in their tendereſt moments, are afterward wrapt in miſerable rags, where they remain three or four months, under the ſame ungentle management; and when that term is elapſed, they are ſet at liberty, and left to crawl about the cottage and before the door, till they learn to walk upright by themſelves; and at the ſame time acquire that ſingular degree of ſtrength and health with which the Morlacchi are endowed, and are able, without the leaſt inconvenience, to expoſe their naked breaſts to the ſevereſt froſts and ſnow.

The infants are allowed to ſuck their mother's milk while ſhe has any, or till ſhe is with child again; and if that ſhould not happen for three, four, or ſix years, they continue all that time to receive nouriſhment from the breaſt. The prodigious length of the breaſts of the Morlacchian women is ſomewhat extraordinary; for it is very certain that they can give the nipple to their children over their ſhoulders, or under their arms.

arms. They let the boys run about, without breeches, in a ſhirt that reaches only to the knee, till the age of thirteen or fourteen, following the cuſtom of Boſſina, ſubject to the Porte, where no haraz or capitation-tax is paid for the boys till they wear breeches, they being conſidered before that time as children, not capable of labouring, or earning their bread. On the occaſion of births, and eſpecially of the firſt, all the relations and friends ſend preſents of eatables to the woman in childbed, or rather to the woman delivered; and the family makes a ſupper of all thoſe preſents together. The women do not enter the church till forty days after child-birth.

While young, the Morlacchi paſs their time in the woods, attending their flocks and herds; and in that life of quiet and leiſure they often become dexterous in carving with a ſimple knife: they make wooden cups, and whiſtles adorned with fanciful baſſe-reliefs, which are not void of merit, and at leaſt ſhew the genius of the people.

There is a people in this country and Carniola, called Uſcocs, a rough ſavage race, large bodied, courageous, and much addicted to rapine; they are alſo noted for their agility, ſkipping like goats among the mountains, from rock to rock: ſome of them live in ſcattered houſes, and others in large villages. Their language is Walachian, and their religion the Greek, or ſomething like it. Theſe people, being galled by oppreſſion, eſcaped out of Dalmatia; from which circumſtance they obtained the name of Uſcocs, from the word Scaco, a *deſerter*.

The duchy of Carniola, which is a ſubdiviſion of Auſtria, in Germany, is bounded by the gulf of Venice to the weſt, by Sclavonia and Croatia to the eaſt, by Carinthia and Stiria to the north, and by the Adriatic Sea to the ſouth. It is 110 miles long, 50 broad, rather cold, but, at the ſame time, tolerably fertile. The lower claſs of people ſpeak the Sclavonian, or Wendiſh language, the better ſort German, but both with a very indifferent dialect. The peaſants are a very hardy ſet of people, going barefoot in the midſt of winter, never covering their breaſts from the inclemency of the weather, and ſleeping on a hard bench, without bed or bolſter. In the Upper and Lower Krain the people wear long beards; and ſuch as live by exporting the commodities of the country on packhorſes are called Samers, or, more properly, Saumers. The ſtates of Carniola conſiſt of the clergy, the nobility, knights, and royal towns. Chriſtianity was firſt planted in this country about the middle of the eighth century, and, in the ſixteenth, Lutheraniſm made a conſiderable progreſs in it; but, excepting the Walachians or Uſcocs, who are of the Greek church, and ſtyle themſelves Staraverzi, i. e. Old Believers, all the inhabitants at preſent are Roman Catholics. In the whole duchy are three biſhoprics, twenty-four cloiſters, four commanderies, and 134 pariſhes; but to the biſhopric of Leybach belong alſo many pariſhes in Stiria and Carinthia. The number of inhabitants are ſuppoſed to amount to 140,000. The principal commodities exported from hence are iron, ſteel, quick-ſilver, white and red wine, oil of olives, cattle, ſheep, cheeſe, linen, and a kind of woollen ſtuff called Mahalan, Spaniſh leather, honey, walnuts, and timber, together with all manner of wood-work, as boxes, diſhes, trenchers, ſpoons, ſieves, &c. Carniola was long a marquiſate or margravate; but, in the year 1231, was erected into a duchy. The arms of Carniola are an eagle crowned, in whoſe breaſt and expanded wings is to be ſeen a diced creſcent.

We ſhall here give a deſcription of the ſurpriſing lake in Carniola, called by the natives the Zirchnitzer-Sea: This lake has ſuch very remarkable qualities in its filling and emptying, and the uſes it is of to the neighbouring people are ſo many and various, that no hiſtorians from the oldeſt times, of which we have any account, have omitted to name it; yet neither the ancients nor moderns have well deſcribed it, nor is there any explanation of its phænomena given in any of our books of travels; wherefore it may be acceptable to the curious reader, to have a full account both of its nature and origin, and the reaſons of all its changes preſerved here.

It was called by the ancients Lugea Palus, or Lacus Lugeus, the Lugean Lake; but it is now generally known by the name of Zirchnitzer-Lake, which it has from the town of Zirknitz, near which it is ſituated.

The baſon of this lake is three miles and three quarters in length, its breadth is two miles in ſome places, and a mile and half in the narroweſt, and its depth, when full of water, is thirty-five feet in the middle, and from that to twelve or fifteen feet in the ſhallows. It lies in a ſmall flat, every way ſurrounded with vaſt mountains, running many miles into the country, ſeveral ways. There run at all times into this lake eight rivers; the two leaſt are called Bellebrech and Treſnez, and are trifling; but the others are all large rivers. With all this vaſt ſupply of water the lake never runs over, but has two large holes, in at which the water runs, and is carried off under the mountains. Beſides theſe there is a third courſe, or ſubterraneous paſſage, which probably communicates with them alſo.

All theſe come out together on the other ſide of the mountain, into which they are received, and form the river Jeſero; this river, after it has run a mile above ground, enters a ſtony cavern, and running ſlowly under the hill, about four hundred yards, it comes out again, and running about a quarter of a mile above ground, after this plunges into the earth again, and having paſſed about half a mile, it falls down a precipice, and is diſperſed through all the adjoining country. All the mountains hereabout are full of vaſt caverns, formed by nature, and ornamented by the ſame great hand, with a vaſt variety of figures, in the manner of thoſe in the grotto of Antiparos, ſo elegantly deſcribed by ſome travellers. The number and ſize of the caverns give us great reaſon to believe there may be others yet larger, which we cannot arrive at; and as thoſe which we know are ſometimes dry, and ſometimes full of water, we may rationally ſuppoſe the others to be ſubject to the ſame alterations. This fair ſuppoſition will account for all the changes of the Zirchnitzer-Lake, and the reader, we hope, will not think this previous account of the face of the country tedious, as it will be neceſſary to the hiſtory of the lake itſelf.

In the latter end of July, or beginning of Auguſt, this lake uſually begins to ſink, and the water is wholly gone out of it in about ſixteen days; it then remains dry till the middle of November, when it fills again. This is the common method, though not certain, for it ſometimes fills three times a year.—There are vaſt numbers of fiſh and fowl brought up with the water, and deſerted at its going off, which afford a vaſt advantage to the ſix or ſeven neighbouring towns, who have a right to the profit. There are three iſlands in the lake, and ſeveral pits in its bottom, of different breadths and depths. According to this difference in depth, theſe pits empty in different order of time, one after another, and give a much better opportunity of ſelling the fiſh, than if they all were to be taken at once. When the water begins to run off, the pit Maljoberch is emptied in three days; the church bell gives notice of this, and all the inhabitants, men and women, lay aſide all other buſineſs, and with it all ſhame and modeſty, and run into the pit naked as they were born. The water runs out at the bottom of this, and of the other pits, by holes too ſmall to admit the fiſh, ſo they are all caught; half is given to the lord of the manor, and the other half is the people's.

The pit Velkioberch is empty three days after this; three hours after this the pit Kamine empties; one hour

hour after this another; five days after that another large one empties, but the holes are ſo large at the bottom of this, that they are forced to uſe nets to take the fiſh, which would otherwiſe get out at them. A day and a half after this, another pit empties; twelve hours after this another empties; and three days after that, a very large one, called Reſchetto; this is fiſhed with nets, and often affords time for three hawls, as the water goes off; and by theſe they will ſometimes get between twenty and thirty carts of fiſh.

A few hours after this there is another emptied; in this pit they fiſh under ground, for there is a great hole in the ſtone at the bottom, and the men go down at this with lighted torches into a vaſt ſubterraneous cavern, the bottom of which is of hard ſtone, but is full of holes, like a ſieve; theſe let the water out, and the fiſh are all taken.

The pits are eighteen in number, and thus gradually become empty, ſo that in the whole there is time for the making the moſt of the fiſhing; but though they empty ſo long after one another, yet when they once begin to let out the water at all, it is all run out to the laſt drop in the ſpace of a few minutes, though ſome of them are eighty feet wide, and thirty or more deep. When the regular fiſhing is over, the church bells give the ſignal all over the neighbouring country, and the inhabitants of towns, many miles diſtant, run to the lake, and enter all ſtark naked, to look for fiſh among the weeds, and in the ſubterraneous caverns, of which there are many which have ways into them through holes in the bottoms of the pits. This gleaning of the fiſh is free for every body.

Some of theſe caverns are of immenſe ſize, and when there is thunder or lightning, thoſe are ſubject to terrible noiſes within; the fiſh alſo, while the pits are yet full of water, are ſometimes ſo ſtunned with lightning, that they float to the ſurface, and are taken out in vaſt numbers; but they come to themſelves when thrown into other water.

In one of the largeſt mountains near this lake, there are two vaſt caverns, which, though generally dry, yet when it thunders, generally pour forth out of their mouths a vaſt quantity of water, in form of a column, of twelve or fourteen feet diameter, and to the height of as many feet; this throws into the lake with it a vaſt number of fiſh, and of wild fowl, as ducks, and the like; and theſe at firſt are all blind, and very bald of feathers, and the people eaſily catch them in great numbers; but in about a fortnight they recover their ſight, and have wings enough to fly with.

When one of theſe caſcades of water has begun, the reſt all follow, and it is a terrible, but pleaſing ſight, to ſee fifty of theſe columns of water toſſed up from different openings in the mountains at once, and twice as many from the dry bottom of the lake itſelf.

The rivers that run conſtantly into this lake, while dry, are all received into the holes at the bottom, and never drown any part of it; but when the water is thus thrown up at many mouths at once, from ſome perpendicularly, from others obliquely, but from all in large columns, the whole lake will be filled in one day's time from being dry.

The firſt ſignal of the lake's filling, is a white vapour like a cloud, iſſuing out of the holes in the mountains; this is followed by thunder, lightning, and the moſt violent rains; and the Lake fills to a certain ſtandard, and never higher.

The fowl are brought up with the water, and they reſort from other places to it, from the neighbouring country for food, as long as the water remains in the lake. When it dries up, they have the vaſt advantage of the fiſhery, before deſcribed; as ſoon as that is all over, and the bottom is thoroughly dry, they pull up vaſt quantities of ruſhes there, which ſerve for many neceſſary uſes of life, and are fine litter for their cattle. The ſoil of the water makes the land ſo rich, that in twenty days the whole bottom is covered with fine graſs for hay; and after they have got this in, they plough it and ſow millet, which quickly ripens, and yields a prodigious increaſe; but this is ſometimes deſtroyed by the too early filling again of the lake; if not, as ſoon as this is got in, there is a fine paſture left for their cattle, and all the while it is on the ground, they have a vaſt quantity of quails among it: always when the bottom is dry there is fine hunting in it, the hares, deer, bears, and ſwine, coming down into it out of the woods and mountains, in great numbers.

The advantages this lake brings the neighbouring people are therefore infinitely greater than thoſe of any other ſpot of ground in the world, and all theſe are brought on in the ſpace of one year, thus ſucceſſively one after the other.

The pike of this lake are found of thirty or forty pound weight, tench of ſix or ſeven pounds are very frequent, and eel-pouts of two or three pounds, very well taſted; there are crabs always found in great plenty in two of the pits, but none in any others, and they are not well taſted. The blind ducks being toſſed up with the water may ſeem a very wonderful incident in other places, but there it is ſo common that no body regards it as a ſtrange thing; and not only this lake, but all the other places, where the water guſhes out of the caverns in mountains thereabout in the ſame manner, afford more or leſs of them.

The cauſe of theſe ſtrange changes in the lake from full to dry, and all its other phænomena, may be accounted for in the following manner. There is under the bottom of this lake another ſubterraneous one, with which it communicates by means of the holes in its bottom; and there are alſo many ſubterranean lakes in the mountain Javornick, whoſe ſurface is much higher than that of this lake. This upper lake is filled by ſome of thoſe ſubterraneous rivers, which we find are frequent in this country, and has an out-paſſage, which is big enough to carry what they uſually bring into it; but when theſe thunder ſtorms and violent rains come, the whole ſurface of the neighbouring mountains pour into theſe rivers all the water they receive; this is too much to be carried off by the common out-paſſage of the upper lake, and ſwelling it beyond its common ſurface, carries it up to places where there are holes in the rocks, by which all this maſs of water is precipitately conducted into the ſubterranean lake, that lies under the bottom of the Zirchnitzer-Lake; and this water, when it has filled that lake, is thrown up through the holes in its top, and in the ſides of the mountains in vaſt columns, up to the height of the ſubterraneous lake in the mountain Javornick. This muſt be the conſequence of theſe accidents, according to the known laws of hydroſtatics.

Such of theſe paſſages as have been level with the ſurface of the water in the lake of Javornick, bring away with the water the ducks of that lake, and theſe creatures are found in all the ſubterranean lakes of this country, covered but poorly with feathers, and their eyes being uſed only to ſo ſmall a quantity of light as is in theſe darkſome regions, when they are thrown up at once into broad day-light, are not able to bear it, but the creatures are blinded for ſome time, till cuſtom makes it eaſy to them. Thoſe paſſages which are wholly under water may throw up fiſh, though no ducks can belong to them, and many others too ſmall to admit either duks or fiſh, can throw up only water. Thus it is that the lake is ſuddenly filled, and that ſome of its feeding ſtreams bring up only water, others water and fiſh, and others water, fiſh, and ducks.

When the lake has been thus filled, it muſt continue full as long as the other lakes which ſupplied it are in the ſame fulneſs; but as ſoon as the lake under the mountain Javornick, being no longer overfilled itſelf, deſcends below the channels, by means

of which it ſupplied the lake under the Zirchnitzer-Lake, when the draughts from this under lake are greater than the ſtreams into the upper lake can ſupply, conſquently the Zirchnitzer-Lake ſinks gradually, according to the exceſs of the water that runs out above that which comes in. Thus things are reduced to their natural ſtate again, till a ſecond land flood comes to over-fill the lake in Javornick, and ſo fill up in conſequence the Zirchnitzer-Lake again; as the ſeveral pits in the bottom of this lake lie higher and lower, they are emptied regularly, one after another, according to this ſituation, the higheſt firſt; when this accidental quantity of water is carried off, all that the common ſupply of the rivers bring into it, is received in holes at the bottom, and running into the under lake, is diſcharged by the river Jeſero, in the country on the other ſide the mountain. All the ducks diſcharged up with the water, are bred in the lake under Javornick, they are all black, only that they have a white ſpot on the forehead, and they are well taſted, but too fat.

CHAP. XXIII.

POLAND.

Name, Extent, Boundaries, Situation, Diviſions, Climate, Produce, Rivers, Animals, Inhabitants, Religion, &c.

THE name of Poland is derived from Polu, a Sclavonian word, implying a country proper for hunting, on account of its abounting with plains, woods, wild beaſts, and every ſpecies of game.

This kingdom, before the late diſmemberment, was very extenſive, being 700 miles in length, and 680 in breadth; and (with the great duchy of Lithuania, anciently called Sarmatia, annexed) was bounded on the north by Livonia, Muſcovy, and the Baltic ſea; by Muſcovy, or Ruſſia, on the eaſt; by Hungary, Turkey, and Little Tartary, on the ſouth; and by Germany, on the weſt. The ſituation, between 46 and 57 deg. north lat. and between 16 and 34 deg. eaſt long. This country is divided into the twelve following provinces; viz.

1. Courland (ſubject to Ruſſia) 174 miles in length, and 80 in breadth, containing 4,114 ſquare miles; its chief city, Mittaw. 2. Lithuania; 333 miles in length, 310 in breadth, contains 64,800 ſquare miles; its chief city, Wilna. Moſt of this diſtrict is now poſſeſſed by Ruſſia. 3. Podolia; 360 miles in length, 120 in breadth, contains 29,000 ſquare miles; its chief city Kaminiuk. 4. Volhinia; 305 miles in length, 150 in breadth; contains 25,000 ſquare miles; its chief city, Lucko. 5. Great Poland, 208 miles in length, 180 in breadth; contains 19,200 ſquare miles; its chief city, Gneſna. 6. Red Ruſſia; 232 miles in length, 185 in breadth; contains 25,200 ſquare miles; its chief city, Lemburg: this diſtrict is now chiefly ſubject to Auſtria. 7. Little Poland; 230 miles in length, 180 in breadth; contains 18,000 ſquare miles; its chief city, Cracow; great part of this diſtrict is now ſubject to Auſtria. 8. Poleſia; 186 miles in length, 97 in breadth; contains 14,000 ſquare miles; its chief city, Breſſici. 9. Maſovia, 152 miles in length, 90 in breadth; contains 8,400 ſquare miles; its chief city, Warſaw. 10. Samogitia, 155 miles in length, 98 in breadth; contains 8000 ſquare miles; its chief city, Raſiun. 11. Pruſſia Royal, or Poliſh Pruſſia; 118 miles in length 104 in breadth; contains, 6,400 ſquare miles; and is now ſubject to Pruſſia. 12. Polachia; 133 miles in length, 42 in breadth; contains 4000 ſquare miles; its chief city, Bielh.

The climate of Poland is in general temperate, healthy, and more ſettled than thoſe of ſuch northern countries uſually are: in the north parts, however, the air is exceedingly cold; and the Carpathian mountains, which ſeparate Poland from Hungary, are covered with perpetual ſnow, which has even been known to fall in the height of ſummer. The ſoil is extremely rich and fruitful, and in many parts clays are found fit for making pipes and earthen-ware.

Poland is fertile in corn, great quantities of which are exported to other nations, it likewiſe produces hemp and flax: the paſtures are rich beyond expreſſion, ſo that the cattle grazing in them can hardly be ſeen for the height of the graſs; all kinds of herbs and fruits are found here; and in many places there are vines, whoſe grapes are agreeable to the taſte, but the wine made from them uſually proves ſharp. In the months of May and June a ſpecies of manna falls on the graſs in the night; and in the morning is collected by the inhabitants, together with the dew, into ſieves: the Poles eſteem this production a great delicacy, and have various methods of dreſſing it. The interior parts of Poland contain foreſts, which furniſh timber in ſuch great quantities, that it is employed in houſe-building inſtead of bricks, ſtone, and tiles.

Here are mines of ſilver, copper, lead, iron, ſalt, and coals; Lithuania abounds in iron ochre, black agate, ſeveral ſpecies of copper and iron pyrites, and red and gray granite; falſe precious ſtones, and marine petrifactions: other mineral productions are ſaltpetre, alum talc, quickſilver, and lapis calaminaris; and on the ſea-coaſt are found large quantities of amber. The water of many ſprings is boiled into ſalt.

The principal rivers in this kingdom are the Viſtula or Weyſell, the Neiſter, Nieper or Boriſthenes, the Wiconen, the Bog, and the Dwina.

The chief lake which merits deſcription, is Gopto, in the palatinate Byzaſty, or Brials, which is ſaid to dye of a ſwarthy hue perſons who work in it.

The foreſts of Poland afford ſhelter to a great number of wild horſes, aſſes, oxen, boars, wolves, elks, deer, foxes, hares, and rabbits. Here are great numbers of uri, or buffaloes, the fleſh of which, when ſalted, is eaten as a great delicacy by the Poles. Here is a kind of wolf reſembling a hart, with ſpots on his belly and legs, and affords excellent furs.

The elk is very common in Pruſſia, Courland, Livonia, Norway, Poland, and other northern countries. It is as high, and every way as large as a horſe, but its ſhape reſembles that of a deer: its feet are broad and cloven, and its horns large, rough and broad, like thoſe of a wild goat. Upon diſſecting one of theſe animals, a vaſt number of large flies were found in its head, which had nearly devoured the brain. Towards winter theſe poor creatures are always attacked by theſe inſects, which, through the paſſage of its ears find a way into its head, and there remain during that cold ſeaſon: the humming of theſe vermin, and the continual torture occaſioned by their feeding on the brain, ſubjects the elk to the epilepſy, when he is eaſily taken, which would otherwiſe prove a very difficult taſk. The fleſh of this animal is eaten by the nobility, and forms the moſt delicious part of their greateſt feaſts.

Poland produces a creature called a bohac; it reſembles a guinea pig, but ſeems to be of the beaver kind. Theſe little animals dig holes in the ground, which they enter in October, and do not quit their lodgings till April, unleſs compelled to it for want of food; and in that caſe, they always ſet one or two as centinels, who on the leaſt appearance of danger give the alarm by making a very peculiar noiſe, which being underſtood by their companions, they all make a haſty retreat to their burrows, wherein they have ſeparate apartments for their proviſions, their lodging, and their dead; ten or twelve of them uſually herding together in one hole. They are eaſily tamed, and in that ſtate are very diverting.

The

The birds in Poland, which are very numerous, are ſuch as have been already deſcribed in the other northern countries, except the quail, which is ſaid to have geen legs, and the fleſh unfit for eating; among thoſe of prey is the eagle and the vulture. Poland has no ſpecies of fiſh peculiar to itſelf; but its ſeas, rivers, and lakes abound in cod, ling, turbot, &c.

Some have ſuppoſed Poland and Lithuania to contain 14,000,000 of inhabitants; and this calculation may not be exaggerated, when we conſider that the Poles have no colonies, have ſometimes enjoyed peace for many years together, and that no fewer than 2,000,000 of Jews are ſaid to dwell there. Since the partition and diſmemberment of the kingdom, the number is only 9,000,000, of which 600,000 are Jews. The provinces taken by Ruſſia are the largeſt; thoſe by the Auſtrians the moſt populous, and the Pruſſians are the moſt commercial. By the diſmemberment of Poland, 5,000,000 of ſouls have been ſeparated from their ancient kingdom; ſince the provinces ſeized by the Ruſſians contain 1,500,000; thoſe by the Auſtrians, 2,500,000; and thoſe by the Pruſſians amount to about 860,000. The Poles, in their perſons, are handſome and well ſhaped, with fair complexions; in their manners, brave, honeſt, hoſpitable, active, and hardy; the women are ſaid to be of exemplary piety and virtue, both in their public and private conduct. Theſe people are divided into three claſſes, namely, nobles, citizens, and peaſants; the nobility are all on a level, except the difference that ariſes from the public poſts they enjoy, and the only title they value is that of a gentleman of Poland.

The nobles poſſeſs great privileges: they have a power of life and death over their tenants and vaſſals, pay no taxes, are ſubject to none but the king, may chooſe whom they pleaſe for their ſovereign, and lay him under what reſtraint they think proper; and none but themſelves, and the burghers of ſome particular towns, can purchaſe lands. Many of them enjoy eſtates from five to thirty leagues in extent, and are alſo hereditary ſovereigns of cities with which the king has no concern. Some of them can raiſe eight or ten thouſand men, and they have always a number of troops in their pay, who do duty night and day before their palaces, and in their antichambers, march before them when they go abroad, and particularly when they appear at the diet, many of them, on this laſt occaſion, having 5000 guards and attendants: for their debates in this great meeting are often determined by the ſword. It frequently happens that two Poliſh noblemen go to war with each other, when caſtles, forts, and whole cities are deſtroyed in the conteſt; though the affair, perhaps, which occaſions all this havock, has been before decided in a court of juſtice: but the ſentence of the civil law has very little weight with men who are in poſſeſſion of the whole power of the military. If a perſon accuſed of a crime, however capital, can fly to the houſe of a nobleman who will afford him his protection, he is ſafe; for no one dares to take him from thence by force: in ſhort, it may be ſaid, that a Poliſh grandee is the moſt independent of any perſon in any country; but if he once enters into trade, he forfeits his nobility, and every privilege thereto annexed.

The citizens of Poland reſemble thoſe of other places, but the peaſants are undoubtedly the moſt wretched race of beings. The nobility ſtyle them their ſubjects, and if they ſell an eſtate, diſpoſe of them in the ſame manner they do the cattle, or any other part of it. If one lord kills the peaſant of another, he is only obliged to make reparation by ſending him another of equal ſtrength and value. When a perſon of diſtinction intends to cultivate a ſpot of land, he cauſes a little wooden hut to be built near it, in which he ſettles a peaſant and his family, giving him a cow, two horſes, a certain number of geeſe, hens, &c. and as much corn as is ſufficient to maintain him for the firſt year; and in return, the peaſant is to improve the land for his own future ſubſiſtence, and the advantage of his lord. Thus are theſe poor creatures born and kept in a ſtate of perpetual ſervitude, of which they never ſee the end, unleſs by the permiſſion of their tyrants, from whom they frequently ſuffer the moſt cruel and wanton inſults. Sometimes theſe monſters proceed ſo far as to injure their wives and daughters, wrongs which muſt rouſe the rage of every being but a Poliſh peaſant, whoſe ſpirit, through oppreſſion, is ſunk into a ſtate of total inſenſibility, ſcarce ever being heard to repine at his hard lot, or wiſh for a better; particularly, if his maſter feeds him well, thinking it impoſſible for a man to be miſerable who has ſufficient to eat; and in this caſe, they are always ready to ſacrifice themſelves and their families for their lords, whom they are taught to regard as a ſuperior order of beings. Lately indeed, a few nobles of enlightened underſtandings have ventured to give liberty to their vaſſals. Zamoiſki, formerly great chancellor, was the firſt who granted this freedom; and in 1760 enfranchiſed ſix villages in the palatinate of Maſovia, and afterwards on all his eſtates. The event has ſhewed this act to be no leſs judicious than humane; conducive to the nobles' own intereſts as well as the happineſs of the peaſants: for it appears, that in the diſtricts in which this new arrangement hath been introduced, the population of the villages is conſiderably increaſed, and the revenues of their eſtates augmented in a triple proportion. Prince Staniſlaus, nephew of the king of Poland, hath very lately enfranchiſed four villages near Warſaw, and hath not only freed his peaſants from ſlavery, but condeſcends to direct their affairs. This conduct is truly laudable, and betokens better times to the lower claſs in this diſtreſſed country.
